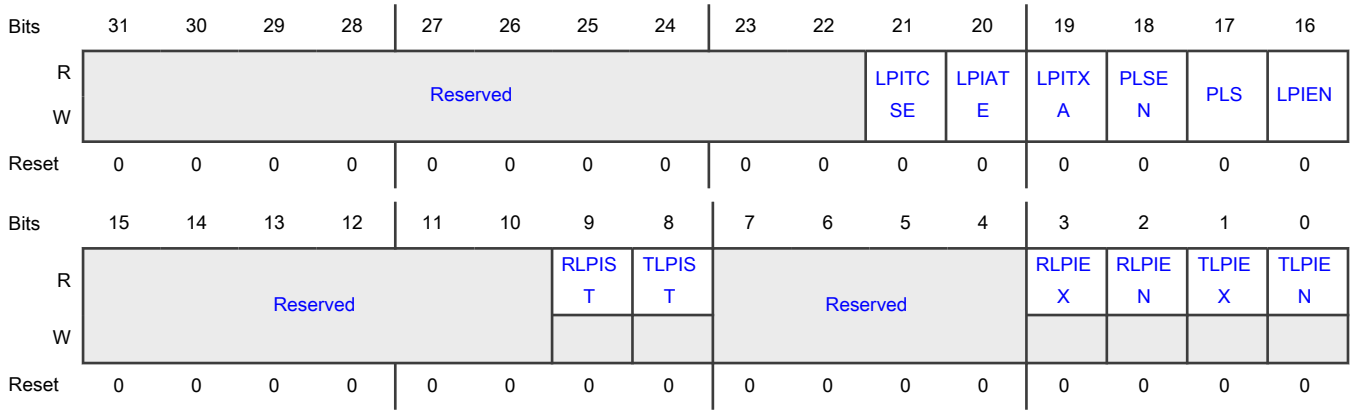
The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

Offset

Register	Offset
MAC_LPI_CONTROL_STATUS	D0h

Diagram



Fields

Field	Description
31-22 —	Reserved
21 LPITCSE	LPI Tx Clock Stop Enable When this bit is set, the MAC asserts sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. LPI Tx Clock Stop Enable When this bit is set, the MAC asserts sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is reset, the MAC does not assert sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed. 0 - LPI Tx Clock Stop is disabled 1 - LPI Tx Clock Stop is enabled
20 LPIATE	LPI Timer Enable This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. LPI Timer Enable This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_ENTRY_TIMER register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions. 0 - LPI Timer is disabled 1 - LPI Timer is enabled
19 LPITXA	LPI Tx Automate This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. LPI Tx Automate This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MAC_TXQ0_OPERATION_MODE register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode. 0 - LPI Tx Automate is disabled 1 - LPI Tx Automate is enabled
18	PHY Link Status Enable This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER.

Table continues on the next page...

Table continued from the previous page...

Field	Description
PLSEN	PHY Link Status Enable This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_CONTROL_STATUS register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_CONTROL_STATUS register and takes only the PLS bit. 0 - PHY Link Status is disabled 1 - PHY Link Status is enabled
17 PLS	PHY Link Status This bit indicates the link status of the PHY. PHY Link Status This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down. 0 - link is down 1 - link is okay (UP)
16 LPIEN	LPI Enable When this bit is set, it instructs the MAC Transmitter to enter the LPI state. LPI Enable When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission. 0 - LPI state is disabled 1 - LPI state is enabled
15-10 —	Reserved
9 RLPIST	Receive LPI State When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII interface. 0 - Receive LPI state not detected 1 - Receive LPI state detected
8 TLPIST	Transmit LPI State When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII interface. 0 - Transmit LPI state not detected 1 - Transmit LPI state detected
7-4	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
3 RLPIEX	Receive LPI Exit When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII interface, exited the LPI state, and resumed the normal reception. Receive LPI Exit When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0 - Receive LPI exit not detected 1 - Receive LPI exit detected
2 RLPIEN	Receive LPI Entry When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. Receive LPI Entry When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock. 0 - Receive LPI entry not detected 1 - Receive LPI entry detected
1 TLPIEX	Transmit LPI Exit When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. Transmit LPI Exit When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). 0 - Transmit LPI exit not detected 1 - Transmit LPI exit detected
0 TLPIEN	Transmit LPI Entry When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. Transmit LPI Entry When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). 0 - Transmit LPI entry not detected 1 - Transmit LPI entry detected

Table continues on the next page...

Field	Description

34.8.1.32 LPI Timers Control (MAC_LPI_TIMERS_CONTROL)

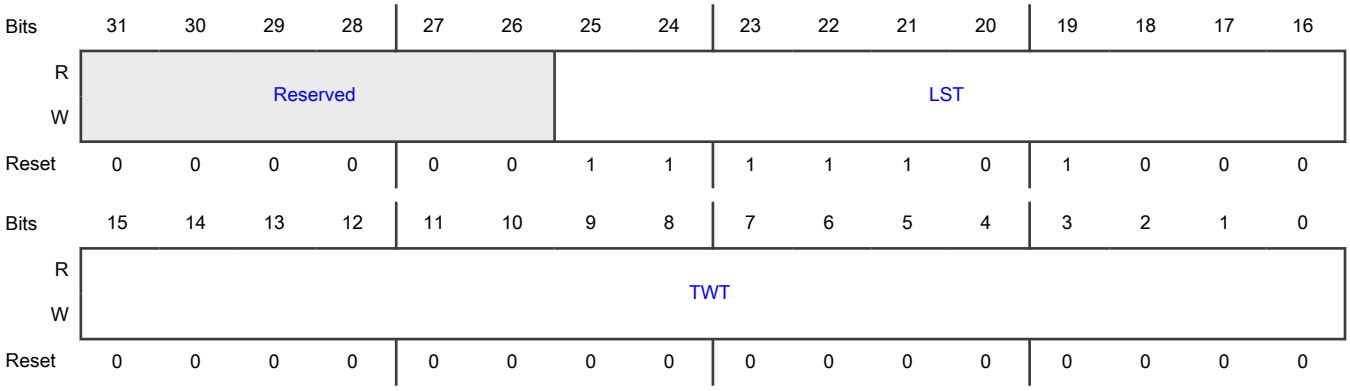
The LPI Timers Control register controls the timeout values in the LPI states.

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

Offset

Register	Offset
MAC_LPI_TIMERS_CONTROL	D4h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-16 LST	LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15-0 TWT	LPI TW Timer This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. LPI TW Timer

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

34.8.1.33 Tx LPI Entry Timer Control (MAC_LPI_ENTRY_TIMER)

This register controls the Tx LPI entry timer.

This register controls the Tx LPI entry timer. This counter is enabled only when bit[20](LPITE) bit of MAC_LPI_CONTROL_STATUS is set to 1.

Offset

Register	Offset
MAC_LPI_ENTRY_TIMER	D8h

Diagram

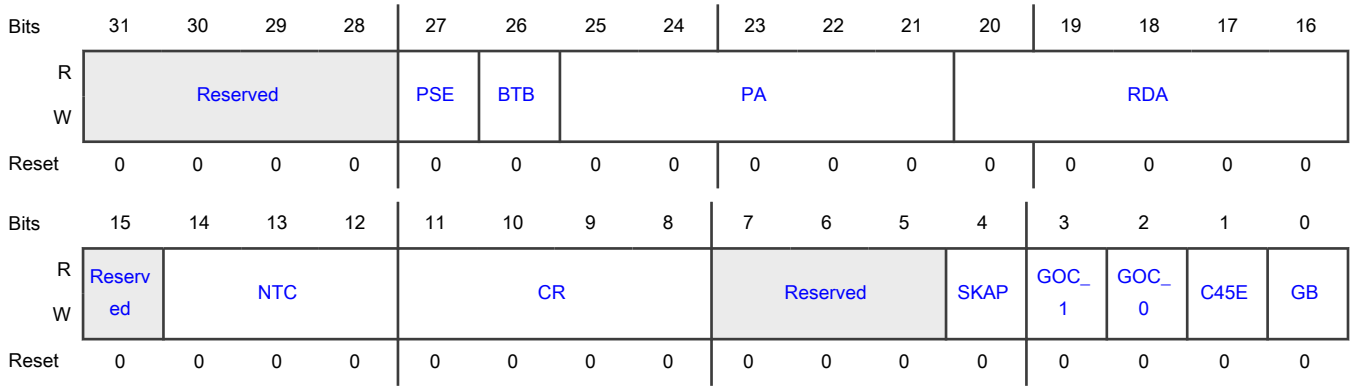
34.8.1.42 MDIO Address (MAC_MDIO_ADDRESS)

The MDIO Address register controls the management cycles to external PHY through a management interface.

Offset

Register	Offset
MAC_MDIO_ADDRESS	200h

Diagram



Fields

Field	Description
31-28 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
27 PSE	Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. 0 - Preamble Suppression disabled 1 - Preamble Suppression enabled
26 BTB	Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. 0 - Back to Back transactions disabled 1 - Back to Back transactions enabled
25-21 PA	Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20-16 RDA	Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
14-12 NTC	Number of Trailing Clocks This field controls the number of trailing clock cycles generated on gmii_mdc_o (MDC) after the end of transmission of MDIO frame. Number of Trailing Clocks This field controls the number of trailing clock cycles generated on gmii_mdc_o (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.
11-8 CR	CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1. CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz freqency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: - 1000: CSR clock/4 - 1001: CSR clock/6 - 1010: CSR clock/8 - 1011: CSR clock/10 - 1100: CSR clock/12

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 1101: CSR clock/14 - 1110: CSR clock/16 - 1111: CSR clock/18 These bits are not used for accessing RevMII. These bits are read-only if the RevMII interface is selected as single PHY interface.
7-5 —	Reserved
4 SKAP	Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. 0 - Skip Address Packet is disabled 1 - Skip Address Packet is enabled
3 GOC_1	GMII Operation Command 1 This bit is higher bit of the operation command to the PHY or RevMII, GOC_1 and GOC_O is encoded as follows: - 00: Reserved - 01: Write - 10: Post Read Increment Address for Clause 45 PHY - 11: Read When Clause 22 PHY or RevMII is enabled, only Write and Read commands are valid. 0 - GMII Operation Command 1 is disabled 1 - GMII Operation Command 1 is enabled
2 GOC_0	GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. When only RevMII is selected in configuration this bit is read-only and tied to 1. 0 - GMII Operation Command 0 is disabled 1 - GMII Operation Command 0 is enabled
1 C45E	Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. 0 - Clause 45 PHY is disabled 1 - Clause 45 PHY is enabled
0	GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave.

Table continues on the next page...

Table continued from the previous page...

Field	Description
GB	GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_ADDRESS and MAC_MDIO_DATA registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDI field (and also RA field when C45E is set) in MAC_MDIO_DATA register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_DATA register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_DATA register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - GMII Busy is disabled 1 - GMII Busy is enabled

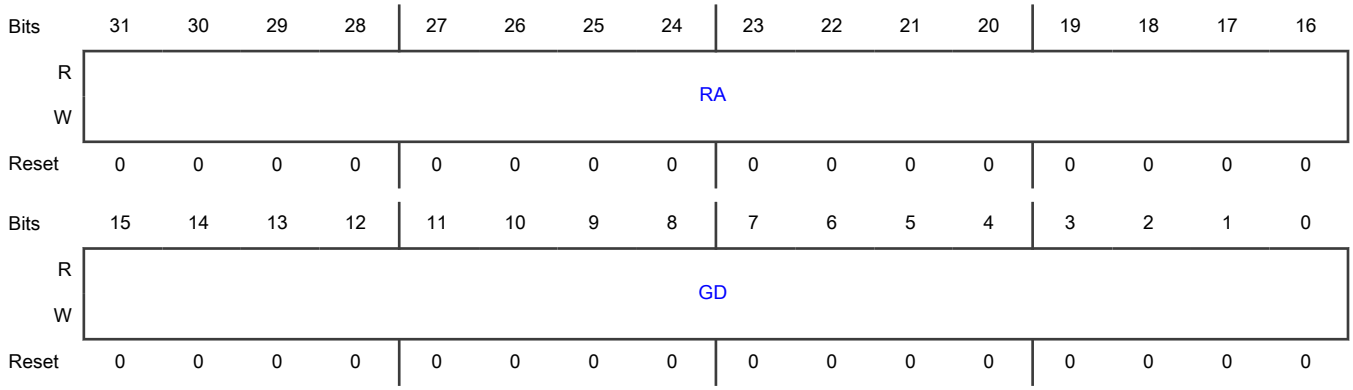
34.8.1.43 MAC MDIO Data (MAC_MDIO_DATA)

The MAC_MDIO_DATA register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_ADDRESS. This register also stores the Read data from the PHY register located at the address specified by MAC_MDIO_ADDRESS register.

