Block Guide

V01.02

Original Release Date: 26 NOV 2002
Revised: 10 Mar 2003

Semiconductor Products Sector
Motorola, Inc.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part. Motorola and  are registered trademarks of Motorola, Inc. Motorola, Inc. is an Equal Opportunity/Affirmative Action Employer.

Revision History

Version Number	Revision Date	Effective Date	Author	Description of Changes
V01.00	26 Nov 2002			Initial version, based on pim_9dp256
V01.01	28 Jan 2003			changed pin name to ROMCTL in Figure 1-1
V01.02	10 Mar 2003			added IIC Module

Preface

Terminology

Acronyms and Abbreviations	
PIM	Port Integration Module
ATD	Analog-to-Digital Converter
TIM	Input Capture/Output Compare Timer
SCI	Serial Communications Interfaces
SPI	Serial Peripheral Interface
IIC	Inter-IC Bus

Section 1 Introduction

1.1 Overview

The Port Integration Module used for the MC9S12B-Family establishes the interface between the peripheral modules and the I/O pins for all ports except ATD.

NOTE: *Port A, B, E, and K are related to the core logic and multiplexed bus interface. Refer to the HCS12 Core User Guide for details.*

This section covers:

- Port T connected to the timer module
- The serial port S associated with 2 SCI and 1 SPI modules
- Port M associated with 1 CAN module
- Port P connected to the PWM, which also can be used as an external interrupt source.
- Port J associated with 1 IIC module, which also can be used as an external interrupt source.
- The standard I/O port H can also be used as external interrupt sources.

Each I/O pin can be configured by several registers in order to select data direction and drive strength, to enable and select pull-up or pull-down resistors. On certain pins also interrupts can be enabled which result in status flags.

The I/O's of SPI module can be routed from their default location to determined pins.

The implementation of the Port Integration Module is device dependent.

1.2 Features

A standard port pin has the following minimum features:

- Input/output selection
- 5V output drive with two selectable drive strengths
- 5V digital and analog input
- Input with selectable pull-up or pull-down device

Optional features:

- Open drain for wired-or connections
- Interrupt inputs with glitch filtering

1.3 Block Diagram

Figure 1-1 is a block diagram of the PIM_9B128.

