

by: NXP Semiconductors

## 1 Introduction

LPC804 has a Programmable Logic Unit (PLU) module. The PLU is used to create small combinatorial and/or sequential logic circuits that operate completely independently from the Arm® Cortex® M0+ Core. The logic operation can be programmed using software, and NXP provides free tools to help designers easily implement circuit designs and automatically generate the required register settings.

PLU features are listed as below:

- Up to 6 inputs from I/O pads
- Up to 8 outputs to I/O pads
- Up to 26 Look Up Tables (LUTs)
- Up to 4 state Flip Flops (FFs)
- Clock input from external I/O pad
- Feedback to MCU via I/O pads or through switch matrix

### 1.1 Look Up Tables (LUTs)

The PLU module has 26 LUTs, which can implement any combinational function of up to five possible inputs.

The inputs include:

- Other LUT outputs
- State FF outputs
- All inputs available from PLU I/O pads

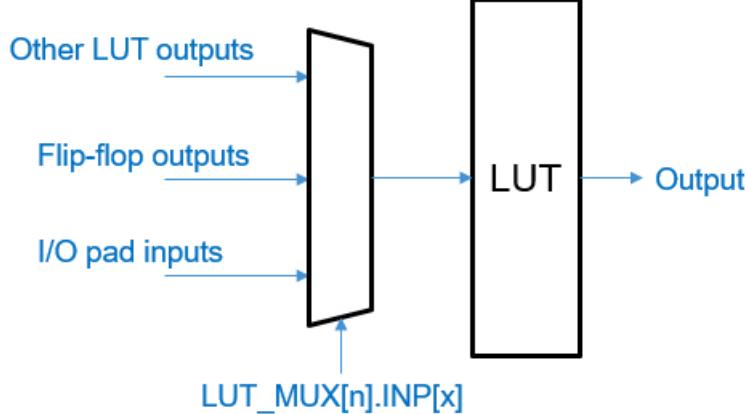

Figure 1. Look Up Tables (LUTs)

Each LUT is programmable using LPC804 registers which implements the logic mapping from 5 input lines to 1 output line with the **Logic Truth Value Table**. The output is immediately determined (allowing for propagation delays) by matching the input values of input lines with the entry in the table that matches the input values.

An example of Logic Truth Value Table for a 5-input customized LUT

IDX	IN4	IN3	IN2	IN1	IN0	OUT	IDX	IN4	IN3	IN2	IN1	IN0	OUT

Figure 2. An example of Logic Truth Value Table for a 5-input customized LUT

## 1.2 Multiplexer

Multiplexers in the PLU are used to set up the connections between units and select the right output signal.

Figure 3 shows the LUT input and output multiplexers for each channel.