Offset

Register	Offset
MAC_MDIO_DATA	204h

Diagram



Fields

Field	Description
31-16 RA	Register Address This field is valid only when C45E is set. Register Address This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15-0 GD	GMII Data This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

34.8.1.44 CSR Software Control (MAC_CSR_SW_CTRL)

This register contains SW programmable controls for changing the CSR access response and status bits clearing.

Fields

Field	Description
31-0 MPTU	MAC 1722 Presentation Time Update This field holds the init value or the update value for the presentation time. MAC 1722 Presentation Time Update This field holds the init value or the update value for the presentation time. When used for update, this field holds the 32-bit value in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_TIMESTAMP_CONTROL register). When ADDSUB field of MAC_SYSTEM_TIME_NANOSECONDS_UPDATE is set, this value is directly used for subtraction

34.8.1.48 MAC Address0 High (MAC_ADDRESS0_HIGH)

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the (G)MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the (G)MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Offset

Register	Offset
MAC_ADDRESS0_HIGH	300h

Fields

Field	Description
31-0 ADDRLO	MAC ADDRESS9 [31:0] This field contains the lower 32 bits of tenth 6-byte MAC address. MAC ADDRESS9 [31:0] This field contains the lower 32 bits of tenth 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

34.8.1.68 MAC Address10 High (MAC_ADDRESS10_HIGH)

The MAC ADDRESS10 High register holds the upper 16 bits of the eleventh 6-byte MAC address of the station.

The MAC ADDRESS10 High register holds the upper 16 bits of the eleventh 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC ADDRESS10 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

The MAC ADDRESS25 High register holds the upper 16 bits of the 26th 6-byte MAC address of the station.

The MAC ADDRESS25 High register holds the upper 16 bits of the 26th 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC ADDRESS25 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Fields

Field	Description
31-0	MAC ADDRESS32 [31:0] This field contains the lower 32 bits of the 33rd 6-byte MAC address.

Table continues on the next page...

Field	Description
ADDRLO	MAC ADDRESS32 [31:0] This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

34.8.1.114 MAC Address33 High (MAC_ADDRESS33_HIGH)

The MAC ADDRESS33 High register holds the upper 16 bits of the 34th 6-byte MAC address of the station.

The MAC ADDRESS33 High register holds the upper 16 bits of the 34th 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

The MAC ADDRESS46 High register holds the upper 16 bits of the 47th 6-byte MAC address of the station.

The MAC ADDRESS46 High register holds the upper 16 bits of the 47th 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Field	Description
31-0 ADDRLO	MAC ADDRESS59 [31:0] This field contains the lower 32 bits of the 60th 6-byte MAC address. MAC ADDRESS59 [31:0] This field contains the lower 32 bits of the 60th 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

34.8.1.168 MAC Address60 High (MAC_ADDRESS60_HIGH)

The MAC ADDRESS60 High register holds the upper 16 bits of the 61st 6-byte MAC address of the station.

The MAC ADDRESS60 High register holds the upper 16 bits of the 61st 6-byte MAC address of the station.

If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Fields

Field	Description
31-9 —	Reserved
8 UCDBC	Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. 0 - Update MMC Counters for Dropped Broadcast Packets is disabled 1 - Update MMC Counters for Dropped Broadcast Packets is enabled
7-6 —	Reserved
5 CNTPRSTLVL	Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. 0 - Full-Half Preset is disabled 1 - Full-Half Preset is enabled
4 CNTPRST	Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - Counters Preset is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Counters Preset is enabled
3 CNTFREEZ	MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode. 0 - MMC Counter Freeze is disabled 1 - MMC Counter Freeze is enabled
2 RSTONRD	Reset on Read When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). Reset on Read When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read. 0 - Reset on Read is disabled 1 - Reset on Read is enabled
1 CNTSTOPRO	Counter Stop Rollover When this bit is set, the counter does not roll over to zero after reaching the maximum value. 0 - Counter Stop Rollover is disabled 1 - Counter Stop Rollover is enabled
0 CNTRST	Counters Reset When this bit is set, all counters are reset. Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0 - Counters are not reset 1 - All counters are reset

34.8.1.177 MMC Rx Interrupt (MAC_MMC_RX_INTERRUPT)

This register maintains the interrupts generated from all Receive statistics counters.

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).

- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Note: R_SS_RC means that this register bit is set internally, and it is cleared when the Counter register is read.

Clears on read. Self-set to 1 on internal event. 0 - MMC Receive Good Bad Packet Counter Interrupt Status not detected 1 - MMC Receive Good Bad Packet Counter Interrupt Status detected

34.8.1.178 MMC Tx Interrupt (MAC_MMC_TX_INTERRUPT)

This register maintains the interrupts generated from all Transmit statistics counters.

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values

(0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Fields

Field	Description
31-0 TXEXSDEF	Tx Excessive Deferral Error This field indicates the number of packets aborted because of excessive deferral error (deferred for more than two max-sized packet times).

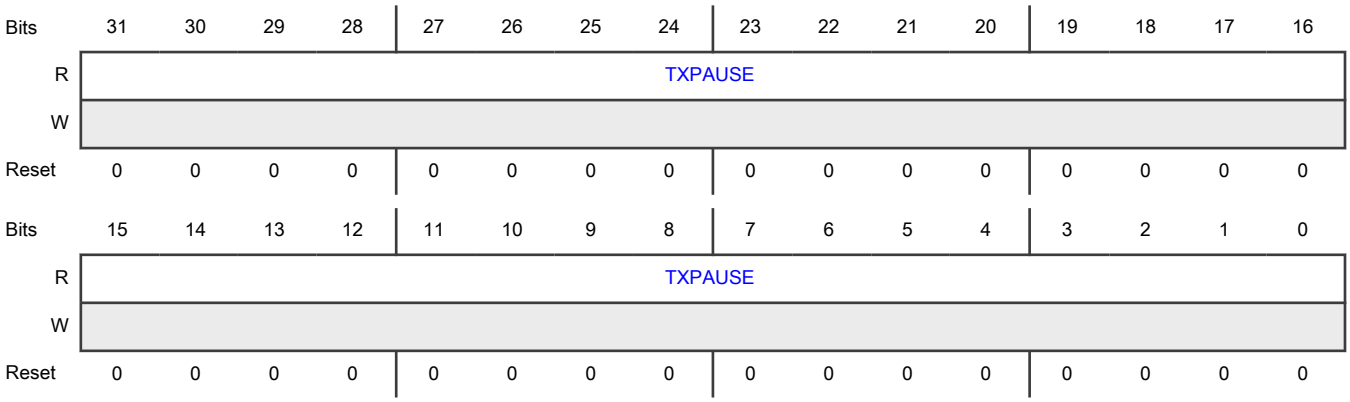
34.8.1.204 Pause Packets Transmitted (MAC_TX_PAUSE_PACKETS)

This register provides the number of good Pause packets transmitted by DWC_ether_qos.

Offset

Register	Offset
MAC_TX_PAUSE_PACKETS	770h

Diagram



Fields

Field	Description
31-0 TXPAUSE	Tx Pause Packets This field indicates the number of good Pause packets transmitted.

34.8.1.205 Good VLAN Packets Transmitted (MAC_TX_VLAN_PACKETS_GOOD)

This register provides the number of good VLAN packets transmitted by DWC_ether_qos.

Offset

Register	Offset
MAC_TX_VLAN_PACKETS_GOOD	774h

Fields

Field	Description
31-0 TXOSIZG	Tx OSize Packets Good This field indicates the number of packets transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the CONFIGURATION register).

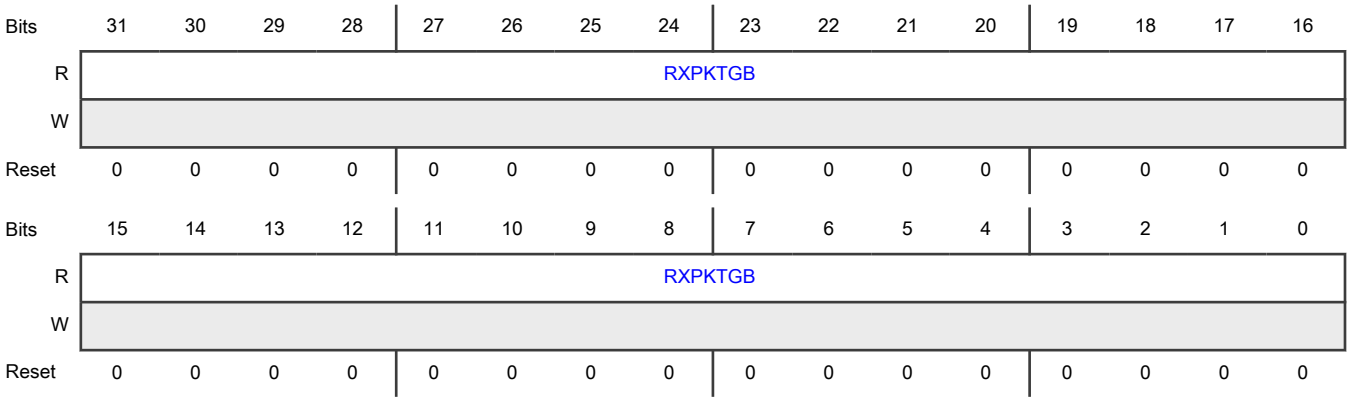
34.8.1.207 Good and Bad Packets Received (MAC_RX_PACKETS_COUNT_GOOD_BAD)

This register provides the number of good and bad packets received by DWC_ether_qos.

Offset

Register	Offset
MAC_RX_PACKETS_COUNT_GOOD_BAD	780h

Diagram



Fields

Field	Description
31-0 RXPKTGB	Rx Packets Count Good Bad This field indicates the number of good and bad packets received.

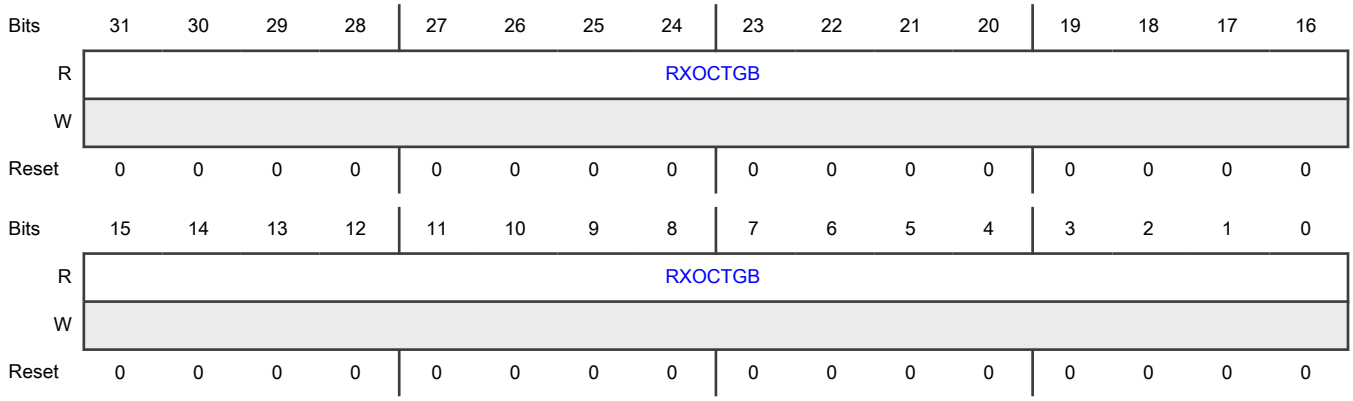
34.8.1.208 Bytes in Good and Bad Packets Received (MAC_RX_OCTET_COUNT_GOOD_BAD)

This register provides the number of bytes received by DWC_ther_qos, exclusive of preamble, in good and bad packets.

Offset

Register	Offset
MAC_RX_OCTET_COUNT_GOOD_BAD	784h

Diagram



Fields

Field	Description
31-0 RXOCTGB	Rx Octet Count Good Bad This field indicates the number of bytes received, exclusive of preamble, in good and bad packets.

