UNLOCK NFC EVERYWHERE.

NOW iOS AND ANDROID READY
WHAT A DIFFERENCE A DAY MAKES.

CAN THINGS REALLY CHANGE OVERNIGHT?

When it comes to Near Field Communication, the answer is definitely yes. Because that’s exactly what happened on September 19, 2019, the day that Apple iOS 13, with support for full read/write NFC functionality, became available.

NFC was suddenly transformed. Having iOS join Android in its full support for NFC meant the smartphone infrastructure instantly became far more complete and widespread. In the blink of an eye, just about every one of the two billion people worldwide with a smartphone now also had an NFC reader that could conduct two-way NFC interactions. One of the biggest obstacles in NFC’s path to high-volume growth simply disappeared.

As a result, everyone with an interest in the technology – hardware designers, software developers, OEMs, ODMs, service providers – can now move ahead with confidence.

A NEW TWIST

To make things even more interesting, NFC itself is heading in a new direction, with support for wireless charging.

A recently introduced standard, issued by the NFC Forum, lets NFC use radio waves to send power and wirelessly charge devices that operate at or below 1 W.

NFC wireless charging lets us rethink the way we power battery-driven devices. Now, instead of hunting for a cord and an outlet, we can simply set a device down to initiate a recharge. What’s more, this new twist on NFC functionality lets us create a whole new category of tiny products that don’t use plugs or ports, so they’re smaller, sleeker, and safer to use. It’s taking convenience to new heights and creating better electronic experiences for us all.

1. You’ll speak with intention
NFC involves only two devices at once, so there’s no crosstalk. Plus, you avoid being overheard and keep secrets safe by getting close before you start to speak.

2. You’ll save energy
Since energy harvesting lets one device power another during an NFC transaction, the second device can save its battery for other tasks or not have a battery at all.

3. You’ll play well with others
NFC is a unifying technology that makes it easier to live in a wireless world. Pair and commission just about any wireless device with a single tap of your NFC-enabled device.

4. You’ll be welcome wherever you go
Fully supported by every Android and iOS 13 smartphone out there, NFC is an integral part of one of the largest infrastructures on the planet, and ready to work whenever you are.

5. You’ll Always Have a Remote Control in Hand
With your smartphone or tablet as the user interface, you’ll be the master of any piece of equipment, be it a robot in a factory, a sensor in a storage room, or a new set of earbuds.

WHAT A DIFFERENCE A DAY MAKES.

UNLIMITED POSSIBILITIES

NFC has never been stronger, and the opportunities for NFC have never been more compelling.

With the arrival of iOS 13 and wireless NFC charging, it’s not just a new day for NFC, it’s the beginning of a whole new era.
At NXP, we never stop moving ahead with NFC. Since 2002, when we co-invented the technology, we’ve been working to expand the ecosystem and improve the technology. We co-founded the NFC Forum, hold the number-one position in the market, and offer the broadest portfolio in the industry.

Yet we continue to push ahead, introducing new formats, including connected NFC tags for electronic systems, and delivering new approaches, such as wireless NFC charging for low-power devices. It’s our way of ensuring that this remarkable technology maintains its forward momentum.
USE CASES

ACCESS CONTROL
(Physical and Logical)

NFC brings mobility to the highest level of security for physical and logical access, so you can do more with your smartphone or a wearable. When you leave home, your phone or wristband can lock the door, and when you arrive at work, it can serve as your ID badge, your computer logon, and your authorization to use certain machines. Your device can also open your hotel room or be your event ticket. With NFC, you reduce waste, increase security, and gain the ability to grant or deny access, as needed, from a remote location.

WHICH PRODUCT?

NFC Frontend
CLRC663 plus Family

- Log time and attendance for secure areas
- Manage key distribution remotely
- Set limits for access times, for temporary personnel, or rental homes
- Reduce maintenance and replacement costs, with fewer lost or damaged keys, cards, or badges

Contactless
PN7462 / PN736x

Contactless Multi-application
Smart Card MIFARE® DESFire® Family

If you already have a microcontroller on board, and need the best NFC performance with the lowest power consumption, especially in a battery-operated system, use this NFC frontend to push your design further.

If you need a small footprint, for a door lock perhaps, use these all-in-one solutions to execute a fully custom application. No external MCU needed.

If you’re designing a card-based access system with MIFARE DESFire EV2, get the benefit of CC EAL5+ security – the same certification level bank cards and electronic passports use. This NFC-compatible MIFARE solution is also available in multiple form factors from key-fobs to wristbands.