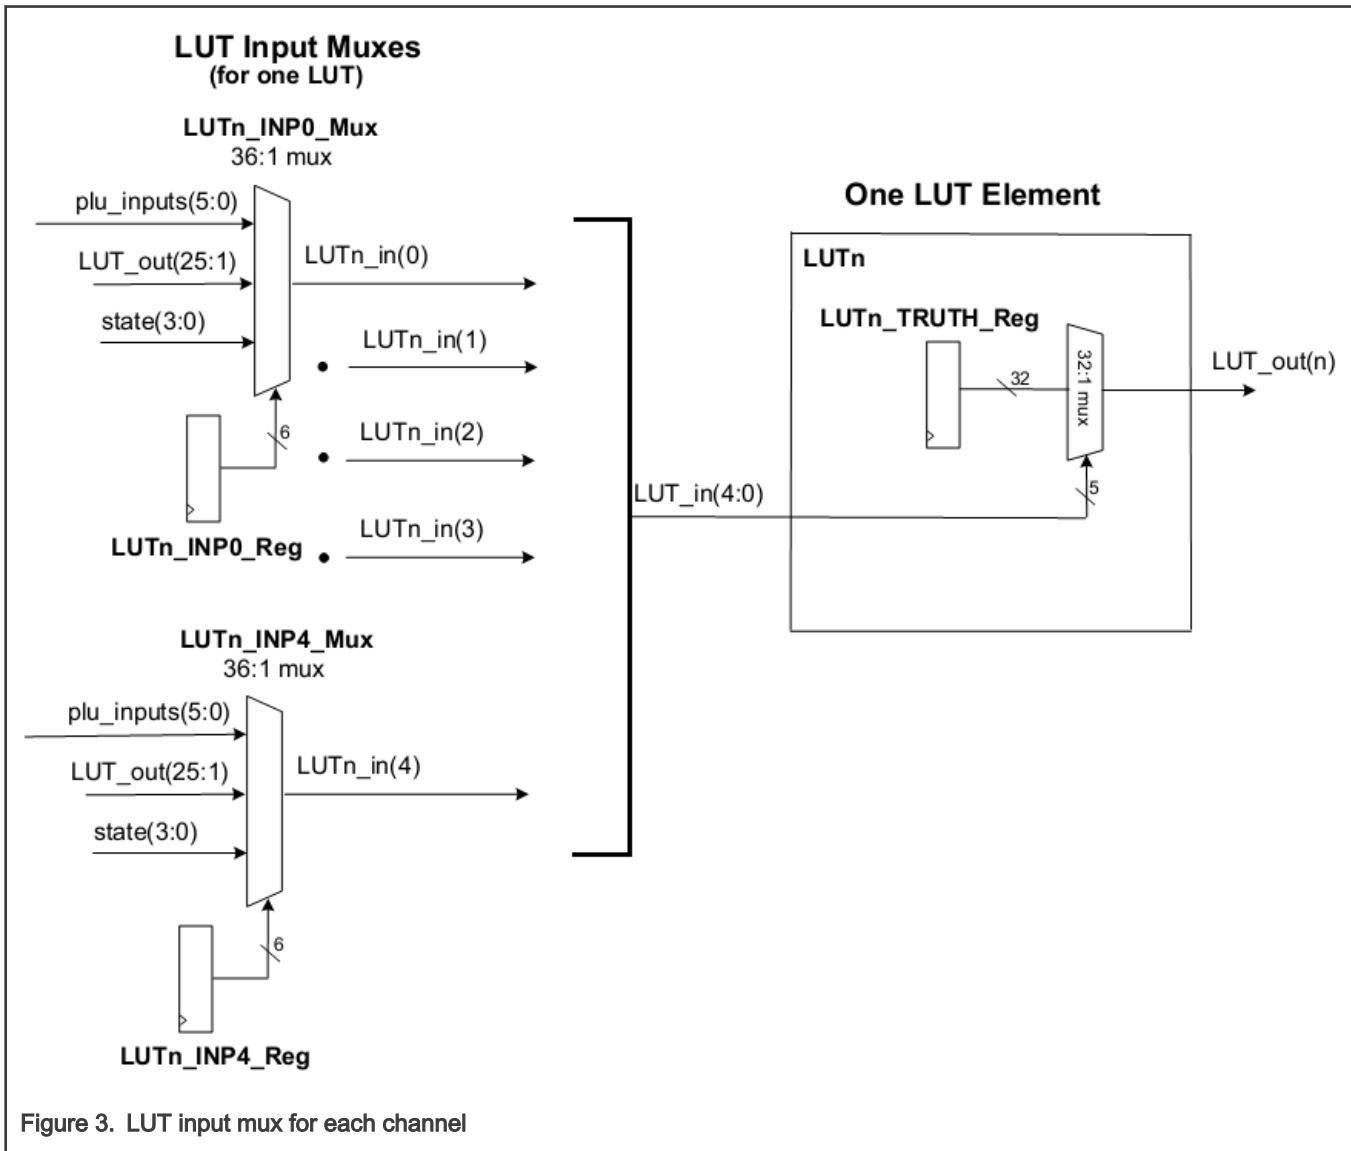

Figure 3. LUT input mux for each channel

Figure 4 shows the PLU output mux for each LUT.

