This page contains information on a product that is no longer manufactured (discontinued). Specifications and information herein are available for historical reference only.

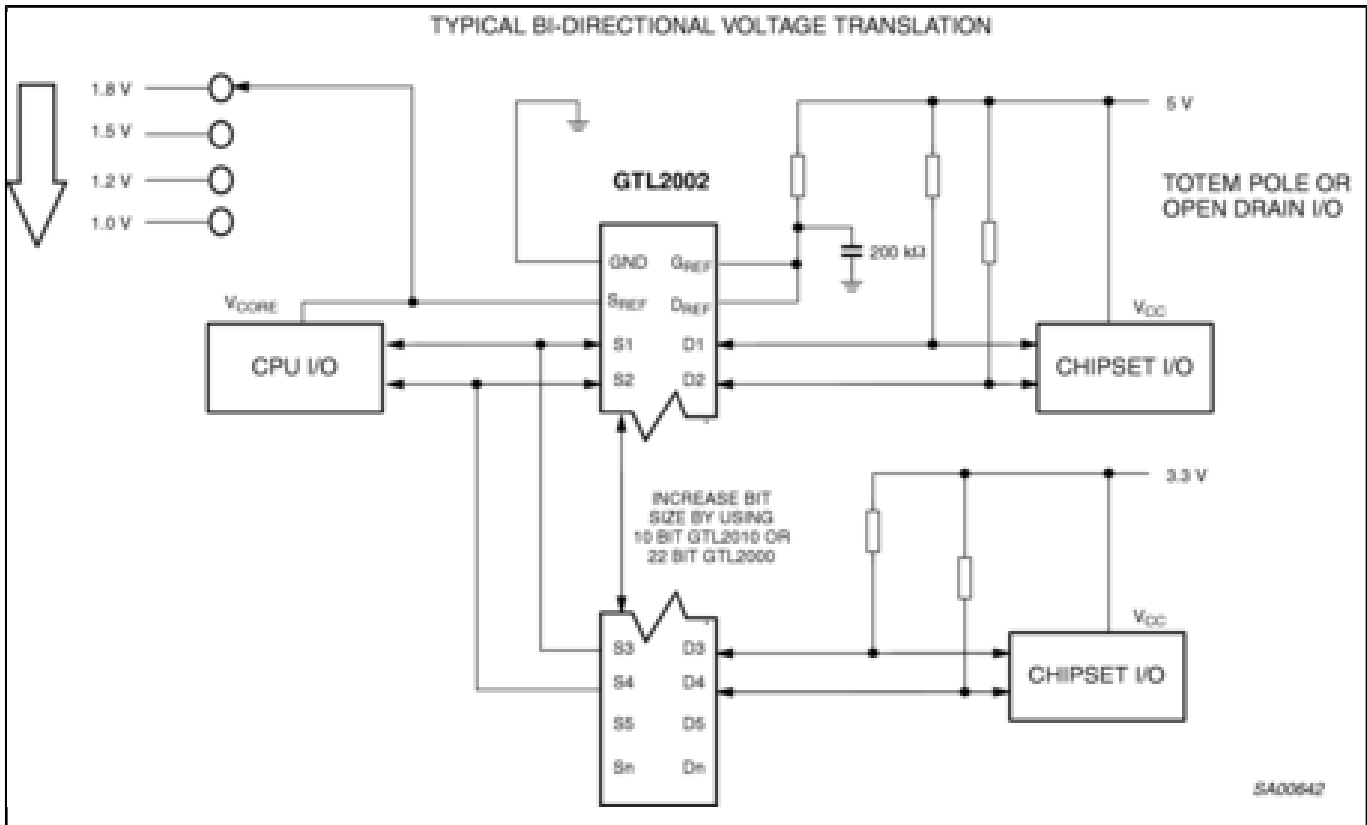

Last Updated: Jun 26, 2023

The Gunning Transceiver Logic - Transceiver Voltage Clamps (GTL-TVC) provide high-speed voltage translation with low ON-state resistance and minimal propagation delay. The GTL2010 provides 10 NMOS pass transistors ( $S_n$  and  $D_n$ ) with a common gate (GREF) and a reference transistor (SREF and DREF). The device allows bidirectional voltage translations between 1.0 V and 5.0 V without use of a direction pin.

When the  $S_n$  or  $D_n$  port is LOW, the clamp is in the ON-state and a low resistance connection exists between the  $S_n$  and  $D_n$  ports. Assuming the higher voltage is on the  $D_n$  port, when the  $D_n$  port is HIGH the voltage on the  $S_n$  port is limited to the voltage set by the reference transistor (SREF). When the  $S_n$  port is HIGH, the  $D_n$  port is pulled to VCC by the pull-up resistors. This functionality allows a seamless translation between higher and lower voltages selected by the user, without the need for directional control.

All transistors have the same electrical characteristics and there is minimal deviation from one output to another in voltage or propagation delay. This is a benefit over discrete transistor voltage translation solutions, since the fabrication of the transistors is symmetrical. Because all transistors in the device are identical, SREF and DREF can be located on any of the other ten matched  $S_n/D_n$  transistors, allowing for easier board layout. The translator's transistors provide excellent ESD protection to lower voltage devices and at the same time protect less ESD-resistant devices.
