

IW623P

2x2 Dual-band (5-7 GHz) Wi-Fi 6/6E, 2x2 (2.4 GHz) Wi-Fi 6, and Bluetooth Combo Solution

Rev. 2.0 — 30 March 2026

Product data sheet

1 Product overview

The IW623P is a highly integrated Wi-Fi 6/6E device enabling Wi-Fi and Bluetooth operation.

The System-on-chip (SoC) implements advanced features including MU-MIMO, OFDMA, target wake-up time (TWT), and Bluetooth LE Audio.

With integrated 2.4 GHz and 5-7 GHz TX power amplifiers (PA), RX low noise amplifiers (LNA), and TX/RX switches (T/R SW) as well as a Bluetooth radio, the IW623P simplifies design. External front-end module (FEM) with PA and LNA is also supported.

The IW623P supports a flexible front-end design with either two or three antennas.

The IW623P implements advanced real-time Wi-Fi and Bluetooth arbitration hardware with software algorithms to optimize coexistence performance.

NXP's Edgelock technology is integrated. The embedded Edgelock secure subsystem (ELS) supports hardware crypto accelerated secure boot, key management, firmware encryption and authentication, secure life cycle management, and anti-rollback protection. IW623P is designed from the ground up to meet SESIP security.

The IW623P integrates dedicated CPUs and memories for both the Wi-Fi and Bluetooth subsystems for real time, independent protocol processing.

The interfaces to external host processors include PCIe for Wi-Fi and UART for Bluetooth.

[Figure 1](#) shows IW623P application diagram.

1.1 Applications

- Wireless power over Ethernet (POE) hub
- Smart home hub
- Mobile router
- Internet of things (IoT) gateways

1.2 Wi-Fi key features

2x2 Wi-Fi 6/6E

- 40 MHz channel for 2.4 GHz (RF paths 2A and 2B)
- 1024 QAM (MCS11), up to 80 MHz channel for 5-7 GHz (RF paths 5A and 5B)
- STA and mobile AP
- Wireless multi stream (WMS)
- Wi-Fi TSF host clock sync between AP and STA
- Wi-Fi cross-chip TSF clock sync between AP and AP

1.3 Bluetooth key features

- Integrated PA (+13 dBm)/LNA/RF switch
- BDR/EDR packet types—1 Mbps (GFSK), 2 Mbps ($\pi/4$ -DQPSK), 3 Mbps (8DPSK)
- Bluetooth LE uncoded (1 Mbps/2 Mbps) and long range (125 kbps/500 kbps) support
- Bluetooth LE advertising extensions for improved capacity
- Isochronous channels (ISOC) supporting LE Audio

1.4 Host interfaces

Wi-Fi and Bluetooth interface options

Table 1. Host interface options

Wi-Fi	Bluetooth
PCIe	UART

1.5 Operating characteristics

- Supply voltage: 1.8 V and 3.3 V
- Operating temperature: –40°C to 85°C
- Storage temperature: –55°C to 125°C

1.6 General features

Package options

- HVQFN148 (dual-row) 11 mm x 11 mm x 0.85 mm with 0.5 mm pitch

Coexistence

- Internal coexistence between Wi-Fi and Bluetooth
- External coexistence interface for connection to external radios such as UWB and cellular modems

Power management

- Individual low-power down for Wi-Fi and Bluetooth subsystems
- Low-power standby
- Integrated high-efficiency buck DC-DC converter
- Wake-up through GPIO, host interface, and RTC

Memory

- One Time Programmable (OTP) memory to store the MAC address and calibration data
- Addressable memory space is accessible to all CPUs

Security

- Targeting SESIP Level 3 security certification
- Secure boot and debug management
- Firmware authentication
- Lifecycle management
- Anti-rollback protection
- Hardware cryptography for boot acceleration
- Secure key generation and management for boot management
- Authenticated, integrity-verified, and encrypted firmware
- Voltage glitch attack resistance

3 Wi-Fi subsystem

3.1 IEEE 802.11 standards

- 802.11ax
 - 2x2 SU and MU-MIMO/OFDMA (MU-MIMO/OFDMA for STA mode only)
 - Target wake time (TWT)
- 802.11ac
 - Wave 1/2 backward compatible
 - Downlink MU-MIMO for STA mode only
- 802.11n/a/g/b backward compatible
- 802.11az accurate ranging
- 802.11d operation in additional regulatory domains
- 802.11e quality of service
- 802.11h
 - Transmit power control
 - DFS radar pulse detection
- 802.11i enhanced security
- 802.11k radio resource measurement
- 802.11mc fine time measurement (FTM)
- 802.11r fast hand-off for AP roaming
- 802.11u Hotspot 2.0 (STA mode only)
- 802.11v TIM frame transmission/reception
- 802.11w protected management frames
- 802.11z tunneled direct link setup
- Fully supports clients (stations) implementing IEEE Power Save mode

3.2 Wi-Fi MAC

- 802.11ax 2x2 MU-MIMO MAC
- Trigger Frame Formats
 - Basic trigger frame
 - Beamforming Report Poll (BFRP)
 - MU-BAR, MU-RTS, BSR Poll (BSRP) trigger variant
 - Trigger frame MAC padding
- Wireless Multi-Stream
- HE Variants of HT Control
 - Basic format
 - UL Power Headroom
 - Receive Operation Mode control sub field
- HE MU Frame Exchange Sequences
- MU Acknowledgment (ACK)
- M-BA and C-BA Variants in BA Frames
- MU-RTS/CTS Procedures
- Target Wake Time Scheduling
- HE Dual-NAV
- UL Carrier Sensing
- Buffer Status Reports
- Operating Mode Indication (OMI)
- Multiple BSS/Station
- A-MPDU Rx (de-aggregation) and TX (aggregation) (supports single-MPDU A-MPDU)
- Management information base counters
- Transmit rate adaptation
- Transmit power control
- Mobile hotspot

3.3 Wi-Fi baseband

BBU - 2x2 baseband

- 802.11ax 2x2 MU-MIMO baseband, backward compatible with 802.11ac/n/a/g/b technology
- 6 GHz PHY data rates up to 1.2 Gbit/s
- 5 GHz PHY data rates up to 1.2 Gbit/s
- 2.4 GHz PHY data rates up to 573.5 Mbps
- Bandwidth support
 - 20 MHz
 - 40 MHz
 - 80 MHz
- Modulation and coding schemes (MCS)
 - 802.11ax—MCS 0~11
 - Up to 2 spatial streams for 20, 40, 80 MHz
 - 802.11ac—MCS 0~9 Nsts = 1 and 2
 - Up to 2 spatial streams for 20, 40, 80 MHz
 - 802.11n—MCS 0~15 and MCS 32 (duplicate 6 Mbps)
 - Dual sub-carrier modulation (DCM)
 - MCS 0 only
 - BCC and LDPC coding
- Frame formats
 - 802.11ax HE_SU (Tx/Rx)
 - 802.11ax HE_MU (RX)
 - 802.11ax HE_ER_SU (Tx/Rx)
 - 802.11ax HE_TB (TX)
 - 802.11ac VHT
 - 802.11n HT
 - 802.11a (including dup/quad modes)
 - 802.11g (including dup mode)
 - 802.11b
- Channel State Information (CSI)
- Optional 802.11ac and 802.11n MIMO features:
 - LDPC transmission and reception for both 802.11ac and 802.11n
 - 256 QAM (MCS 8, 9) modulation (optional support for 802.11ac MCS 9 in 20 MHz using LDPC)
 - Spectral intelligence
 - Spectrum monitoring
 - DFS assist to reduce false detections

BBU additional features

- Uplink MU-MIMO (STA mode only)
- Packet extension
 - Up to 8 us for highest rates
 - 0 us for all other modes
- Range extension
- Beam change
- Guard interval (GI) modes
 - 1x HE-LTF with 0.8 us GI
 - 1x HE-LTF with 1.6 us GI (for UL TB PPDU)
 - 2x HE-LTF with 0.8 us GI
 - 2x HE-LTF with 1.6 us GI
 - 4x HE-LTF with 3.2 us GI
 - 4x HE-LTF with 0.8 us GI
- Optional 802.11ac and 802.11n MIMO features:
 - 20/40/80 MHz coexistence with middle-packet detection (GI detection) for enhanced CCA
 - Short guard interval (0.4 us)
 - RIFS on receive path for 802.11n packets
 - VHT MU-PPDU (receive)
- Precise indoor location positioning (802.11mc)
- Power save features