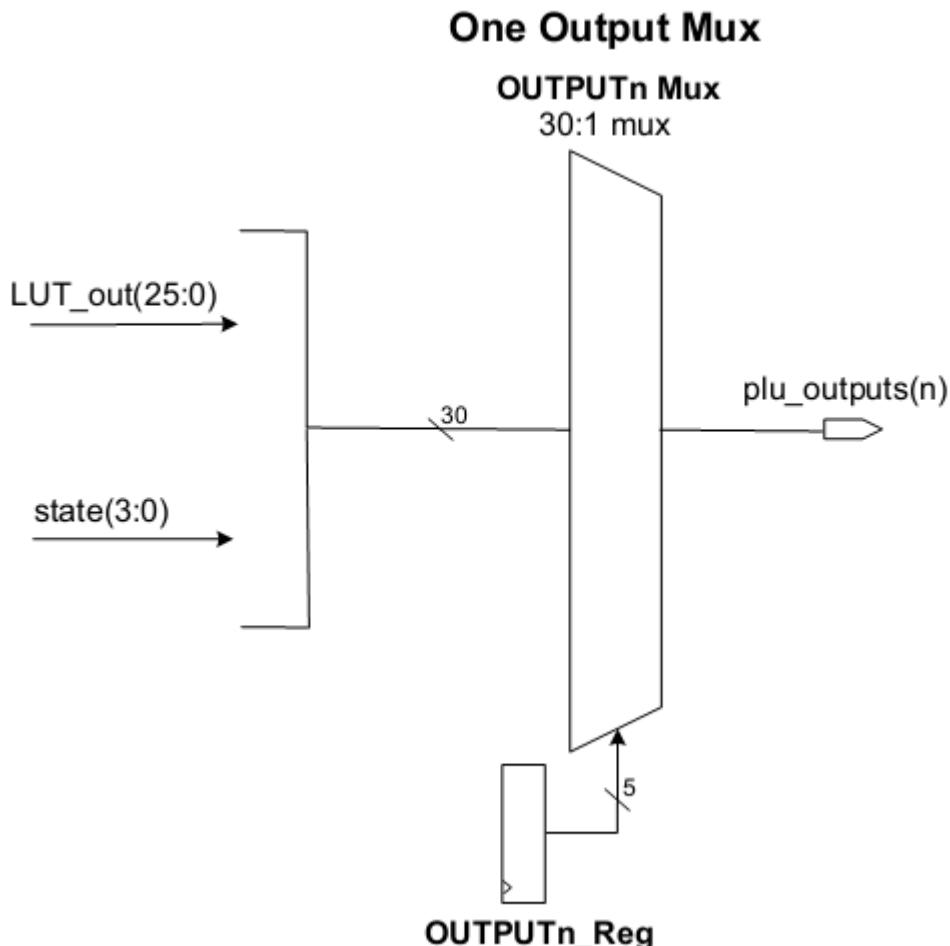

Figure 4. PLU output mux for each LUT

### 1.3 Steps for using the PLU

The PLU works as a general peripheral. Configure the PLU as below:

#### 1. Enable clocks

Enable PLU and SWM clock in `SYSCON_SYSABCLKCTRLx` register and toggle the **PLU Reset** bit in the `SYSCON_PRESETCTRLx` register.

#### 2. Assign pins

Assign PLU inputs and outputs to specific pins using `SWM_PINASSIGNFIXED0`. Some pins can be configured as both input and output of the PLU. For example, `PIO0_08` can be assigned to both `PLU_OUT1` and `PLU_INPUT0`.

#### 3. Create a logic network

Perform as below to implement a logic design with the PLU:

- Considering the approach to be used, direct LUT implementation or using primitive logic gates (or a mix of both approaches)
- Programming the customized LUTs, if primitive logic gates are not used
- Programming the connection of PLU inputs and outputs to LUTs

To help developers create a logic design, NXP provides a PLU Config Tool to help user create logic networks easily. This tool can be downloaded for free from [PLU configuration tool page](#). The following illustrates how to build a simple design with the PLU Design Tool. MCUXpresso Configuration tools also include support for setting up the PLU, assistant to pin connection and error checking.

## 2 Build user App. with PLU Config tool

PLU Config tool can run on Windows 8 or 10.

With the PLU Config tool, a user can:

- Create customized LUTs by direct, LUT-based and/or gate-level design.
- Automatically generate LUT configurations from a schematic design.
- Implement a design from Verilog.
- Generate C code to set up the PLU configuration registers automatically.

Users still need to connect PLU inputs, outputs, PLU `clk_in` to the physical pins via the switch matrix.

In this document, we build two example circuits to illustrate how to use the PLU Config tool, one using the direct LUT-based design and the other using a schematic design approach.

### 2.1 Required environment for demos

#### 2.1.1 Hardware

- LPCXpresso804 evaluation board
- A USB cable
- Host computer

##### Board rework:

PLU input pins connection (using wires to connect):

- Input1 - CN3\_7 (GPIO0\_8) to CN8\_2 (PLU\_IN2, GPIO0\_21).
- Input2 - CN3\_6 (GPIO0\_9) to CN3\_10 (PLU\_IN3, GPIO0\_20).
- Input3 - CN5\_1 (GPIO0\_10) to CN8\_5 (PLU\_IN4, GPIO0\_19).

PLU output pins connection (using wires to connect):

- Output1 - CN3\_1 (PLU\_OUT0, GPIO0\_14) to CN8\_4 (LED\_RED, GPIO0\_13).

#### 2.1.2 Software

Examples built using MCUXpresso IDE v11.2.1 and SDK 2.8.0 are provided on [NXP](#) to complement this application note. Two sets of demo code are included:

- Using direct, LUT-based design to generate C code to set up PLU configuration register
- Using schematic design to generate C code to set up PLU configuration register

### 2.2 Direct, LUT-based design demo

This demo illustrates how to use LUT-based method in PLU config tool to create an example LUT-based design with no specific purpose, just for illustrative purpose, which has the logic needed between inputs and outputs as below.

