The Kinetis KV5x family of microcontrollers (MCUs) is a high-performance solution offering precision, sensing and control for some of the most demanding real-time control in motor and power conversion.

**TARGET APPLICATIONS**
- Connected industrial drives
- Industrial motor control
  - BLDC motors
  - PMSM motors
  - AC induction motors
- Industrial automation
- Multi-motor control
- Switch mode power supply (SMPS)
- Photovoltaic systems
- Uninterruptible power supply (UPS)

The Kinetis KV5x family of MCUs is built on the ARM® Cortex®-M7 core running at 240 MHz with a single precision floating point unit. It features advanced high-speed and high-accuracy peripherals such as high-resolution pulse-width modulation (PWM) with as low as 260 picosecond resolution, four 12-bit analog-to-digital converters (ADCs) sampling at 5 mega samples per second (MSPS), a total of 44 PWM channels for support of multi-motor systems with PFC, three FlexCAN modules and optional Ethernet communications. NXP and third-party resources support the Kinetis KV5x MCU with a comprehensive enablement suite that includes reference designs, software libraries and motor configuration tools.

**FEATURES AND BENEFITS**
- High-performance 240 MHz ARM Cortex-M7 core combined with a high level of analog and digital integration targeted at real-time control applications
- Up to 1 MB flash and 256 KB RAM, 16 KB instruction cache and 8 KB data cache
- 256 KB of RAM includes 64 KB of ITCM RAM ensuring maximum CPU performance of fast control loops with minimal latency
- 64-bit AXI memory interface with I-Cache and D-Cache
  - efficient access to external resources
  - interface to large external memories for a complete RTOS experience
  - support for richer HMI with higher resolution graphics, multiple connectivity stacks and middleware
Four 8-ch., 12-bit ADCs sampling at 5 MSPS with dual sample and hold circuitry, can capture current and voltage simultaneously for two motors giving true independent dual motor control

Ethernet option with true random number generator and cryptographic unit providing a low-cost integrated connectivity solution

Two eFlexPWM blocks provides four independent time bases per module with a highly flexible configuration that easily supports motor and power control topologies

Multiple instantiations of timer blocks provide a vast array of timers (44 channels) simplifying the complex task of advanced motor control

A single eFlexPWM block featuring 12 channels with nano-edge capability, providing up to 285 psec resolution on pulse width and frequency modulation

Up to three FlexCAN modules for high-speed, high-reliability industrial communication

Inter-peripheral cross bar, with AND-OR-Invert logic, provides a highly flexible connection fabric between peripherals that supports simplified control topology implementation

**DEVELOPMENT TOOLS**

**TWR-KV58F220M development board**

The TWR-KV58F220M board is a cost-effective, modular development module that features the Kinetis KV5x MCU in a 144 LQFP package with an integrated OpenSDA debug adapter (requires no external debug interface). It is compatible with the TWR-MC-LV3PH 3-phase motor peripheral module and the FreeMASTER run-time debugging tool.

**TWR-MC-LV3PH development board**

The TWR-MC-LV3PH low-voltage, 3-phase motor control Tower® System peripheral module provides a complete motor control reference design kit for developing BLDC and PMSM motor solutions. Compatible with the Kinetis KV5x MCU (and several other of our controllers), it includes a 3-phase BLDC motor and motor drive circuitry.

**Motor control development toolbox**

NXP’s motor control development toolbox is a comprehensive collection of tools that plug into the MATLAB®/Simulink™ model-based design environment to support rapid application development targeting our MCUs.

**Integrated development environment (IDE)**

Kinetis KV5x MCUs will be supported by the Kinetis Design Studio IDE, IAR Embedded Workbench® for ARM and ARM Keil® Microcontroller Development Kit. All IDEs support the Processor Expert® auto code generator—a GUI-based, device-aware software configuration tool that automatically generates peripheral start-up code and device drivers to dramatically reduce application development time.

**FreeMASTER**

FreeMASTER is a free, simple, yet highly customizable real-time debug monitor and data visualization tool designed for software development that requires real-time data access.

**Embedded software libraries**

NXP provides several advanced software libraries for motor control, math, filter and other general functions an advanced and modular software library for the Cortex-M7 core; and a core self-test library for IEC 60730 certification.

**Motor control reference designs**

NXP provides multiple reference designs for motor control and power conversion applications that leverage NXP’s extensive knowledge earned over decades of developing solutions for these applications. All reference designs are fully tested and validated, enabling use in a production environment.
