

Inter-Platform Communication Framework (IPCF)

IPCF

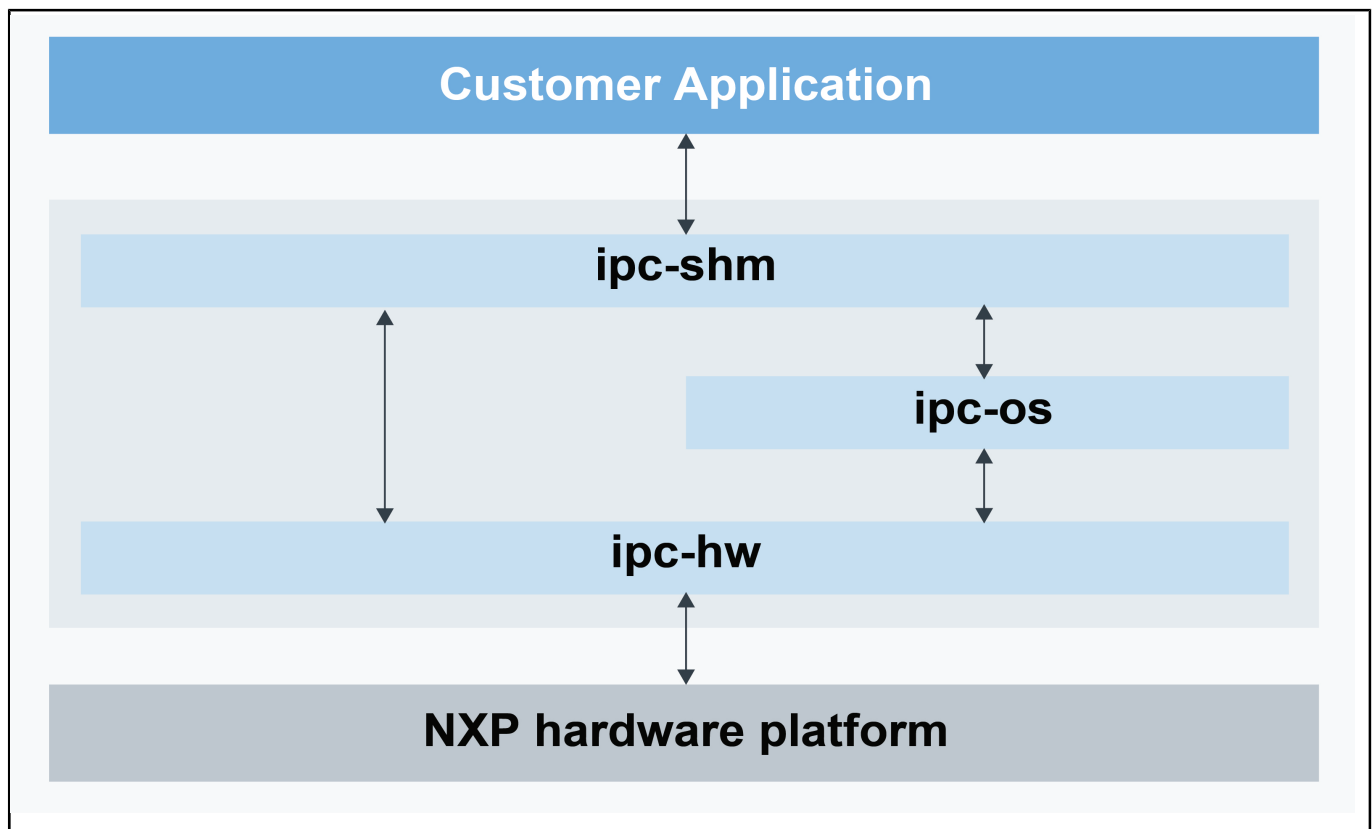

Last Updated: Sep 26, 2022

The Inter-Platform Communication Framework (IPCF) is a subsystem that enables applications (running on multiple homogenous or heterogeneous processing cores) located on the same chip or different chips (running on other operating systems like AUTOSAR™, FreeRTOS™, or more) to communicate over various transport interfaces (such as Shared Memory and others).