#### 2.2.1 Logic between inputs and outputs

For this demo, we set up the design for the relationship between inputs and outputs, as shown in [Table 1](#).

Table 1. Logic between inputs and outputs for LUT-based design demo

Input3	Input2	Input1	Output1
PLU_IN4	PLU_IN3	PLU_IN2	PLU_OUT0
P0_19	P0_20	P0_21	P0_14 (Red LED, ON for 0)
LUT_IN2	LUT_IN1	LUT_IN0	LUT_OUT0
0	0	0	1
0	0	1	0
0	1	0	1
0	1	1	0
1	0	0	1
1	0	1	0
1	1	0	1
1	1	1	0

## 2.2.2 PLU Config tool usage

1. Open the PLU Config tool and choose working flow for Direct, LUT-based design. Place Input ports 1, 2, and 3, then output1 and LUT0 in the schematic, draw the connections between inputs, LUT and output, as shown in [Figure 5](#).

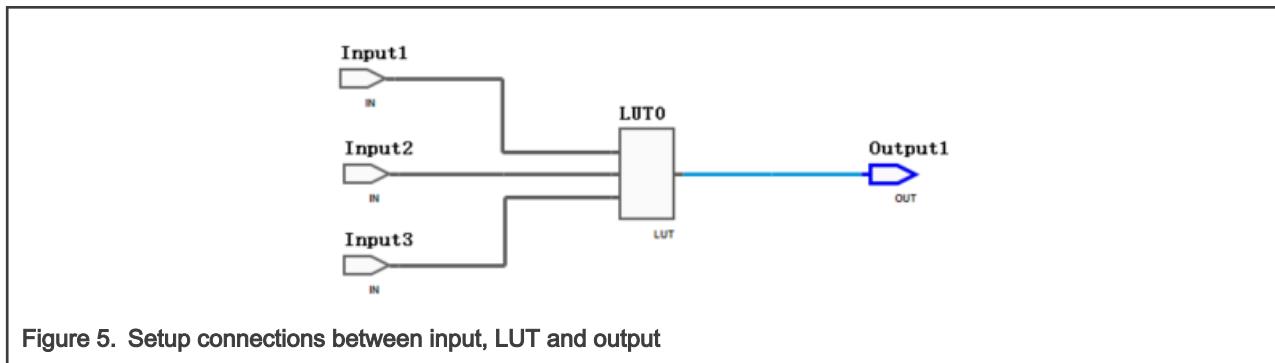

Figure 5. Setup connections between input, LUT and output

2. After finishing the connections, on the left of the window, there is a **mapping** setup window ready for setup. It specifies connections from the inputs and outputs to specific PLU resources. Map PLU inputs and output to the LUT by choosing the needed pins from the pull-down menu. The demo code uses `PLU_INPUT2` for input1, `PLU_INPUT3` for input2, `PLU_INPUT4` for input3, and `PLU_OUTPUT0` for output1. These relationships are shown in [Table 1](#).

Schematic Name	Mapped
Input1	IN2
Input2	IN3
Input3	IN4
LUT0	LUTO
Output1	OUT0

Figure 6. Map PLU input and output to LUTs

3. In the right panel of the Config Tool, there is a LUT setup form which can be used to set up the LUT values directly, according to [Table 1](#). Click on the table output column to change the 0 or 1 value as desired.

index	E	D	C	B	A	OUT
0x0	x	x	0	0	0	1
0x1	x	x	0	0	1	0
0x2	x	x	0	1	0	1
0x3	x	x	0	1	1	0
0x4	x	x	1	0	0	1
0x5	x	x	1	0	1	0
0x6	x	x	1	1	0	1
0x7	x	x	1	1	1	0
0x8	x	x	x	x	x	x
0x9	x	x	x	x	x	x
0xa	x	x	x	x	x	x
0xb	x	x	x	x	x	x
0xc	x	x	x	x	x	x
0xd	x	x	x	x	x	x
0xe	x	x	x	x	x	x
0xf	x	x	x	x	x	x