3.4 Wi-Fi radio

RFU – 2x2 dual-band Wi-Fi RF

- 802.11ax 2x2 MU-MIMO on-chip RF radio
- 2.4 GHz Wi-Fi band operation
- 802.11ax 1x1 on-chip RF radio

RFU additional features

- Integrated PA
- On-chip LNAs with optimized noise figure and power consumption
- High dynamic range Rx AGC
- Optimized TX gain distribution for linearity and noise performance

3.5 Wi-Fi encryption

- Data Frame Encryption/Decryption
 - AES/CCMP
 - AES/GCMP
 - WAPI
- Management Frame Encryption/Decryption for broadcast/multicast packets
 - AES/CMAC
- Management Frame Encryption/Decryption for unicast packets
 - AES/CCMP
 - AES/GCMP

3.6 Transmit Beamforming (TxBF)

- 802.11ax/ac/n explicit beamformer
 - NDP sounding to stations capable of explicit beamformee
 - Beamforming up to two streams
- 802.11ax/ac/n explicit beamformee
 - Supports sounding feedback for up to 8x8 beamformer

3.7 RF channels

The list of channels for Wi-Fi is available in [Section 14.1](#).

3.8 Wi-Fi host interfaces

- PCI Express 1.0 interface (Gen 1, single lane)

Note: The PCIe host must allocate memory for DMA buffer within the physical address of up to 512 GB (less than 0x80_0000_0000) for IW623P.

4 Bluetooth subsystem

4.1 Bluetooth features

- Bluetooth 5.4 certified
- Bluetooth Class 2
- Bluetooth Class 1
- Single-ended, shared Tx/Rx path for Bluetooth
- PCM and I2S interfaces for voice applications
- Baseband/radio BDR/EDR packet types—1 Mbps (GFSK), 2 Mbps ($\pi/4$ -DQPSK), 3 Mbps (8DPSK)
- Fully functional Bluetooth baseband—AFH, forward error correction, header error control, access code correlation, CRC, encryption bit stream generation, and whitening
- Adaptive Frequency Hopping (AFH) using Packet Error Rate (PER)
- Interlaced scan for faster connection setup
- Simultaneous active ACL connection support
- Automatic ACL packet type selection
- Full central and peripheral piconet support¹
- Scatternet support
- Standard UART HCI transport layer
- SCO/eSCO links with hardware accelerated audio signal processing and hardware supported PPEC algorithm for speech quality improvement
- All standard pairing, authentication, link key, and encryption operations
- Standard Bluetooth power saving mechanisms (sniff modes, and sniff sub-rating)
- Enhanced Power Control (EPC)
- Channel Quality Driven Data Rate (CQDDR)
- Wideband Speech (WBS) support (two WBS links)²
- Encryption (AES) support
- HCI Encryption Key Size Control

¹ The master/slave replacement in this document follows the recommendation of Bluetooth SIG.

² Two WBS over PCM where the device under test (DUT) must be central.

4.2 Bluetooth Low Energy (LE) features

- Bluetooth LE 5.4 certified
- Supports up to 16 simultaneous central/peripheral connections³
- Wi-Fi/Bluetooth coexistence protocol support
- Shared RF with BDR/EDR
- Encryption (AES) support
- Intelligent Adaptive Frequency Hopping (AFH)
- Bluetooth LE Privacy
- Bluetooth LE Secure Connection
- Bluetooth LE Data Length Extension
- Bluetooth LE Advertising Extension
- Bluetooth LE Long Range
- Bluetooth LE 2 Mbps
- Bluetooth LE Power Control (LEPC)
- Bluetooth LE Isochronous Channels (ISOC)⁴
- Bluetooth LE Connection Subrating⁵
- Bluetooth LE Channel Classification Enhancement⁵
- Periodic Advertising ADI support⁵

4.3 Bluetooth host interfaces

- High-Speed UART interface

³ The master/slave replacement in this document follows the recommendation of Bluetooth SIG.

⁴ Bluetooth LE audio supported with external host running Low Complexity Communication Codec (LC3) through HCI interface.

⁵ Check the feature support in the software release notes.

4.4 Digital audio interfaces

4.4.1 I2S interface

- I2S (Inter-IC Sound) interface for audio data connection to Analog-to-Digital Converters (ADC) and Digital-to-Analog Converters (DAC)
- Central and peripheral mode for I2S, MSB, LSB audio interfaces (single Bluetooth)⁶
- Tri-state I2S interface compatibility
- I2S pins shared with PCM pins
- I2S narrow band speech (NBS) with 8 kHz sampling rate
- I2S wide band speech (WBS) with 16 kHz sampling rate

4.4.1.1 I2S interface signals

Refer to [Section 6.5.8 "Digital audio interface"](#).

4.4.1.2 I2S interface protocol

[Figure 4](#) shows I2S interface protocol.

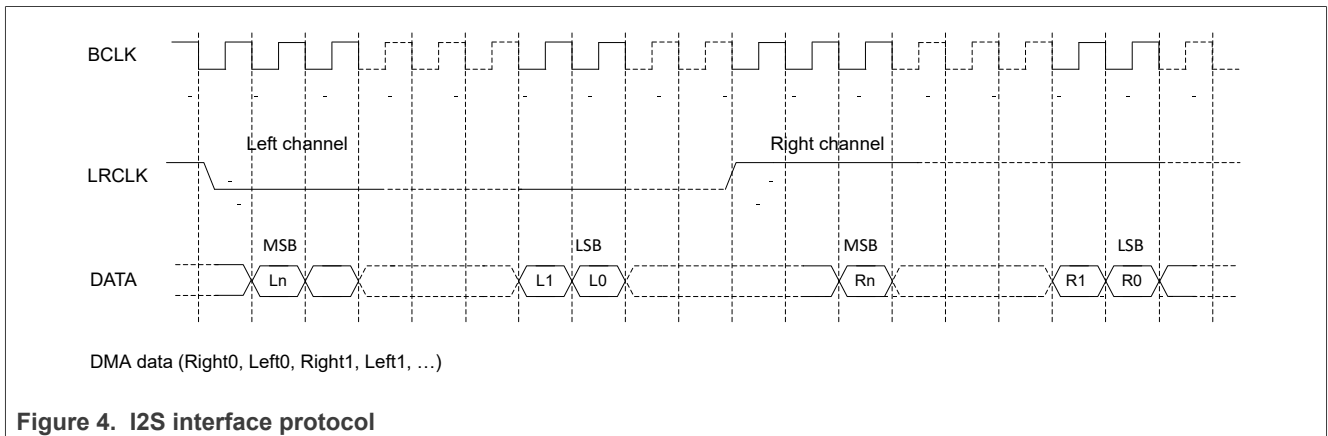

Figure 4. I2S interface protocol

⁶ The master/slave replacement in this document follows the recommendation of Bluetooth SIG.

IW623P supports mono and dual channel modes.

In mono-channel mode, by default the left channel is used for data.