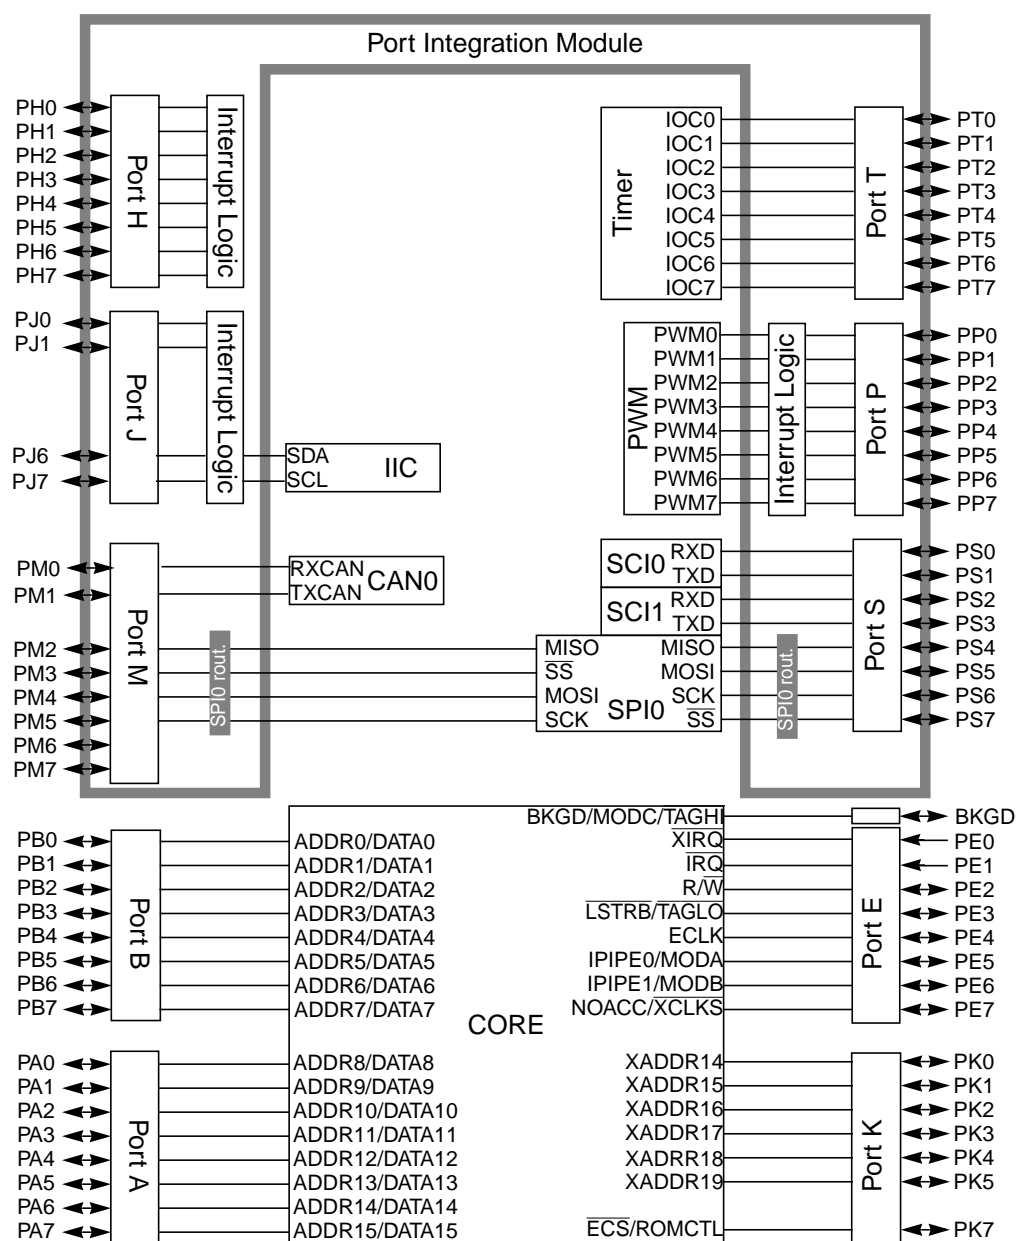

Figure 1-1 PIM_9B128 Block Diagram

Section 2 External Signal Description

2.1 Overview

This section lists and describes the signals that do connect off-chip.

2.2 Signal properties

Table 2-1 shows all the pins and their functions that are controlled by the PIM_9B128. If there is more than one function associated with a pin, the priority is indicated by the position in the table from top (highest priority) to down (lowest priority).

Table 2-1 Pin Functions and Priorities

Port	Pin Name	Pin Function & Priority	Description	Pin Function after Reset
Port T	PT[7:0]	IOC[7:0]	Standard Timer Channels 7 to 0	GPIO
		GPIO	General-purpose I/O	
Port S	PS7	$\overline{SS}0$	Serial Peripheral Interface 0 slave select output in master mode, input in slave mode or master mode.	GPIO
		GPIO	General-purpose I/O	
	PS6	SCK0	Serial Peripheral Interface 0 serial clock pin	
		GPIO	General-purpose I/O	
	PS5	MOSI0	Serial Peripheral Interface 0 master out/slave in pin	
		GPIO	General-purpose I/O	
	PS4	MISO0	Serial Peripheral Interface 0 master in/slave out pin	
		GPIO	General-purpose I/O	
	PS3	TXD1	Serial Communication Interface 1 transmit pin	
		GPIO	General-purpose I/O	
	PS2	RXD1	Serial Communication Interface 1 receive pin	
		GPIO	General-purpose I/O	
	PS1	TXD0	Serial Communication Interface 0 transmit pin	
		GPIO	General-purpose I/O	
	PS0	RXD0	Serial Communication Interface 0 receive pin	
		GPIO	General-purpose I/O	

