OVERVIEW

Automotive Ethernet does more than support mobile connectivity and complex, high-bandwidth automotive applications; it’s a key enabler in perfecting the completely connected car of tomorrow and creating safer, more affordable, and higher-performing vehicles. As a long-time proponent of the connected car, NXP has designed a broad portfolio of robust, flexible and cost-effective automotive Ethernet products to connect your vehicle systems faster and more efficiently.

Driving In-Vehicle Networking
Two million automotive transceivers shipped every day

Driving Ethernet
NXP offers a complete solution from safe and secure PHY transceivers and switches to development platforms and software

Driving the Network of Tomorrow
IEEE silicon standards with scalable speed grades and levels of integration
APPROACHING AUTONOMY: THE PROMISE OF FUTURE MOBILITY

Today’s cars are equipped with dozens of electronic control units (ECUs), transmitters, receivers, actuators, sensors and other electronic components. Many of them work together in highly refined advanced driver assistance systems (ADAS) to support the driver and make the car safer, more connected, comfortable, energy efficient, environmentally friendly and easier to drive. To meet these goals, the car needs to gather, process and respond to an enormous amount of data that will only increase as cars take on more autonomy.

DATA DILEMMAS MEET NXP SOLUTIONS

Managing and distributing all that data in a cost-effective, efficient way is a significant challenge. ADAS functions can strain the data capacity of an in-vehicle network (IVN) already taxed by an onboard entertainment system with its own demanding bandwidth requirements. Each evolution of ADAS and infotainment systems will require even more bandwidth. For self-driving cars to become an everyday reality, designers first need to find a way to manage all the data and processing required to support autonomy. Then, they need to do it in a way that both increases safety and adds convenience, all while reducing overall cost.

NXP is an integral part of recent technological advances that help designers increase bandwidth and manage complex autonomous driving requirements. As we anticipate future requirements for ADAS, IVNs and onboard entertainment, we see enormous potential for automotive Ethernet in a distributed vehicle network as the best solution for automotive data management. It enables broadband connectivity with the necessary latency and predictability required for advanced control functions and full-motion video. At the same time, it reduces vehicle weight, saves power, increases efficiency, enables upgrades and makes autonomous driving more affordable.

THE DISTRIBUTED VEHICLE NETWORK

In an automotive Ethernet setup, multiple vehicle systems simultaneously access high bandwidth over a single UTP cable. The Ethernet becomes the backbone of the vehicle network and supports higher levels of data processing and more communication types. Using traffic engineering features such as VLANs means each port receives dedicated bandwidth and the entire backbone is capable of IP connectivity. We envision a backbone architecture made of hierarchically organized domain controllers, with IP-based routing and high communication bandwidth. Instead of supporting individual high-bandwidth functions, the architecture supports all the high-bandwidth functions that reside on the same physical network but use logically separated virtual networks.

By using automotive Ethernet in a distributed vehicle network, manufacturers can move components out of the head unit and place them closer to where they’re needed throughout the vehicle, freeing space in the head unit while also increasing operational efficiency and performance. For example, if a designer moves the tuner module closer to the antenna, they can reduce heat in the head unit and dashboard area and significantly reduce cabling costs.

LEADING THE WAY TO AUTONOMOUS DRIVING

Real-time processing and in-vehicle networking technologies of the next decade will likely revolutionize how we move around, how we interact with our vehicles and how our vehicles react to the infrastructure and each other. At NXP, we envision automotive Ethernet as an essential part of this revolution.

Working with Ethernet in the car, however, means a paradigm shift in next-generation IVN system designs as automotive designers connect different domain networks, transport various data (control data, streaming, etc.) and meet strict requirements for extended temperature ranges and EMC performance. We believe this new way of designing is worthwhile because it increases bandwidth, reduces vehicle weight and lowers costs so designers can introduce new and desirable functionality without enormous cost increases.
The SJA1110 automotive Ethernet switch family offers innovative and dedicated safety and security features designed for optimal integration in auto ECUs. The four switch variants enable modular ECU design and platforms and support different automotive applications such as gateways, ADAS boxes, and infotainment ECUs.