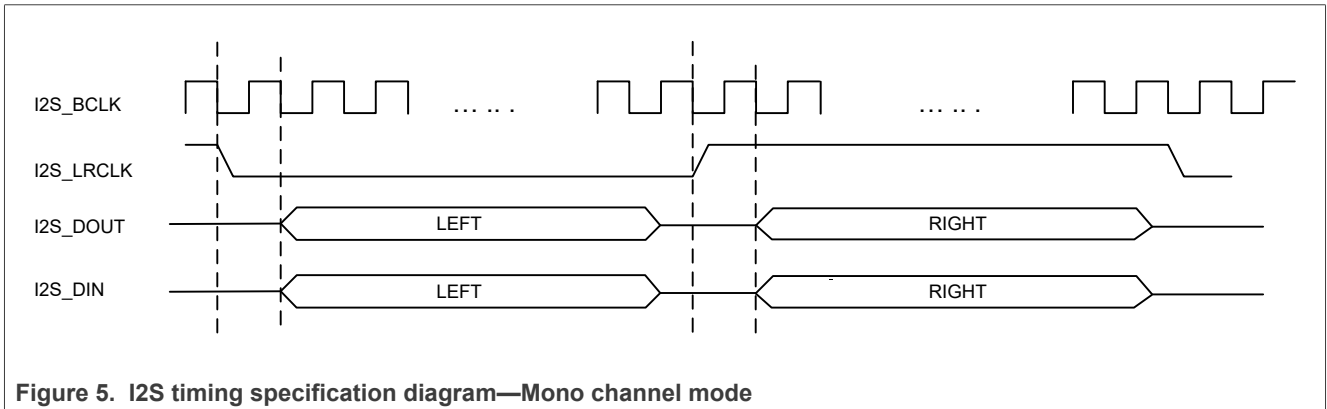

Figure 5. I2S timing specification diagram—Mono channel mode

In dual-channel mode, the two channels are supported on two time slots.

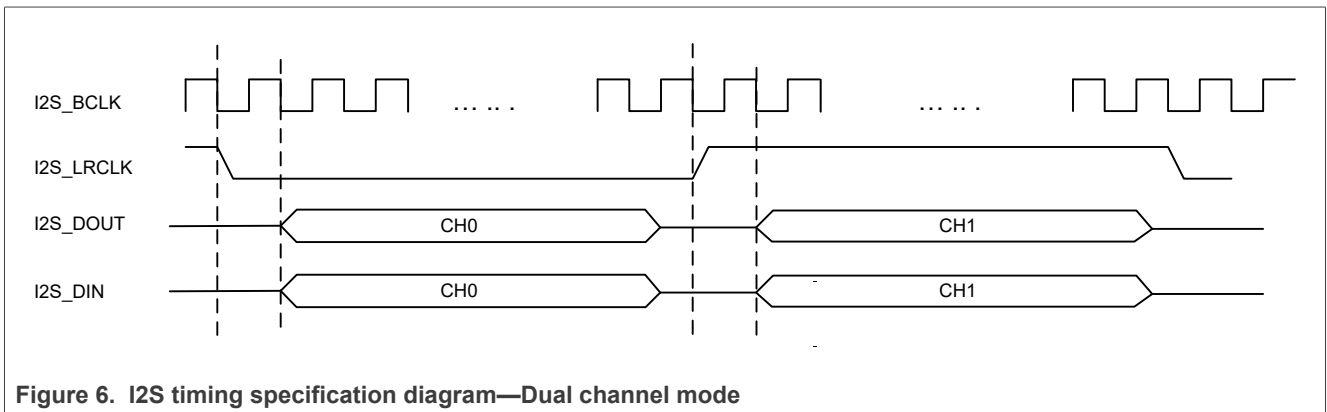

Figure 6. I2S timing specification diagram—Dual channel mode

4.4.1.3 Clock frequency and audio data resolutions

Audio data may arrive with different input data formats with different sampling rates.

In central mode, the I2S interface uses an audio input clock of 4.096 MHz or 2.048 MHz to provide the appropriate M clock (MCLK) and bit clock (I2S_BCLK) frequency to match the sampling rates of each audio data format. The sampling rates can be 8 kHz to 16 kHz.⁷

In peripheral mode, the I2S interface does not provide the bit clock (I2S_BCLK) but it can provide the M clock (MCLK).⁷

⁷ The master/slave replacement in this document follows the recommendation of Bluetooth SIG.

4.4.2 PCM interface

- Central or peripheral mode⁸
- PCM bit width size of 16 bits
- Up to 4 slots with configurable bit width and start positions
- Tri-state PCM interface capability
- PCM short frame synchronization
- PCM pins shared with I2S
- PCM narrow band speech (NBS) with 8 kHz sampling rate
- PCM wide band speech (WBS) with 16 kHz sampling rate⁹
- Dual Hands free profile (HFP) (WBS/NBS) PCM

4.4.2.1 PCM interface signal description

Refer to [Section 6.5.8 "Digital audio interface"](#).

4.4.2.2 PCM protocol

The PCM interface supports short frame sync. [Figure 7](#) shows an example of a PCM interface with four signals.

Figure 7. PCM short frame sync

8 The master/slave replacement in this document follows the recommendation of Bluetooth SIG.
 9 Two WBS over PCM where the device under test (DUT) must be Bluetooth piconet central

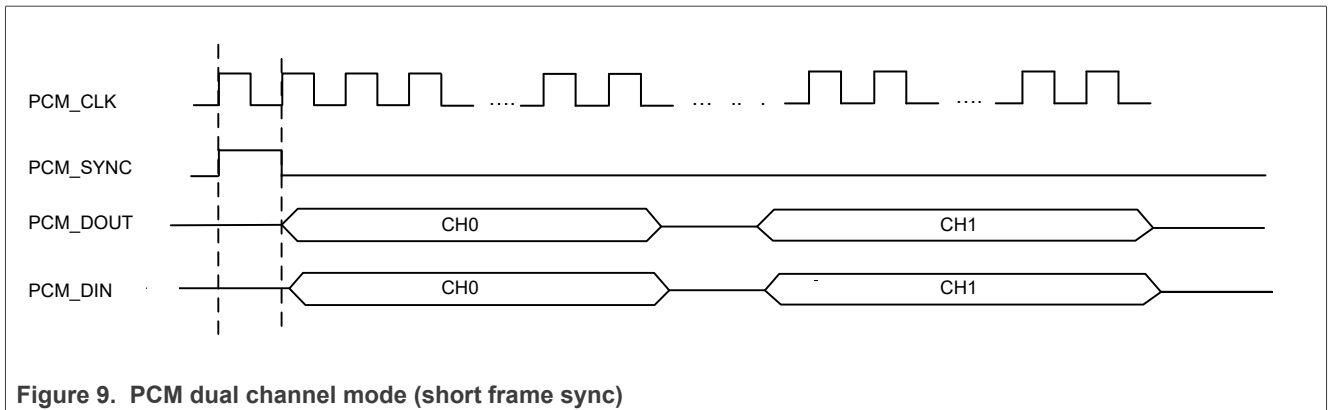

IW623P supports mono and dual channel modes.

Note: [Figure 8](#) and [Figure 9](#) illustrate PCM mono and dual channel modes in short frame sync.

In mono-channel mode, by default the left channel is used for data.

In dual-channel mode, the two channels are supported on two time slots.

4.4.2.3 PCM modes of operation

The PCM interface supports two modes of operation:

- PCM central¹⁰
- PCM peripheral¹⁰

When in PCM central mode, the interface generates a 2 MHz or a 2.048 MHz PCM_CLK and 8 kHz PCM_SYNC signal. An alternative PCM central mode is available that uses an externally generated PCM_CLK, but still generates the 8 kHz PCM_SYNC. The external PCM_CLK must have a frequency that is an integer multiple of 8 kHz. Supported frequencies are in the 512 kHz to 4 MHz range.¹⁰

When in PCM peripheral mode, the interface has both PCM_CLK and PCM_SYNC as inputs, thereby letting another unit on the PCM bus generate the signals.¹⁰

The PCM interface consists of up to four PCM slots (time divided) preceded by a PCM sync signal. Each PCM slot can be either 8 bit or 16 bit wide. The slots can be separated in time, but are not required to follow immediately after one other. The timing is relative to PCM_CLK. Figure 10 shows an example of a PCM burst with two slots.

The burst starts with a PCM_SYNC and then follows the PCM burst. In this example, the PCM burst consists of two PCM slots (the first slot is 8 bit wide, the second slot is 16 bit wide) separated with two PCM_CLK clock cycles. The PCM slots can be configured to start at an arbitrary point in time, and the start value is given relative to the start of the PCM_SYNC. The timing of the four PCM slots must be such that slot 0 is always located before slot 1, slot 1 before slot 2, etc. It is possible to only use for example slot 1 and not slot 0.