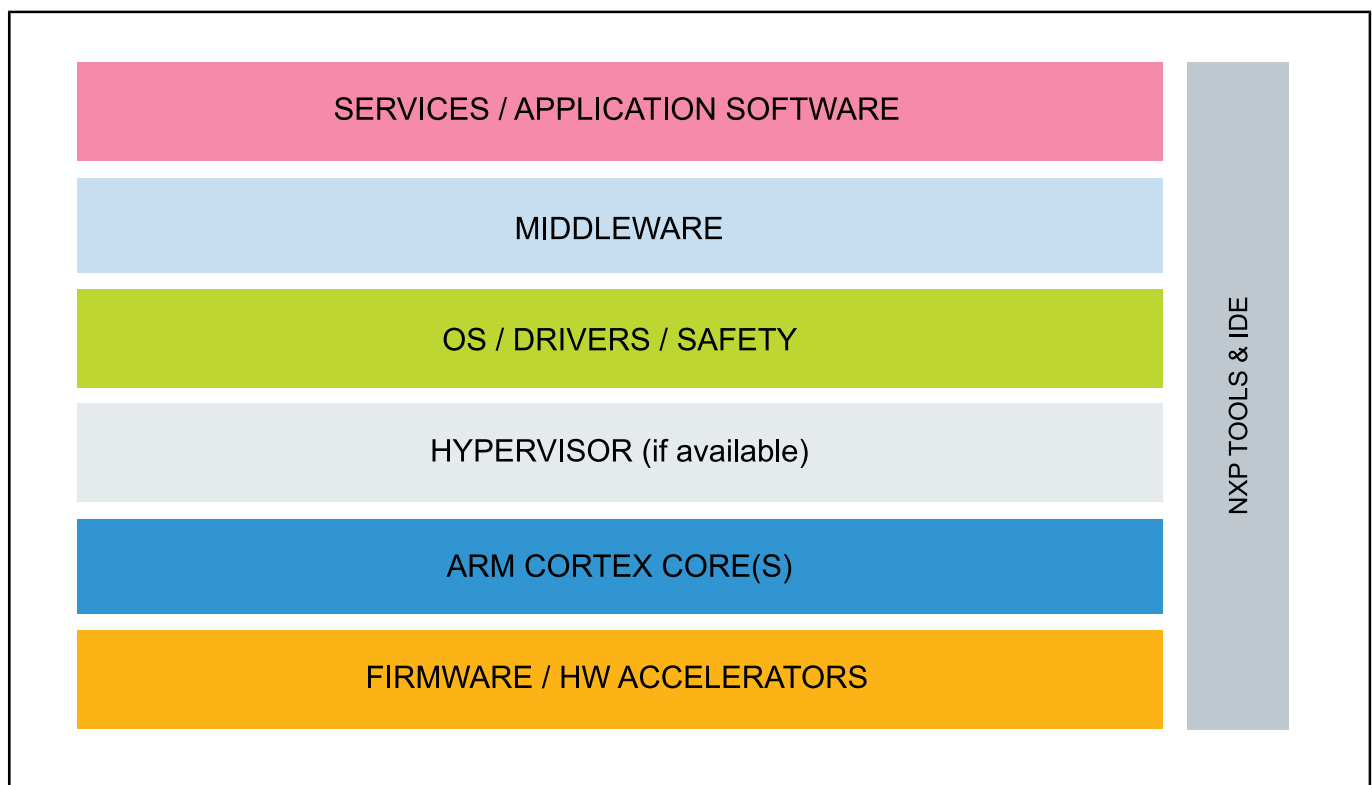

IPCF exposes a zero-copy API that customers can directly use for maximum performance, minimum overhead, and low CPU load. The driver ensures freedom from interference between local and remote shared memory by executing all writing operations only in the local memory domain.

Customers can enforce memory protection for their software with IPCF.
