AN13574

i.MX RT1170 CM4 Primary Core Application

Rev. 0 — 24 February 2022 Application Note

1 Introduction

This application note introduces how to set up environment for i.MX RT1170 CM4 primary core case.

It covers the following IDE:

- MCUXpresso
- IAR
- KEIL

By default, CM7 core is primary core on i.MX RT1170. By fusing 960 [12], we can switch to CM4 primary core and then the system boots from CM4 core.

i.MX RT1170 SDK only supports CM7 main core. This document is a supplement to provide basic environment for CM4 primary core case.

AN13574SW is tested by the tool version below:

- MCUXPRESSO 11.4.1
- IAR 9.20.2
- KEIL 5.36.0.0

2 Using MCUXpresso

For CM4 primary core in MCUXpresso, see AN13574SW.

NOTE

MCUXPresso IDE needs an initial state of the board to work for CM4 primary core case.

To set the environment, put the board in serial download mode (Set **SW1** to OFF, OFF, OFF, OFF), connect USB cable to SDP port (USB1 port, J20), and execute *AN_SWlinit_cm4_xip\program.bat*.

Switch to XIP boot mode (Set SW1 to OFF, OFF, ON, OFF), and the information appears on the console as below:

This is the init image to setup CM4 primary core environment.

Perform the settings only once before using MCUXpresso for CM4 primary core application on a board.

2.1 By DAP LINK

To run CM4 primary core hello world example in MCUXpresso, perform the following steps:

- 1. Install the SDK attached with this application note into MCUXPresso.
- 2. Import the multicore example. It includes a CM7 slave project and a CM4 master project.

7. Select CM7 project and run. The log is shown in console as below:

```
Hello World from the Primary Core!
Starting Secondary core.
The secondary core application has been started.
```

2.2 By JLink

To use JLink, first remove the jumper **J6** and **J7** on board.

The SEGGER version tested in this application note is v7.54b. To set flashloader in SEGGER for i.MX RT1170 CM4 primary core, perform the following steps:

- 1. Go to <segger installation directory> |JLink|Devices|NXP.
- 2. Create a folder called iMXRT117x.
- 3. Copy AN_SW\example_mcuxpresso\MIMXRT117x_QuadSPI_4KB_SEC_Alias.FLM\text{ in AN13574SW to <segger installation directory>\JL\text{ink\Devices\NXP\imxRT117x}.}
- 4. Add text below to <segger installation directory>\JLink\JLinkDevices.xml. AN_SW\example_mcuxpresso\ JLinkDevices.xml\ in AN13574SW.

```
<Device>
<ChipInfo Vendor="NXP"

Name="MIMXRT1176xxxA_M4"

Core="JLINK_CORE_CORTEX_M4"

WorkRAMAddr="0x20000000"

WorkRAMSize="0x00008000" />
```

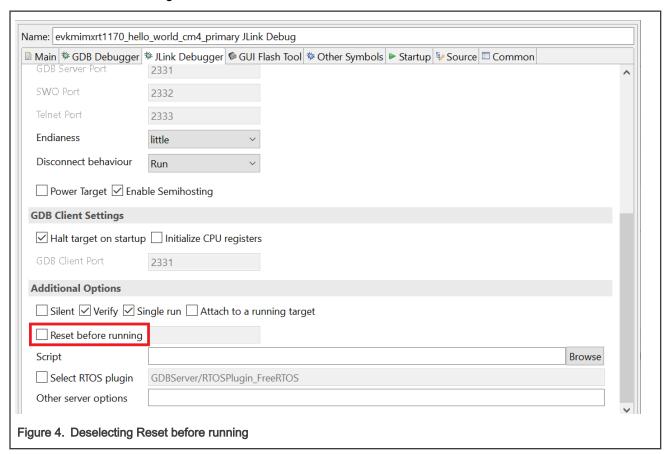

i.MX RT1170 CM4 Primary Core Application, Rev. 0, 24 February 2022

Application Note 3 / 9

```
<FlashBankInfo Name="QSPI Flash"
    BaseAddr="0x08000000"
    MaxSize="0x01000000"
    Loader="Devices/NXP/iMXRT117x/MIMXRT117x_QuadSPI_4KB_SEC_Alias.FLM"
    LoaderType="FLASH_ALGO_TYPE_OPEN" />
</Device>
```

For debugging, perform the following steps:

- Perform Step 1- 5 in By DAP LINK.
- To exit debugging mode, click
- · Deselect Reset before running.

• To start debugging again, press . As shown in Figure 5, CM4 project is loaded and stops at main ().