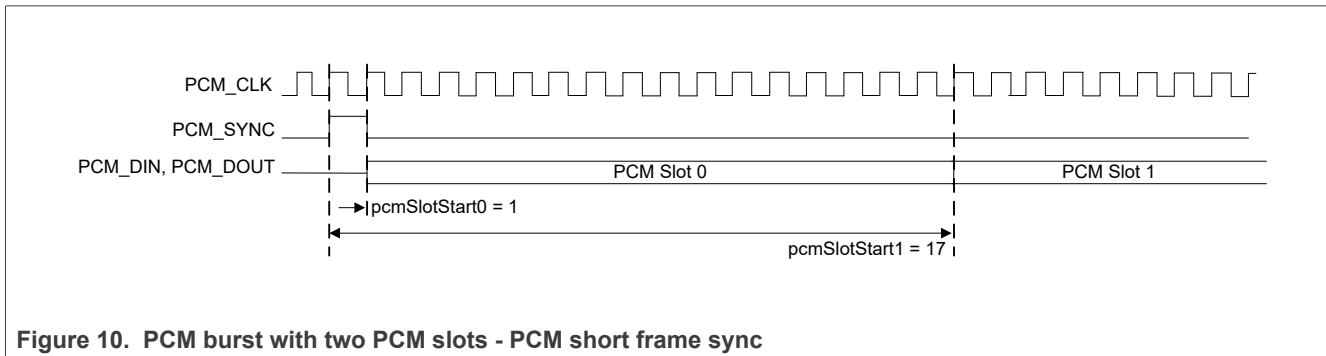

Figure 10. PCM burst with two PCM slots - PCM short frame sync

10 The master/slave replacement in this document follows the recommendation of Bluetooth SIG.

5 Coexistence

5.1 Antenna configurations

The IW623P supports two-antenna and three-antenna configurations.

5.1.1 Two-antenna configuration

The two separate antennas allow simultaneous independent operation of the Wi-Fi and Bluetooth radios, depending upon the antenna isolation.

5.1.2 Three-antenna configuration

The three separate antennas allow simultaneous independent operation of the Wi-Fi and Bluetooth radios, depending upon the antenna isolation.

5.2 Central hardware packet traffic arbiter

The central hardware packet traffic arbiter arbitrates the transmit and/or receive operations between the on-chip Wi-Fi and Bluetooth radios as per the supported hardware configuration. See [Section 5.1](#).

The central hardware packet traffic arbiter has the following features:

- Supports simultaneous Wi-Fi and Bluetooth transmissions to optimize output transmit power levels and performance
- Supports simultaneous receive for all on-chip radios

In addition to the on-chip radios, the central hardware packet traffic arbiter arbitrates up to three external radios. Refer to [Section 5.3](#).

5.3 Coexistence with external radios

The available interfaces for external coexistence are PTA, WCI-2, coex-UART, and debug-UART.

Note: The external coexistence interfaces share the same multi-function pins (MFP). Refer to [Section 6.5.2](#) for more details.

WCI-2 external coexistence interface

WCI-2 is the two-wire wireless coexistence interface 2 protocol defined in the Bluetooth Core Specification (Vol 7 Part C).

[Figure 11](#) illustrates the hardware coexistence interface between the central hardware packet traffic arbiter and the external radio. In the figure, Wireless SoC is IW623P.

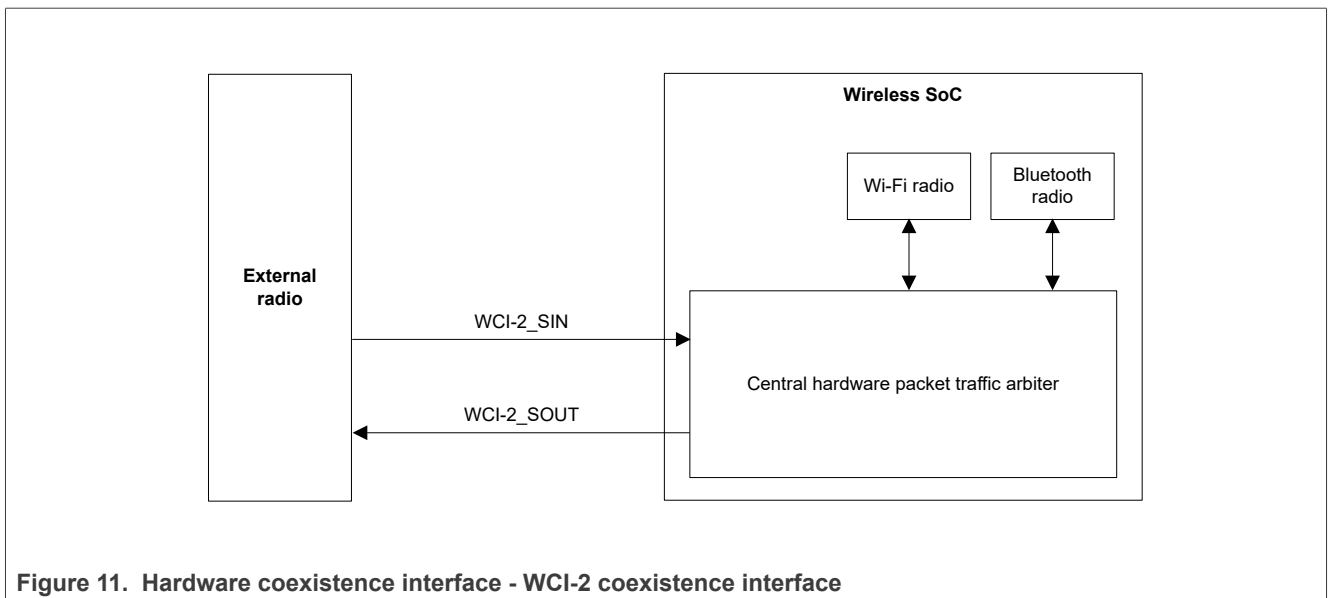

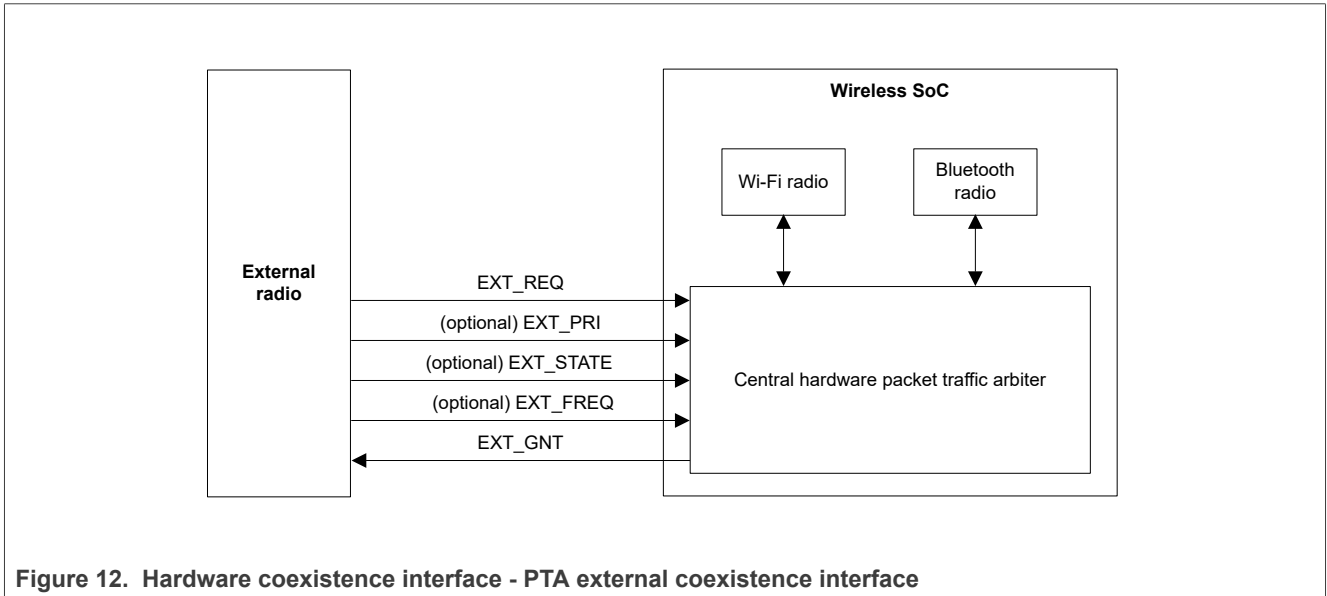

Figure 11. Hardware coexistence interface - WCI-2 coexistence interface

Note: Refer to [Section 6.5.10](#) for the description of WCI-2 coexistence interface signals.