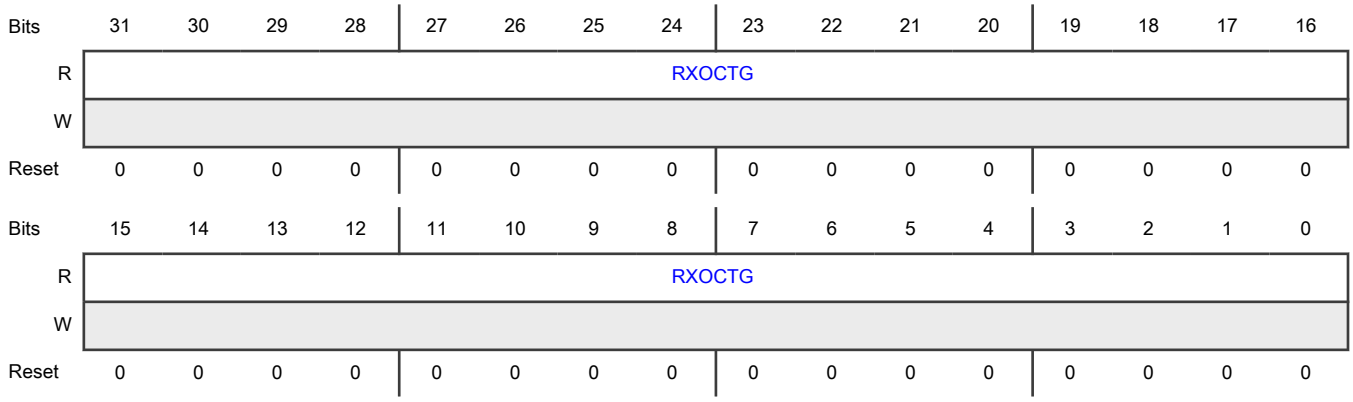
34.8.1.209 Bytes in Good Packets Received (MAC_RX_OCTET_COUNT_GOOD)

This register provides the number of bytes received by DWC_ether_qos, exclusive of preamble, only in good packets.

Offset

Register	Offset
MAC_RX_OCTET_COUNT_GOOD	788h

Diagram



Fields

Field	Description
31-0 RXOCTG	Rx Octet Count Good This field indicates the number of bytes received, exclusive of preamble, only in good packets.

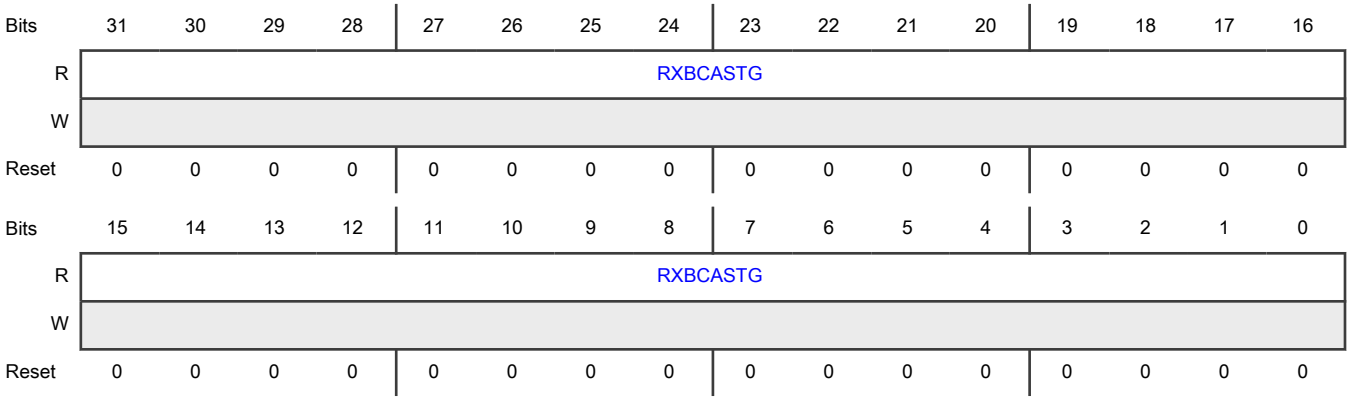
34.8.1.210 Good Broadcast Packets Received (MAC_RX_BROADCAST_PACKETS_GOOD)

This register provides the number of good broadcast packets received by DWC_ether_qos.

Offset

Register	Offset
MAC_RX_BROADCAST_PACKETS_GOOD	78Ch

Diagram



Fields

Field	Description
31-0 RXBCASTG	Rx Broadcast Packets Good This field indicates the number of good broadcast packets received.

34.8.1.211 Good Multicast Packets Received (MAC_RX_MULTICAST_PACKETS_GOOD)

This register provides the number of good multicast packets received by DWC_ether_qos.

Offset

Register	Offset
MAC_RX_MULTICAST_PACKETS_GOOD	790h

Fields

Field	Description
31-0 RXCRCERR	Rx CRC Error Packets This field indicates the number of packets received with CRC error.

34.8.1.213 Alignment Error Packets Received (MAC_RX_ALIGNMENT_ERROR_PACKETS)

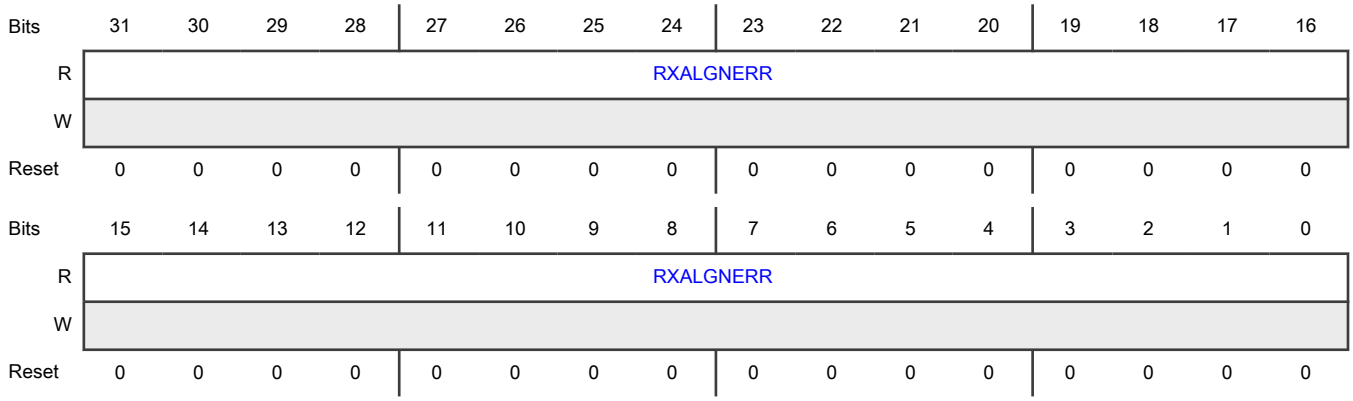
This register provides the number of packets received by DWC_ether_qos with alignment (dribble) error.

This register provides the number of packets received by DWC_ether_qos with alignment (dribble) error. It is valid only in 10/100 mode.

Offset

Register	Offset
MAC_RX_ALIGNMENT_ERROR_PACKETS	798h

Diagram



Fields

Field	Description
31-0 RXALGNERR	Rx Alignment Error Packets This field indicates the number of packets received with alignment (dribble) error. Rx Alignment Error Packets This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

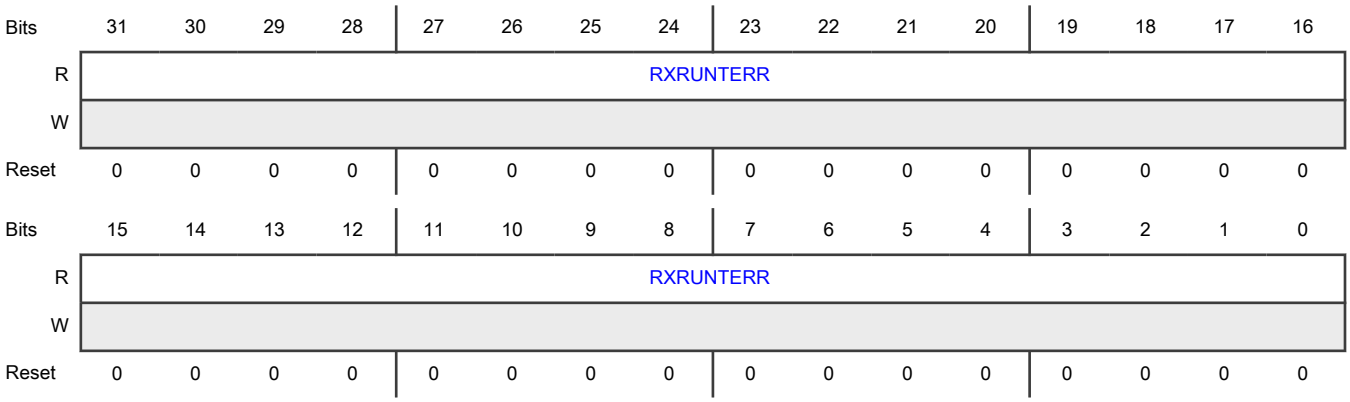
34.8.1.214 Runt Error Packets Received (MAC_RX_RUNT_ERROR_PACKETS)

This register provides the number of packets received by DWC_ether_qos with runt (length less than 64 bytes and CRC error) error.

Offset

Register	Offset
MAC_RX_RUNT_ERROR_PACKETS	79Ch

Diagram



Fields

Field	Description
31-0 RXRUNTERR	Rx Runt Error Packets This field indicates the number of packets received with runt (length less than 64 bytes and CRC error) error.

34.8.1.215 Jabber Error Packets Received (MAC_RX_JABBER_ERROR_PACKETS)

This register provides the number of giant packets received by DWC_ether_qos with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error.

This register provides the number of giant packets received by DWC_ether_qos with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

34.8.1.237 MMC IPC Receive Interrupt Mask (MAC_MMC_IPC_RX_INTERRUPT_MASK)

This register maintains the mask for the interrupt generated from the receive IPC statistic counters.

The MMC Receive Checksum Off load Interrupt Mask register maintains the masks for the interrupts generated when the receive IPC (Checksum Off load) statistic counters reach half their maximum value, and when they reach their maximum values. This register is 32 bits wide.

34.8.1.238 MMC IPC Receive Interrupt (MAC_MMC_IPC_RX_INTERRUPT)

This register maintains the interrupt that the receive IPC statistic counters generate.

The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Receive Checksum Offload Interrupt register is 32 bit wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The counter's least-significant byte lane (Bits[7:0]) must be read to clear the interrupt bit.

Field	Description
	MMC Receive IPV4 Good Packet Counter Interrupt Status This bit is set when the rxipv4_gd_pkts counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - MMC Receive IPV4 Good Packet Counter Interrupt Status not detected 1 - MMC Receive IPV4 Good Packet Counter Interrupt Status detected

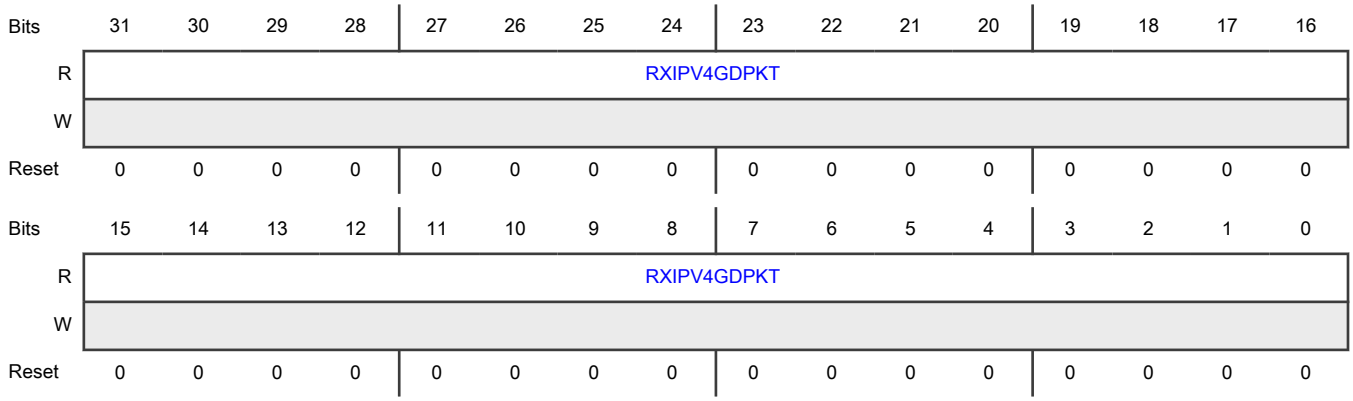
34.8.1.239 Good IPv4 Datagrams Received (MAC_RXIPV4_GOOD_PACKETS)

This register provides the number of good IPv4 datagrams received by DWC_ether_qos with the TCP, UDP, or ICMP payload.

