1. Introduction

This document gives a description on how to get started with the OM5578 PN7150 NFC-Controller SBC Kit on BeagleBone Black platform. This document provides a step by step guide to the installation procedure of the hardware and the software. Finally, it shows PN7150 NFC Controller functionalities through demonstration application.

1.1 OM5578/PN7150BBB demo kit

OM5578/PN7150BBB kit is a high performance fully NFC compliant expansion board for BeagleBone Black (refer to [1] for more details). It meets compliance with Reader mode, P2P mode and Card emulation mode standards. The board features an integrated high-performance RF antenna to insure high interoperability level with NFC devices.

The demo kit is comprised of a PN7150 NFC Controller Board, a dedicated interface board, and a NFC Sample Card.

![OM5578/BBB kit overview](image)

The demo kit is fully described in UM10935 document [4].

1.2 Linux driver support

PN7150 NFC Controller is supported under GNU/Linux system using the NXP Linux libnfc-nci software stack delivered through public GitHub repository [https://github.com/NXPNFCLinux/linux_libnfc-nci](https://github.com/NXPNFCLinux/linux_libnfc-nci) (for more details, refer to AN11697 [2]).

1.3 Android driver support

PN7150 NFC Controller is supported from the official Android Open Source Project (refer to [5] for more details) with the addition of dedicated patches (refer to AN11690 [3]).
2. Quick Startup on BeagleBone

2.1 Required items

- BeagleBone Black [1]
- MicroSD card of at least 4 Gb (8 Gb for Android demo image)
- 5V adapter to power the BeagleBone (Note: Micro USB cable doesn’t provide the 5V required by the antenna supply of the OM5578/PN7150S board. Without it no RF field can be generated by the OM5578).
- USB Keyboard
- USB Mouse
- USB Hub to connect both Mouse and Keyboard to the BeagleBone
- HDMI cable to connect to a Monitor / TV
- Computer (running Windows, Linux or Mac OS X) for MicroSD card installation
- BeagleBone demo image file (see [6])

2.2 Hardware setup

First of all, assemble the PN7150 NFC Controller Board with the BeagleBone Interface Board.

![Fig 2. OM5578/PN7150S BeagleBone configuration](image)
Then stacked together the boards with the BeagleBone.

Fig 3. OM5578/PN7150S and BeagleBone Black stacked together

2.3 Software setup

Prepare a MicroSD card, with the downloaded BeagleBone demo image (see [6]), following the installation guidelines. First extract the ".img" file from the archive, then flash it on the microSD card according to below guidelines.

2.3.1 On Windows

Insert the MicroSD card into your computer (note the device drive letter), and using Win32 Disk Imager, write the image into it:

Fig 4. Win32 Disk Imager
2.3.2 On Linux

Insert the MicroSD card into your computer and determine the device node assigned to it (ignore the device number; e.g. /dev/sdb, not sdb1):

```bash
$ sudo dmesg | tail -20
```

Then, unmount the device node using following command:

```bash
sudo umount /dev/devicenode
```

Finally flash the image to the device node using following command:

```bash
sudo dd if=path_to_image_file.img of=/dev/devicenode bs=1M
```

2.3.3 On MAC OS X

Using PiFiller (see https://learn.adafruit.com/beaglebone-black-installing-operating-systems/mac-os-x), select the image file then insert the MicroSD card into your computer to flash it.
2.4 Linux NFC demo application

2.4.1 Application details

The demo application is part of the Linux libnfc-nci stack available on public GitHub repository https://github.com/NXPNFCLinux/linux_libnfc-nci. The related source code can then be found there (more details in document AN11697 [2]).

2.4.2 Starting Linux NFC demo

Insert the MicroSD card in the BeagleBone. Connect HDMI Display, mouse and keyboard via the USB Hub. Finally supply the BeagleBone using 5V adapter.

The BeagleBone boots and displays the bone-debian GUI:

![bone-debian GUI](image)

Open a terminal and browse to the Linux libnfc-nci stack directory (refer to chapter 1.2 for more details about the Linux NFC software stack).

```
$ cd ~/linux_libnfc-nci
```

The application requires parameters to run:

```
$ ./nfcDemoApp <OPTIONS>
```

You can get the parameters details by launching the application help menu:

```
$ ./nfcDemoApp --help
```
The demo application offers 3 modes of operation:

- **Polling**: continuously waiting for a remote NFC device (tag or peer device) and displays related information
- **Tag writing**: allows writing NDEF content to a NFC tag
- **Device push**: allows pushing NDEF content to a remote NFC peer device

### 2.4.2.1 Polling mode

When in this mode, the application will display information of any discovered NFC tags or remote NFC device.