PTA external coexistence interface

Figure 12 illustrates the hardware coexistence interface between the central hardware packet traffic arbiter and the external radio. In the figure, Wireless SoC is IW623P.

Note: Refer to [Section 6.5.9](#) for the description of PTA external coexistence interface signals.

Coex-UART external coexistence interface

Figure 13 illustrates the hardware coexistence interface between the central hardware packet traffic arbiter and the external radio. In the figure, Wireless SoC is IW623P.

Figure 13. Hardware coexistence interface - Coex-UART external coexistence interface

Note: Refer to [Section 6.5.11](#) for the description of PTA external coexistence interface signals.

The UART messages from the external radio are handled within the CPU and coordinated with the central hardware packet traffic arbiter for the arbitration with the on-chip radios.

Debug-UART external coexistence interface

Figure 14 illustrates the hardware coexistence interface between the central hardware packet traffic arbiter and the external radio. In the figure, Wireless SoC is IW623P.

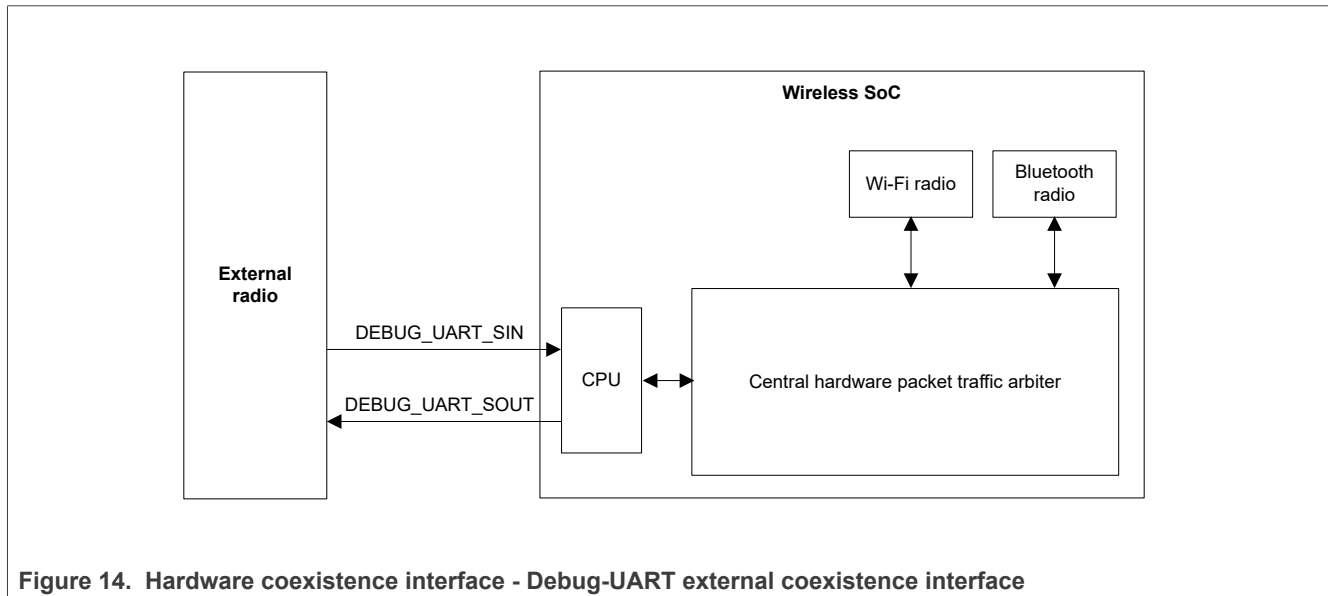

Figure 14. Hardware coexistence interface - Debug-UART external coexistence interface

Note: Refer to [Section 6.5.12](#) for the description of PTA external coexistence interface signals.

The UART messages from the external radio are handled within the CPU and coordinated with the central hardware packet traffic arbiter for the arbitration with the on-chip radios.

6.5 Pin description

6.5.1 Pin states

The pin states information provided in the tables includes:

- **No Pad Power State** indicates the state when there is no power
- **PwrDwn State** denotes the power-down state in the default configuration. Many pads have programmable power-down values which can be set by firmware.
- **Reset State** is the state after the power-on-reset state and before the hardware state (HW State)
- **HW State** (hardware state) is the state after the boot code finishes and before the firmware download begins (firmware may change the pin state). HW State may differ based on the pin muxing/configuration setting. For example, for UART_RTSn and UART_SOUT, the boot code enables the UART interface when the device is in PCIe-UART mode, making the HW states output high and output low, respectively.
- **PwrDwn Prog** indicates if the power-down state can be programmed
- **Internal PU/PD** columns indicates the following:
 - Type of PU/PD (weak vs nominal)
 - The polarity (PU vs. PD)The internal pull-up or pull-down applies when the pin is in input mode
- **PU** denotes whether the pull-up can be programmed or not
- **PD** denotes whether the pull-down can be programmed or not
- Pull-up and pull-down are only effective when the pad is in input mode
- At the end of the firmware download, the pads (for example GPIO and RF control) are programmed in the functional mode corresponding to the functionality of the pins

Reference clock input signal.
The reference clock signal frequency must be 40 MHz from an external crystal or external crystal oscillator.
To achieve lower power consumption in sleep mode, it is recommended to use an external crystal instead of an external crystal oscillator.
See [Section 11.8 "Reference clock specifications"](#).

XTAL_OUT	AVDD18	—	—	—	—	—	—	—	—
----------	--------	---	---	---	---	---	---	---	---

Reference clock output signal.
Connect this pin to an external crystal when an external crystal is used.
When an external crystal oscillator is used, connect this pin to ground with resistance less than 100 Ω.

[1] Maximum input voltage is 0.4V when VIO has no power (or in uncertain situations).

- PDn can accept an input of 1.8V to 4.5V
- PDn may be driven by the host
- PDn must be high for normal operation

No internal pull-up on this pin.
 This pin has an always-on internal weak pull-down.

6.6 Configuration pins

[Table 25](#) shows the pins used as configuration inputs to set parameters following a reset. The definition of these pins changes immediately after reset to their usual function.

To set a configuration bit to 0, attach a 51 kΩ resistor from the pin to ground. No external circuitry is required to set a configuration bit to 1.

External circuitry that shares functionality with the configuration pins after a device reset must not pull the configuration pins to undesired values/states as this will change the post-reset behavior of the device.

7 Power information

7.1 Internal buck regulator

VCORE must be supplied by the internal buck regulator. The following figure shows the application circuit for VCORE supply using the internal Buck regulator. The power inductor in the application is chosen to maximize the internal Buck efficiency.

Note: In [Figure 17](#), Wireless SoC is IW623P.

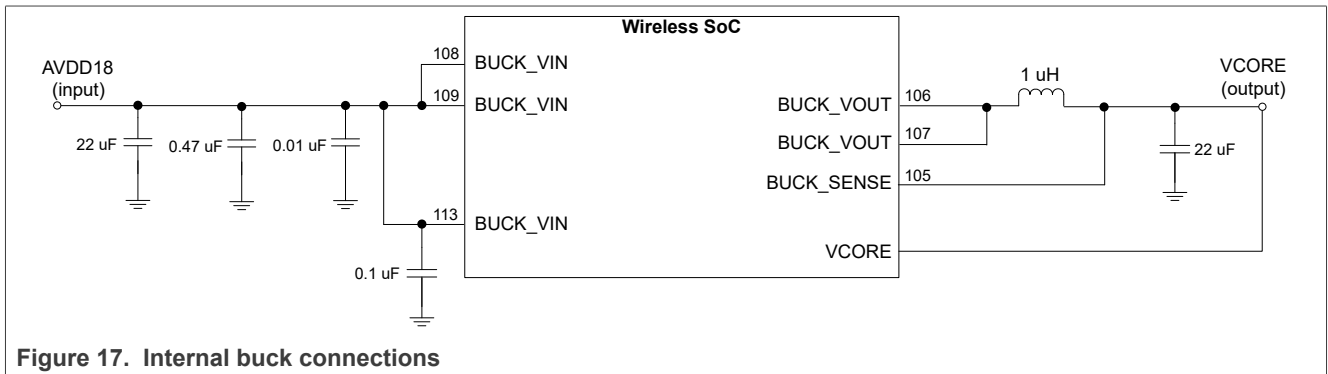

Figure 17. Internal buck connections

Deep-sleep mode

When the internal Buck is used to supply VCORE, the VCORE level can be reduced to approximately 0.8 V to reduce power consumption in deep sleep mode.