Port	Pin Name	Pin Function & Priority	Description	Pin Function after Reset
Port M	PM7	GPIO	General-purpose I/O	GPIO
	PM6	GPIO	General-purpose I/O	
	PM5	SCK0	Serial Peripheral Interface 0 serial clock pin	
		GPIO	General-purpose I/O	
	PM4	MOSI0	Serial Peripheral Interface 0 master out/slave in pin	
		GPIO	General-purpose I/O	
	PM3	$\overline{SS}0$	Serial Peripheral Interface 0 slave select output in master mode, input for slave mode or master mode.	
		GPIO	General-purpose I/O	
	PM2	MISO0	Serial Peripheral Interface 0 master in/slave out pin	
		GPIO	General-purpose I/O	
	PM1	TXCAN0	MSCAN0 transmit pin	
		GPIO	General-purpose I/O	
	PM0	RXCAN0	MSCAN0 receive pin	
		GPIO	General-purpose I/O	
Port P	PP[7:0]	PWM[7:0]	Pulse Width Modulator channel 7 to 0	GPIO
		GPIO/KWP[7:0]	General-purpose I/O with interrupt	
Port H	PH[7:0]	GPIO/KWH[7:0]	General-purpose I/O with interrupt	GPIO
Port J	PJ7	SCL	Inter Integrated Circuit serial clock line	
		GPIO/KWJ7	General-purpose I/O with interrupt	
	PJ6	SDA	Inter Integrated Circuit serial data line	
		GPIO/KWJ6	General-purpose I/O with interrupt	
	PJ[1:0]	GPIO/KWJ[1:0]	General-purpose I/O with interrupt	

Section 3 Memory Map/Register Definition

This section provides a detailed description of all registers.

Table 3-1 shows the register map of the Port Integration Module.

Table 3-1 PIM_9B128 Memory Map

Address offset	Use	Access
\$00	Port T I/O Register (PTT)	RW
\$01	Port T Input Register (PTIT)	R

\$2E	Port J Interrupt Enable Register (PIEJ)	RW ¹
\$2F	Port J Interrupt Flag Register (PIFJ)	RW ¹
\$30 - \$3F	Reserved	-

NOTES:

1. Write access not applicable for one or more register bits. Please refer to detailed signal description.

NOTE: *Register Address = Base Address + Address Offset, where the Base Address is defined at the MCU level and the Address Offset is defined at the module level.*

3.1 Register Descriptions

The following table summarizes the effect on the various configuration bits, data direction (DDR), output level (I/O), reduced drive (RDR), pull enable (PE), pull select (PS) and interrupt enable (IE) for the ports. The configuration bit PS is used for two purposes:

1. Configure the sensitive interrupt edge (rising or falling), if interrupt is enabled.
2. Select either a pull-up or pull-down device if PE is active.

Table 3-2 Pin Configuration Summary

DDR	IO	RDR	PE	PS	IE ¹	Function	Pull Device	Interrupt
0	X	X	0	X	0	Input	Disabled	Disabled
0	X	X	1	0	0	Input	Pull Up	Disabled
0	X	X	1	1	0	Input	Pull Down	Disabled
0	X	X	0	0	1	Input	Disabled	falling edge
0	X	X	0	1	1	Input	Disabled	rising edge
0	X	X	1	0	1	Input	Pull Up	falling edge
0	X	X	1	1	1	Input	Pull Down	rising edge
1	0	0	X	X	0	Output, full drive to 0	Disabled	Disabled
1	1	0	X	X	0	Output, full drive to 1	Disabled	Disabled
1	0	1	X	X	0	Output, reduced drive to 0	Disabled	Disabled
1	1	1	X	X	0	Output, reduced drive to 1	Disabled	Disabled
1	0	0	X	0	1	Output, full drive to 0	Disabled	falling edge
1	1	0	X	1	1	Output, full drive to 1	Disabled	rising edge
1	0	1	X	0	1	Output, reduced drive to 0	Disabled	falling edge
1	1	1	X	1	1	Output, reduced drive to 1	Disabled	rising edge

NOTES:

1. Applicable only on port P, H and J.

NOTE: All bits of all registers in this module are completely synchronous to internal clocks during a register read.