Offset

Register	Offset
MAC_RXIPV4_GOOD_PACKETS	810h

Diagram



Fields

Field	Description
31-0 RXIPV4GDPKT	RxIPv4 Good Packets This field indicates the number of good IPv4 datagrams received with the TCP, UDP, or ICMP payload.

34.8.1.240 IPv4 Datagrams Received with Header Errors (MAC_RXIPV4_HEADER_ERROR_PACKETS)

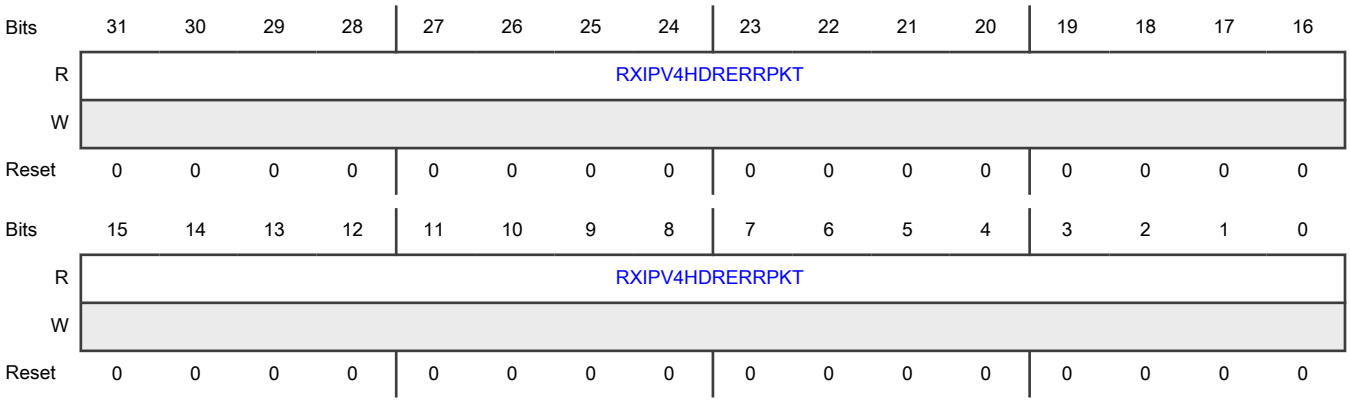
RxIPv4 Header Error Packets

This register provides the number of IPv4 datagrams received by DWC_ether_qos with header (checksum, length, or version mismatch) errors.

Offset

Register	Offset
MAC_RXIPV4_HEADER_ERROR_PACKETS	814h

Diagram



Fields

Field	Description
31-0 RXIPV4HDRERRPKT	RxIPv4 Header Error Packets This field indicates the number of IPv4 datagrams received with header (checksum, length, or version mismatch) errors.

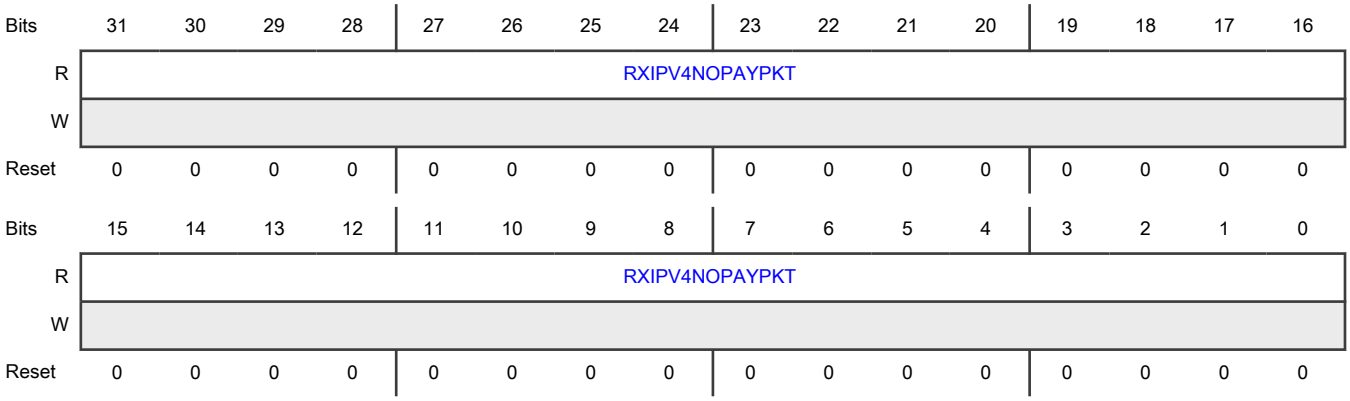
34.8.1.241 IPv4 Datagrams Received with No Payload (MAC_RXIPV4_NO_PAYLOAD_PACKETS)

This register provides the number of IPv4 datagram packets received by DWC_ether_qos that did not have a TCP, UDP, or ICMP payload.

Offset

Register	Offset
MAC_RXIPV4_NO_PAYLOAD_PACKETS	818h

Diagram



Fields

Field	Description
31-0 RXIPV4NOPAYPKT	RxIPv4 Payload Packets This field indicates the number of IPv4 datagram packets received that did not have a TCP, UDP, or ICMP payload.

34.8.1.242 IPv4 Datagrams Received with Fragmentation (MAC_RXIPV4_FRAGMENTED_PACKETS)

This register provides the number of good IPv4 datagrams received by DWC_ether_qos with fragmentation.

Offset

Register	Offset
MAC_RXIPV4_FRAGMENTED_PACKETS	81Ch

34.8.1.267 MMC FPE Transmit Interrupt (MAC_MMC_FPE_TX_INTERRUPT)

This register maintains the interrupts generated from all FPE related Transmit statistics counters.

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Field	Description
31-0 TXHRC	Tx Hold Request Counter This field indicates count of number of a hold request is given to MAC. Tx Hold Request Counter This field indicates count of number of a hold request is given to MAC. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration.

34.8.1.271 MMC FPE Receive Interrupt (MAC_MMC_FPE_RX_INTERRUPT)

This register maintains the interrupts generated from all FPE related Receive statistics counters.

This register maintains the interrupts generated from all FPE related Receive statistics counters. The MMC FPE Receive Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

34.8.1.278 Layer 4 Address 0 (MAC_LAYER4_ADDRESS0)

The MAC_LAYER4_ADDRESS0, MAC_L3_L4_CONTROL0, MAC_LAYER3_ADDR0_Reg0, MAC_LAYER3_ADDR1_Reg0, MAC_LAYER3_ADDR2_Reg0 and MAC_LAYER3_ADDR3_Reg0 registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Field	Description
31-0 L3A02	Layer 3 Address 0 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets. Layer 3 Address 0 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

34.8.1.292 Layer 3 Address 0 Register 2 (MAC_LAYER3_ADDR1_REG2)

For IPv4 packets, the Layer 3 Address 1 Register 2 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

34.8.1.296 Layer 4 Address 3 (MAC_LAYER4_ADDRESS3)

The MAC_LAYER4_ADDRESS4, MAC_L3_L4_CONTROL4, MAC_LAYER3_ADDR0_Reg4, MAC_LAYER3_ADDR1_Reg4, MAC_LAYER3_ADDR2_Reg4 and MAC_LAYER3_ADDR3_Reg4 registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Field	Description
	- 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM4	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0 - Layer 3 IP DA Inverse Match is disabled 1 - Layer 3 IP DA Inverse Match is enabled
4 L3DAM4	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0 - Layer 3 IP DA Match is disabled 1 - Layer 3 IP DA Match is enabled
3 L3SAIM4	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set. 0 - Layer 3 IP SA Inverse Match is disabled 1 - Layer 3 IP SA Inverse Match is enabled
2	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching.

Table continues on the next page...

Table continued from the previous page...

Field	Description
L3SAM4	Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering. 0 - Layer 3 IP SA Match is disabled 1 - Layer 3 IP SA Match is enabled
1 —	Reserved
0 L3PEN4	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

34.8.1.302 Layer 4 Address 4 (MAC_LAYER4_ADDRESS4)

The MAC_LAYER4_ADDRESS4, MAC_L3_L4_CONTROL4, MAC_LAYER3_ADDR0_Reg4, MAC_LAYER3_ADDR1_Reg4, MAC_LAYER3_ADDR2_Reg4 and MAC_LAYER3_ADDR3_Reg4) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

34.8.1.314 Layer 4 Address 6 (MAC_LAYER4_ADDRESS6)

The MAC_LAYER4_ADDRESS6), MAC_L3_L4_CONTROL6, MAC_LAYER3_ADDR0_Reg6, MAC_LAYER3_ADDR1_Reg6, MAC_LAYER3_ADDR2_Reg5 and MAC_LAYER3_ADDR3_Reg6 registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Field	Description
1 —	Reserved
0 L3PEN7	Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set. 0 - Layer 3 Protocol is disabled 1 - Layer 3 Protocol is enabled

34.8.1.320 Layer 4 Address 7 (MAC_LAYER4_ADDRESS7)

The MAC_LAYER4_ADDRESS7, MAC_L3_L4_CONTROL7, MAC_LAYER3_ADDR0_Reg7, MAC_LAYER3_ADDR1_Reg7, MAC_LAYER3_ADDR2_Reg7 and MAC_LAYER3_ADDR3_Reg7 registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

Layer 3 Address 3 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_CONTROL0 register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_CONTROL0 register, this field is not used.

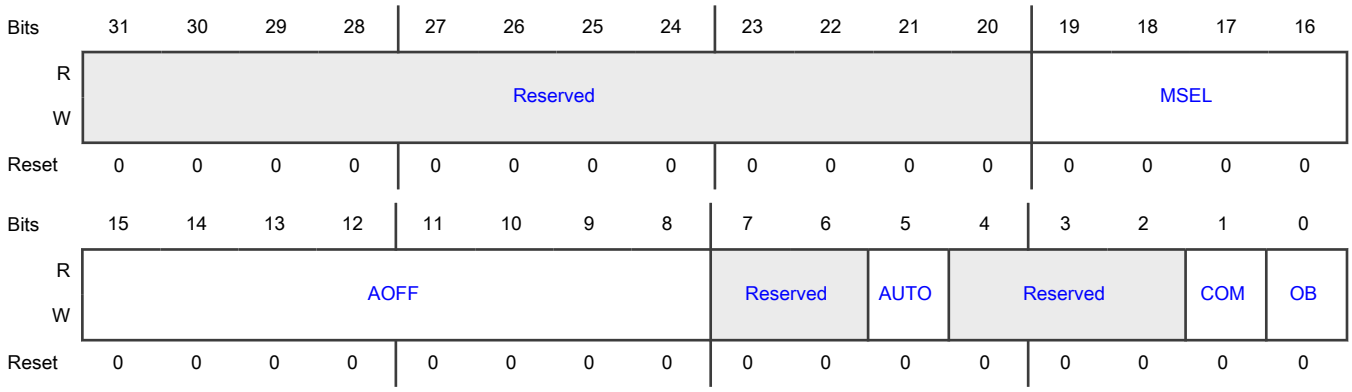
34.8.1.325 MAC_INDIR_ACCESS_CTRL (MAC_INDIR_ACCESS_CTRL)

This register provides the Indirect Access control and status for MAC_<MSEl>_<AOFF> registers.

