1 Introduction

Instead of using a high end impedance analyzer or vector network analyzer (VNA), there are cheaper solutions available, which can be used instead. The high end VNA (like for example, the ZVL, see [1]) allows for an easy and accurate measurement of NFC antennas. They are flexible and powerful tools.

However, even with a simple tool like the NanoVNA (see [2] and Figure 1) a very accurate measurement for the NFC antenna tuning can be done.

Figure 1. NanoVNA

This document describes the NanoVNA, its limitations, and how to use available PC SW to extend the measurement features of the NanoVNA for the NFC antenna design.
2 NanoVNA

The NanoVNA is easy to use. It provides touch display and a wheel / button as shown in Figure 2 to control the measurement and display settings.

The USB-C connector can be used to load the battery and to connect the NanoVNA to the PC (see [3]).

For the NFC antenna tuning, only the S11 measurement is required and described. The S11 measurement is used to determine the antenna loop inductance (which is required to start the tuning process), and it is used to measure the tuning itself. All reference measurements use the smith chart.

The NanoVNA can be set in such a way that it simply shows the smith chart. The marker, which should be set to 13.56 MHz allows to easily read the required data. For a proper reading and documentation, the use of a PC tool is recommended, for example, the NanoVNA Saver (see [3]).

2.1 Preparation

The proper S11 measurement requires a proper connection and a proper calibration. The low measurement frequency range from 10 MHz to 20 MHz allows the use of a very simple but effective calibration.

2.1.1 Standard single pin row header

It is recommended to use a simple standard single pin row header for all measurements, as shown in Figure 3.
1. The 2-pin female header is connected via thin wires to Tx1 and Tx2 to protect the SMD pads.

*Figure 3. Standard pin row header for all connection*

The NXP NFC reader evaluation boards are prepared to cut off the antenna from the tuning circuitry and to cut off the tuning circuitry from the main board. On each side of the cutting line, there is the option to solder a standard single pin row header to reconnect the parts again.

With this simple preparation, antennas with or without tuning circuitry can be easily exchanged without soldering.

Normally it is a good solution to keep the tuning circuitry connected to the antenna loop. The major part of the EMC filter and the Rx-path connection is assembled on the main board. This part normally does not need to be changed at all. So all tuning can be done on the tuning part, which can be kept connected to the antenna.

With this concept, different antennas with different tunings can easily be connected to the main board without the requirement to solder anything.

The measurement cable can be prepared with a male 2-pin row header, which allows a simple access to all measurement points:

- The antenna loop can provide a female 2-pin row header, which allows the antenna loop inductance measurement.
- The Tx1 and Tx2 pins or preferably the related L0 pads can be connected to a female 2-pin row header via thin wires, as shown in *Figure 3*. These short wires have an impact on the measurement, since they add some nH to the measurement. However, this impact can be kept minor, as long as the wires are very short.
2.1.2 Calibration

The S11 measurement requires a proper calibration. Some VNA tools offer a calibration and a correction. The calibration is done at the measurement port, while the correction adds some (mechanical or electrical) cable length.

For the NFC frequency range, the measurement can be simplified. A simple full 1-Port calibration (Open, Short, and Load) with a self-made calibration kit is recommended, as shown in Figure 4.

![Self-made calibration kit](image)

1. This typically works accurately enough for frequency <100 MHz.

Figure 4. Self-made calibration kit

Using the standard pin row header, as described in Section 2.1.1, the calibration kit is a simple female pin row, where the short provides a short, the open provides “nothing” and the load is done with standard SMD resistor. The photograph in Figure 4 shows two 100 Ω resistors in parallel instead to achieve the 50 Ω load.

This calibration is accurate in the given frequency range, since it calibrates the measurement port in that plane, where the measurement takes place.

2.2 Stand-alone operation

The NanoVNA can be used stand-alone, as shown in Fig 5. The display is small but accurate enough to see the smith chart plot. And the marker info reads the relevant impedance data.
2.3 Known limitations

Obviously the number of measurement points is limited to 101. This limitation requires to either use a small sweep range (i.e. only 5 MHz) around the center frequency of 13.56 MHz. Such a small sweep range is recommended to be used in the stand-alone mode to get a proper result.