For single-application uses, MIFARE DESFire Light offers a cost-effective solution with CC EAL4 security.

RocketXS
A ready-to-produce design for the growing smart lock market in China that supports NFC card reading, Bluetooth LE, fingerprint reading, pinpad operation, and secure key sharing via WeChat.
USE CASES

PAIRING & COMMISSIONING

Just bringing two NFC-enabled devices close together is all it takes to create a connection. What’s more, NFC can also trigger other protocols, like Bluetooth, ZigBee, or Wi-Fi. Pairing is practically instantaneous and, because NFC only works when you ask it to, there aren’t any unintended device connections, and none of the device conflicts that can happen with Bluetooth.

It’s also easier to commission new devices or expand your home network, even if you’re adding devices that don’t have a battery – and there’s no need to search for a connection or type in a serial number.

**WHICH PRODUCT?**

<table>
<thead>
<tr>
<th>NFC Connected Tag</th>
<th>NFC Controller with Integrated Firmware</th>
<th>NFC Connected Tag for Tiny Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NTAG® I²C plus</strong></td>
<td><strong>PN7150</strong></td>
<td><strong>NTAG 5 boost</strong></td>
</tr>
</tbody>
</table>

If you’re working on a battery-powered design that already has a microcontroller, such as a speaker or IoT node, use this tag IC to wake the system and initiate Bluetooth or Wi-Fi pairing.

If you’re running an OS, like Android, Windows, or Linux, use the embedded NFC firmware and NCI interface in these controllers to quickly add fully compliant NFC functionality. The PN7150 is also a good choice for routers and gateways that will interact with NTAG-equipped nodes.

The NTAG 5 boost is a Type 5 Tag that delivers exceptional read range, giving tiny devices the ability to interact with the cloud and other NFC-enabled devices, including smartphones.

**PAIRING & COMMISSIONING**

- Enable two-way interactions with Peer-to-Peer mode
- Pair Bluetooth or Wi-Fi devices 20x faster with NFC
- Identify a device instantly, without entering codes or creating device conflicts
- Make devices easier to use and reduce tech-support costs
- Exchange credentials securely, just by tapping
- Use protocol-agnostic operations to trigger actions

**PAIR WITH**

- Bluetooth devices faster, without conflicts
- Wi-Fi devices with just a tap
- View images and videos on the big screen, with just a tap
- Add sensors and lights to your home or office network in just seconds, without entering codes

**PAIR WITH**

- Bluetooth devices faster, without conflicts
- Wi-Fi devices with just a tap
- View images and videos on the big screen, with just a tap
- Add sensors and lights to your home or office network in just seconds, without entering codes
USE CASES

AUTHENTICATION & IDENTIFICATION

NFC is the one technology that makes it easier and safer, at every point of ownership, to enjoy any type of electronic device. From using personal care items and household appliances to adjusting settings of smart gym equipment based on your very own profile, NFC can simplify configuration, increase personalization, enable reorders, enhance safety, and fight fakes.

The same NFC operations increase automation in industrial settings, too, for greater efficiency.

WHICH PRODUCT?

- **Authenticate replacement parts and automatically adjust settings of the main unit based on the accessory attached**
- **Identify users and immediately provide personalized settings and preferences**
- **Send notifications when accessories are nearing replacement, and make offers based on usage patterns**

**NFC Frontend**
- **MFRC630 plus**
  - Tags: NTAG21x, MIFARE Ultralight® C
- **SLRC610 plus**
  - Tags: ICODE SLIX, ICODE DNA

**NFC Controller with Integrated Firmware**
- **PN71xx**

Tags based on NTAG and MIFARE offer a wide range of security options and can be read by all NFC phones. Once you’ve chosen a tag, the MFRC630 plus is an ideal single-protocol reader for this use case.

If you need to support longer distances between the tag and its reader, then the SLRC610 plus reader, which works with ICODE tags, gives you the extra margin in read range.

If you’re working with an OS, like Android, Windows, or Linux, use one of these controllers for plug-and-play functionality when reading NTAG, MIFARE, and ICODE tags.