3.1.1 Port T Registers

Address Offset: \$__00

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTT7	PTT6	PTT5	PTT4	PTT3	PTT2	PTT1	PTT0
Write:								
TIM:	IOC7	IOC6	IOC5	IOC4	IOC3	IOC2	IOC1	IOC0
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-1 Port T I/O Register (PTT)

Read:Anytime.

Write:Anytime.

If the data direction bits of the associated I/O pins are set to 1, a read returns the value of the port register, otherwise the value at the pins is read.

Address Offset: \$__01

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTIT7	PTIT6	PTIT5	PTIT4	PTIT3	PTIT2	PTIT1	PTIT0
Write:								
Reset:	-	-	-	-	-	-	-	-

 = Reserved or unimplemented

Figure 3-2 Port T Input Register (PTIT)

Read:Anytime.

Write:Never, writes to this register have no effect.

This register always reads back the status of the associated pins. This can also be used to detect overload or short circuit conditions on output pins.

Address Offset: \$__02

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	DDRT7	DDRT6	DDRT5	DDRT4	DDRT3	DDRT2	DDRT1	DDRT0
Write:								
Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented

Figure 3-3 Port T Data Direction Register (DDRT)

Read:Anytime.

Write:Anytime.

This register configures each port T pin as either input or output.

The TIM forces the I/O state to be an output for each timer port associated with an enabled output compare. In these cases the data direction bits will not change.

The DDRT bits revert to controlling the I/O direction of a pin when the associated timer output compare is disabled.

The timer input capture always monitors the state of the pin.

DDRT[7:0] — Data Direction Port T

1 = Associated pin is configured as output.

0 = Associated pin is configured as input.

Due to internal synchronization circuits, it can take up to 2 bus cycles until the correct value is read on PTT or PTIT registers, when changing the DDRT register.

Address Offset: \$__03

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	RDRT7	RDRT6	RDRT5	RDRT4	RDRT3	RDRT2	RDRT1	RDRT0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-4 Port T Reduced Drive Register (RDRT)

Read:Anytime.

Write:Anytime.

This register configures the drive strength of each port T output pin as either full or reduced. If the port is used as input this bit is ignored.

RDRT[7:0] — Reduced Drive Port T

1 = Associated pin drives at about 1/3 of the full drive strength.

0 = Full drive strength at output.

Address Offset: \$__04

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PERT7	PERT6	PERT5	PERT4	PERT3	PERT2	PERT1	PERT0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-5 Port T Pull Device Enable Register (PERT)

Read:Anytime.

Write:Anytime.

This register configures whether a pull-up or a pull-down device is activated, if the port is used as input. This bit has no effect if the port is used as output. Out of reset no pull device is enabled.

PERT[7:0] — Pull Device Enable Port T

1 = Either a pull-up or pull-down device is enabled.

0 = Pull-up or pull-down device is disabled.

Address Offset: \$__05

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PPST7	PPST6	PPST5	PPST4	PPST3	PPST2	PPST1	PPST0
Write:								
Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented
Figure 3-6 Port T Polarity Select Register (PPST)

Read:Anytime.

Write:Anytime.

This register selects whether a pull-down or a pull-up device is connected to the pin.

PPST[7:0] — Pull Select Port T

1 = A pull-down device is connected to the associated port T pin, if enabled by the associated bit in register PERT and if the port is used as input.

0 = A pull-up device is connected to the associated port T pin, if enabled by the associated bit in register PERT and if the port is used as input.

3.1.2 Port S Registers

Address Offset: \$__08

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTS7	PTS6	PTS5	PTS4	PTS3	PTS2	PTS1	PTS0
Write:

Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented
Figure 3-7 Port S I/O Register (PTS)

Read:Anytime.

Write:Anytime.

If the data direction bits of the associated I/O pins are set to 1, a read returns the value of the port register, otherwise the value at the pins is read.