Or the PC SW allows to measure a wider sweep range in segments of 101 measurement points each. The NanoVNA Saver allows such an automatic scan in n segments, which makes it very easy to measure a full sweep from 10 MHz to 20 MHz in, e.g., 7 segments. That gives a very accurate measurement with e.g. 707 measurement in total. The segments are added into one plot automatically.

The display size and the related resolution are limited, too. However, the display is very clear and good enough to read and judge the results. And then the data can be retrieved via USB to any other platform. So in case of the use of NanoVNA Saver, there is no limitation in resolution anymore.
3 NanoVNA Saver

There are several open source SW tools available to drive and read the NanoVNA. Here in this document the NanoVNA Saver has been chosen (see [3]).

3.1 Driver

There is no driver installation required in MS WIN10. The NanoVNA automatically connects as “USB Serial Device”, as shown in Fig 6.

![Standard USB driver for WIN10](image.png)

1. No driver installation is required in WIN10.

Figure 6. Standard USB driver for WIN10

3.2 NanoVNA Saver installation

The NanoVNA Saver can be downloaded from [3]. It is licensed under version 3 of the GNU General Public License, and comes without any warranty.

The Fig 7 shows a measurement result with a sweep from 10 MHz to 20 MHz with 707 measurement points, plotted in the smith chart.

There is no installation required, the SW simply can be started after download. It takes a few seconds, when started, before the full screen shows up. The SW is available for Microsoft Windows, Linux and MacOS.
1. Smith Chart Plot in “Dark mode”

Figure 7. Screenshot of the NanoVNA Saver

It makes sense to set the marker to 13.56 MHz.

The screenshot shows a sweep based on 7 segment, resulting in 707 measurement points, from 10 MHz to 20 MHz.

3.3 Recommended settings

Here some recommended settings are listed. These settings work fine especially for the NFC antenna tuning.

3.3.1 General settings and info

The Fig 8 shows the general settings, as they can be set in the main window, and all the info that is shown besides the smith chart.
1. This is part of the main window.

Figure 8. General settings and info

Normally a single marker is sufficient.

3.3.2 Sweep settings

The Fig 9 shows the Sweep settings.
The NFC band had been defined and set before in the Display settings. It defines the Start frequency of 10 MHz and the Stop frequency of 20 MHz. Any other band with any other name can be defined there.

A Sweep name can be entered, which then is shown in the top of the smith chart.

**Note:** In the stand-alone operation, a smaller sweep range makes sense. In the stand-alone operation only a “single segment” with 101 measurement points is used, so it makes sense to reduce the sweep range to e.g. +/- 2.5 MHz around the 13.56 MHz.
3.3.3 Display settings

The Fig 10 shows the Display settings.

![Display settings](image)

1. These settings are not default.

Figure 10. Display Settings

In the Display settings colors and the look & feel can be defined. It is recommended to disable all traces except the first one, which should be set to “S11 smith chart”.

In the sub menu <Manage bands> the available frequency bands can be edited. In this menu, it might make sense to define the “NFC” band.
### 3.3.4 Marker settings

The Fig 11 shows the most relevant data settings for the marker(s) for the NFC antenna design.

![Marker settings](image)

1. A useful selection of data for NFC antenna tuning.

**Figure 11. Marker settings**

For every marker, the NanoVNA Saver shows some related data, if needed. For the NFC antenna tuning, the selected data is useful.
4 NFC antenna design with NanoVNA

The NFC antenna design is done in the same way as described in the related application notes (see [4], [5], [6], and [7]). The following sections show a comparison of measurement results between a reference measurement, done with a ZVL from Rohde & Schwarz (refer to [1]) and the NanoVNA.

4.1 Measuring the antenna loop

Before measuring anything, it is required to calibrate the setup and check the calibration. The easiest way to perform a 1-Port calibration with the NanoVNA is to use the Calibration assistant of the NanoVNA Saver. It is required to make all relevant settings upfront:

1. Set the measurement start and stop frequency, for example, from 10 MHz to 20 MHz.
2. Set the number of segments to get a proper resolution, for example, 7.
3. Set a marker to 13.56 MHz.

