Pad Configuration and GPIO Driver for MPC5500

by: Martin Kaspar, EMEAGTM, Roznov
Daniel McKenna, MSG Applications, East Kilbride

1 Introduction
This document describes an application programming interface (API) that provides a functional set for pad configuration and access on the MPC5500 family. The API software (AN2855SW) is available to download from www.freescale.com.

2 Target Device
This API was designed for MPC5500 family devices; however, it can be adapted for use with MPC5510 family devices by making small changes; for example, by modifying the SIU header file to suit the target device.

3 C Compiler Compliance
The API was tested using the following C compilers:

- Metrowerks CodeWarrior for MPC5500 v1.5
- Diab Data Compiler 5.1.1

© Freescale Semiconductor, Inc., 2008. All rights reserved.
4 General Description

All GPIO functionality is provided by the SIU for MPC55xx. Each MPC55xx pad that has GPIO functionality has an associated pad configuration register (SIU_PCRn) in the SIU where the GPIO function is selected. The GPIO pads are typically multiplexed with other I/O pad functions. In addition, each MPC55xx pad with GPIO functionality has an input data register (SIU_GPDIIn) and an output data register (SIU_GPDOIn).

5 Quick Reference

This section is intended to be a source of quick access information; the API functions are described in detail in Section 6, “Detailed API Description”.

5.1 Required Header Files

The following header files are needed in order to use this peripheral software driver.

```c
#include "siu_struct.h" /* header file for SIU module */
#include "fs_gpio.h"
```

5.2 Public Data Structure(s)

```c
typedef struct
{
    uint16_t pad;    /* This is the pad number */
    uint16_t config;  /* This is the configuration value for the pad */
}fs_gpio_config_array_ts;
```

5.3 Configuration Items

Not applicable.

5.4 API Specification

Function arguments for each routine are described as in, out, or inout.

1. **in** argument means that the parameter value is an input only to the function.
2. **out** argument means that the parameter value is an output only from the function.
3. **inout** argument means that a parameter value is an input to the function, but the same parameter is also an output from the function.

**NOTE**

inout parameters are typically input pointer variables in which the caller passes the address of a pre-allocated data structure to a function. The function stores its results within that data structure. The actual value of the inout pointer parameter is not changed.

Table 1 lists the peripheral software driver routines.
**Table 1. GPIO API**

### 6 Detailed API Description

The detailed functionality of all driver routines is explained in this section. The code examples illustrate the usage of the API.
6.1 fs_gpio_config_input

Configure a pad for use as general purpose input.

**Call:**

```c
void fs_gpio_config_input(uint16_t pad, uint16_t hysteresis, uint16_t weak_pull);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pad</td>
<td>in</td>
<td>This is the pad number. The pad number will be in the range 0–511. Note that not all pad numbers in the range are implemented on silicon.</td>
</tr>
<tr>
<td>hysteresis</td>
<td>in</td>
<td>This defines if hysteresis should be enabled for the pad. Use FS_GPIO_HYSTERESIS_ENABLE to enable it, or FS_GPIO_HYSTERESIS_DISABLE to disable it.</td>
</tr>
<tr>
<td>weak_pull</td>
<td>in</td>
<td>This defines the weak pull device for the pad. It should be set to FS_GPIO_WEAK_PULL_UP, FS_GPIO_WEAK_PULL_DOWN, or FS_GPIO_WEAK_PULL_DISABLE.</td>
</tr>
</tbody>
</table>

**Description:**

- **Returns:** None
- **Range Issues:** None
- **Special Issues:** None
- **Implementation:** This routine is implemented as a function call.

**Example:**

```c
fs_gpio_config_input( 179, FS_GPIO_HYSTERESIS_ENABLE, FS_GPIO_WEAK_PULL_UP );  /* EMIOS0 */
fs_gpio_config_input( FS_GPIO_EMIOS1, FS_GPIO_HYSTERESIS_DISABLE, FS_GPIO_WEAK_PULL_DISABLE );  /* 180 */
```
6.2  fs_gpio_config_output

Configure a pad for use as general purpose output.

Call:

```c
void fs_gpio_config_output( uint16_t pad, uint16_t drive_strength, uint16_t slew_rate,
                            uint16_t open_drain, uint16_t readback );
```

Arguments:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pad</td>
<td>in</td>
<td>This is the pad number. The pad number will be in the range 0–511. Note that not all pad numbers in the range are implemented on silicon.</td>
</tr>
<tr>
<td>drive_strength</td>
<td>in</td>
<td>This defines the drive strength. It should be set to FS_GPIO_DRIVE_STRENGTH_10PF, FS_GPIO_DRIVE_STRENGTH_20PF, FS_GPIO_DRIVE_STRENGTH_30PF or FS_GPIO_DRIVE_STRENGTH_50PF.</td>
</tr>
<tr>
<td>slew_rate</td>
<td>in</td>
<td>This defines the slew rate. It should be set to FS_GPIO_MINIMUM_SLEW_RATE, FS_GPIO_MEDIUM_SLEW_RATE or FS_GPIO_MAXIMUM_SLEW_RATE.</td>
</tr>
<tr>
<td>open_drain</td>
<td>in</td>
<td>This enables open drain mode. It should be set to FS_GPIO_OUTPUT_DRAIN_ENABLE to enable open drain mode or to FS_GPIO_OUTPUT_DRAIN_DISABLE to disable it.</td>
</tr>
<tr>
<td>readback</td>
<td>in</td>
<td>This enables reading of the actual value of the pad by fs_gpio_read_data() function. Use FS_GPIO_READBACK_ENABLE to enable such functionality, or FS_GPIO_READBACK_DISABLE to disable it and thus to reduce noise and power consumption.</td>
</tr>
</tbody>
</table>

Description:

This function configures a pad for use as general purpose output. It modifies the corresponding SIU_PCRn register according to the selected arguments when the GPIO function and the output buffer are always enabled.

Returns:  None
Range Issues:  None
Special Issues:  None
Implementation:  This routine is implemented as a function call.

Example:

```c
fs_gpio_config_output( 183, FS_GPIO_DRIVE_STRENGTH_50PF, FS_GPIO_MEDIUM_SLEW_RATE,
                        FS_GPIO_OUTPUT_DRAIN_DISABLE, FS_GPIO_READBACK_DISABLE ); /* EMIOS4 */
fs_gpio_config_output( FS_GPIO_EMIOS5, FS_GPIO_DRIVE_STRENGTH_30PF, 0, 0,
                        FS_GPIO_READBACK_ENABLE ); /* 184 */
```
Detailed API Description

6.3  fs_gpio_config

Configure a pad (a general configuration).

Call:

```c
void fs_gpio_config( uint16_t pad, uint16_t config );
```

Arguments:

<table>
<thead>
<tr>
<th>pad</th>
<th>in</th>
<th>This is the pad number. The pad number will be in the range 0–511. Note that not all pad numbers in the range are implemented on silicon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>in</td>
<td>This is the configuration value for the pad. The best way to determine this is to add the appropriate configuration values together from the fs_gpio.h file.</td>
</tr>
</tbody>
</table>

Description:

This function configures a pad (a general configuration). It modifies the corresponding SIU_PCRn register according to the specified configuration value.

Returns:  None
Range Issues:  None
Special Issues:  User must be fully familiar with the GPIO configuration.
Implementation:  This routine is implemented as a function call.

Example:

```c
fs_gpio_config( 186, FS_GPIO_IO_FUNCTION+FS_GPIO_OUTPUT_MODE+FS_GPIO_DRIVE_STRENGTH_50PF ); /* EMIOS7 */
fs_gpio_config( FS_GPIO_EMIOS8, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE | FS_GPIO_WEAK_PULL_DISABLE ); /* 187 */
fs_gpio_config( 209, FS_GPIO_ALTERNATE_FUNCTION2 ); /* configured as S0UDT */
fs_gpio_config( 83, FS_GPIO_PRIMARY_FUNCTION ); /* configured as CNTXA */
```
6.4 fs_gpio_config_array

Configure an array of pads (a general configuration).

Call:

```c
void fs_gpio_config_array( uint16_t size, fs_gpio_config_array_ts *config_array );
```

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>This is the number of elements in the config_array, that is, the number of pads to be configured.</td>
</tr>
<tr>
<td>config_array</td>
<td>This is an array of pad and configuration data.</td>
</tr>
</tbody>
</table>

Description:

This function configures an array of pads (a general configuration). It modifies the corresponding SIU_PCRn registers according to the specified array of pads and configuration values.

Returns: None
Range Issues: None
Special Issues: User must be fully familiar with the GPIO configuration.
Implementation: This routine is implemented as a function call.

Example:

```c
/* static structures for configuring several pins */
static fs_gpio_config_array_ts byte_in[] =
{ 114, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA0 */
  115, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA1 */
  116, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA2 */
  117, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA3 */
  118, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA4 */
  119, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA5 */
  120, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE, /* ETPUA6 */
  121, FS_GPIO_IO_FUNCTION | FS_GPIO_INPUT_MODE | FS_GPIO_HYSTERESIS_ENABLE |
  FS_GPIO_WEAK_PULL_DISABLE /* ETPUA7 */
};

static fs_gpio_config_array_ts byte_out[] =
{ 122, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA8 */
  123, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA9 */
  124, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA10 */
  125, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA11 */
  126, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA12 */
  127, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA13 */
  128, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF, /* ETPUA14 */
  129, FS_GPIO_IO_FUNCTION + FS_GPIO_OUTPUT_MODE + FS_GPIO_DRIVE_STRENGTH_50PF /* ETPUA15 */
};

fs_gpio_config_array( 8, byte_in );
fs_gpio_config_array( 8, byte_out );
```
Detailed API Description

6.5   fs_gpio_read_data

Return the current state of a pad.

Call:

uint8_t fs_gpio_read_data( uint16_t pad );

Arguments:

| pad | in | This is the pad number. The pad number will be between 0-511. Note that not all pad numbers in the range are implemented on silicon. |

Description:

This function returns the current state of a pad. It reads the corresponding SIU_GPDIn register.

Returns: State of the specified pad as uint8_t.
Range Issues: None
Special Issues: This function assumes that the pad is already configured for input.
Implementation: This routine is implemented as a function call.

Example:

uint8_t a;

a = fs_gpio_read_data(179);
a = fs_gpio_read_data(FS_GPIO_EMIOS1);
6.6  fs_gpio_write_data

Set the state of a pad.

Call:

```c
void fs_gpio_write_data( uint16_t pad, uint8_t value );
```

Arguments:

<table>
<thead>
<tr>
<th>pad</th>
<th>in</th>
<th>This is the pad number. The pad number will be in the range 0–511. Note that not all pad numbers in the range are implemented on silicon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>in</td>
<td>This is the value (0 or 1) to be written to the output pad.</td>
</tr>
</tbody>
</table>

Description:

This function sets the state of a pad. It writes the specified argument value to the corresponding SIU_GPDOn register.

Returns: None
Range Issues: None
Special Issues: This function assumes that the pad is already configured for output.
Implementation: This routine is implemented as a function call.

Example:

```c
uint8_t a;

a = 1;

fs_gpio_write_data( 183, a );
fs_gpio_write_data( 183, 0 );

fs_gpio_write_data( FS_GPIO_EMIOS5, 1 );
fs_gpio_write_data( FS_GPIO_EMIOS5, 0 );

fs_gpio_write_data( FS_GPIO_EMIOS5, !fs_gpio_read_data(FS_GPIO_EMIOS5) );
```
6.7  fs_gpio_read_byte

Return the current states the of the pads composing a byte.

Call:

```c
uint8_t fs_gpio_read_data( uint16_t pad );
```

Arguments:

<table>
<thead>
<tr>
<th>pad_msb</th>
<th>in</th>
<th>This is the pad number of the MSB bit from a byte. The pad number will be in the range 0–504. Note that not all pad numbers in the range are implemented on silicon.</th>
</tr>
</thead>
</table>

Description:

This function returns the current states the of the pads forming a byte. It reads the corresponding SIU_GPDIn registers.

- **Returns:** State of the eight subsequent pads as `uint8_t`.
- **Range Issues:** Pads forming a byte must be continuous.
- **Special Issues:** This function assumes that the pads are already configured for input.
- **Implementation:** This routine is implemented as a function call.

Example:

```c
uint8_t c;

c = fs_gpio_read_byte( 114 );
c = fs_gpio_read_byte( byte_in[0].pad );
```
6.8 fs_gpio_write_byte

Set the states of the pads composing a byte.

**Call:**

```c
void fs_gpio_write_byte( uint16_t pad_msb, uint8_t value );
```

**Arguments:**

<table>
<thead>
<tr>
<th>pad_msb</th>
<th>in</th>
<th>This is the pad number. The pad number will be in the range 0–504. Note that not all pad numbers in the range are implemented on silicon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>in</td>
<td>This is the 8-bit (= 1 byte) value to be written to the outputs.</td>
</tr>
</tbody>
</table>

**Description:**

This function sets the states of the pads forming a byte. It writes the specified argument value to the corresponding SIU_GPDOn registers.

- **Returns:** None
- **Range Issues:** Pads forming a byte must be continuous.
- **Special Issues:** This function assumes that the pads are already configured for output.
- **Implementation:** This routine is implemented as a function call.

**Example:**

```c
uint8_t b;

fs_gpio_write_byte( 122, 0xe0 );

b = 0x5a;
fs_gpio_write_byte( 122, b );
fs_gpio_write_byte( byte_out[0].pad, 0xf1 );
```