The SPI pins (PS[7:4]) configuration is determined by several status bits in the SPI module. *Refer to SPI Block Guide for details.*

The SCI ports associated with transmit pins 3 and 1 are configured as outputs if the transmitter is enabled. The SCI ports associated with receive pins 2 and 0 are configured as inputs if the receiver is enabled. *Refer to SCI Block Guide for details.*

Address Offset: \$__09

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTIS7	PTIS6	PTIS5	PTIS4	PTIS3	PTIS2	PTIS1	PTIS0
Write:								
Reset:	-	-	-	-	-	-	-	-

= Reserved or unimplemented

Figure 3-8 Port S Input Register (PTIS)

Read:Anytime.

Write:Never, writes to this register have no effect.

This register always reads back the status of the associated pins. This also can be used to detect overload or short circuit conditions on output pins.

Address Offset:\$__0A

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	DDRS7	DDRS6	DDRS5	DDRS4	DDRS3	DDRS2	DDRS1	DDRS0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-9 Port S Data Direction Register (DDRS)

Read:Anytime.

Write:Anytime.

This register configures each port S pin as either input or output

If SPI is enabled, the SPI determines the pin direction. *Refer to SPI Block Guide for details.*

If the associated SCI transmit or receive channel is enabled this register has no effect on the pins. The pin is forced to be an output if a SCI transmit channel is enabled, it is forced to be an input if the SCI receive channel is enabled.

The DDRS bits revert to controlling the I/O direction of a pin when the associated channel is disabled.

DDRS[7:0] — Data Direction Port S

1 = Associated pin is configured as output.

0 = Associated pin is configured as input.

Due to internal synchronization circuits, it can take up to 2 bus cycles until the correct value is read on PTS or PTIS registers, when changing the DDRS register.

Address Offset: \$__0B

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	RDRS7	RDRS6	RDRS5	RDRS4	RDRS3	RDRS2	RDRS1	RDRS0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-10 Port S Reduced Drive Register (RDRS)

Read:Anytime.

Write:Anytime.

This register configures the drive strength of each port S output pin as either full or reduced. If the port is used as input this bit is ignored.

RDRS[7:0] — Reduced Drive Port S

1 = Associated pin drives at about 1/3 of the full drive strength.

0 = Full drive strength at output.

Address Offset: \$__0C

	Bit 7	6	5	4	3	2	1	Bit 0

Write:								
Reset:	1	1	1	1	1	1	1	1

= Reserved or unimplemented

Figure 3-11 Port S Pull Device Enable Register (PERS)

Read:Anytime.

Write:Anytime.

This register configures whether a pull-up or a pull-down device is activated, if the port is used as input or as output in wired-or (open drain) mode. This bit has no effect if the port is used as push-pull output. Out of reset a pull-up device is enabled.

PERS[7:0] — Pull Device Enable Port S

1 = Either a pull-up or pull-down device is enabled.

0 = Pull-up or pull-down device is disabled.

Address Offset: \$__0D

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PPSS7	PPSS6	PPSS5	PPSS4	PPSS3	PPSS2	PPSS1	PPSS0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-12 Port S Polarity Select Register (PPSS)

Read:Anytime.

Write:Anytime.

This register selects whether a pull-down or a pull-up device is connected to the pin.

PPSS[7:0] — Pull Select Port S

1 = A pull-down device is connected to the associated port S pin, if enabled by the associated bit in register PERS and if the port is used as input.

0 = A pull-up device is connected to the associated port S pin, if enabled by the associated bit in register PERS and if the port is used as input or as wired-or output.

Address Offset: \$__0E

Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-13 Port S Wired-Or Mode Register (WOMS)

Read:Anytime.

Write:Anytime.

This register configures the output pins as wired-or. If enabled the output is driven active low only (open-drain). A logic level of “1” is not driven. It applies also to the SPI and SCI outputs and allows a multipoint connection of several serial modules. This bit has no influence on pins used as inputs.

WOMS[7:0] — Wired-Or Mode Port S

1 = Output buffers operate as open-drain outputs.

0 = Output buffers operate as push-pull outputs.

3.1.3 Port M Registers

Writing a “0” has no effect.

Section 4 Functional Description

4.1 General

Each pin can act as general purpose I/O. In addition the pin can act as an output from a peripheral module or an input to a peripheral module.

A set of configuration registers is common to all ports. All registers can be written at any time, however a specific configuration might not become active.

