

# Errata for FXAS21002C

This errata sheet describes the functional problems known at the release date of this document.

## Revision History

Rev	Date	Description
0	2/3/2015	Added E1: SPI Multipoint Communication
0.1	5/1/2015	E1 Fix Plan, Changed the date from WW19'2015 to WW32'2015 (2 places)

## Contents

<b>1</b>	<b>Part Identification .....</b>	<b>1</b>
<b>2</b>	<b>Errata.....</b>	<b>2</b>
2.1	E1: SPI Multipoint Communication .....	2

## 1 Part Identification

The following errata affect the behavior of all production FXAS21002C devices.

## 2 Errata

### 2.1 E1: SPI Multipoint Communication

#### Problem

FXAS21002C does not support *multi-point* 4-wire SPI communication protocol (multiple slave devices on the bus).

FXAS21002C, when connected for a 4-wire SPI communication with the master, does not tri-state the MISO line when the SPI\_CS\_B (SPI chip select, Active low) pin is deasserted (logic high). This leads to a bus conflict if there are multiple devices on the same SPI bus. As the part pulls MISO down to GND, instead of tri-stating, this part blocks the other slave devices on the bus from sending data to the master by means of 4-wire SPI communication.

#### Workarounds

Three possible workarounds are associated with the erratum.

##### Workaround 1

Add a tri-state buffer with the MISO line and the SPI\_CS\_B line as inputs to the buffer (see Figure 1).

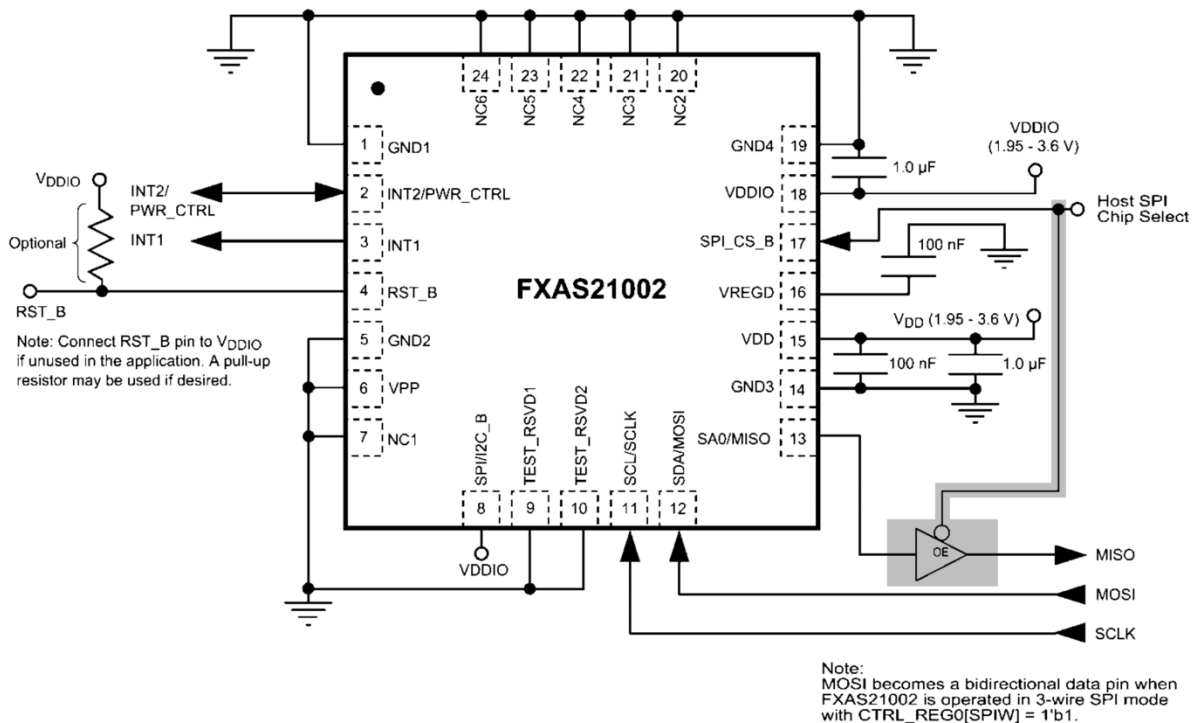

Figure 1. Typical application circuit with addition of tri-state buffer

##### Workaround 2

Use I<sup>2</sup>C communication instead of SPI 4-wire communication as the part's I<sup>2</sup>C communication works as expected with multiple slave devices on the bus.

### **Workaround 3**

Use 3-wire SPI communication with FXAS21002C and all other slave devices on the SPI bus.

If the device is connected and configured to operate in 3-wire SPI mode, it works as expected with multiple slave devices on the bus with the only condition that all slave devices on the bus must be connected for a 3-wire SPI communication with the master. In this configuration, FXAS21002C's SA0/MISO pin must be left unconnected.

### **Fix Plan**

A fix for *E1: SPI Multipoint Communication* is planned.

An ASIC revision is planned for the first half of 2015. Parts not subject to this errata will be identifiable by means of a clean date code currently targeted for WW32'2015. All material manufactured WW32'2015 and later will not be subject to this errata.