Name: LUTO  
Hex: 0x55555555  
Type: Custom  
Input: 3

Figure 7. Set up the LUT value directly

4. After completing the LUT setup, press the **Sources** tab in this window. The tool generates the C code automatically and this code can be used to set up PLU configuration registers.

```

/*
 * This file was generated by the PLU Config Tool.
 * 6 Inputs 26 LUTs 4 flip flops and 8 outputs */

/* LUT0 (LUT0) */
PLU->LUT[0].INP_MUX[0] = 0x00000002; /* IN2 (Input1) */
PLU->LUT[0].INP_MUX[1] = 0x00000003; /* IN3 (Input2) */
PLU->LUT[0].INP_MUX[2] = 0x00000004; /* IN4 (Input3) */
PLU->LUT[0].INP_MUX[3] = 0x0000003F; /* default */
PLU->LUT[0].INP_MUX[4] = 0x0000003F; /* default */
PLU->LUT_TRUTH[0] = 0x55555555; /* LUT0 (LUT0) CUSTOM */

PLU->OUTPUT_MUX[0] = 0x00000000; /* LUT0 (LUT0) -> Output1

```

Figure 8. Generate the C code to set up PLU configuration register

5. Refer to the SDK PLU demo code in the example project, */pcxpresso804\_plu\_AN\_direct\_LUT\_design*. The example code has a value of `0x55555555` for `LUT_TRUTH[0]`. Because in this demo only three inputs are used, as shown in [Table 1](#), the `LUT_OUT0` only uses eight values in the truth table, only the first eight bits are needed to configure the LUT, so the configuration value, `0x00000055`, could be used in the output code.