**XIAOMI AIR PURIFIER**
The Xiaomi Mi 2S and Mi 2Pro Air Purifiers work with an NFC frontend in the actual purifier device and an NFC tag in the removable filter, protecting from counterfeit and ensuring good quality reputation. NFC does further allow to track the time a filter is in use and will help to reset the device automatically once you insert a new filter.
USE CASES

PARAMETRIZATION & DIAGNOSIS

Any NFC-enabled phone or tablet can serve as a temporary touchscreen for your product, enabling sophisticated interactions and configurability at little additional cost. Your product can be smaller, lighter, more rugged, and less expensive to produce – yet easier to use. What’s more, NFC works with sealed devices, so sensors operating in difficult environments can easily interact with the control unit. Energy harvesting uses power from the active reader device, so unlike Bluetooth or Wi-Fi, with NFC the device doesn’t need a battery to send or receive information. Systems with a battery can even remain in sleep mode while being read.

NFC advantages over Bluetooth or Wi-Fi connection:

- Device can be unpowered
- No ambiguities - the device you tap is the device you connect to
- Inherent security due to short range and additional password and AES key option
- Very cost effective

WHICH PRODUCT?

MFRC630 + NTAG I²C plus

SLRC610 + NTAG 5 Family

With the high performance, energy-harvesting connected tag NTAG I²C plus on board, your device can be read, measured, or made interactive – even if it doesn’t have a power source.

To embed also the reader function into an electronic device, use the MFRC630 reader frontend to read data from or write data to the NTAG I²C plus.

NTAG 5 boost will give you a great read range with very small antennas. It can even work without an onboard MCU further reducing the BoM.

Select NTAG 5 link when you need an I²C master interface, for example when reading out sensors.

NTAG 5 switch which is designed to ease the configuration of GPIOS or PMW.

The SLRC610 NFC frontend creates a perfect match with the new NTAG 5 Family.

LATE-STAGE CUSTOMIZATION

The NTAG I²C plus supports zero-power configuration, so you can save on logistics costs with late-stage customization. Limit production variants by producing a generic item that can be configured in its unpowered state, just before shipping, through the packaging. Or let installers and consumers do the customizing for you, with a quick tap of their NFC-enabled phones.

Energy harvesting uses power from the active reader device, so the device doesn’t need a battery to send or receive information.

When precision matters, Schneider’s Zelio Timer Relay uses NFC to deliver 50 times the accuracy of conventional timer relays.

Let a fully sealed, batterycharge sensor unit interact with the meter housing

Avoid galvanic connections by letting machines talk without wires

Enable interactions with small, sealed devices that are not powered, for example configure the current of LED drivers

Get all the details, with complete control over every setting and configuration, even if the device is unpowered
**USE CASES**

**PAYMENT**

State-of-the-art contactless technology lets you do business with open systems like EMV, or with closed systems like MIFARE. You can count on full compatibility with every form factor, from smartcards and NFC-equipped mobile phones to wearables, tokens, and more. Using contactless technology also lets you increase consumer share-of-mind with value-added services, such as personalized messages, loyalty programs, and coupons based on recent purchases.

### WHICH PRODUCT?

- **NFC Frontend**
  - PN5180
  - CLRC663
- **NFC Controller with Customizable Firmware**
  - PN7462
- **Contact Reader Frontend**
  - TDA8035
  - TDA8026

If you want your design to talk to any other NFC-enabled system, and you already have a microcontroller on board, use one of these EMVCo-compliant frontends to add secure payment functions.

If you need a small footprint, use this single-chip solution to create a very compact design. You can easily add a coprocessor for time-critical functions in the EMV1 protocol layer, for fast payment performance.

If you want to support contact cards in your terminal, you can choose the single-slot TDA8035, or select the TDA8026 for use with multiple SAMs. Both offer full support for all classes of smartcard.

### GET READY FOR EMV 3.0 CONTACTLESS LEVEL 1

This latest version of the payment standard improves interoperability between terminals and adds three new test targets (PICC) to support cards, mobiles, wearables, and other form factors that use antennas of different shapes and sizes. NXP is already there, with the PN5180, which includes advanced transmitter features, such as DPC, AWS, and ARC, and full compliance built into the NXP Reader Library.

- **Offer tap-and-pay convenience**
  - with enhanced security
- **Accept EMV and MIFARE payments,**
  - and send paperless receipts
- **Increase engagement with messages,**
  - loyalty, and couponing
- **Use system-level solutions to save**
  - design and certification time
- **Use protocol-agnostic operations**
  - to trigger actions

- **Offer new kinds of loyalty**
  - and couponing programs, with new levels of interaction
- **Let micro-merchants**
  - accept and confirm payments just like the mega-merchants
- **Use a secure, protected connection**
  - to access your bank or initiate transactions

- **Get a snack or a drink,**
  - even if you left your cash at home
- **Get access to any kind of energy through**
  - prepaid systems
- **Create self-service kiosks**
  - that attract attention while selling more tickets

### USE CASES

INTRODUCING OUR NFC PORTFOLIO

As the leading provider of NFC solutions, we offer the widest selection of form, fit, and function.