Offset

Register	Offset
MAC_INDIR_ACCESS_CTRL	A70h

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 MSEL	Mode Select This field is used in indirect access of MAC_<MSEL>_<AOFF>. This field must be set along with initiation of read/write to MAC_<MSEL>_<AOFF> and should not be changed until the OB is reset. Values: 0000: ESTTyp_RXQ_ (Type based RXQ mappping) 0001-1111: Reserved for future use.
15-8 AOFF	Address Offset This field is used in indirect access of MAC_<MSEL>_<AOFF>. This field must be set along with initiation of read/write to MAC_<MSEL>_<AOFF> and should not be changed until the OB is reset. Values: 00000000: IndReg0(Indirect register 0) 00000001: IndReg1(Indirect register 1) ... 00000111: IndReg7(Indirect register 7) 00001000-11111111: Reserved for future use.
7-6 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
5 AUTO	Auto increment enable 0 - AOFF is not incremented automatically. Software should program the correct Address Offset for each access. 1 - AOFF is incremented by 1. Software should ensure not to cause a wrap condition. Byte wise read/write is not supported when auto increment is enabled.
4-2 —	Reserved
1 COM	Command type. Indicates the register access type. 0 - Indicates a write operation 1 - Indicates a read operation
0 OB	Operation Busy This bit is set along with a read or write command for initiating the indirect access to MAC_<MSEL>_<AOFF> register. This bit is reset when the read or write command to MAC_<MSEL>_<AOFF> register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into MAC_<MSEL>_<AOFF> register. During a read operation, the data should be read from MAC_INDIR_ACCESS_DATA register only after this bit is reset.

34.8.1.326 MAC_INDIR_ACCESS_DATA (MAC_INDIR_ACCESS_DATA)

This register holds the read/write data for Indirect Access of MAC_<MSEL_<AOFF> registers.

Offset

Register	Offset
MAC_INDIR_ACCESS_DATA	A74h

28 AV8021ASMEN	AV 802. AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. 0 - AV 802.1AS Mode is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - AV 802.1AS Mode is enabled
27-25 —	Reserved
24 TXTSSTSM	Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register. 0 - Transmit Timestamp Status Mode is disabled 1 - Transmit Timestamp Status Mode is enabled
23-21 —	Reserved
20 ESTI	External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. 0 - External System Time Input is disabled 1 - External System Time Input is enabled
19 CSC	Enable checksum correction during OST for PTP over UDP/IPv4 packets When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. Enable checksum correction during OST for PTP over UDP/IPv4 packets When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes. When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - checksum correction during OST for PTP over UDP/IPv4 packets is disabled 1 - checksum correction during OST for PTP over UDP/IPv4 packets is enabled
18 TSENMACADDR	Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0 - MAC Address for PTP Packet Filtering is disabled 1 - MAC Address for PTP Packet Filtering is enabled
17-16 SNAPTYPSEL	Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15 TSMSTRENA	Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. 0 - Snapshot for Messages Relevant to Master is disabled 1 - Snapshot for Messages Relevant to Master is enabled
14 TSEVNTENA	Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. 0 - Timestamp Snapshot for Event Messages is disabled 1 - Timestamp Snapshot for Event Messages is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
13 TSIPV4ENA	Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. 0 - Processing of PTP Packets Sent over IPv4-UDP is disabled 1 - Processing of PTP Packets Sent over IPv4-UDP is enabled
12 TSIPV6ENA	Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. 0 - Processing of PTP Packets Sent over IPv6-UDP is disabled 1 - Processing of PTP Packets Sent over IPv6-UDP is enabled
11 TSIPENA	Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. 0 - Processing of PTP over Ethernet Packets is disabled 1 - Processing of PTP over Ethernet Packets is enabled
10 TSVER2ENA	Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. 0 - PTP Packet Processing for Version 2 Format is disabled 1 - PTP Packet Processing for Version 2 Format is enabled
9 TSCTRLSSR	Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Timestamp Digital or Binary Rollover Control is disabled 1 - Timestamp Digital or Binary Rollover Control is enabled
8 TSENALL	Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. 0 - Timestamp for All Packets disabled 1 - Timestamp for All Packets enabled
7 —	Reserved
6 PTGE	Presentation Time Generation Enable When this bit is set the Presentation Time generation will be enabled. 0 - Presentation Time Generation is disabled 1 - Presentation Time Generation is enabled
5 TSADDREG	Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Addend Register is not updated 1 - Addend Register is updated
4 —	Reserved
3 TSUPDT	Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Timestamp is not updated 1 - Timestamp is updated

Table continues on the next page...

Table continued from the previous page...

Field	Description
2 TSINIT	Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Timestamp is not initialized 1 - Timestamp is initialized
1 TSCFUPDT	Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. 0 - Coarse method is used to update system timestamp 1 - Fine method is used to update system timestamp
0 TSENA	Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set. 0 - Timestamp is disabled 1 - Timestamp is enabled

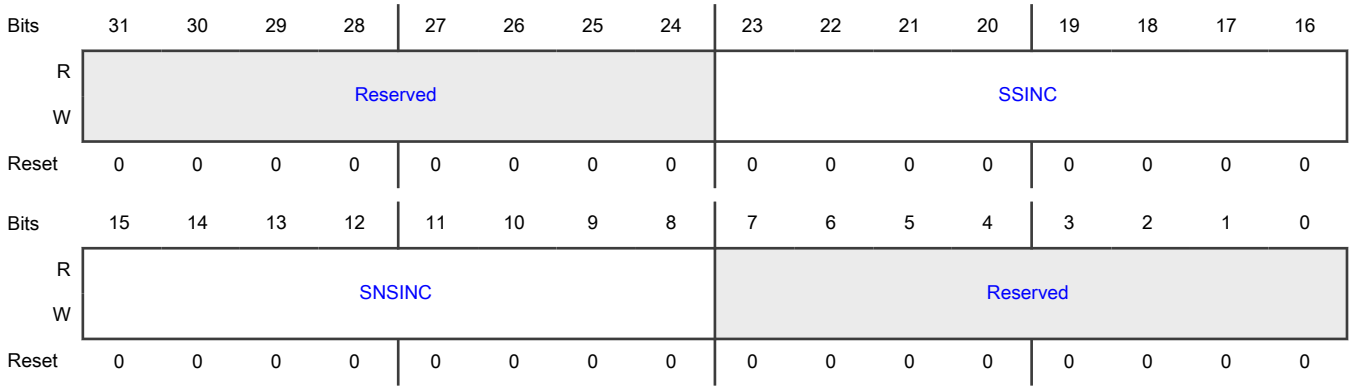
34.8.1.328 Subsecond Increment (MAC_SUB_SECOND_INCREMENT)

This register specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock.

Offset

Register	Offset
MAC_SUB_SECOND_INCREMENT	B04h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 SSINC	Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in TIMESTAMP_CONTROL]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15-8 SNSINC	Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the TIMESTAMP_CONTROL register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7-0 —	Reserved

34.8.1.329 System Time Seconds (MAC_SYSTEM_TIME_SECONDS)

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

Offset

Register	Offset
MAC_SYSTEM_TIME_SECONDS	B08h

Fields

Field	Description
31-0 TSS	Timestamp Seconds The value in this field is the seconds part of the update. Timestamp Seconds The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, 2^32 - 2).

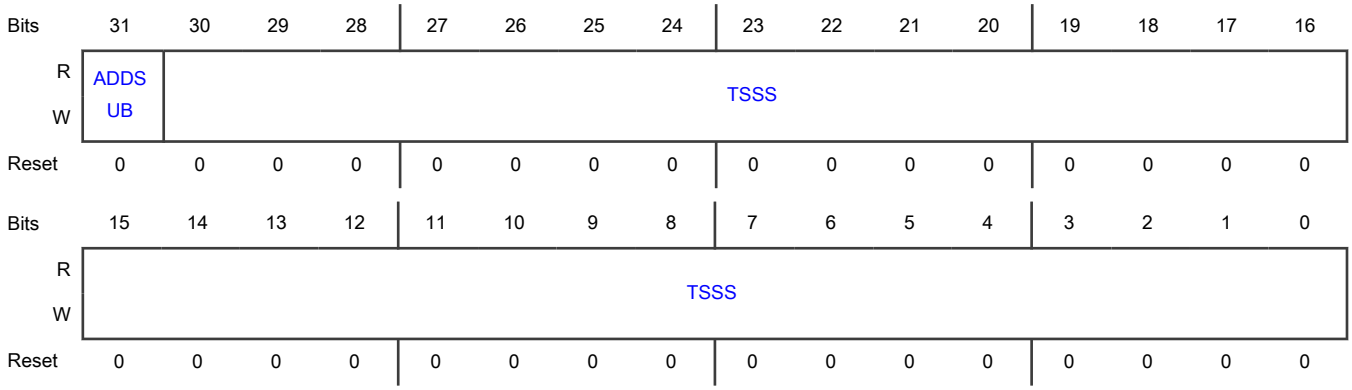
34.8.1.332 System Time Nanoseconds Update (MAC_SYSTEM_TIME_NANOSECONDS_UPDATE)

MAC System Time Nanoseconds Update register.

Offset

Register	Offset
MAC_SYSTEM_TIME_NANOSECONDS_UPDATE	B14h

Diagram



Fields

Field	Description
31 ADDSUB	Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. 0 - Add time 1 - Subtract time
30-0 TSSS	Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the TIMESTAMP_CONTROL register. When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is set, the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is reset, the programmed value must be 2^31 - <sub-second_value>. When the TSCTRLSSR bit is reset in the TMAC_IMESTAMP_CONTROL register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_TIMESTAMP_CONTROL register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_TIMESTAMP_CONTROL is set.

34.8.1.333 Timestamp Addend (MAC_TIMESTAMP_ADDEND)

Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_TIMESTAMP_CONTROL register). The content of this register is added to a 32-bit accumulator in every clock cycle (of clk_ptp_ref_i) and the system time is updated whenever the accumulator overflows.

Offset

Register	Offset
MAC_TIMESTAMP_ADDEND	B18h

Fields

Field	Description
31-16 —	Reserved
15-0 TSHWR	Timestamp Higher Word Register This field contains the most-significant 16-bits of timestamp seconds value. Timestamp Higher Word Register This field contains the most-significant 16-bits of timestamp seconds value. This register is optional. You can add this register by selecting the Add IEEE 1588 Higher Word Register option. This register is directly written to initialize the value and it is incremented when there is an overflow from 32-bits of the System Time Seconds register. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.

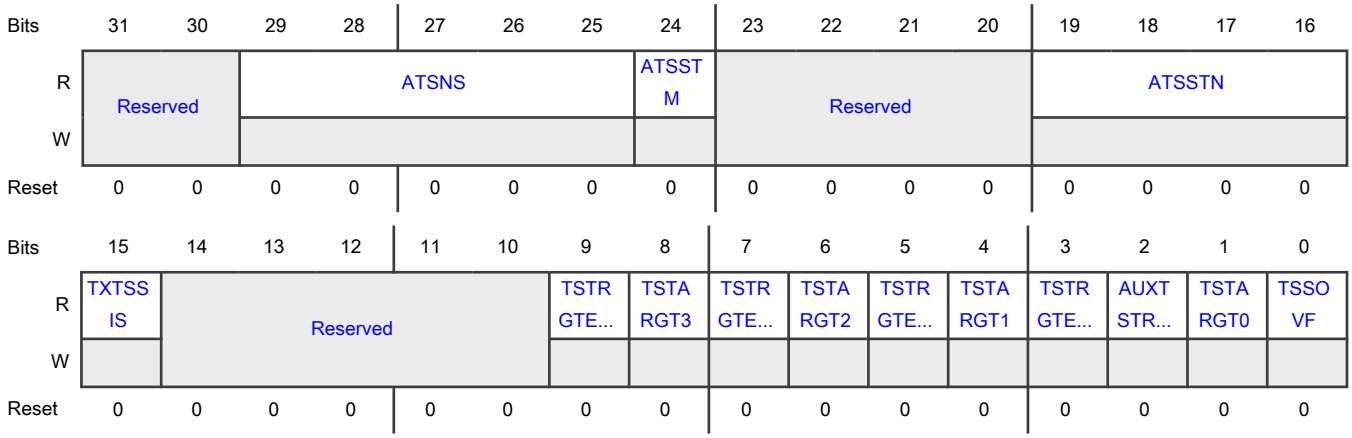
34.8.1.335 Timestamp Status (MAC_TIMESTAMP_STATUS)

Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register.