**KEY FEATURES**

- Integrated 100BASE-T1 and 100BASE-TX PHYs
- Integrated Arm® Cortex®-M7 based core
- Best-in class packet inspection and DoS prevention capabilities
- Advanced secure boot capabilities
- Purpose built functional safety features
- Support for Wake-over-Ethernet (OPEN TC10)
- Rich set of Time-Sensitive Networking (TSN) standards
- Rich set of NXP original AVB and AUTOSAR® software
- System solution with S32G Vehicle Networking Processor and VR5510 power management unit

**ENABLEMENT**

- Production-grade Software Development Kit (SDK)
- Native integration with NXP Design Studio IDE
- Production grade AUTOSAR drivers
- Production grade AVB/802.1AS synchronization protocol middleware
- Evaluation board compatible with NXP’s Smart Application Blueprint for Rapid Engineering (SABRE)
- Linux® Drivers
- More will be announced soon

For more information visit [www.nxp.com/sja1110](http://www.nxp.com/sja1110)
NETWORKING APPLICATIONS

- Optimized NXP chipset solution with S32G processor enables unmatched routing, firewalling, intrusion/detection/prevention capabilities
- Best-in-class TCAM-based frame inspection for IDPS support, DOS prevention and advanced frames management
- BOM optimization features include compatibility with VR5510 PMIC, four pin-compatible variants and optimized cascaded configuration

ADAS APPLICATIONS

- Functional safety-dedicated features improving ECU safety design
- Safety manual enable optimized safety design up to ASIL-D ECUs
- Automotive Grade 1 (-40 / +125° C) capability for optimized PCB design
- High-SGMII count for EMC friendly design
- Production-grade AUTOSAR drivers
- Compatible with TTTech® MotionWise® middleware

INFOTAINMENT/CLUSTER APPLICATIONS

- Multi-gigabit SGMII for external Gigabit and Multi-Gigabit PHYs
- Autonomous operation support avoids dependency from untrusted external host
- Avnu®-Certified* AVB/gPTP stack for integrated controller
- Support for Wake over Ethernet (OPEN TC10)
- Integrated controller with programmable GPIOs
ETHERNET SWITCHES: ENABLING FASTER IN-VEHICLE NETWORKS

The five-port automotive Gigabit Ethernet switch SJA1105x series targets automotive applications such as gateway, infotainment and ADAS fusion boxes with an array of configurable ports, advanced security features and a comprehensive, production-grade development ecosystem. Each switch’s audio-video bridging support (AVB) feature fully leverages infotainment and advanced driver assistance systems.

SJA1105P/ SJA1105Q/ SJA1105R/ SJA1105S ETHERNET SWITCH FAMILY

This Ethernet switch family extends the capability of the previous SJA1105EL/TEL switches with improved security-related features and extended interface options. The new frame listing feature limits the switch data processing to known sources, preventing the forwarding of erroneous or malicious data. The updated interfaces offer extended IO voltage supply options and a new SGMII interface. These interfaces allow the switch to support any type of external PHY such as Fast Ethernet, Gigabit Ethernet or 100BASE-T1 PHYs like the TJA1101HN and TJA1102HN transceivers. The switch can also operate as an inter-processor communication device between multiple processors and the DSPs on the same board. All ports can operate at gigabit speed in a non-blocking mode.

Finally, the switches are delivered with a rich set of tools, including an evaluation board; original, production-grade AUTOSAR drivers and AVB software stack.

GENERIC FEATURES

- Fully automotive AEC-Q100 qualified
- Automotive Grade 2 operation
- LFBGA-159 pin package (12 mm x 12 mm)
- Five ports, 10/100/1000 Mbit/s MII/RMII/RGMII and SGMII interfaces
- Non-blocking
- Support for AVB and TSN/802.1Qbv
- MAC address filtering
- TCAM based white / blacklisting of MAC addresses
- Learning process with one-short learn option
- Double VLAN tag, frame replication and retagging

SJA1105Q-EVB EVALUATION BOARD

The SJA1105Q-EVB is an evaluation system that supports the SJA1105P/Q/R/S Automotive Ethernet switch family together with the TJA1102HN Ethernet PHY. The board enables the evaluation of the features common to the four switch family variants and facilitates the early development of the software required for the switch applications. Further the board supports the OPEN Alliance TC10 Wake-up Forwarding feature implemented by the TJA1102 dual 100BASE-T1 PHY. Finally, the board also offers a connector capable of mating with NXP processor motherboards such as i.MX 6, i.MX 8 and S32x processor families.