In line30 of the *plu\_combination.c* file, modify the configured value according to the generated C code. And in order to watch the Red LED only, configure LUT1 (Green) and LUT2 (Blue) to `0xFF`.

```

### 2.2.3 Direct\_LUT design demo result

1. Set up the board as described in [Board rework](#).
2. Build and run the provided demo code, */pcxpresso804\_plu\_AN\_direct\_LUT\_design.zip*.
3. Input **0** or **1** for input 1, 2, 3 from the MCUXpresso IDE Console window, and watch the Red LED status. The results are shown in [Table 2](#).

**Table 2. Direct\_LUT design demo result**

Input3	Input2	Input1	Output1 - RED LED
0	0	0	OFF
0	0	1	ON
0	1	0	OFF
0	1	1	ON
1	0	0	OFF
1	0	1	ON
1	1	0	OFF
1	1	1	ON

## 2.3 Schematic design demo

The difference between LUT-based method and schematic method is that in LUT-based method the user defines the LUT truth table directly. In the Schematic method, the users place inputs, outputs and logic primitive gates, such as **AND**, **OR**, **XOR**, etc., connect them, and allows the tool to synthesize the logic network into LUTs.

This demo illustrates how to use schematic method in PLU config tool to configure a wanted LUT which is used to make synthesis according to the logic units used.

In the schematic design demo, we config an example LUT with no real purpose, just for illustration, which has the logic needed between inputs and outputs as below.

### 2.3.1 Logic between inputs and outputs

For this demo, we set logic between inputs and outputs as shown in [Table 3](#).

**Table 3. Logic between input and output for LUT-based design demo**

Input3	Input2	Input1	Output1 (Red LED, ON for 0)	Output2 (Green LED, ON for 0)
PLU_IN4	PLU_IN3	PLU_IN2	PLU_OUT0	PLU_OUT1
P0_19	P0_20	P0_21	P0_14	P0_15
LUT_IN2	LUT_IN1	LUT_IN0	LUT_OUT0	LUT_OUT1
	0	0	0	
	0	1	0	
	1	0	0	
	1	1	1	