CONNECTED TAGS
These small, passive tag ICs are the best, most cost-effective solution when you have an NFC reader or NFC phone on the other side of the transaction. They use an RF interface that’s fully compliant with the FC Forum’s specifications, and they support energy harvesting, so there’s no need for a battery to power NFC interactions.

NFC CONTROLLERS WITH INTEGRATED FIRMWARE
These plug-and-play solutions combine an NFC frontend with a 32-bit Cortex-M0 microcontroller equipped with integrated firmware, and are optimized for use with an OS. They come with Linux, Android, and WinIoT drivers, and include an NCI interface, so they’re fully compliant with the NFC Forum’s specifications.

NFC CONTROLLERS WITH CUSTOMIZABLE FIRMWARE
These highly integrated devices combine an NFC frontend with a freely programmable 32-bit Cortex-M0 microcontroller. They let you create a fully custom design, complete with NFC, in a very compact footprint. State-of-the-art options include support for both contactless and contact technologies, so you can deliver a system with maximum appeal and compatibility.

NFC FRONTENDS
These NFC devices are the most flexible way to add NFC connectivity to a system. All our NFC frontends are supported by our NFC Reader Library (see p30), so design-in is fast and easy.

LONGEVITY
The Product Longevity program ensures a stable supply of products for your embedded designs. Longevity products remain in the program even if the manufacturing site changes. Supported products: CLRC663 plus, PN7150, NTAG PC plus, and NTAG 5 family.

NFC PRODUCT SELECTION PATH FOR EMBEDDED ELECTRONICS

PASSIVE SOLUTION
My device will only communicate with NFC phones or readers

- I want highest integration (single chip MCU + passive NFC interface)
- I want a flexible add-on to an existing MCU/MPU
- I want to add an existing MCU/MPU with a GPIO/PWM interface
- I want to read instantaneous value from a sensor without using any MCU/MPU
- I want to add NFC to a tiny device and get a reliable and better read range

- LPC8N04
- NTAG 5 switch
- NTAG 5 link
- NTAG 5 boost
- NTAG 5 link AES

ACTIVE SOLUTION
My device will communicate with NFC phones, readers and tags

- I want highest integration (single chip MCU + Full NFC reader)
- I have an applications processor running Linux, Android or WinIoT
- My device will interact with contactless cards or NFC phones
- I need full NFC functionality including Card emulation and Peer-to-peer

- PN762 NFC controller family with customizable FW
- PN71xx NFC controller with integrated FW
- PNS180 Full NFC frontend
- High performance multi-protocol reader
- Reader for NTAG® / MIFARE® products
- Reader for ICODE® products

- CLRC663 plus NFC frontend
- MFRC630, ISO/IEC14443A reader frontend
- SLRC610, ISO/IEC15693 and ISO/IEC18000-3M3 reader frontend
We make NFC easy

We reduce complexity, streamline tasks, and add flexibility at every point in development, so you can deliver a competitive advantage in record time. Links to the support tools listed below can be found on nxp.com/nfc.

**TOOLS TO SUPPORT PRODUCT SELECTION**

- **Linecard NFC (print/online)**
  Complete NFC product listings, with detailed specs and side-by-side comparisons

- **Parametric search**
  Online tool with parametric search features

**NFC DEVELOPMENT KITS**

- **NFC Development Kits**
  Full range of development kits for every NFC product, incl. design files and Gerber files

- **MCU Compatibility Guide**
  Check compatibility with common MCU boards and single-board computers at nxp.surl.ms/nfcmcu

**TOOLS AND APPLICATIONS**

- **NFC Cockpit**
  Intuitive GUI to configure and adapt NFC IC settings without coding

- **NFC Antenna Design Hub**
  A comprehensive portal of resources and tutorials on NFC antenna design featuring the NFC Antenna Design Tool.