FEATURES:

- Enables evaluation of SJA1105P/Q/R/S series (with exception of SGMII)
- Directly connect to PC via USB
- Connect to i.MX 6, i.MX 8 and S32x processor evaluation boards
- Compatible with OPEN Alliance TC10 Wake Up forwarding
- Software and documentation are available on docstore.nxp.com/SJA1105Q-EVB (NDA required)

SOFTWARE AND TOOLS

- Linux drivers
- AUTOSAR 4.3.0 drivers licensed separately
- AVB/gPTP software stack licensed separately
- Customer evaluation board

White dots: feature compatible with other white dots but NOT compatible with black dots.
TJA1101 ETHERNET PHY TRANSCEIVER
The IEEE 802.3bw (100BASE-T1) compliant TJA1101 Ethernet PHY transceiver provides 100 Mbit/s transmit and receive capability over unshielded twisted pair (UTP) cables to withstand the most taxing automotive applications, while still maintaining low-power consumption and system costs.

TJA1101 APPLICATION
The TJA1101 PHY transceiver provides robust, automotive-grade signal quality with a bit error rate (BER) of at least 1E-10 or less. It is optimized for capacitive signal coupling to the UTP lines and supports a cable length of at least 15 meters. To comply with automotive EMC requirements, a common-mode choke (CMC) is typically inserted into the signal path. Communication with the media access control (MAC) unit can be realized via the MII or the RMII.

TJA1102 DUAL ETHERNET PHY TRANSCEIVER
The TJA1102, the industry’s first 100BASE-T1 compliant dual-port Ethernet PHY transceiver, enables superior system efficiency for high-speed networks. This robust and reliable transceiver offers 100 Mbit/s per port full duplex and supports lightweight UTP cables of up to 30 m in repeater mode for challenging automotive applications.

TJA1101 / TJA1102 COMMON FEATURES
- AEC-Q100 Grade 1 qualified
- MII- and RMII-compliant interfaces
- Receive and forward CLK signal
- Diagnosis of cabling errors (shorts and opens)

PARTIAL NETWORKING
- OPEN-Alliance-TC10-compliant sleep-and-wake-up forwarding solution
  - Global system wake-up
  - Robust remote wake-up detection via bus lines
  - Wake-up forwarding on PHY level
  - Go-to-sleep hand shaking
  - Saves an additional wake-up line
- Local wake-up pin for wake-up line

LOW-POWER MODE
- Sleep mode current: 45 μA
- Dedicated PHY enable/disable input pin to minimize power consumption
- Inhibit-pin for voltage regulator control
- Single 3.3 V supply
- External 1.8 V supply option

SOFTWARE AND TOOLS
- Linux and low-level drivers
- AUTOSAR 4.3.0 drivers
- Customer Evaluation Board

AUTOMOTIVE APPLICATIONS
- Gateway
- IP Camera, Radar and LIDAR links
- Driver assistance systems
- Cluster & Infotainment
**TJA1102/TJA1102S TRANSCEIVER USE CASES**

**SMALLEST AREA AND HIGHEST FLEXIBILITY**

- The TJA1102 transceiver has a pin-to-pin compatible single PHY variant, the TJA1102S, which gives the car OEM/Tier-1 the opportunity to scale up or down the port count without redesigning the PCB
- >30% area saving with TJA1102 compared to a 2x single port PHY solution

**PARTIAL NETWORKING**

- TJA1102 and TJA1101 enable self-contained sleep and wake-up signaling over data line
- The wake-up forwarding function allows fast signal propagation without intervention of a switch, MAC or μC
- The wake-up can be forwarded via non-active links (blue PHYs in the figure) but also active links (green PHY in the figure)
- Saves an additional wake-up line

**REPEATER MODE**

- The TJA1102 transceiver supports internal reverse MII to operate the device in Repeater Mode
- Example applications:
  - ECU2 and ECU3 can quickly start to communicate ahead of MCU/switch boot up on ECU1
  - Fall-back mode for security purposes, bypassing the switch
  - Duplicate max cable length up to 30 m

THE SJA1105SMBEVM NXP ETHERNET GATEWAY PROTOTYPING PLATFORM

The new SJA1105SMBEVM prototyping platform is a ready-to-go solution to jump-start your true-automotive design.