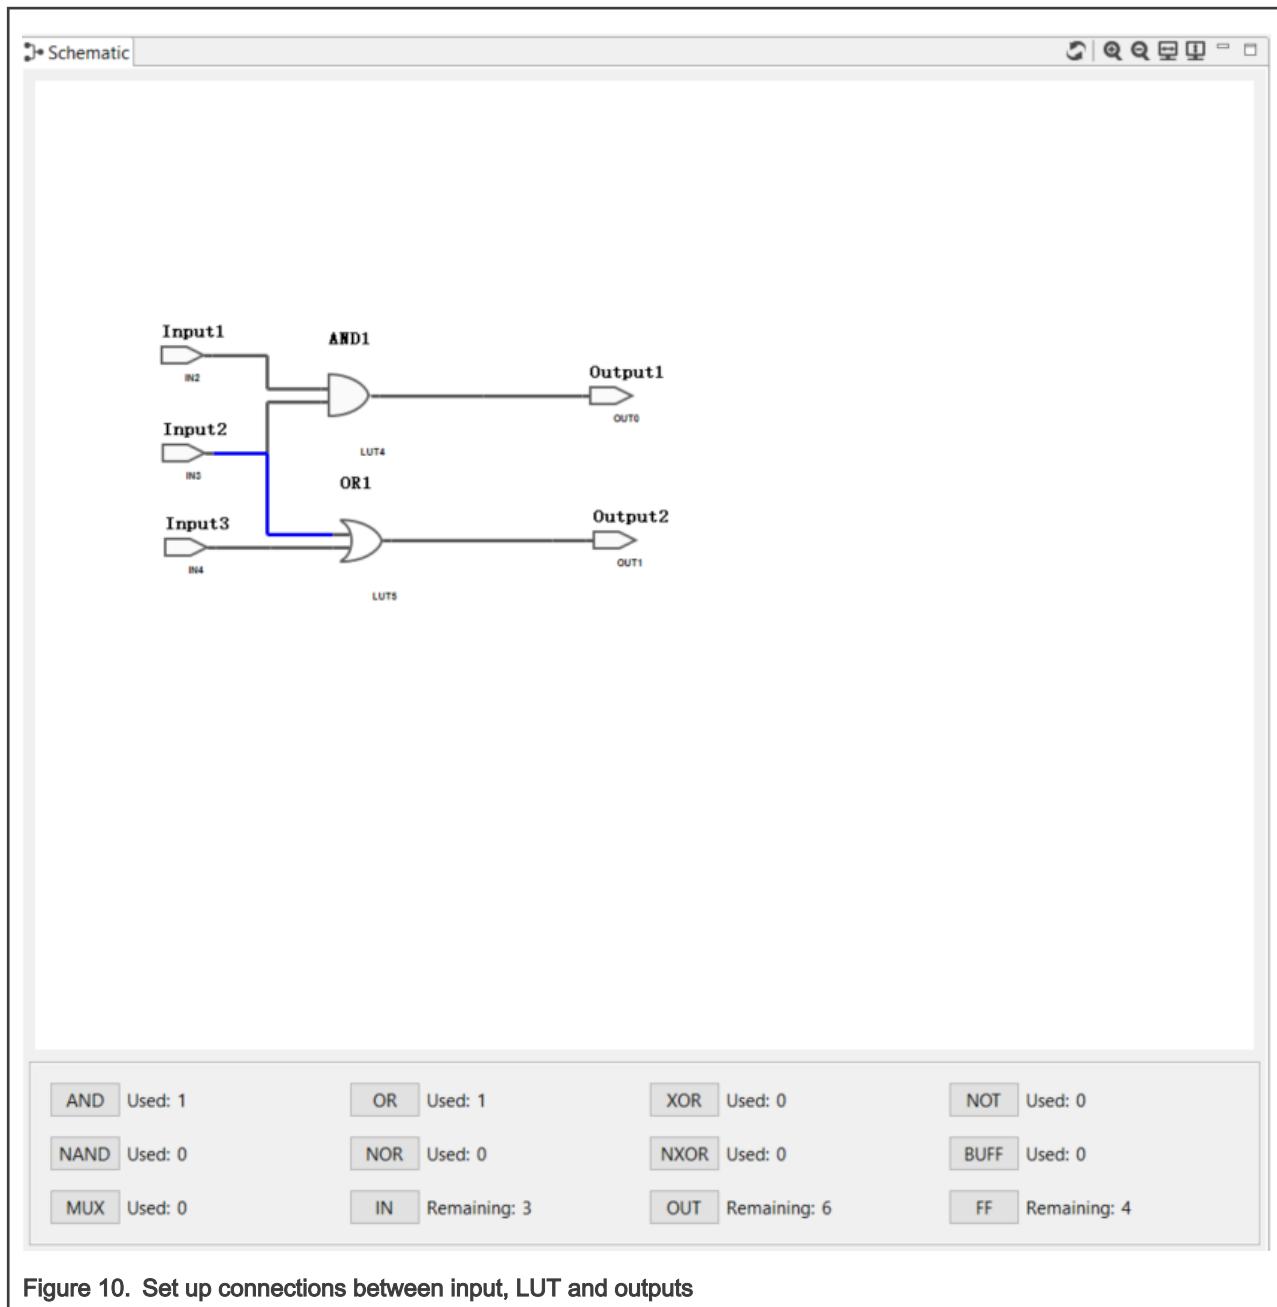

*Table continues on the next page...*

**Table 3. Logic between input and output for LUT-based design demo (continued)**

Input3	Input2	Input1	Output1 (Red LED, ON for 0)	Output2 (Green LED, ON for 0)
0	0			0
0	1			1
1	0			1
1	1			1

### 2.3.2 PLU Config tool usage

1. Open a new design in the PLU Config tool to choose the schematic design option. Place needed Inputs 1, 2, and 3, and output 1 and 2, add logic gates AND1, OR1 in the schematic, and draw the connections between inputs, logic units and output, as shown in [Figure 10](#). The number of gates that can be added is unlimited. Only inputs, outputs and flip-flops have a restricted quantity.

2. After completing the schematic, on the left panel of the tool, to map PLU input and output to specific input/output resources, click the **mapping** and select from the pull-down menu. The demo code uses `PLU_INPUT2` for input1, `PLU_INPUT3` for input2, `PLU_INPUT4` for input3, `PLU_OUTPUT0` for output1, `PLU_OUTPUT1` for output2, as shown in [Table 3](#).

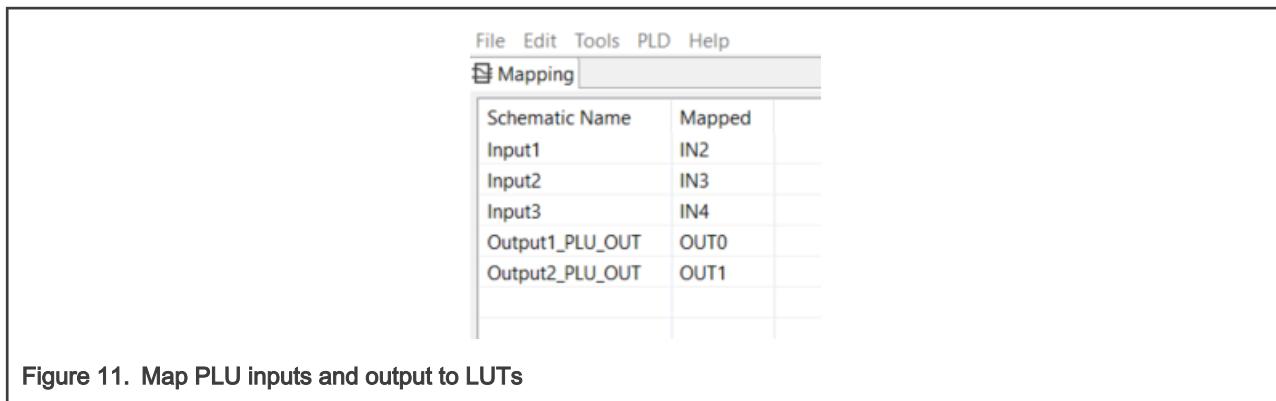

Figure 11. Map PLU inputs and output to LUTs

3. In the top-level menu, select PLD menu and then click **Finalize**. PLD is a tool to optimize the logic design, mapping it to the available LUTs. It is implemented using an open source and a third party (UCLA) tool, and is integrated in the PLU Config Tool installation. If you want to use the standard versions of these tools just click next when the Optimize wizard dialog appears.

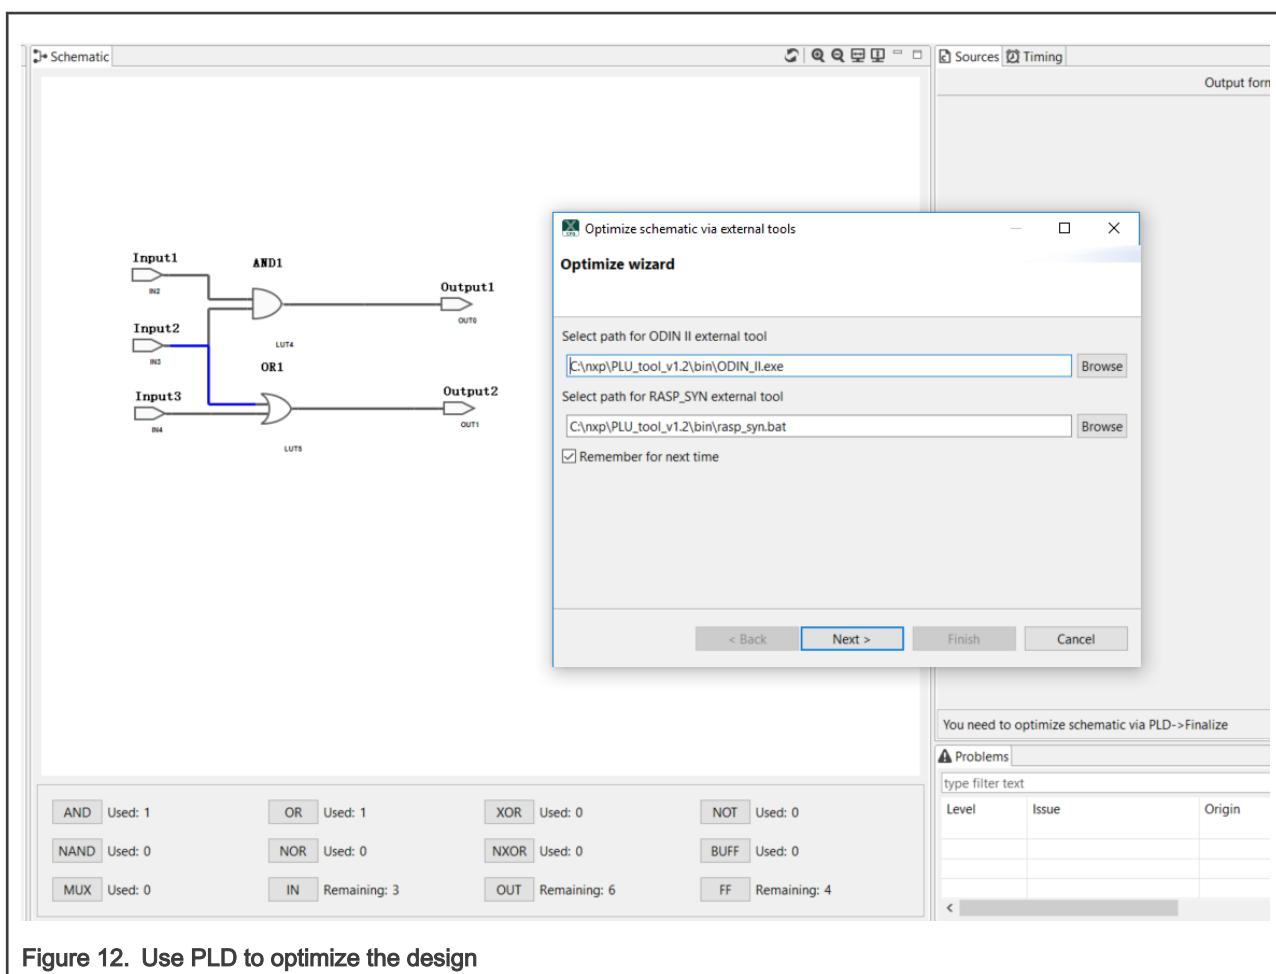

Figure 12. Use PLD to optimize the design

4. Once the finalize operation has completed, click on the **Sources** tab in the right-hand panel of the tool and observe the C code that has been generated. This C code can now be used to set up the PLU configuration register.