Offset

Register	Offset
MAC_TIMESTAMP_STATUS	B20h

Diagram



Fields

Field	Description
31-30 —	Reserved
29-25 ATSNS	Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24 ATSSTM	Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. 0 - Auxiliary Timestamp Snapshot Trigger Missed status not detected 1 - Auxiliary Timestamp Snapshot Trigger Missed status detected
23-20 —	Reserved
19-16 ATSSTN	Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary

Field	Description
	triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: - Bit 16: Auxiliary trigger 0 - Bit 17: Auxiliary trigger 1 - Bit 18: Auxiliary trigger 2 - Bit 19: Auxiliary trigger 3 The software can read this register to find the triggers that are set when the timestamp is taken. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15 TXTSSIS	Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and MAC_TX_TIMESTAMP_STATUS_SECONDS registers. Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and TMAC_X_TIMESTAMP_STATUS_SECONDS registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_TX_TIMESTAMP_STATUS_NANOSECONDS and MAC_TX_TIMESTAMP_STATUS_SECONDS registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_TX_TIMESTAMP_STATUS_SECONDS register is read (or write to MAC_TX_TIMESTAMP_STATUS_SECONDS register when RCWE bit of CSR_SW_CTRL register is set). 0 - Tx Timestamp Status Interrupt status not detected 1 - Tx Timestamp Status Interrupt status detected
14-10 —	Reserved
9 TSTRGTERR3	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
8 TSTARGT3	Timestamp Target Time Reached for Target Time PPS3 When this bit is set, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS3 When this bit is set, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS3 status not detected 1 - Timestamp Target Time Reached for Target Time PPS3 status detected
7 TSTRGTERR2	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected
6 TSTARGT2	Timestamp Target Time Reached for Target Time PPS2 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS2 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS2 status not detected 1 - Timestamp Target Time Reached for Target Time PPS2 status detected
5 TSTRGTERR1	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers elapses. Timestamp Target Time Error

Field	Description
	This bit is set when the latest target time programmed in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected
4 TSTARGT1	Timestamp Target Time Reached for Target Time PPS1 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers. Timestamp Target Time Reached for Target Time PPS1 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached for Target Time PPS1 status not detected 1 - Timestamp Target Time Reached for Target Time PPS1 status detected
3 TSTRGTERR0	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_TARGET_TIME_NANOSECONDS registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Error status not detected 1 - Timestamp Target Time Error status detected
2 AUXTSTRIG	Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Auxiliary Timestamp Trigger Snapshot status not detected 1 - Auxiliary Timestamp Trigger Snapshot status detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
1 TSTARGT0	Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_TARGET_TIME_SECONDS and MAC_PPS0_TARGET_TIME_NANOSECONDS registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Target Time Reached status not detected 1 - Timestamp Target Time Reached status detected
0 TSSOVF	Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in CSR_SW_CTRL register is set). Self-set to 1 on internal event. 0 - Timestamp Seconds Overflow status not detected 1 - Timestamp Seconds Overflow status detected

34.8.1.336 Transmit Timestamp Status Nanoseconds (MAC_TX_TIMESTAMP_STATUS_NANOSECONDS)

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

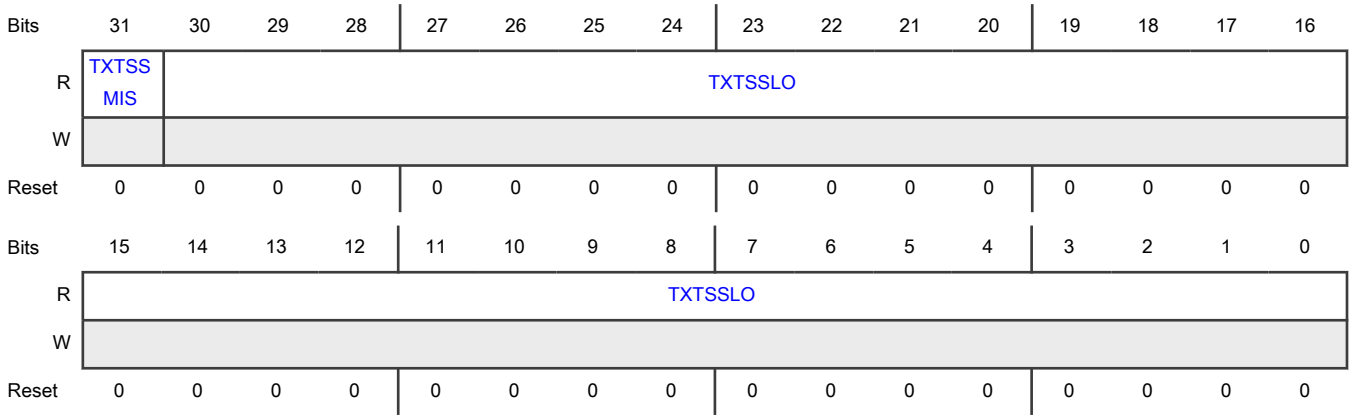
The MAC_TX_TIMESTAMP_STATUS_NANOSECONDS register, along with MAC_TX_TIMESTAMP_STATUS_SECONDS, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte of MAC_TX_TIMESTAMP_STATUS_NANOSECONDS is read. In the little-endian mode, this means when bits[31:24] are read; in big-endian mode, bits[7:0] are read.

If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC_TIMESTAMP_CONTROL register. The status bit TXTSC bit [15] in MAC_TIMESTAMP_STATUS register is set whenever the MAC transmitter captures the timestamp.

Offset

Register	Offset
MAC_TX_TIMESTAMP_STATUS_NANOSECONDS	B30h

Diagram



Fields

Field	Description
31 TXTSSMIS	Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the TIMESTAMP_CONTROL register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_TIMESTAMP_CONTROL register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Transmit Timestamp Status Missed status not detected 1 - Transmit Timestamp Status Missed status detected
30-0 TXTSSLO	Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

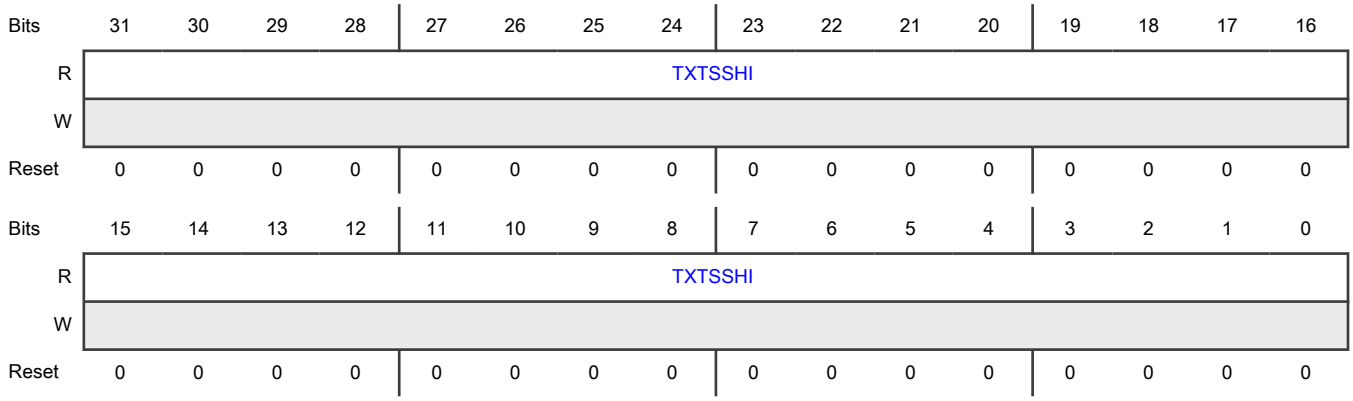
34.8.1.337 Transmit Timestamp Status Seconds (MAC_TX_TIMESTAMP_STATUS_SECONDS)

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Offset

Register	Offset
MAC_TX_TIMESTAMP_STATUS_SECONDS	B34h

Diagram



Fields

Field	Description
31-0 TXTSSHI	Transmit Timestamp Status High This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

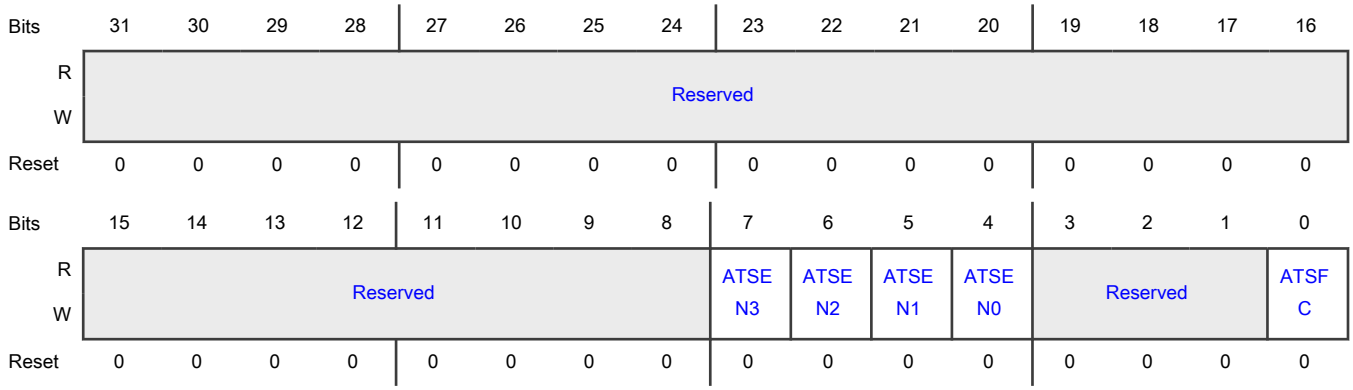
34.8.1.338 Auxiliary Timestamp Control (MAC_AUXILIARY_CONTROL)

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

Offset

Register	Offset
MAC_AUXILIARY_CONTROL	B40h

Diagram



Fields

Field	Description
31-8 —	Reserved
7 ATSEN3	Auxiliary Snapshot 3 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[3] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
6 ATSEN2	Auxiliary Snapshot 2 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[2] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
5 ATSEN1	Auxiliary Snapshot 1 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
4 ATSEN0	Auxiliary Snapshot 0 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored. 0 - Auxiliary Snapshot $i is disabled 1 - Auxiliary Snapshot $i is enabled
3-1 —	Reserved
0 ATSFC	Auxiliary Snapshot FIFO Clear When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Auxiliary Snapshot FIFO Clear is disabled 1 - Auxiliary Snapshot FIFO Clear is enabled

34.8.1.339 Auxiliary Timestamp Nanoseconds (MAC_AUXILIARY_TIMESTAMP_NANOSECONDS)

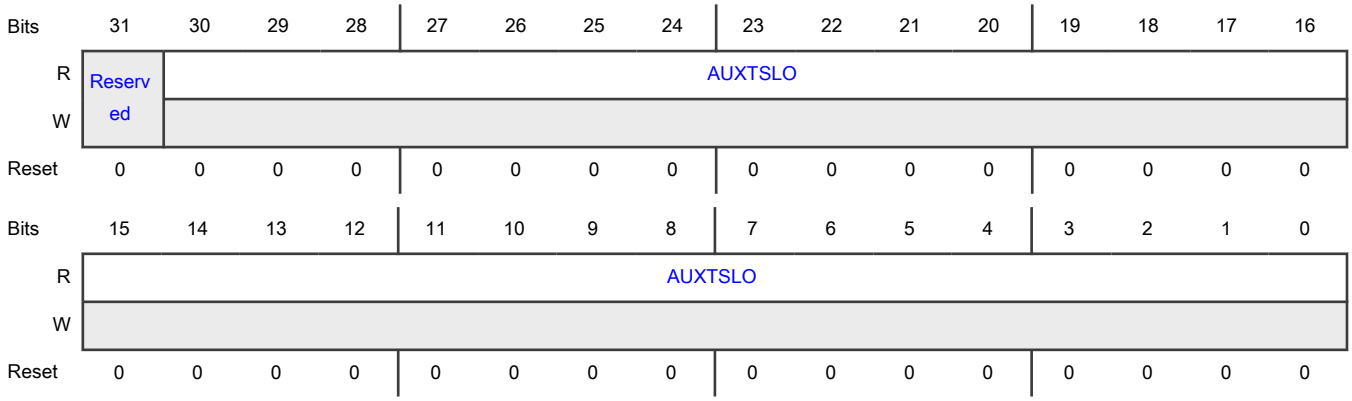
The Auxiliary Timestamp Nanoseconds register, along with MAC_Auxiliary_Timestamp_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4, 8, or 16 as selected while configuring the core.

You can store multiple snapshots in this FIFO. Bits[29:25] in MAC_TIMESTAMP_STATUS indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte of MAC_AUXILIARY_TIMESTAMP_SECONDS register is read. In the little-endian mode, this means when Bits[31:24] are read and in big-endian mode, Bits[7:0] are read.