Example:

Selecting a pull-up resistor. This resistor does not become active while the port is used as a push-pull output.

4.1.1 I/O register

This register holds the value driven out to the pin if the port is used as a general purpose I/O.

Writing to this register has only an effect on the pin if the port is used as general purpose output. When reading this address, the value of the pins is returned if the data direction register bits are set to 0.

If the data direction register bits are set to 1, the contents of the I/O register is returned. This is independent of any other configuration (**Figure 4-1**).

4.1.2 Input register

This is a read-only register and always returns the value of the pin (**Figure 4-1**).

4.1.3 Data direction register

This register defines whether the pin is used as an input or an output.

If a peripheral module controls the pin the contents of the data direction register is ignored (**Figure 4-1**).

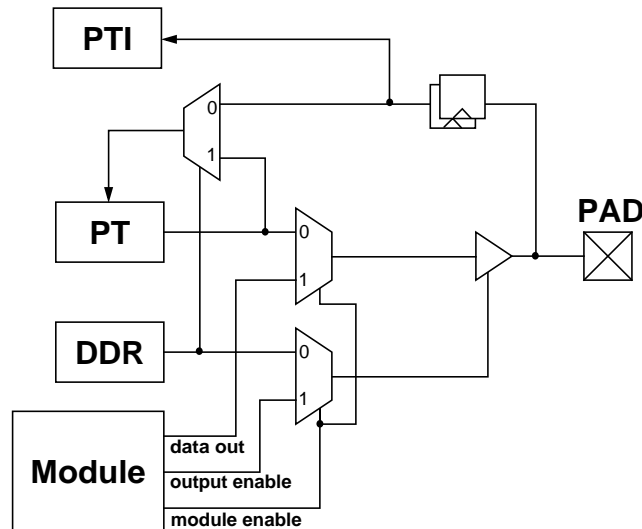

Figure 4-1 Illustration of I/O pin functionality

4.1.4 Reduced drive register

If the port is used as an output the register allows the configuration of the drive strength.

4.1.5 Pull device enable register

This register turns on a pull-up or pull-down device.

It becomes only active if the pin is used as an input or as a wired-or output.

4.1.6 Polarity select register

This register selects either a pull-up or pull-down device if enabled.

It becomes only active if the pin is used as an input. A pull-up device can be activated if the pin is used as a wired-or output.

4.2 Port T

This port is associated with the Timer (TIM) module.

Port T pins PT[7:0] can be used for either general-purpose I/O, or with the channels of the Timer (TIM).

During reset, port T pins are configured as high-impedance inputs.

4.3 Port S

This port is associated with SCI0, SCI1 and SPI0.

Port S pins PS[7:0] can be used either for general-purpose I/O, or with the SCI and SPI subsystems.

During reset, port S pins are configured as inputs with pull-up.

The SPI0 pins can be re-routed. Refer to **Figure 3-21**.

4.4 Port M

This port is associated with CAN0 and SPI0.

Port M pins PM[7:0] can be used for either general purpose I/O, or with the CAN and SPI subsystems.

During reset, port M pins are configured as high-impedance inputs.

The SPI0 pins can be re-routed. Refer to **Figure 3-21**.

4.4.1 Module Routing Register

This register allows to re-route the SPI0 pins to predefined pins. Refer to **Figure 3-21**.

NOTE: *The purpose of the Module Routing Register is to allow SPI0 flexibility for 112 LQFP package of the MC9S12B-Family.*

4.5 Port P

This port is associated with the PWM.

Port P pins PP[7:0] can be used for either general purpose I/O, or with the PWM subsystems.

If the PWM is enabled the pins become PWM output channels with the exception of pin 7 which can be PWM input or output.

During reset, port P pins are configured as high-impedance inputs.

Port P offers 8 I/O pins with edge triggered interrupt capability in wired-or fashion. The interrupt enable as well as the sensitivity to rising or falling edges can be individually configured on per pin basis. All 8 bits/pins share the same interrupt vector. Interrupts can be used with the pins configured as inputs or outputs.