```

/*
 * This file was generated by the PLU Config Tool.
 * 6 Inputs 26 LUTs 4 flip flops and 8 outputs */

/* LUT4 (Output1) */
PLU->LUT[4].INP_MUX[0] = 0x00000003; /* IN3 (Input2) */
PLU->LUT[4].INP_MUX[1] = 0x00000002; /* IN2 (Input1) */
PLU->LUT[4].INP_MUX[2] = 0x0000003F; /* default */
PLU->LUT[4].INP_MUX[3] = 0x0000003F; /* default */
PLU->LUT[4].INP_MUX[4] = 0x0000003F; /* default */
PLU->LUT_TRUTH[4] = 0x88888888; /* Output1 CUSTOM */

/* LUT5 (Output2) */
PLU->LUT[5].INP_MUX[0] = 0x00000004; /* IN4 (Input3) */
PLU->LUT[5].INP_MUX[1] = 0x00000003; /* IN3 (Input2) */
PLU->LUT[5].INP_MUX[2] = 0x0000003F; /* default */
PLU->LUT[5].INP_MUX[3] = 0x0000003F; /* default */
PLU->LUT[5].INP_MUX[4] = 0x0000003F; /* default */
PLU->LUT_TRUTH[5] = 0xeeeeeeee; /* Output2 CUSTOM */

PLU->OUTPUT_MUX[0] = 0x00000004; /* LUT4 (Output1) -> Outp
PLU->OUTPUT_MUX[1] = 0x00000005; /* LUT5 (Output2) -> Outp

```

Figure 13. Generate C code to set up PLU configuration register

5. Finally, we can modify the SDK PLU demo code in the *lpcxpresso804\_plu\_AN\_Schematic\_design* project. The LUT4 and LUT5 are used by default by the tool, while in the demo we used LUT0 and LUT1, so the LUT4 and LUT5 in the C Code, can be changed to LUT0 and LUT1 in the output code.

The generated C code sets a value of `0x88888888` for `LUT_TRUTH[4]`, and `0xeeeeeeee` for `LUT_TRUTH[5]`, because in this demo, only two inputs are used. As shown in [Table 3](#), the `LUT_OUT0` and `LUT_OUT1` only use four values in the truth table, so we need only the first four bits to configure the LUT, the configuration value can use `0x00000008` for LUT0 and `0x0000000E` for LUT1.

In lines 30 and 31 of the *plu\_combination.c* file, modify the configured value according to the generated C code, and in order to enable changes of the Red and Green LEDs only, configure LUT2 (Blue) to `0xFF`.