Offset

Register	Offset
MAC_AUXILIARY_TIMESTAMP_NANOSECONDS	B48h

Diagram



Fields

Fields

Field	Description
31-0 OSTIAC	One-Step Timestamp Ingress Asymmetry Correction This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

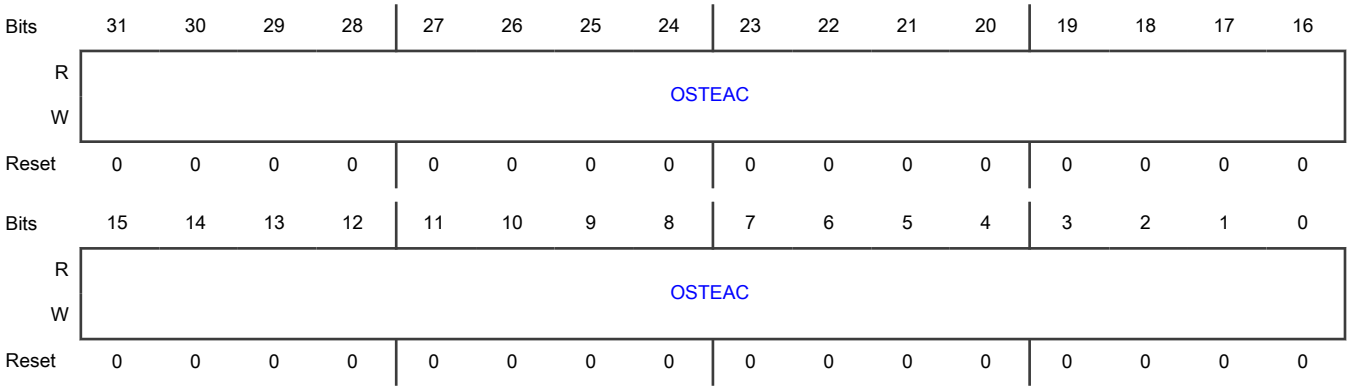
34.8.1.342 Timestamp Egress Asymmetry Correction (MAC_TIMESTAMP_EGRESS_ASYM_CORR)

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

Offset

Register	Offset
MAC_TIMESTAMP_EGRESS_ASYM_CORR	B54h

Diagram



Fields

Field	Description
31-0 OSTEAC	One-Step Timestamp Egress Asymmetry Correction This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

34.8.1.343 Timestamp Ingress Correction Nanosecond (MAC_TIMESTAMP_INGRESS_CORR_NANOSECOND)

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Offset

Register	Offset
MAC_TIMESTAMP_INGRESS_CORR_NANOSECOND	B58h

Fields

Field	Description
31 MCGREN3	MCGR Mode Enable for PPS3 Output This field enables the 3rd PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS3 Output This field enables the 3rd PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode.

Table continues on the next page...

Table continued from the previous page...

Field	Description
30-29 TRGTMODSEL3	Target Time Register Mode for PPS3 Output This field indicates the Target Time registers (MAC_PPS3_TARGET_TIME_SECONDS and MAC_PPS3_TARGET_TIME_NANOSECONDS) mode for PPS3 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
28 —	Reserved
27-24 PPSCMD3	Flexible PPS3 Output Control This field controls the flexible PPS3 output (ptp_pps_o[3]) signal. Flexible PPS3 Output Control This field controls the flexible PPS3 output (ptp_pps_o[3]) signal. This field is similar to the PPSCMD0[2:0] field. If MCGREN3 is set, then PPSCMD3 indicated by these 4 bits [27:24] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 3. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN3 is not set then only 3 bits from [26:24] is used as PPSCMD3 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
23 MCGREN2	MCGR Mode Enable for PPS2 Output This field enables the 2nd PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS2 Output This field enables the 2nd PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 2nd PPS instance is disabled to operate in PPS or MCGR mode 1 - 2nd PPS instance is enabled to operate in PPS or MCGR mode
22-21 TRGTMODSEL2	Target Time Register Mode for PPS2 Output This field indicates the Target Time registers (MAC_PPS2_TARGET_TIME_SECONDS and MAC_PPS2_TARGET_TIME_NANOSECONDS) mode for PPS2 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation

Table continues on the next page...

Table continued from the previous page...

Field	Description
	11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
20 —	Reserved
19-16 PPSCMD2	Flexible PPS2 Output Control This field controls the flexible PPS2 output (ptp_pps_o[2]) signal. Flexible PPS2 Output Control This field controls the flexible PPS2 output (ptp_pps_o[2]) signal. This field is similar to the PPSCMD0 field. If MCGREN2 is set, then PPSCMD2 indicated by these 4 bits [19:16] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 2. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN2 is not set then only 3 bits from [18:16] is used as PPSCMD2 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
15 MCGREN1	MCGR Mode Enable for PPS1 Output This field enables the 1st PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS1 Output This field enables the 1st PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 1st PPS instance is disabled to operate in PPS or MCGR mode 1 - 1st PPS instance is enabled to operate in PPS or MCGR mode
14-13 TRGTMODSEL1	Target Time Register Mode for PPS1 Output This field indicates the Target Time registers (MAC_PPS1_TARGET_TIME_SECONDS and MAC_PPS1_TARGET_TIME_NANOSECONDS) mode for PPS1 output signal. 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
12 —	Reserved
11-8 PPSCMD1	Flexible PPS1 Output Control This field controls the flexible PPS1 output (ptp_pps_o[1]) signal. Flexible PPS1 Output Control This field controls the flexible PPS1 output (ptp_pps_o[1]) signal. This field is similar to the PPSCMD0 field.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If MCGREN1 is set, then PPSCMD1 indicated by these 4 bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN1 is not set then only 3 bits from [10:8] is used as PPSCMD1 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7 MCGREN0	MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode. 0 - 0th PPS instance is enabled to operate in PPS mode 1 - 0th PPS instance is enabled to operate in MCGR mode
6-5 TRGTMODSEL0	Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_TARGET_TIME_SECONDS and MAC_PPS0_TARGET_TIME_NANOSECONDS) mode for PPS0 output signal: 00 - Target Time registers are programmed only for generating the interrupt event. The Flexible PPS function must not be enabled in this mode, otherwise spurious transitions may be observed on the corresponding ptp_pps_o output port 01 - Reserved 10 - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11 - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
4 PPSEN0	Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode). 0 - Flexible PPS Output Mode is disabled 1 - Flexible PPS Output Mode is enabled
3-0 PPSCTRL_PPSCMD	PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - .. - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register. or Flexible PPS Output (ptp_pps_o[0]) Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control If MCGREN0 is set then these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: No Operation related to MCGR will be carried out. If set to this value in the mid of clock recovery or generation all the processing inputs will be flushed. - 0001: Capture the Presentation time at rising edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at falling edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle - 1100-1111: Reserved

34.8.1.350 PPS0 Target Time Seconds (MAC_PPS0_TARGET_TIME_SECONDS)

The PPS0 Target Time Seconds register, along with PPS0 Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_TIMESTAMP_STATUS] when the system time exceeds the value programmed in these registers.

Offset

Register	Offset
MAC_PPS0_TARGET_TIME_SECONDS	B80h

Fields

Field	Description
31 TRGTBUSY0	PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the PPS_CONTROL register is programmed to 010 or 011. PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_CONTROL register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0 - PPS Target Time Register Busy status is not detected 1 - PPS Target Time Register Busy is detected
30-0 TTSL0	Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in PPS_CONTROL. When the TSCTRLSSR bit is reset in the MAC_TIMESTAMP_CONTROL register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_TIMESTAMP_CONTROL register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

34.8.1.352 PPS0 Interval (MAC_PPS0_INTERVAL)

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (ptp_pps_o[0]).

Offset

Register	Offset
MAC_PPS0_INTERVAL	B88h

Diagram

	When the TSCTRLSSR bit is reset in the TIMESTAMP_CONTROL register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the TIMESTAMP_CONTROL register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

34.8.1.360 PPS2 Interval (MAC_PPS2_INTERVAL)

The PPS2 Interval register contains the number of units of sub-second increment value between the rising edges of PPS2 signal output (ptp_pps_o[2]).

Offset

Register	Offset
MAC_PPS2_INTERVAL	BA8h

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Description
31-0 PPSINT2	PPS Output Signal Interval These bits store the interval between the rising edges of PPS2 signal output. PPS Output Signal Interval These bits store the interval between the rising edges of PPS2 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS2 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

34.8.1.361 PPS2 Width (MAC_PPS2_WIDTH)

The PPS2 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS2 signal output (ptp_pps_o[2]).

Offset

Register	Offset
MAC_PPS2_WIDTH	BACh

Fields

Field	Description
31-0 PPSWIDTH2	PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

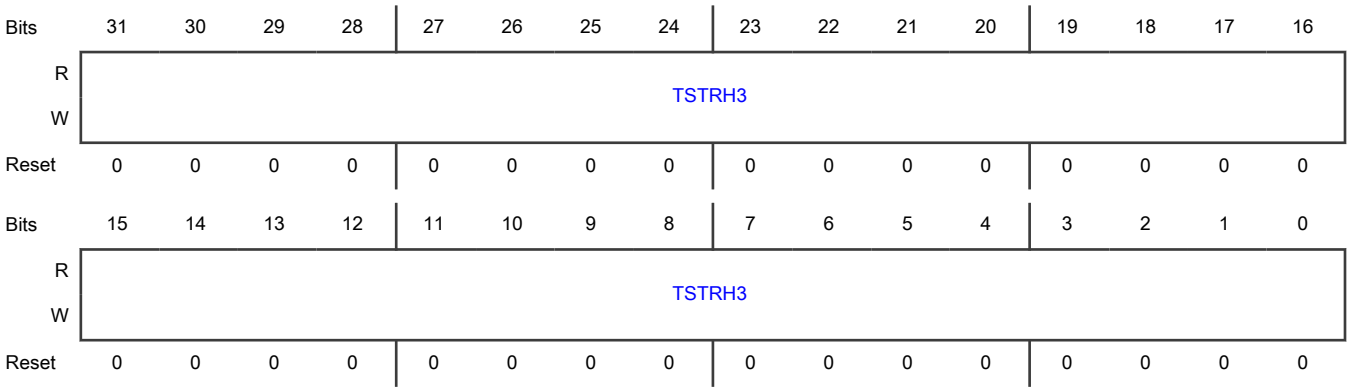
34.8.1.362 PPS3 Target Time Seconds (MAC_PPS3_TARGET_TIME_SECONDS)

The PPS3 Target Time Seconds register, along with PPS3 Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of TIMESTAMP_STATUS] when the system time exceeds the value programmed in these registers.

Offset

Register	Offset
MAC_PPS3_TARGET_TIME_SECONDS	BB0h

Diagram



Fields

Field	Description
31-0 TSTRH3	PPS Target Time Seconds Register This field stores the time in seconds. PPS Target Time Seconds Register This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the PPS_CONTROL register.

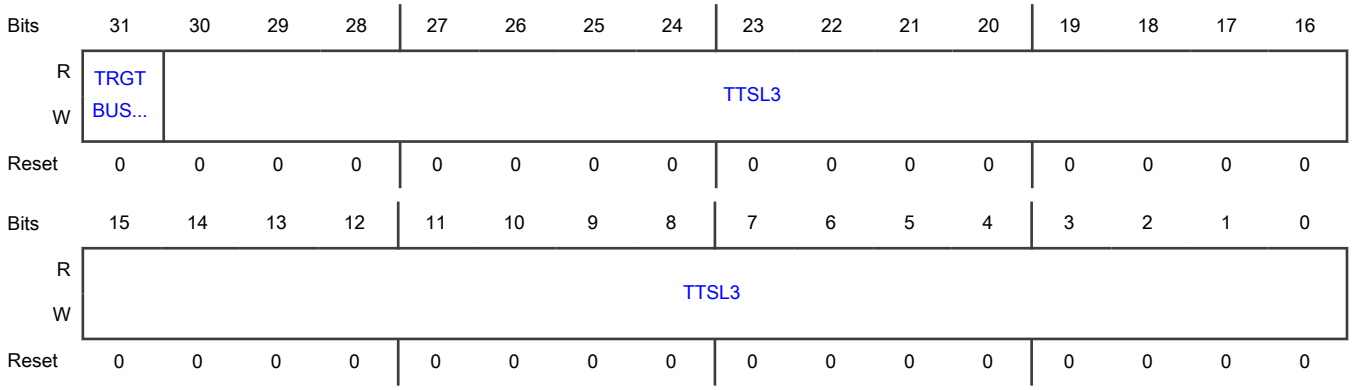
34.8.1.363 PPS3 Target Time Nanoseconds (MAC_PPS3_TARGET_TIME_NANOSECONDS)

PPS3 Target Time Nanoseconds register.