- **NFC Library**
  Complete software support library for NFC Frontend ICs
  - Sample code to speed up development
  - App notes: Detailed instructions on a broad range of applications

- **EMVCo 3.0 compliance**
  EMVCo 3.0 (analog and digital) library in source code

**TRAINING AND SUPPORT**

- **NFC Training Catalog**
  Complete index of on-demand trainings and tutorials by industry experts

- **Technical NFC Community**
  Online platform to ask and discuss NFC queries at https://community.nxp.com/community/nfc

- **Design Partners**
  Independent Design Houses certified by NXP IDH Partners www.nxp.com/partners select HW/SW engineering service
NFC TAGS

Choose from a complete range of 13.56 MHz high-frequency (HF) ICs for inlays, tags, labels, and cards, featuring multiple security, memory storage, and interactivity options that address varied customer needs, from feature-light to feature-rich applications.

ICODE® is the leading brand for smart, high-frequency (HF) label solutions with billions of ICs in the field. As the ideal vicinity solution, ICODE® is ISO/IEC 15693 and ISO/IEC 18000-3 compliant, and follows NFC Forum Tag Type 5 specifications. An operating range of up to 1 m with long range readers, additional read range vs ISO/IEC 14443 with standard ISO/IEC 15693 readers for extra small form factors and NFC phone readability make ICODE® an ideal solution for a range of applications:

- Library management,
- Consumable and accessory identification and authentication
- Brand protection and anti-counterfeiting
- Supply chain control
- Industrial

NFC tags can be read by all standard NFC-enabled phones and are available as bare bumped dies on wafers, intended for use in inlays, tags an labels, as well as modules.

ICODE SLIX 2 | ICODE DNA
---|---

NTAG

NTAG is the ideal solution to add the benefits of contactless technology to high-security and/or high-volume applications. The NTAG family fully complies to ISO 14443A and NFC Forum Tag Type 2 and 4 specifications, ensuring universal interoperability with NFC devices and operating with and without apps. NFC tags enable a number of entirely new business applications:

- Consumable and accessory identification and authentication
- Direct 1:1 consumer engagement
- Brand protection and anti-counterfeiting
- Anti-tampering and anti-refilling
- Document authentication

SOFTWARE

TapLinx
SDK for the creation of Android-based NFC mobile apps. NXP’s entire NFC smart objects portfolio in one open API.

RFID Discover
Explore and deploy all the features of our MIFARE, NTAG, ICODE and MIFARE SAM AV2 13.56 MHz platforms.

NFC TagWriter by NXP
Quickly and easily program contacts, bookmarks, geolocation, Bluetooth pairing, email, and more.

NFC TagInfo by NXP
Read out the complete tag memory layout, extract NDEF messages, use the value-checker function, and more.
CONNECTED TAGS

These tags enable an easy link to the cloud by offering both, an RF and a host interface. The user memory can be configured for multiple rewrites or can be password protected, so data can’t be manipulated.

NXP’s Originality Signature, an algorithm that supports digital elliptic curve cryptography (ECC), adds an extra level of security and enables tag validation without a cloud connection.

Field detection, which can be used to wake the tag when it senses an NFC interaction, helps save power. NTAG PC plus can also use a pass-through mode (SRAM) to act as a modem for direct communication between the NFC device and the MCU.

The NTAG 5 boost uses active load modulation (ALM) to deliver robust and reliable communication with NFC phones, bringing a new level of convenience to tiny devices.

SOFTWARE

Software integration with the connected tags is easy. From the MCU side, the connected tag looks like an I²C memory, and from the phone side it looks like an NFC tag. There are no protocols to follow, and in many cases no specific timings, either. Here are the main steps for software integration.

**MCU/Embedded**
- Download the sample MCU source code
- Adapt it to your application
- For static testing of the NFC device, use an NFC-enabled phone with the NTAG PC Demo app or the USB reader from the OM5569-NT322ER demo kit, together with the "NTAG PC Demo" software running on a Windows PC.

**Phone/NFC device**
- Download the sample Android source code
- Write your app
- To test your NFC app with an NTAG PC plus counterpart, use either your own board (with MCU + NTAG PC plus + your firmware), or the NTAG PC plus Explorer Kit, plugged via USB into your Windows PC, and the "Peek&Poke" software.

All source code and PC software can be downloaded from the NTAG PC plus Explorer Kit webpage. Search for "OM5569-NT322ER" on nxp.com.

NFC AS MCU REPLACEMENT

In some lighting and gaming applications, NTAG 5 switch enables simple and cost-effective designs without a microcontroller. It implements multiplexed pins, offering general-purpose I/O (GPIO) and pulse width modulation (PWM) as well as NFC field detection. The characteristics of the PWM or GPIO signal can be configured through the NFC interface. These features can be used to switch on/off and control motor speed or LED brightness.

