1 56F8036 Description

The 56F8036 is a member of the 56800E core-based family of Digital Signal Controllers (DSCs). It combines, on a single chip, the processing power of a DSP and the functionality of a microcontroller with a flexible set of peripherals to create an extremely cost-effective solution. Because of its low cost, configuration flexibility, and compact program code, the 56F8036 is well-suited for many applications. The 56F8036 includes many peripherals that are especially useful for industrial control, motion control, home appliances, general purpose inverters, smart sensors, fire and security systems, switched-mode power supply, power management, and medical monitoring applications.

The 56800E core is based on a dual Harvard-style architecture consisting of three execution units operating in parallel, allowing as many as six operations per instruction cycle. The MCU-style programming model and optimized instruction set allow straightforward generation of efficient, compact DSP and control code. The instruction set is also highly efficient for C compilers to enable rapid development of optimized control applications.
56F8036 Description

The 56F8036 supports program execution from internal memories. Two data operands can be accessed from the on-chip data RAM per instruction cycle. The 56F8036 also offers up to 39 General Purpose Input/Output (GPIO) lines, depending on peripheral configuration.

The 56F8036 Digital Signal Controller includes 64KB of Program Flash and 8KB of Unified Data/Program RAM. Program Flash memory can be independently bulk erased or erased in pages. Program Flash page erase size is 512 Bytes (256 Words).

A full set of programmable peripherals—PWM, ADCs, QSCI, QSPI, I2C, PITs, Quad Timers, DACs, and analog comparators—supports various applications. Each peripheral can be independently shut down to save power. Any pin in these peripherals can also be used as General Purpose Input/Outputs (GPIOs).

Figure 1. 56F8036 Block Diagram
2 Digital Signal Controller Core

- Efficient 16-bit 56800E family Digital Signal Controller (DSC) engine with dual Harvard architecture
- As many as 32 Million Instructions Per Second (MIPS) at 32MHz core frequency
- Single-cycle 16 × 16-bit parallel Multiplier-Accumulator (MAC)
- Four 36-bit accumulators, including extension bits
- 32-bit arithmetic and logic multi-bit shifter
- Parallel instruction set with unique DSP addressing modes
- Hardware DO and REP loops
- Three internal address buses
- Four internal data buses
- Instruction set supports both DSP and controller functions
- Controller-style addressing modes and instructions for compact code
- Efficient C compiler and local variable support
- Software subroutine and interrupt stack with depth limited only by memory
- JTAG/Enhanced On-Chip Emulation (OnCE) for unobtrusive, processor speed-independent, real-time debugging

3 Memory

- Dual Harvard architecture permits as many as three simultaneous accesses to program and data memory
- Flash security and protection that prevent unauthorized users from gaining access to the internal Flash
- On-chip memory
  - 64KB of program flash
  - 8KB of Unified Data/Program RAM
- EEPROM emulation capability using Flash

4 Peripheral Circuits for 56F8036

- One multi-function six-output Pulse Width Modulator (PWM) module
  - Up to 96MHz PWM operating clock
  - 15 bits of resolution
  - Center-aligned and edge-aligned PWM signal mode
  - Four programmable fault inputs with programmable digital filter
  - Double-buffered PWM registers
Peripheral Circuits for 56F8036

— Each complementary PWM signal pair allows selection of a PWM supply source from:
  — PWM generator
  — External GPIO
  — Internal timers
  — Analog comparator outputs
  — ADC conversion result which compares with values of ADC high- and low-limit registers to set PWM output

• Two independent 12-bit Analog-to-Digital Converters (ADCs)
  — 2 x 5 channel inputs
  — Supports both simultaneous and sequential conversions
  — ADC conversions can be synchronized by both PWM and timer modules
  — Sampling rate up to 2.67MSPS
  — 16-word result buffer registers

• Two internal 12-bit Digital-to-Analog Converters (DACs)
  — 2 microsecond settling time when output swing from rail to rail
  — Automatic waveform generation generates square, triangle and sawtooth waveforms with programmable period, update rate, and range

• One 16-bit multi-purpose Quad Timer module (TMR)
  — Up to 96MHz operating clock
  — Eight independent 16-bit counter/timers with cascading capability
  — Each timer has capture and compare capability
  — Up to 12 operating modes

• One Queued Serial Communication Interface (QSCI) with LIN Slave functionality
  — Full-duplex or single-wire operation
  — Two receiver wake-up methods:
    — Idle line
    — Address mark
  — Four-bytes-deep FIFOs are available on both transmitter and receiver

• One Queued Serial Peripheral Interfaces (QSPI)
  — Full-duplex operation
  — Master and slave modes
  — Four-words-deep FIFOs available on both transmitter and receiver
  — Programmable Length Transactions (2 to 16 bits)

• One Inter-Integrated Circuit (I²C) port
  — Operates up to 400kbps
  — Supports both master and slave operation
  — Supports both 10-bit address mode and broadcasting mode
Peripheral Circuits for 56F8036

- One Freescale scalable controller area network (MSCAN) module
  - Fully compliant with CAN protocol - Version 2.0 A/B
  - Supports standard and extended data frames
  - Supports data rate up to 1Mbps
  - Five receive buffers and three transmit buffers
- Three 16-bit Programmable Interval Timers (PITs)
- Two analog Comparators (CMPS)
  - Selectable input source includes external pins, DACs
  - Programmable output polarity
  - Output can drive Timer input, PWM fault input, PWM source, external pin output and trigger ADCs
  - Output falling and rising edge detection able to generate interrupts
- Computer Operating Properly (COP)/Watchdog timer capable of selecting different clock sources
- Up to 39 General-Purpose I/O (GPIO) pins with 5V tolerance
- Integrated Power-On Reset (POR) and Low-Voltage Interrupt (LVI) module
- Phase Lock Loop (PLL) provides a high-speed clock to the core and peripherals
- Clock sources:
  - On-chip relaxation oscillator
  - External clock: crystal oscillator, ceramic resonator and external clock source
- JTAG/EOnCE debug programming interface for real-time debugging