7.2 Power-up sequence

The IW623P does not have power-up sequence requirements. The power-down pin (PDn) must be held low (asserted) until all power supply rails are stable. The following figures and tables are recommendations.

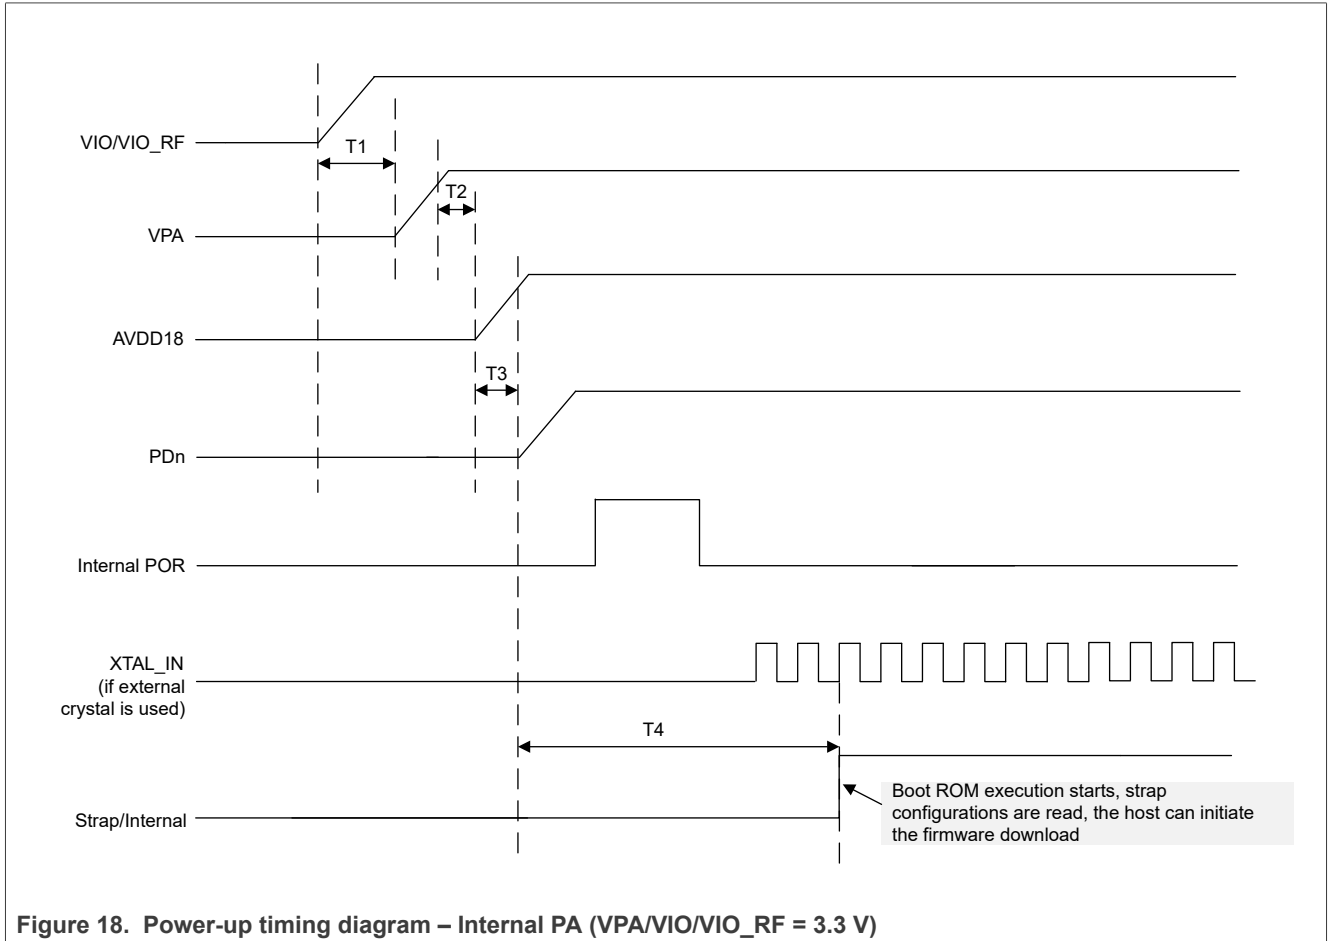

Table 27. Power-up timing parameters – Internal PA (VPA/VIO/VIO_RF = 3.3 V)^[1]

Symbol	Description	Min	Typ	Max	Unit
T1	Delay from start of VIO/VIO_RF ramp-up to start of VPA ramp-up	0	—	—	ms
T2	Delay from VPA high (at least 90%) to start of AVDD18 ramp-up	0	100	—	ms
T3	Delay from start of AVDD18 ramp-up to start of PDn ramp-up	0	—	—	ms
T4	Delay from AVDD18 high (90%) to start of Boot ROM	—	10	—	ms

[1] The ramp-up time of VIO/VIO_RF, VPA and AVDD18 must be less than 100 ms. All supplies must be monotonic. If using an external crystal oscillator, the reference clock must be stable before PDn ramps up.

Table 28. Power-up timing parameters – Internal PA (VIO/VIO_RF = 1.8 V, VPA = 3.3 V)^[1]

Symbol	Description	Min	Typ	Max	Unit
T2	Delay from VPA high (at least 90%) to start of AVDD18 ramp-up	0	100	—	ms
T3	Delay from start of AVDD18 ramp-up to start of PDn ramp-up	0	—	—	ms
T4	Delay from AVDD18 high (90%) to start of Boot ROM	—	10	—	ms

[1] The ramp-up time of VIO/VIO_RF, VPA and AVDD18 must be less than 100 ms.
 All supplies must be monotonic.
 If using an external crystal oscillator, the reference clock must be stable before PDn ramps up.