---

**NTAG I²C plus Explorer Kit**

An all-in-one demonstration and development resource to evaluate the NTAG I²C plus in an electronic system. Use it to explore tag operation, the NFC RF communication link, and the I²C serial bus link. The OM5569-NT322ER provides an additional NFC reader, so you can explore reader and tag functionality without having to have an NFC-enabled phone.

**Development Kits for NTAG 5 family**

The dedicated NTAG 5 switch/link and NTAG 5 boost Arduino®-compatible customer development boards are suitable for any boards featuring an Arduino header, including NXP LPCXpresso, Kinetis and i.MX boards. I²C access software for peek and poke as well as an Android application based on TapLinx is available from NXP.
NFC FRONTENDS

Our frontends are the most flexible way to upgrade your design to NFC connectivity. The CLRC663 plus family is primarily intended for use with contactless smartcards and tags, while the PN5180 is designed for broad-based applications, connecting with everything from smartcards to mobile handsets.

Libraries for embedded systems, fully compliant with ISO/IEC, EMV, and the NFC Forum, deliver reliable performance and simpler certification. Energy-saving features like low-power card detection extend battery life, and seamless integration with our NFC Reader Library means you can add or subtract functions with ease.

GET READY FOR EMV 3.0

This new standard version for payment targets better interoperability between terminals and various payment form factors (like cards, mobiles, wearables) which come with different antenna sizes and shapes. EMV 3.0 defines 3 new test targets (PICC) to represent the variety of form factors. Due to its advanced transmitter features such as DPC, AWS, ARC, PN5180 is a perfect candidate to be used for EMV 3.0 certification. On top, NXP delivers a fully EMVCo 3.0 compliant NFC reader library.

## EVALUATE, PROTOTYPE & FINE-TUNE

**OM25180 PN5180 Development Kit**
This kit includes a PN5180 board optimized for reader and EMVCo applications, two different antenna boards (65 x 65 mm and 30 x 50 mm, equipped with matching components), three small matching boards for implementation of a custom antenna-matching circuit, an NFC sample card and ten PN5180 samples in HVQFN packages.

**OM26630 CLRC663 plus Development Kit**
This kit includes a CLRC663 plus board demonstrating the extended Low Power Card Detection, with optimizations for access control applications, plus different antenna boards, an NFC sample card, and ten CLRC663 plus samples in HVQFN packages.

**CLEV6630ARD CLRC663 plus Arduino interface board**
This board enables the CLRC663 plus board integration with any board compatible with Arduino header, including most LPCXpresso, Kinetis and i.MX boards. Out of the box, it works perfectly with FRDM-K82F, the Freedom development platform for Kinetis® K82, K81, and K80 MCUs and is fully supported by the NFC Reader Library.

**OM29263ADK NFC Antenna Development Kit**
This kit comes with various ready-to-use antennas in popular sizes. The included matchings enable immediate prototyping.

## PN5180: HOW DPC SOLVES POWER TRANSFER FOR EMVCo COMPLIANCE

**EMVCo Non Compliancy**

**EMVCo Maximum Power Limit**

**EMVCo Minimum Power Limit**

- NFC reader with DPC
- NFC reader without DPC (symmetrical tuning)

THE NFC READER LIBRARY

Everything you need to create your own software stack and application for a contactless reader – at no extra charge. Our NFC Reader Library is a modular, multi-layer software library that provides all the application programming interfaces (APIs) needed to complete a design and prepare it for certification.

Available for free download, written in C programming language, and capable of supporting multiple design environments and platforms, the Library includes all the latest features to ensure 100% standards compliance. It enables full interoperability with devices already deployed in the market, and saves time and money at every point in the design cycle.

THE PROCESS

1 Focus on Scalability
The multi-layered software design ensures scalability of the software stack. Only the required software components and protocol implementations need to be enabled, so the final application has a smaller memory footprint.

2 Optimize Performance
Fine-tune your design with built-in MCU support, interrupt-based event handling, a full complement of host interfaces, free RTOS support, and compilers that produce highly compact, efficient code.

3 Simplify Test & Debug
Save time and effort by using a rich set of examples for all the most common functionalities, including call for inventory, polling, card emulation, application for EMVCo certification, low-power card detection, and dynamic power control.

