

# LCD Driver for the HC08/HCS08 Family

By **Eduardo Estrada**  
**Diego Garay**  
**Jaime Herrero**  
RTAC Americas, Mexico

---

## Overview

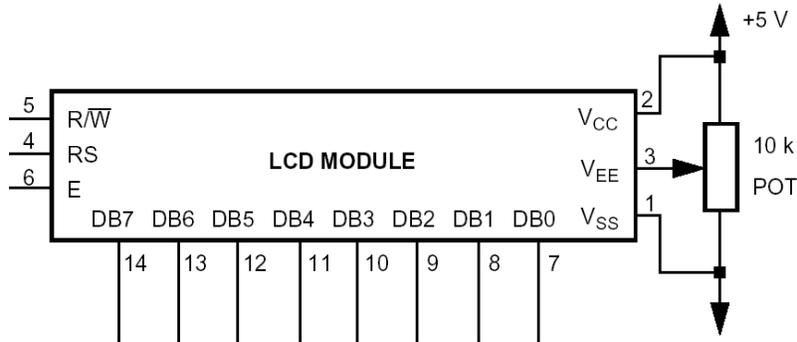

This document is a quick reference for an embedded engineer to get a LCD driver for any HC08 or HCS08 MCU up and running. Basic knowledge about the functional description will give the user a better understanding of how the LCD driver works. This application note provides an example that demonstrates the use of the LCD driver. The example may be modified to suit the specific needs of any application.

The code was written for a LCD module that already had a hardware LCD driver compatible with the HD44780 LCD driver, providing the possibility to directly drive the module with a parallel interface.

This application note includes a step-by-step guide to configure the LCD driver features. The example code described in this document is provided in its entirety as zip file, AN2940SW.zip; which can be downloaded from [www.freescale.com](http://www.freescale.com).

## LCD General Operation

Most LCDs have the interface shown in [Figure 1](#).

**Figure 1. LCD Module Interface**

## Hardware Interface Description

**Table 1. LCD Pin Descriptions**

Pin	Description
$\overline{R/W}$	Select read or write: 1 = Read 0 = Write
RS	Select data or instruction: 1 = Data 0 = Instruction
E	Starts data read/write on falling edge
DB0–DB3 <sup>(1)</sup>	Four high order data bus pins (not used in 4-bit mode)
DB4–DB7 <sup>(1)</sup>	Four low order data bus pins
$V_{SS}$	Ground
$V_{EE}$	Contrast voltage
$V_{CC}$	4.5 V to 5.0 V

Note 1: Used to send and receive information between the LCD and the MCU.

**Software Configuration:**

The LCD module has some instructions to customize the display:

**Table 2. LCD Module Instructions**

Instruction	Description																				
<p><b>Clear Display</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>RS</th> <th>R/W</th> <th>DB7</th> <th>DB6</th> <th>DB5</th> <th>DB4</th> <th>DB3</th> <th>DB2</th> <th>DB1</th> <th>DB0</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> </tr> </tbody> </table> <p>(1) Execution Time: 1.64 ms</p>	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	0	0	0	0	0	0	0	0	0	1	<p>The display disappears and the cursor goes to the left edge of the first line of the display.</p>

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0												
0	0	0	0	1	DL	N	F	X	X												

**NOTES:**

- The execution time is the time delay needed to configure each instruction.

## Example Description

The following example describes how to configure the LCD driver, using:

- MC68HC908AP64 MCU
- External clock source with a frequency equal to 9.8304 MHz
- Delay base time of 100  $\mu$ s
- LCD settings are: display on, cursor off, blinking off, display 5x10 [character size], 2 lines, data 4-bit length mode
- Pin connection configured to control the LCD (see [Figure 2](#))

