

Industrial, Scientific and Medical Solutions (ISM)

Technology to enhance
performance, reliability and
ease of use in industrial
RF systems

Freescal’s portfolio of ISM RF power amplifiers is designed to simplify the use of solid-state RF in high-powered industrial, scientific and medical applications at frequencies from DC to 2450 MHz.

Applications

- CO₂ industrial lasers
- Medical laser and electrosurgery
- MRI
- Plasma etching
- Particle accelerators
- Lighting
- Industrial heating
- Amateur radio

Freescal has been a trusted supplier of RF power semiconductors for over 50 years. Building on this history, we introduced in 2010 the industry-first Extremely Rugged transistor (‘E’ Series), making it possible for engineers to use solid-state RF instead of vacuum tubes in the harshest environments. The Extremely Rugged transistor enabled engineers to design more compact industrial systems, which feature longer lifetimes and reduced service costs.

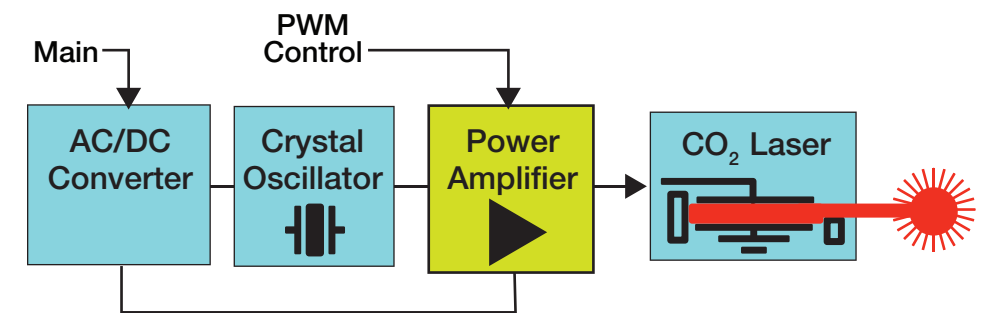

Freescal’s enhanced rugged devices are designed to handle operation into a voltage standing wave ratio (VSWR) greater than 65:1 without damage or degradation in performance. They will survive to most mismatch conditions and will not break even if the load receiving the RF energy changes dynamically, as happens in the applications described below.

Laser, Plasma and Medical

RF is used as an energy source to generate a homogenous plasma inside a CO₂ gas discharge tube, which either stimulates CO₂ molecules to generate a laser light or directly etches microstructures. Typically, a 100 W laser requires 1 kW of RF energy. Extreme ruggedness and high efficiency enable simplification of the system design.

Block Diagram Overview

Example of Lineup

2500 W RF (250 W optical) Industrial Laser @ 81.36 MHz

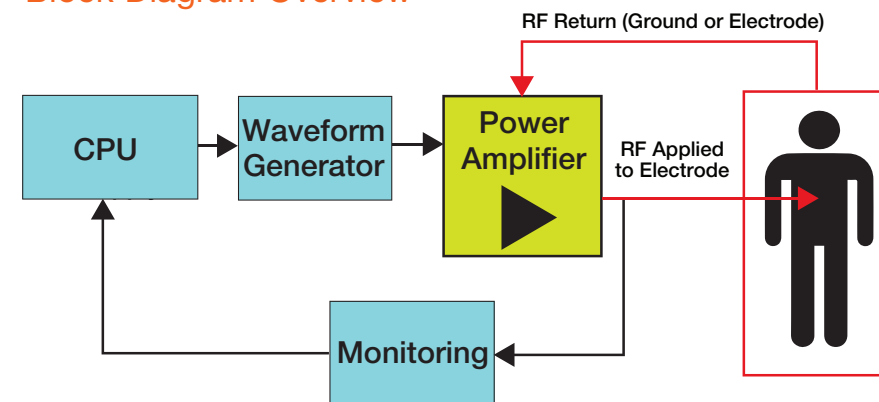

Medical Laser and Electrosurgery

In medical lasers, RF is also used as an energy source for skin treatments such as dermabrasion, hair removal, and reduction of acne or cellulite. Another alternative is electrosurgery, which applies electric currents to biological tissues as a means to cut, coagulate, desiccate or fulgurate. It allows bloodless and precise surgical cuts.