4 Validate Interoperability
Get ready for certification with test apps that cover everything from payment and ID cards to automotive, EMVCo L1, NFC Forum, and ISO/IEC 10373-6 PICC/PCD. Broaden compatibility with the MIFARE portfolio and LLCP/SNEP protocols for P2P mode.

THE NFC COCKPIT

The CLRC663 plus, the PN5180, and the PN7462 family are supported by the NFC Cockpit, an intuitive graphical user interface (GUI) that lets you configure and adapt IC settings without writing a single line of software code.

- Let the hardware designers optimize antenna parameters, including wave shape, while the software designers work on other things
- Fine-tune the Dynamic Power Control and Low Power Card Detection settings
- Activate a contactless smartcard, including basic card communication, with options for APDU and EMVCo polling
- Implement firmware updates for the PN5180
- Access all EEPROM cells and registers

Join the NFC Community and browse projects, questions, and answers regarding the NFC Reader Library, or make your own case and interact with our NFC experts: https://community.nxp.com/community/nfc
NFC WITH CUSTOMIZABLE Firmware

By combining an NFC frontend with an advanced, power efficient 20-MHz ARM Cortex-M0 microcontroller, our all-in-one NFC controllers with customizable firmware are the best choice for compact systems, since they enable higher integration with fewer components.

The flash memory can be loaded with fully-custom applications, and the optimized antenna operation, in combination with low-power modes, delivers best-in-class performance. All the controllers are accompanied by extensive support tools, including sample source code and the NFC Reader Library (see p30).

PN7462 Family

The PN7462 Family extends the possibilities, with added features that make it easy to deliver the most advanced functionality. Ensure market interoperability with full MIFARE support. Full NFC Forum compliance, along with EMVCo for payments, saves time and gives you a shorter path to certification. Advanced power-management functions enable longer battery life, and DPC (see p26) delivers optimized antenna performance. Use the ISO/IEC 7816 interface to communicate with contact cards. This highly integrated device lets you design a complete system with just one small package.

Extensive host and peripheral interfaces include:

- Host/slave & master interfaces: I2C, SPI, USB, HSUART
- Contactless interface: NFC Forum compliant, EMVCo 3.0
- Contact interface: UART, ISO/IEC 7816, EMVCo 4.3c
- 12 to 21 GPIOs

SOFTWARE

The contactless and contact frontends of the controller are supported by the freely downloadable NFC Reader Library (see p30). The frontend further supports Dynamic Power Control (see p26).

EVALUATE, PROTOTYPE & FINE-TUNE

OM27462CDKP

PN7462 Family Development Kit

Designed for comprehensive application development, this kit contains a PN7462 board, two different antenna boards, three small antenna-matching boards for implementation of a custom antenna-matching circuit, a smartcard reader and ten PN7462 samples. Compatibility with the NFC Cockpit and PCB adaptors simplifies antenna matching. Full NFC Forum compliance and contact software libraries save time on code development.
NFC CONTROLLERS WITH INTEGRATED Firmware

Designed to save time when developing a system that uses an OS, our NFC controllers with integrated firmware combine an NFC frontend with an advanced, power-efficient 20-MHz ARM Cortex-M0 microcontroller, and come pre-loaded with drivers for Linux, Android, and WinIoT.

They communicate via the NCI interface, to conform with the NFC Forum’s guidelines for interactions with the system’s main application processor. You can move quickly from initial prototype to full production, since these controllers support the most popular development platforms, and are supported by sample applications and source code.

SOFTWARE FOR EVERY OS INTEGRATION

Our NFC controllers with integrated firmware are the perfect fit for systems that use a large OS.

- Our libnfc-nci library offers easy, smooth integration into GNU Linux-based systems and has a high-level API for NFC functionality.
- Patches to Android Open Source Project (AOSP) are available for simple integration into Android-based systems. The solution benefits from all the NFC implementations already available with Android.
- Our NFC controllers are natively supported as proximity platform devices, through the universal NFC device driver model of the Win10 IoT OS.
- We provide code examples running on NXP LPC, Kinetics, and i.MX MCUs, for a full NFC experience with an RTOS-based system, or a system that doesn’t use an OS.

EVALUATE, PROTOTYPE & FINE-TUNE

- PN7150 Board with Arduino-Compatible Header: A PN7150 controller board with an Arduino interface board (for use with LPCXpresso, Kinetics, iMX, and more), plus an NFC Forum Type 2 Tag.
- PN7150 Board for Raspberry Pi: A PN7150 controller board with a Raspberry Pi interface board and an NFC Forum Type 2 Tag.
- PN7150 Board for BeagleBone Black: A PN7150 controller board with a BeagleBone Black interface board and an NFC Forum Type 2 Tag.
THE THREE TYPES OF NFC INTERACTIONS

Read/Write Mode
This is where NFC spends most of its time, with one NFC-enabled device interacting with another to get information or initiate an action. The initiating device can read data in from the second device or write data out to it.