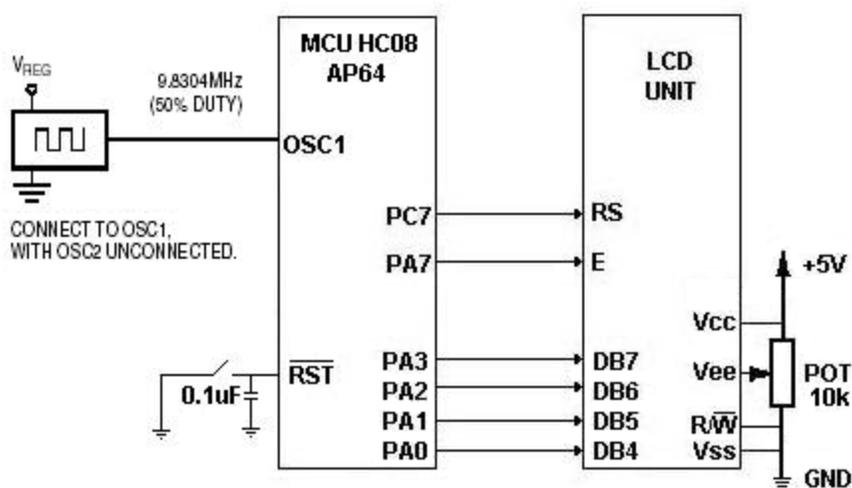

Figure 2. Pin-Out Control Connection

## LCD Driver Description

It is necessary to understand the main content of each file from the LCD driver project. This section describes each file.

### *mcu\_driver\_select.h*

This file allows the user to select the target MCU and contains the following information:

- Specific MCU header, which contains the peripheral declarations
- Definition of two constants:
  - “gTimeBaseInterrupteachus” is the number of microseconds required for each timer interrupt
  - “gTimeBaseInterruptperms” is the number of timer interrupts necessary to equal 1 ms
- Declaration to select the MCU family to be used
- Type definitions for the variables used in the LCD driver

*Lcd.h*

This file allows the user to select the pinout connection and contains the following information:

- Definition of the data direction and pinout ports, which control the LCD module as long as the constant “lcdExists” is declared
- Definition of flags needed for the correct functionality of the driver; this section must not be modified
- Function declaration (prototypes) of all the subroutines needed in the driver; this section also must not be modified

*Lcd.c*

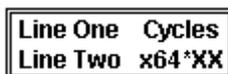

This file contains the functions needed for the LCD driver, as described in [Table 3](#).

**Table 3. LCD Driver Functions**

Subroutine Name	Type	Parameters	Functionality
LCD_Init	void	void	Initializes the LCD
LCD_Clear	void	void	Clears the LCD
LCD_2L	void	void	Sets the cursor in the second line of LCD
LCD_Print	void	uint8 *where, uint8 length	Prints a string of specified length
LCD_TimeBase	void	void	Controls the delays needed for internal control and configuration
LCD_Status	uint8 status	void	Indicates whether the LCD drive is busy or available
LCD_Cursor	void	uint8 ddramAddress	Sets the cursor in a specific place on the LCD

*Main.c*

This file contains the main application of the project. The included example will display the message shown in [Figure 3](#) on the LCD.

**Figure 3. LCD Default Message**

- The message shows the line number of each line and the number of cycles that can be used while the LCD driver works. “x64” is the time base, which takes each timer overflow interrupt as hexadecimal number and ‘XX’ is the number of times (cycles) the main function was executed since the last time the LCD was refreshed. This number of times is calculated with the following formula: **Cycles = 0x64\*0xXX**
- The configuration of the source clock and the timer mode must not be modified.

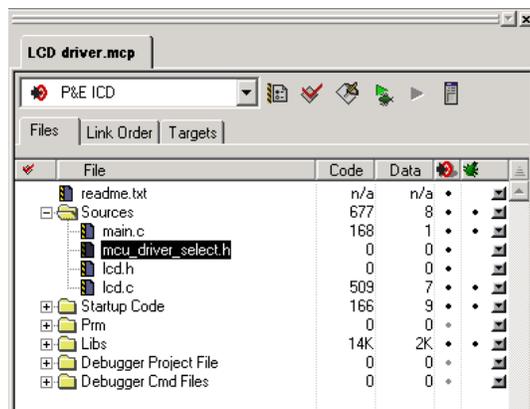

## Example Description

### Setting LCD Driver — Step-by-Step

This section describes how to configure the LCD driver. If you need to download the LCD\_driver firmware, please see the [References](#) section for a link to the Lumex web site.

#### A) Setting the MCU

1. Open the project named LCD\_driver.mcp, which is in the folder LCD\_driver.
2. Search in the project window for the folder sources and open the mcu\_driver\_select.h (see [Figure 4](#)).

**Figure 4. Sources Folder Location in the CodeWarrior Window for mcu\_driver\_select.h**

In the first lines of this file, add the appropriate header of the MCU to be used in order to include the correct peripheral declarations.