Block Diagram Overview

Examples of Lineups

300 W Medical Laser @ 1.8 MHz

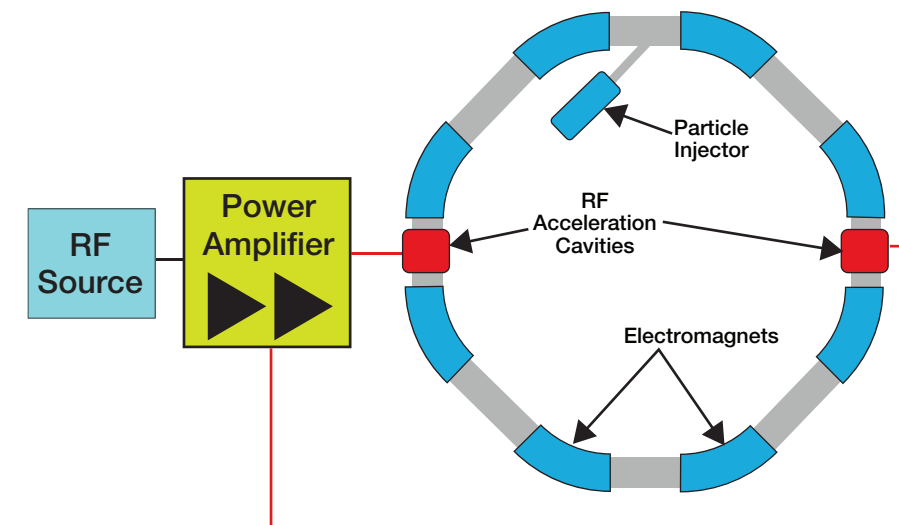

70 W Electrosurgery

Particle Accelerators

Solid-state RF is changing synchrotrons and cyclotrons. Instead of one large vacuum tube, the use of numerous solid-state amplifiers makes on-the-fly replacements possible, removing the need to stop the accelerator. Their 100 to 1,000 years of MTTF provide advanced reliability to scientists.

Block Diagram Overview

Example of Lineup

10 kW PA for 500 kW Synchrotron @ 352 MHz

Industrial Heating

Extreme ruggedness now makes it possible to use RF energy to heat or weld any material. Each material reacts optimally to a different frequency. RF is used for welding PVC and polyurethane, for the pasteurization and drying of food products, sterilization of medical waste, and preheating of thermoset sheet molding compounds.

Block Diagram Overview

Examples of Lineups

1 kW Industrial Oven @ 915 MHz

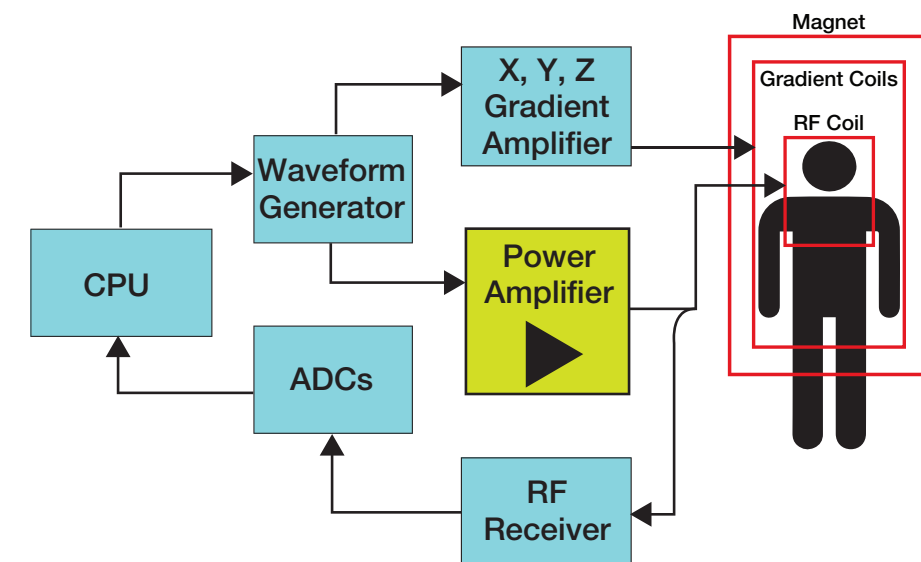

2 kW Welding System @ 27 MHz

MRI (Magnetic Resonance Imaging)

MRI scanners rely on detecting a radio frequency signal emitted by excited hydrogen atoms in the body (water molecules), using energy from an RF magnetic field applied at the appropriate resonance frequency: 1.5 Tesla MRIs operate at 63.87 MHz, and 3 Tesla MRIs at 127 MHz.

Block Diagram Overview

Example of Lineup

3T 10 kW MRI @ 127 MHz