Figure 12 shows the calibration of a short: the smith chart indicates the uncalibrated measurement, using the calibration short.

1. The calibration with Short was done, and the next calibration step is requested.

Figure 12. Calibration with Short

Figure 13 shows the calibration of an open: the smith chart indicates the uncalibrated measurement, using the calibration open.

Figure 13
1. The calibration with Open was done, and the next calibration step is requested.

**Figure 13. Calibration with Open**

**Figure 14** shows the calibration of a load: the smith chart indicates the uncalibrated measurement, using the calibration load.

1. The calibration with Open was done, and the calibration is completed.

**Figure 14. Calibration with Load**

The 1-Port calibration is done now, and it can be applied. Afterwards the calibration should be checked, measuring the Open, Short and Load again: now they must return a single dot in the related position of the smith chart, as shown in **Figure 15, Figure 16**, and **Figure 17**.
Figure 15. Measuring the short

Figure 16. Measuring the open
Figure 17. Measuring the load

Now the measurement can start. **Figure 18** and **Figure 19** show the same measurement with NanoVNA and with ZVL.

1. \( L_{\text{ant}} = 1.15\mu\text{H} + j\ 2\Omega \)

**Figure 18. Measurement of the antenna loop with NanoVNA**
4.2 Measuring the tuning impedance

The same comparison is done with the complete antenna tuning circuitry, as derived in [7].

The Fig 20 shows the antenna tuning circuit with the simulation result in Fig 21.

The Fig 22 shows the S11 measurement result measured with the NanoVNA, the Fig 23 the same measured with the ZVL. The results both are good, i.e. the NanoVNA demonstrates a good enough performance for the NFC antenna tuning.

NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

6.2 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive or consequential damages (including - without limitation - lost profits, lost savings, business interruption costs, related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors’ aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer’s own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer’s sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer’s applications and products planned, as well as for the planned application and use of customer’s third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer’s applications or products, or the application or use by customer’s third party customer(s). Customer is responsible for doing all necessary testing for the customer’s applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer’s third party customer(s). NXP does not accept any liability in this respect.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Evaluation products — This product is provided on an “as is” and “with all faults” basis for evaluation purposes only. NXP Semiconductors, its affiliates and their suppliers expressly disclaim all warranties, whether express, implied or statutory, including but not limited to the implied warranties of non-infringement, merchantability and fitness for a particular purpose. The entire risk as to the quality, or arising out of the use or performance, of this product remains with customer. In no event shall NXP Semiconductors, its affiliates or its suppliers be liable to customer for any special, indirect, consequential, punitive or incidental damages (including without limitation damages for loss of business, business interruption, loss of use, loss of data or information, and the like) arising out of the use of or inability to use the product, whether or not based on tort (including negligence), strict liability, breach of contract, breach of warranty or any other theory, even if advised of the possibility of such damages. Notwithstanding any damages that customer might incur for any reason whatsoever (including without limitation, all damages referenced above and all direct or general damages), NXP Semiconductors’ aggregate and cumulative liability shall apply to the maximum extent permitted by applicable law, even if any remedy fails of its essential purpose.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — While NXP Semiconductors has implemented advanced security features, all products may be subject to unidentified vulnerabilities. Customers are responsible for the design and operation of their applications and products to reduce the effect of these vulnerabilities on customer’s applications and products, and NXP Semiconductors accepts no liability for any vulnerability that is discovered. Customers should implement appropriate design and operating safeguards to minimize the risks associated with their applications and products.

6.3 Licenses

Purchase of NXP ICs with NFC technology

Purchase of an NXP Semiconductors IC that complies with one of the Near Field Communication (NFC) standards ISO/IEC 18092 and ISO/IEC 21481 does not convey an implied license under any patent right infringed by implementation of any of those standards. Purchase of NXP Semiconductors IC does not include a license to any NXP patent (or other IP right) covering combinations of those products with other products, whether hardware or software.
