

Arm Servers

Last Updated: Nov 12, 2021

Because the electricity is a significant component of data center operating cost, there is interest in using low-power Arm processors as servers. NXP's LX2160A is a good candidate with competitive performance, low power, low cost and reduced system cost through SOC integration. It's well-suited for hyperscale installations, gaming servers and edge processing. With Arm Server Ready, SBSA and SBBR, it's easier to use Arm processors as servers.