Peer-to-Peer Mode
Sometimes referred to as “P2P” mode, this is the one you can use to exchange files between smartphones, or receive loyalty points when making a purchase.

Card Emulation Mode
This mode, used almost exclusively by NFC smartphones, lets the system behave as an ISO/IEC 14443-compliant contactless smartcard. That means your phone can be used in the existing contactless infrastructure, for things like ticketing, access control, transit, tollgates, and payments. The mode takes very little power, and can work even when the phone is off.
WITH **PAS**SIVE COMMUNICATION, the target uses the RF field generated by the initiator, but with **A**CTIVE COMMUNICATION, each side generates its own field. Which method you use depends on the operating mode.

PASSIVE OR ACTIVE COMMUNICATION?

**PASSIVE COMMUNICATION SCHEME**

1. **The initiator produces a 13.56 MHz carrier field**
   - The field enables data exchanges and sends energy to the target.

2. **The initiator sends commands**
   - The initiator transfers data by directly modulating the field.

3. **The target responds**
   - The target transfers data by load-modulating the field.

**ACTIVE COMMUNICATION SCHEME**

1. **The initiator sends commands**
   - The initiator generates a 13.56 MHz carrier field, uses Amplitude Shift Key (ASK) modulation to send commands, then cuts the field.

2. **The target responds**
   - Once the initiator cuts its field, the target generates its own and uses ask modulation to send responses.

**READ/WRITE, PASSIVE PEER-TO-PEER, AND CARD EMULATION MODES**

**ACTIVE PEER-TO-PEER MODE**

To avoid collisions, only the sending device emits an electromagnetic field. The send/receive roles are reversed as needed to support the transaction.
NFC TECH ESSENTIALS

NFC FORUM TAG TYPES

The NFC Forum mandates that all their defined tag types be interoperable with NFC devices. All the tag types are based on existing contactless formats.

Type 1 and 2 tags provide a basic set of features and can be compared to the MIFARE Ultralight format. Type 3 and 4 tags offer higher memory capacity and more advanced features. Type 3 tags are based on Japan Industry Standard JIS X 6319-4 primarily used in Japan and can be compared to FeliCa formats. Type 4 tags can be compared to MIFARE DESFire formats. Type 5 tags are designed for communication over longer ranges (up to 1m). Type 5 tags are based on the ISO/IEC 15693 standard, which is also known as vicinity RFID, and can be compared to ICODE SLIX formats.

COMMON NFC RECORD TYPES

- **Device Information (Di)**: Basic details about the device model and its identity, for use when the device acts as host.
- **Smart Poster (Sp)**: Text strings, such as URLs, SMS messages, or phone numbers stored in an NFC tag.
- **Text (T)**: Text strings in multiple languages.
- **URI (U)**: Universal Resource Identifiers (URIs), which include web addresses (URLs) and other network resources and files.
- **Connection Handovers (Hr/Hs/Hc)**: Pairing with Bluetooth, Wi-Fi, or other protocols. Includes record formats for handover request (Hr), select (Hs), and carrier (Hc).
- **Signature (Sig)**: Provides an algorithm or certificate type for use as a digital signature.

FORMATS FOR DATA EXCHANGE (NDEF, RTD, SNEP)

All NFC Forum-compliant devices and tags support the same NFC Data Exchange Format (NDEF).

NDEF lets you encode data into the device or tag so it can share information with other NFC Forum-compliant devices and tags. The NDEF message sequence includes a series of records that contain data.

The record structure varies depending on the type of data conveyed. Record formats are specified in the NFC Record Type Definition (RTD). When NDEF messages are exchanged in Peer-to-Peer mode, the transaction follows the Simple NDEF Exchange Protocol (SNEP), which improves reliability by making use of the Logical Link Control Protocol (LLCP) connection-oriented transport mode.

FOR MORE ON THESE FORMATS, CHECK OUT NFC-FORUM.ORG
## Relevant Standards & Specifications

NFC is compatible with a number of industry-defined formats. Here’s a quick rundown, in alphanumeric order, of the ones most relevant to system designers.