The board includes the NXP MPC574xG ultra-reliable MCUs for Automotive & Industrial Control and Gateways, the NXP SJA1105S safe and secure Ethernet TSN Switch, the NXP TJA1102 Automotive 100BASE-T1 dual PHY and the NXP TJA1145FD CAN transceiver. The board also offers three 100/1000BASE-T PHYs for easy connect to a PC and network equipment.

The board is OPEN TC10 ready and comes with an SDK based on NXP S32 Design Studio enabling you to start your project within minutes after receiving it.

Finally, the board is compatible with NXP-original AUTOSAR OS and AUTOSAR Ethernet drivers, licensed separately.

TARGET APPLICATIONS

- Gateway and Body controllers
- Autonomous vehicles
- TC10 Wake up evaluation

ADVANTAGES

- Jump-start ECU development
- Evaluate CAN-to-Ethernet communication
- Network diagnostics and media converter

www.nxp.com/ETHERNET
NXP’S ETHERNET PHY TRANSCEIVER WITH SLEEP AND WAKE UP FORWARDING OVER DATA LINE. STANDARD COMPLIANT AND INTEROPERABLE ACCORDING TO OPEN ALLIANCE TC-10.

Having this technology integrated in NXP’s 100BASE-T1 PHYs - TJA1101 and TJA1102 - the power modes of the individual PHY and whole ECU can be dynamically managed. It propagates sleep requests and forwards wake up pulses over the Ethernet data line (single twisted pair cable). It saves a dedicated wake up line, and hence additional cost, weight and real estate for cables and connectors.

The system level evaluation of the technology is now simplified by this new development kit, which is available on nxp.com. The kit combines OPEN TC10 enabled HW with out of the box SW examples: easy to load, configure and modify via common SDK, NXP’s S32 Design Studio.

System engineers may scale the complexity up or down and adjust the sample code to apply full custom system requirements, to orchestrate the wake up sequence and define forwarding rules.
ENGINEERED TO ACCELERATE THE DEVELOPMENT OF NEXT-GENERATION SERVICE-ORIENTED GATEWAYS.

The MPC-LS-VNP-RDB is an optimized, automotive reference design board for vehicle network processing applications. Used by carmakers, suppliers, and software ecosystem partners, it helps accelerate development of next-generation service-oriented gateways.

**MPC-LS VEHICLE NETWORK PROCESSING REFERENCE DESIGN BOARD**

Combining automotive and enterprise networking technology, the MPC-LS-VNP-RDB offers high levels of computing, real-time network performance, multi-Gigabit packet acceleration, and security for new service-oriented gateways.

The MPC-LS-VNP-RDB integrates standards-based, open source software with feature-rich hardware for establishing a common and open framework for secure service delivery within a vehicle network.

Learn more at [www.nxp.com/MPC-LS-VNP-RDB](http://www.nxp.com/MPC-LS-VNP-RDB)
**NXP BlueBox – The Autonomous Driving Development Platform**

**AT THE HEART OF THE NETWORK**

The NXP BlueBox is a development platform series that provides the required performance, functional safety and automotive reliability for engineers to develop self-driving cars. The latest addition to the series, the BLBX2-xx family, incorporates the S32V234 automotive vision and sensor fusion processor, the LS2084A embedded computer processor and the S32R27 radar microcontroller.

**NXP BLUEBOX: AUTONOMOUS DRIVING DEVELOPMENT PLATFORM**

Situated in the heart of the system, the BlueBox requires strong networking capabilities. Populated on the board, the 5-port switch SJA1105P/Q/R/S series provides the multi-gigabit switching capability to the system. Combined with 4x TJA1102 dual port PHY, the BlueBox is perfectly connected and ready to master complex network topologies.

As safe central computer or in automotive vision systems, the NXP BlueBox platform delivers the performance required to analyze driving environments, assess risk factors and then direct the car’s behavior.