It is reached starting the application with "poll" parameter:

```
$ ./nfcDemoApp poll
```

![Linux demo application polling mode](image)

**Fig 8. Linux demo application polling mode**
2.4.2.2 Tag writing mode

This mode allows writing data to an NFC tag. It is reached using "write" parameter:

$ ./nfcDemoApp write <OPTIONS>

![Linux demo application tag writing mode](image)

You can get more information about the message format using "-h" or "--help" parameter:

$ ./nfcDemoApp write --help

2.4.3 Device push mode

This mode allows pushing data to a remote NFC device (e.g. an NFC phone). It is reached using "push" parameter:

$ ./nfcDemoApp push <OPTIONS>
You can get more information about the message format using "-h" or "--help" parameter:

```
$ ./nfcDemoApp push --help
```

### 2.5 Android NFC demo

Insert the MicroSD card in the BeagleBone. Connect HDMI Display, mouse and keyboard via the USB Hub. Finally supply the BeagleBone using 5V adapter.

After a few seconds Android boots up, NFC is then running, ready to read tags or interact with remote NFC device (e.g. NFC phone).
You can enable/disable the NFC function via “Settings/Wireless & Network/More…”

Fig 12. Android “Setting/Wireless&Network” menu

Using provided NXP TagInfo and NXP TagWriter applications you can get information from discovered tag and write content.

3. References

[1] BeagleBone is a low-power open-source hardware single-board credit-card-sized Linux computer that connects to the Internet and runs software such as Android and Ubuntu. With plenty of I/O and processing power for real-time analysis provided by a 720MHz ARM® processor based SoC (System on Chip), BeagleBone can be complemented with cape plug-in boards to augment functionality.

For more information about it please visit http://beagleboard.org/bone

[5] Android is an open-source software stack for a wide range of mobile devices and a corresponding open-source project led by Google.

4. Legal information

4.1 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

4.2 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in whatsover, NXP Semiconductors' aggregate and cumulative liability

including without limitation, all damages referenced above and

reasonable reliance up to the greater of the amount actually paid by

of warranty or any other theory, even if advised of the possibility of such

notwithstanding any damages that customer might incur for any reason

NXP Semiconductors does not accept any liability related to any default,

damage, costs or problem which is based on any weakness or default in the
customer's applications or products, or the application or use by customer’s
third party customer(s). Customer is responsible for doing all necessary
testing for the customer’s applications and products using NXP
Semiconductors products in order to avoid a default of the applications and
the products or of the application or use by customer’s third party
customer(s). NXP does not accept any liability in this respect.

Export control — This document as well as the item(s) described herein
may be subject to export control regulations. Export might require a prior
authorization from competent authorities.

Translations — A non-English (translated) version of a document is for
reference only. The English version shall prevail in case of any discrepancy
between the translated and English versions.

Evaluation products — This product is provided on an "as is" and "with all
faults" basis for evaluation purposes only. NXP Semiconductors, its affiliates
and their suppliers expressly disclaim all warranties, whether express,
implied or statutory, including but not limited to the implied warranties of non-
INFRINGEMENT, MERCHANTABILITY and fitness for a particular purpose. The entire
risk as to the quality, or arising out of the use or performance, of this product
remains with customer.

In no event shall NXP Semiconductors, its affiliates or their suppliers be
liable to customer for any special, indirect, consequential, punitive or
incidental damages (including without limitation damages for loss of
business, business interruption, loss of use, loss of data or information, and
the like) arising out the use of or inability to use the product, whether or not
based on tort (including negligence), strict liability, breach of contract, breach
of warranty or any other theory, even if advised of the possibility of such
damages.

Notwithstanding any damages that customer might incur for any reason
whatsoever (including without limitation, all damages referenced above and
all direct or general damages), the entire liability of NXP Semiconductors, its
affiliates and their suppliers and customer’s exclusive remedy for all of the
foregoing shall be limited to actual damages incurred by customer based on
reasonable reliance up to the greater of the amount actually paid by
customer for the product or five dollars (US$5.00). The foregoing limitations,
exclusions and disclaimers shall apply to the maximum extent permitted by
applicable law, even if any remedy fails of its essential purpose.

4.3 Licenses

Purchase of NXP ICs with NFC technology

Purchase of an NXP Semiconductors IC that complies with one of the Near
Field Communication (NFC) standards ISO/IEC 18092 and ISO/IEC 21481
does not convey an implied license under any patent right infringed by
implementation of any of those standards. Purchase of NXP
Semiconductors IC does not include a license to any NXP patent (or other
IP right) covering combinations of those products with other products,
whether hardware or software.

4.4 Trademarks

Notice: All referenced brands, product names, service names and
trademarks are property of their respective owners.

MIFARE — is a trademark of NXP B.V.
