VR249 HV PMIC Board Socket for Industrial Safety Programming

KITVR249SKTEVM

Active

Last Updated: Aug 25, 2026

Combined with an LQFP48 socket, the KITVR249SKTEVM enables configuration and evaluation of the VR249 high-voltage power management-integrated circuit (PMIC) family for 24 V industrial applications. Devices can be easily inserted into the socket, enabling one#time programming (OTP) emulation, functional testing and final OTP fuse programming once the configuration is ready. The onboard FRDM#KL25Z development platform, combined with the VR249 NXP graphical user interface (GUI) software, allows users to fully configure, control and monitor the VR249 PMIC.