An interrupt is generated when a bit in the port interrupt flag register and its corresponding port interrupt enable bit are both set. This external interrupt feature is capable to wake up the CPU when it is in STOP or WAIT mode.

A digital filter on each pin prevents pulses (**Figure 4-3**) shorter than a specified time from generating an interrupt. The minimum time varies over process conditions, temperature and voltage (**Figure 4-2** and **Table 4-1**).

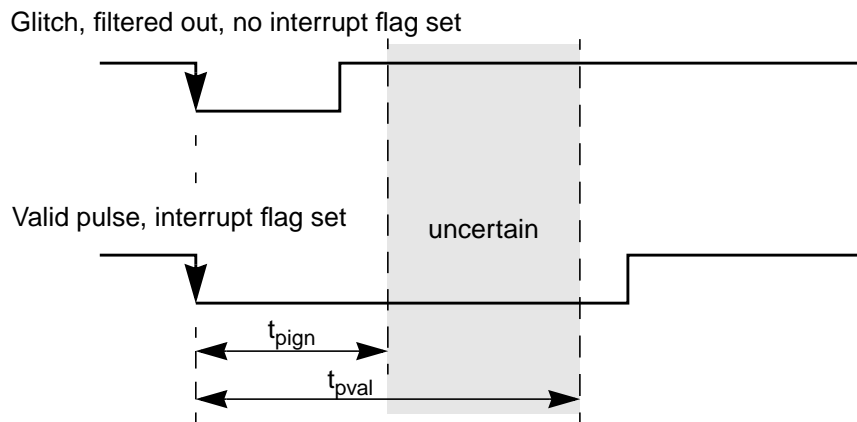

Figure 4-2 Interrupt Glitch Filter on Port P, H and J (PPS=0)

Table 4-1 Pulse Detection Criteria

Pulse	Mode		
	RUN & WAIT		STOP ¹
		Unit	
Ignored	$t_{\text{pulse}} \leq 3$	bus clocks	$t_{\text{pulse}} \leq t_{\text{pign}}$
Uncertain	$3 < t_{\text{pulse}} < 4$	bus clocks	$t_{\text{pign}} < t_{\text{pulse}} < t_{\text{pval}}$
Valid	$t_{\text{pulse}} \geq 4$	bus clocks	$t_{\text{pulse}} \geq t_{\text{pval}}$

NOTES:

1. These values include the spread of the oscillator frequency over temperature, voltage and process.

Figure 4-3 Pulse Illustration

A valid edge on an input is detected if 4 consecutive samples of a passive level are followed by 4 consecutive samples of an active level directly or indirectly.

The filters are continuously clocked by the bus clock in RUN and WAIT mode. In STOP mode the clock is generated by a single RC oscillator in the Port Integration Module. To maximize current saving the RC oscillator runs only if the following condition is true on any pin:

Sample count ≤ 4 and port interrupt enabled (PIE=1) and port interrupt flag not set (PIF=0). Refer to the device user guide for the specified t_{pign} and t_{pval} values.

4.6 Port H

Port H pins PH[7:0] can be used for general purpose I/O.

During reset, port H pins are configured as high-impedance inputs.

Port H offers 8 I/O ports with the same interrupt features as port P.

4.7 Port J

This port is associated with the IIC.

Port J pins PJ[7:6] and PJ[1:0] can be used for general purpose I/O or with IIC subsystem.

During reset, port J pins are configured as inputs with pull-up.

If IIC takes precedence the pins become IIC open-drain output pins.

Port J offers 4 I/O ports with the same interrupt features as port P.

4.8 Port A, B, E, K, and BKGD pin

All port and pin logic is located in the core module. *Refer to MEBI in HCS12 Core User Guide for details.*

4.9 External Pin Descriptions

All ports start up as general purpose inputs on reset.

4.10 Low Power Options

4.10.1 Run Mode

No low power options exist for this module in run mode.

4.10.2 Wait Mode

No low power options exist for this module in wait mode.

4.10.3 Stop Mode

All clocks are stopped. There are asynchronous paths to generate interrupts from STOP on port P, H and J.

Section 5 Initialization/Application Information
