Add design flexibility with multi-channel I²C/SMBus muxes and switches

Designed for systems that use multiple I²C/SMBus devices with identical addresses, these multi-channel devices enable I²C multiplexing, voltage level shifting, capacitive load sharing, and more.

Key features
- Multi-channel multiplexers and switches for use in I²C/SMBus systems
- Muxes (PCA9540B, PCA9542A, PCA9544A, PCA9547)
- Switches (PCA9543A/B/C, PCA9545A/B/C, PCA9546A, PCA9548A)
- Cross-bar switch (PCA9549)
- Bi-directional translation directs upstream pairs to 2, 4, or 8 downstream channels
- Interrupt pins enable AND function
- Hardware address pins allow up to 8 devices to share I²C bus
- External pull-up resistors set channel voltage
- All I/O tolerant to 6.0 V
- SO, TSSOP, and HVQFN package options
- Operating voltage range of 2.3 to 6.0 V
- Operating temperature range of -40 to 85 °C
- Maximum operating frequency of 400 kHz

Applications
- I²C multiplexing: split a single I²C address without conflicts
- Voltage level shifting: translate between 1.65 and 5.5 V
- Capacitive load sharing: reduce system load by isolating idle devices

PCA954x multiplexers (muxes) and switches fan the input I²C/SMBus signals to two, four, or eight downstream channels of SCx/SDx pairs. Control is performed directly through the I²C/SMBus, so there’s no need for an additional control pin. The muxes select one downstream channel at a time; the switches can select one or more. Some devices have an external active-low hardware reset pin (RESET). If the bus locks up or communication with the master is interrupted, the RESET pin can be used to reset the downstream channels to their default values (“not selected”).

NXP 2-, 4-, and 8-channel I²C/SMBus muxes and switches PCA954x
I2C multiplexing
PCA954x devices split a single I2C-bus into several sub-branches so the I2C master can select and address devices with identical addresses one at a time without raising address conflict issues.

Voltage level shifting
The PCA954x family can be used to translate voltages between 1.65 and 5.5V. The channel pass gates let the \( V_{DD} \) pin limit the maximum voltage to be passed by a device, so different bus voltages can be used on each pair. That way, 5-V devices can coexist with devices of 1.8, 2.5, or 3.3 V without any additional protection or external voltage translators. External pull-up resistors on the upstream and downstream channels are used to set the desired voltage levels for each channel, and all I/O pins are tolerant up to 6.0 V. PCA954x switches can have multiple downstream channels active simultaneously, so they’re an excellent choice for this application, as well as for broadcast applications.

Capacitive load sharing
When the number of I2C/SMBus devices risks exceeding the 400-pF limit for system loading, PCA954x devices can be used to isolate idle devices and reduce the overall load. Active channels function as wires, so the cumulative capacitive loading of the upstream channel, along with all the active downstream channels, needs to be taken into account.

2-to-1 I2C master selector with interrupt logic and reset PCA9541
The PCA9541 is designed for use in high-reliability, dual-master I2C applications that require continuous operation even if one master fails or if its controller card is removed for maintenance. I2C commands are sent via the primary or back-up master and either master can, at any time, gain control of the downstream slave devices. If a master fails, it’s isolated from the system and doesn’t impact communication between the on-line master and the downstream slave devices. Two versions, /01 and /03, are available:
- PCA9541/01 – Master Channel 0 is selected after power-up/reset
- PCA9541/03 – No master channel (off) is selected after power-up/reset and either master can take control of the bus

PCA9549 I2C 8-bit bus switch (CBT) with reset
The PCA9549, a CBT with hardware reset, powers up with all bits in a HighZ off state. Each bit can then be turn on or off individually via I2C-bus commands. Pulling \( \text{RESET} \) low disables the device, resets the I2C state machine, and turns off all bits.
### Pinout Diagrams

#### 2 channel
- **Device**: PCA9540B
- **Features**: 1-2 Mux, 1 Interrupt, 8 Count
- **Switch**: I/O
- **Options**: Tape-and-reel

#### 2-to-1 master selector with reset
- **Device**: PCA9545A/B/C
- **Features**: 1-4 Mux, 4 Interrupt, 16 Count
- **Switch**: I/O
- **Options**: Tape-and-reel

#### 2 channel with Interrupt
- **Device**: PCA9547
- **Features**: 1-8 Mux, 8 Interrupt
- **Switch**: I/O
- **Options**: Tape-and-reel

#### 2 channel with Interrupt and reset
- **Device**: PCA9548A
- **Features**: 1-8 Mux, 8 Interrupt
- **Switch**: I/O
- **Options**: Tape-and-reel

#### 8 channel with reset
- **Device**: PCA9549
- **Features**: 8 Mux, 8 Interrupt
- **Switch**: I/O
- **Options**: Tape-and-reel

#### 8-bit bus switch with reset
- **Device**: PCA9543A/B/C
- **Features**: 1-2 Mux, 4 Interrupt
- **Switch**: I/O
- **Options**: Tape-and-reel