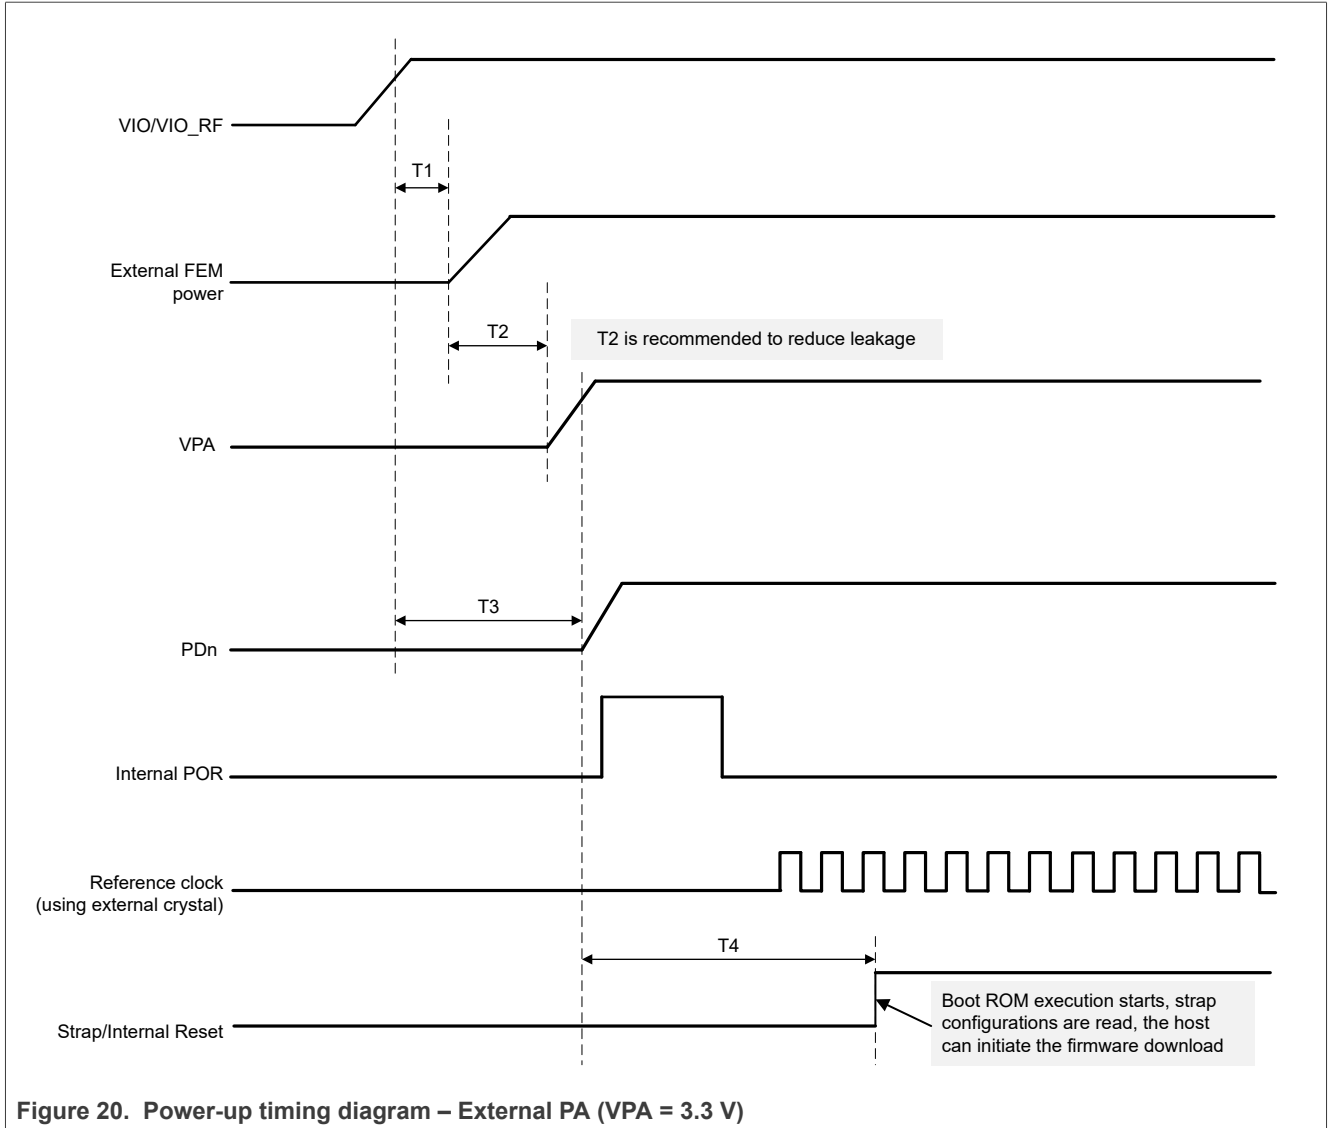

Table 29. Power-up timing parameters - External PA ^[1]

Symbol	Description	Min	Typ	Max	Unit
T1	Delay from VIO/VIO_RF high (at least 90%) to start of External FEM power ramp-up	0	—	—	ms
T2	Delay from External FEM power ramp-up to start of VPA ramp-up	0	—	—	ms
T3	Delay from VIO/VIO_RF high (at least 90%) to start of PDn ramp-up	0	—	—	ms
T4	Delay from start of PDn ramp-up to start of Boot ROM	—	10	—	ms

[1] The ramp-up time of VIO/VIO_RF, VPA and AVDD18 must be less than 100 ms.
 All supplies must be monotonic.
 If using an external crystal oscillator, the reference clock must be stable before PDn ramps up.

7.3 Power-down sequence

PDn must be discharged to less than 0.2 V before Power-On Reset (POR) is triggered again.

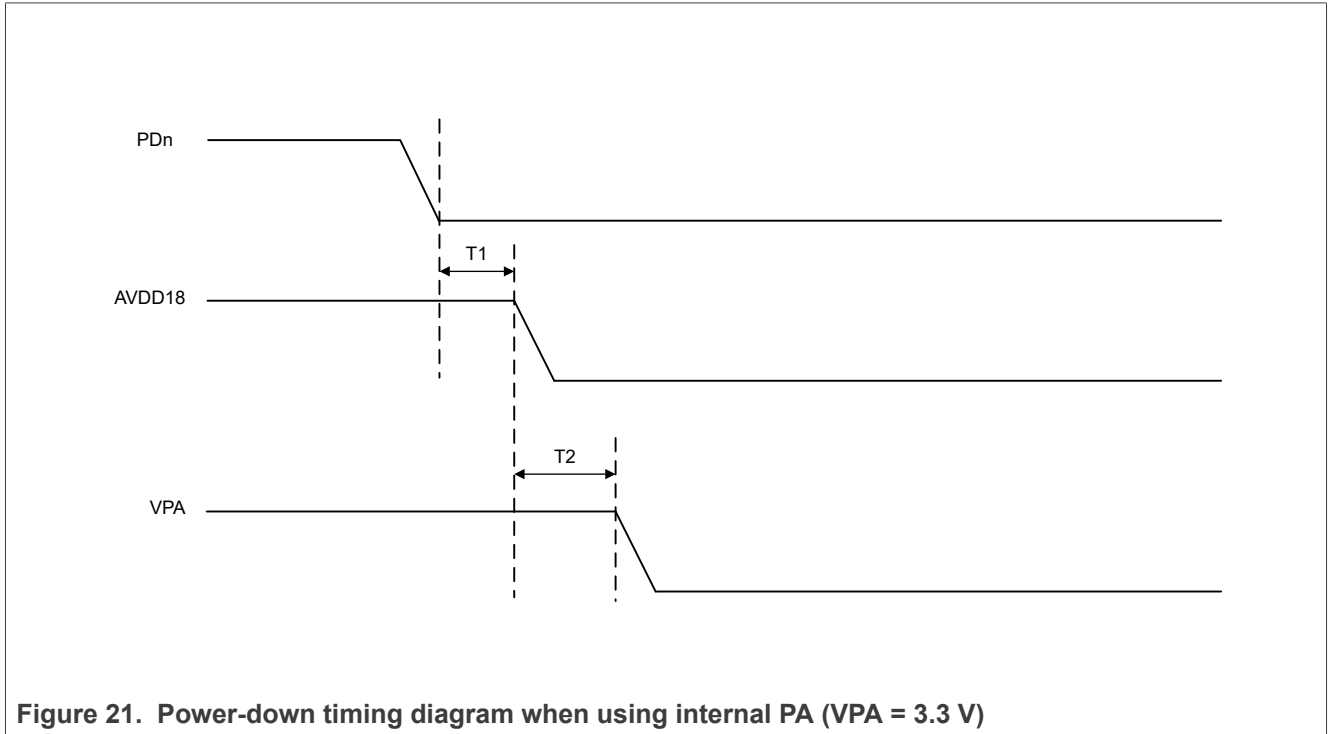

Figure 21. Power-down timing diagram when using internal PA (VPA = 3.3 V)

Table 30. Power-down timing parameters - when using internal PA

Symbol	Description	Min	Typ	Max	Units
T1	Recommended delay from PDn low (less than 0.2V) to start of AVDD18 ramp-down	0	—	—	ms
T2	Recommended delay from start of AVDD18 ramp-down to start of VPA ramp-down	0	—	—	ms

- One of the following conditions must be met before Power-On Reset (POR) is triggered again:
 - PDn is discharged to less than 0.2V
 - VCORE and PDn are discharged to less than 0.2V
 - AVDD18 and PDn are discharged to less than 0.2V
 - VCORE, AVDD18, and PDn are discharged to less than 0.2V