3 Using IAR

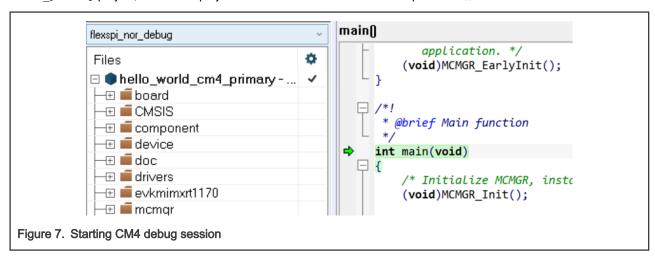

There is an example in AN13574SW for CM4 primary core in IAR. Use this example for the operation below.

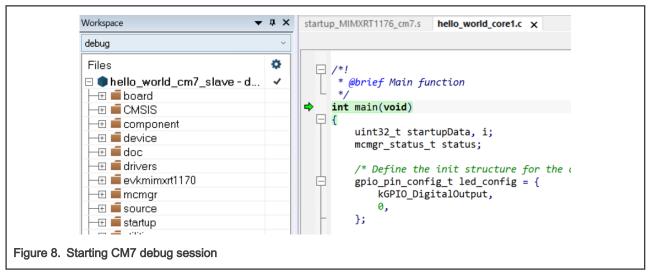

i.MX RT1170 CM4 Primary Core Application, Rev. 0, 24 February 2022

3.1 By DAP LINK

To run CM4 primary core hello world example in IAR, perform the following steps:

- 1. Open and build CM7 slave project.
- 2. Open and build CM4 master project.
- 3. In CM4 primary project, launch the project. Both cores are detected and stop at main().

4. Run CM4 project, and both cores start running.

3.2 By JLink

To use JLink, perform the following steps:

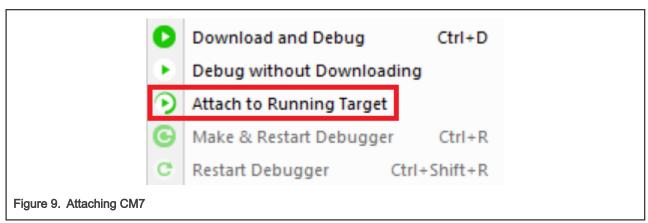

- Back up iMXRT_1170.dmac in <IAR installation path>larm|config|debugger|NXP.
- Back up FlashIMXRT1170_FlexSPI.mac in <IAR installation path>| arm|config|flashloader|NXP.
- Copy AN_SWlexample_iarliMXRT_1170.dmac in AN13574SW to <IAR installation path>larmlconfigldebuggerINXP.
- Copy AN_SWIexample_iar\FlashIMXRT1170_FlexSPI.mac in AN13573SW to <IAR installation path>\ arm\config\flashloader\NXP.

Perform the following steps:

1. Remove the jumper J6 and J7 on board.

7/9

- 2. Switch the debugger to be JLink in the example projects.
- 3. Build, download, and run CM4 project.
- 4. Build and attach CM7 project (from IAR -> Project).

5. If necessary, press and the code stop where it is running.

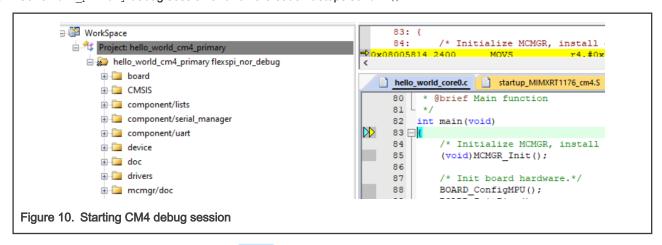

4 Using KEIL

There is an example in AN13574SW for CM4 primary core in KEIL. Use this example for the operation below.

Keil also needs an initial board state for first image download. For details, see Note in Using MCUXpresso.

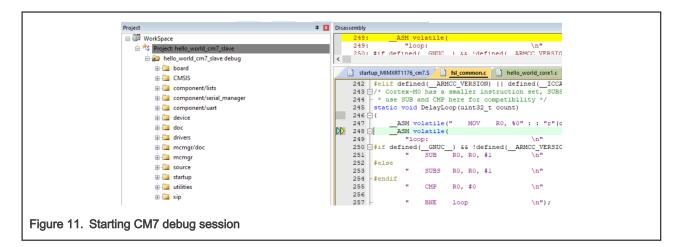

4.1 By DAP LINK

- 1. Open and build CM7 slave project.
- 2. Open and build CM4 primary project.
- 3. Launch CM4 primary debug session and run the code. It stops at main().

4. To attach CM7 slave debug session, click

Application Note

4.2 By JLink

To use JLink, remove the jumpers **J6** and **J7** on board.

Switch the debugger setting in the example to be JLink.

For debugging, follow Steps 1 - 4 in By DAP LINK.