---

```
#ifndef MC68HC908AP64_h
    #define MC68HC908AP64_h
    #include <MC68HC908AP64.h> /* Include peripheral declarations */
#endif
```

---

3. In the line 11 of the same file, select the family, commenting-out the appropriate line according the MCU family used.

---

```
/* Define the kind of the MCU */
#define MC908 /* In case of HC08 family */
// #define MCS08 /* In case of HCS08 family */
```

---

### B) Setting the MCU Pin-Out to Control the LCD

Each MCU has a specific number of ports and GPIO pins, so it is necessary to choose which of them will control the LCD.

1. Open the file lcd.h, which is located in the sources folder. See [Figure 4](#).
2. Go to the line 6 and make sure that define “lcdExists” isn’t disabled. This feature allows us to use this driver with other applications and disable it when it is necessary.

---

```
#define lcdExists 1          /* If LCD does not exist, do not declare this define */
```

---

3. Go to the line 8 and specify which configuration must be used for the LCD driver.

#### NOTE

*The MCU pins that control the data pins of the LCD must be consecutive. Configure the data length as 8 or 4 bits for the LCD.*

---

```
#define lcd4bit 1          /* 4 bit interface; comment this line if is 8 bit
                           interface */
#define lcdE   PTD_PTD6   /* Enabled pin of LCD */
#define lcdEDD DDRD_DDRD6 /* Data Direction of Enabled Pin */
#define lcdRS  PTD_PTD7   /* RS pin of LCD (Data/Instruction Select) */
#define lcdRSDD DDRD_DDRD7 /* Data Direction of RS Pin */
#define lcdPort PTA       /* Port of 4 data bits to lcd connection */
#define lcdPortDD DDRA    /* Data direction for 4 data pins */
#ifdef lcd4bit
#define lcdDataPins 0     /* Number of pin of the port where begin the data
                           pins (4 pins). These pins must be
                           consecutive. Only in case of 4 bit interface */
#endif
#endif
```

---

## References

### C) Define the Delay Time Base

In case you need to use a different crystal frequency,  $f_{OSC}$ , follow these steps to recalculate the time base.

1. Open main.c, which is in the sources folder (see [Figure 4](#)).
2. Set how much time each timer overflow, TOF, requires (in microseconds and less than to 1000). That value must be placed in the variable “gTimeBaseInterrupteachus”, which is in the mcu\_driver\_select.h file. (See TOF, [Table 4](#))
3. Use the value from the T1MOD equation (see [Table 4](#)) in line 126 of main.c.

**Table 4. Defining the Delay Time Base Example**

Desired external clock source frequency	$(f_{OSC})$	=	9.8304 MHz
TIM clock prescaler	$(TIM_{Prescaler})$	=	1
Timer count equation <sup>(1)</sup>	$(t_{Count})$	=	$\frac{4 \times TIM_{Prescaler}}{f_{OSC}} = 0.4069 \mu s$
Time required for each overflow interrupt <sup>(2)</sup>	(TOF)	=	100 $\mu s$
T1MOD equation:	$\frac{TOF_{Delay}}{t_{Count}} = \frac{100 \mu s}{0.4069 \mu s}$	=	245.76 $\cong$ 246 = F6 hexadecimal

#### NOTES:

1. This equation is correct for the HC08 Family; in case of a HCS08 application, the timer count equation must be multiplied by 2 instead of 4.
2. Define “gTimeBaseInterrupteachus” as the number of microseconds selected in the mcu\_driver\_select.h file.

## References

- Download the LCD\_driver project, AN2940SW.zip, from [www.freescale.com](http://www.freescale.com)
- Download the LCD data sheet from Lumex provider at <http://www.lumex.com>
- Download the last CodeWarrior version from <http://www.metrowerks.com>

## Considerations

### CodeWarrior

The user should get or download the newest version of the compiler CodeWarrior from Metrowerks (the LCD driver was made with CW08 V3.1). HC908 and HCS08 devices can be compiled with this software.

### Timer Interface Module (HC08) and Timer PWM Module (HCS08)

The interrupt logic from the timer is already used in this implementation; so the user must consider that functions such as input capture, output compare and PWM generation, are limited or unavailable.

The user must consider that the timer base source in the example is specific to the MC68HC908AP64. Changes to the timer configuration may be required for use with a different MCU.