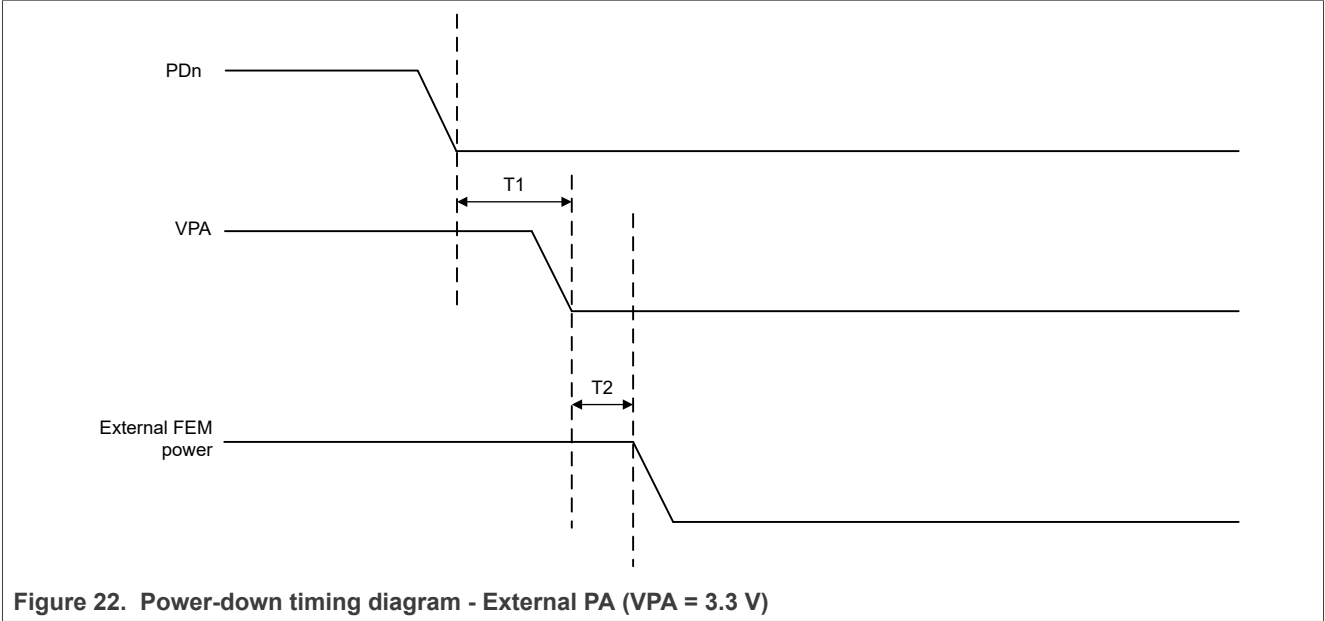

Table 31. Power-down timing parameters - External PA

Symbol	Description	Min	Typ	Max	Units
T1	Recommended delay from PDn low (less than 0.2V) to VPA low (less than 0.2V)	0	—	—	ms
T2	Delay from VPA low to start of external FEM power ramp-down	0	—	—	ms

7.4 Reset

The IW623P is reset to its default operating state under any of the following conditions:

- Internal Power-On Reset (POR): POR is triggered when the device receives power and V_{CORE} and AVDD18 supplies are good. See [Section 7.2](#).
- Software/Firmware reset: software/firmware issues a reset.
- External PDn pin assertion: the device is reset when the PDn input pin is <0.2V and transitions from low to high.

See [Section 11.9 "Power-down specifications"](#) for the electrical specifications.

Lowest power state

The device can be put into the lowest power mode of operation to conserve energy when Wi-Fi and Bluetooth are not in use.

To put the device in the lowest power mode, assert PDn low to enter power-down mode. Once PDn is de-asserted, the power sequence must be followed. If the firmware is not downloaded, the device must be kept in power-down mode to reduce leakage.

8 Absolute maximum ratings

CAUTION: The absolute maximum ratings table defines the limitation for electrical and thermal stresses. These limits prevent permanent damage to the device. Exposure to conditions at or beyond these ratings is not guaranteed and can damage the device.

[1] For applications that support dual-WBS (Wide Band Speech) capabilities over Bluetooth, a minimum PCM clock rate of 1.024 MHz is required due to bandwidth considerations. A single-WBS link or dual-NBS link configuration can be supported using a 0.512 MHz PCM clock rate.

11.6 External radio coexistence interface specifications

11.6.1 WCI-2 coexistence interface specifications

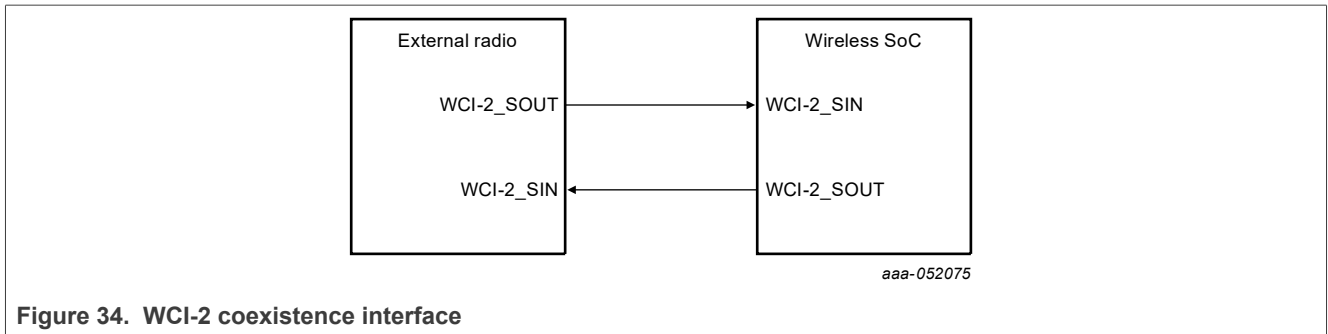

11.6.1.1 WCI-2 interface

WCI-2 is a simplified 2-wire UART interface defined in Bluetooth Core Spec Vol 7 Part C.

[Figure 33](#) shows UART waveform.

[Figure 34](#) illustrates WCI-2 hardware coexistence interface between IW623P (Wireless SoC) and the external radio.

11.6.1.2 WCI-2 messages

WCI-2 coexistence interface supports the messages defined in Bluetooth Core Specification Vol 7 Part C for request and grant, where:

- The real time message from the external radio to IW623P indicates the request to operate (Figure 35)
 - MWS_Rx=1 indicates an external radio request to Rx
 - MWS_Tx=1 indicates an external radio request to Tx

- The real time message from IW623P to the external radio indicates the arbitration results (Figure 37):
 - BT_Rx_Pri = 1: the Bluetooth radio Rx wins the arbitration and is in operation
 - BT_Tx_On = 1: the Bluetooth radio Tx wins the arbitration and is in operation
 - 802_Rx_Pri = 1: Wi-Fi Rx wins the arbitration and is in operation
 - 802_Tx_On = 1: Wi-Fi Tx wins the arbitration and is in operation
 - Otherwise, the external radio is granted

12 Package information

12.1 Package thermal conditions

12.1.1 HVQFN thermal conditions

Table 67. Package thermal conditions—HVQFN148

Symbol	Rating	Board type ^[1]	Value	Unit
Rthj-a/θja	Junction to ambient thermal resistance ^[2]	JESD51-9, 2s2p board	25	°C/W
Ψj-top/Ψj-top	Junction to top of package thermal characterization parameter ^[2]	JESD51-9, 2s2p board	0.9	°C/W

[1] The thermal test board meets JEDEC specification for this package (JESD51-9).

[2] Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment.

Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <https://www.nxp.com>.

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

2x2 Dual-band (5-7 GHz) Wi-Fi 6/6E, 2x2 (2.4 GHz) Wi-Fi 6, and Bluetooth Combo Solution

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

HTML publications — An HTML version, if available, of this document is provided as a courtesy. Definitive information is contained in the applicable document in PDF format. If there is a discrepancy between the HTML document and the PDF document, the PDF document has priority.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