Offset

Register	Offset
MAC_PPS3_TARGET_TIME_NANOSECONDS	BB4h

Diagram



Fields

Field	Description
31 TRGTBUSY3	PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the PPS_CONTROL register is programmed to 010 or 011. PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the PPS_CONTROL register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0 - PPS Target Time Register Busy status is not detected 1 - PPS Target Time Register Busy is detected
30-0 TTSL3	Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in PPS_CONTROL. When the TSCTRLSSR bit is reset in the TIMESTAMP_CONTROL register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the TIMESTAMP_CONTROL register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

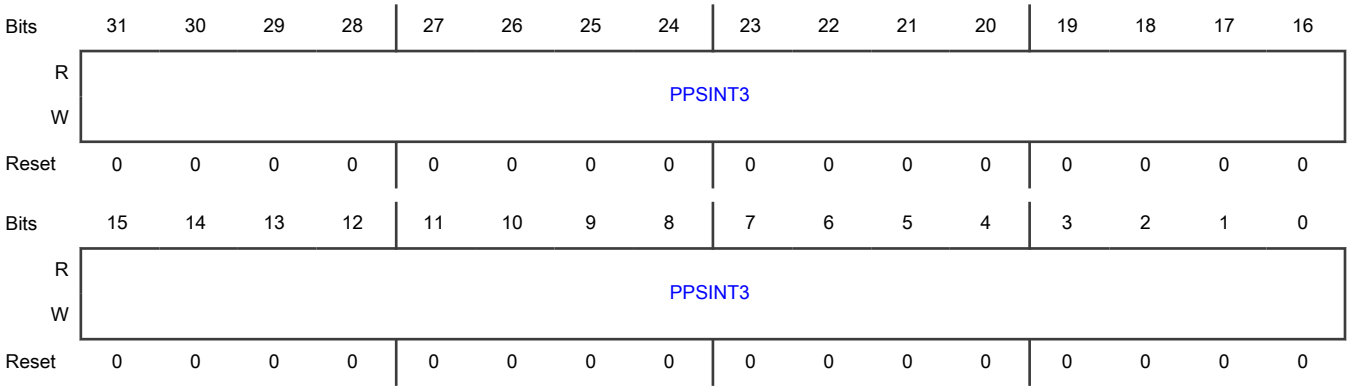
34.8.1.364 PPS3 Interval (MAC_PPS3_INTERVAL)

The PPS3 Interval register contains the number of units of sub-second increment value between the rising edges of PPS3 signal output (ptp_pps_o[3]).

Offset

Register	Offset
MAC_PPS3_INTERVAL	BB8h

Diagram



Fields

Field	Description
31-0 PPSINT3	PPS Output Signal Interval These bits store the interval between the rising edges of PPS3 signal output. Field	Description
	11 - EOP Data/EOP
0 FIFOBUSY	FIFO Busy When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_DEBUG_DATA register 0 - FIFO Busy not detected 1 - FIFO Busy detected

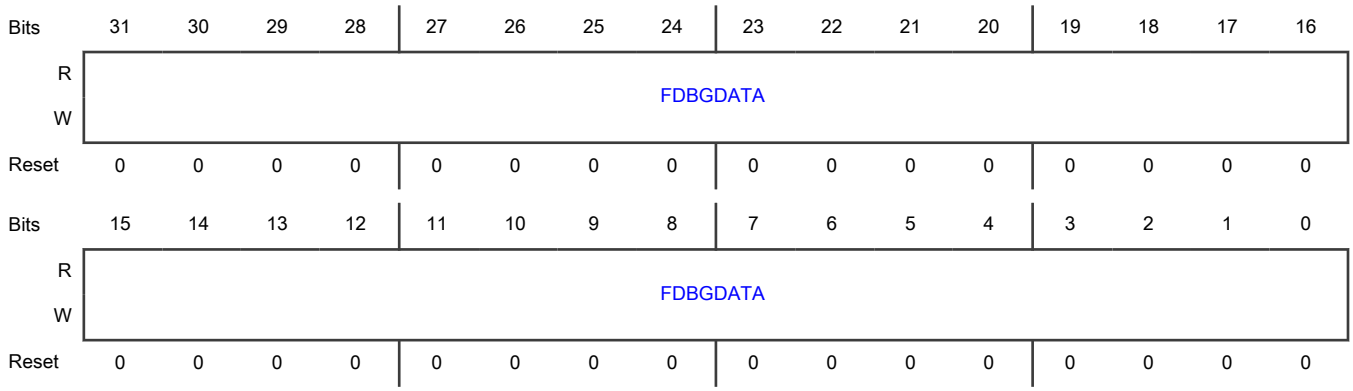
34.8.1.374 FIFO Debug Data (MTL_FIFO_DEBUG_DATA)

The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

Offset

Register	Offset
MTL_FIFO_DEBUG_DATA	C10h

Diagram



Fields

Field	Description
31-0 FDBGDATA	FIFO Debug Data During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. FIFO Debug Data During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

34.8.1.375 MTL Interrupt Status (MTL_INTERRUPT_STATUS)

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

Offset

Register	Offset
MTL_INTERRUPT_STATUS	C20h

Diagram

Fields

Field	Description
31-29 —	Reserved
28 Q3DDMACH	Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 3 are routed to the DMA Channel programmed in the Q3MDMACH field (Bits[26:24]). 0 - Queue 3 disabled for DA-based DMA Channel Selection 1 - Queue 3 enabled for DA-based DMA Channel Selection
27 —	Reserved
26-24 Q3MDMACH	Queue 3 Mapped to DMA Channel This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q3DDMACH field is reset. Queue 3 Mapped to DMA Channel This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q3DDMACH field is reset. Note: The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the others are reserved
23-21 —	Reserved
20 Q2DDMACH	Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]). 0 - Queue 2 disabled for DA-based DMA Channel Selection 1 - Queue 2 enabled for DA-based DMA Channel Selection
19 —	Reserved
18-16 Q2MDMACH	Queue 2 Mapped to DMA Channel This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q2DDMACH field is reset.
15-13 —	Reserved
12 Q1DDMACH	Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]). 0 - Queue 1 disabled for DA-based DMA Channel Selection 1 - Queue 1 enabled for DA-based DMA Channel Selection
11 —	Reserved
10-8 Q1MDMACH	Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q1DDMACH field is reset. Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7-5 —	Reserved
4 Q0DDMACH	Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field. 0 - Queue 0 disabled for DA-based DMA Channel Selection

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Queue 0 enabled for DA-based DMA Channel Selection
3 —	Reserved
2-0 Q0MDMACH	Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q0DDMACH field is reset. Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: Reserved - 110: Reserved - 111: Reserved This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values may be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

34.8.1.377 Receive Queue and DMA Channel Mapping 1 (MTL_RXQ_DMA_MAP1)

The Receive Queue and DMA Channel Mapping 1 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Description
31-8 LEOS	Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7 —	Reserved
6-4	Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time.

Table continues on the next page...

Table continued from the previous page...

Field	Description
LEGOS	Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3-2 —	Reserved
1 LEOV	Launch Expiry Offset Valid When set indicates the LEOS field is valid. Launch Expiry Offset Valid When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. 0 - LEOS field is invalid 1 - LEOS field is valid
0 ESTM	EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. 0 - EST offset Mode is disabled 1 - EST offset Mode is enabled

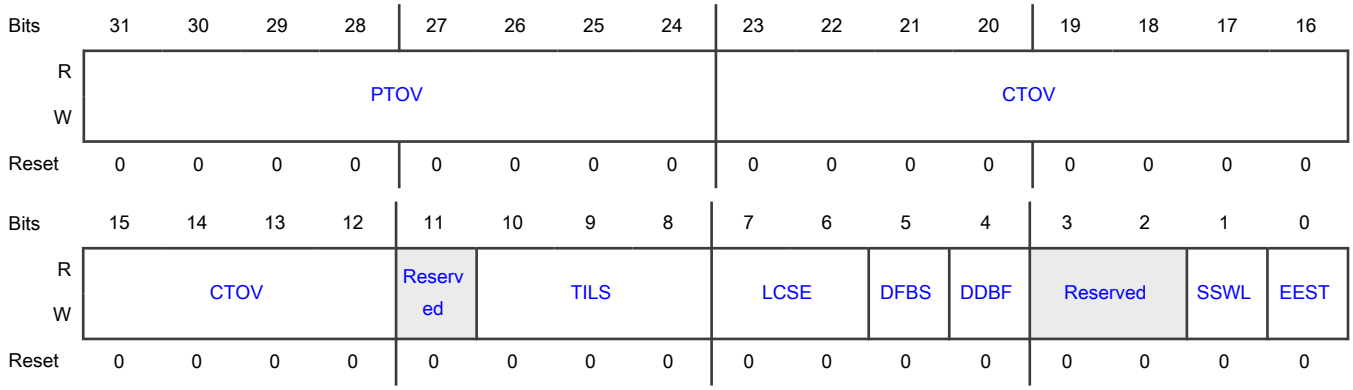
34.8.1.379 Enhancements to Scheduled Transmission Control (MTL_EST_CONTROL)

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Offset

Register	Offset
MTL_EST_CONTROL	C50h

Diagram



Fields

Field	Description
31-24 PTOV	PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23-12 CTOV	Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11 —	Reserved
10-8 TILS	Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. - 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . - . - 100: Left shift TI by 7 bits (equal to x128ns)

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7-6 LCSE	Loop Count to report Scheduling Error Programmable number of GCL list iterations before reporting an HLBS error defined in EST_STATUS register. 00 - 4 iterations 01 - 8 iterations 10 - 16 iterations 11 - 32 iterations
5 DFBS	Drop Frames causing Scheduling Error When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_STATUS register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped. 0 - Do not Drop Frames causing Scheduling Error 1 - Drop Frames causing Scheduling Error
4 DDBF	Do not Drop frames during Frame Size Error When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of MTL_EST_STATUS register). 0 - Drop frames during Frame Size Error 1 - Do not Drop frames during Frame Size Error
3-2 —	Reserved
1 SSWL	Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Switch to S/W owned list is disabled 1 - Switch to S/W owned list is enabled
0 EEST	Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. When DWC_EQOS_ASP_ECC is selected during the configuration, if any uncorrectable error is detected in the EST memory the hardware will reset this bit and disable the EST function.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - EST is disabled 1 - EST is enabled

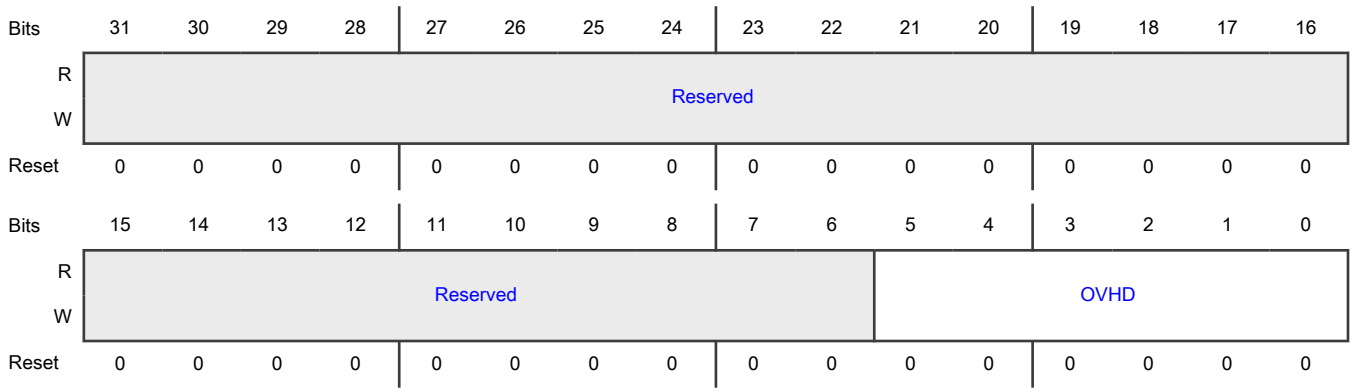
34.8.1.380 MTL_EST_EXT_CONTROL (MTL_EST_EXT_CONTROL)

This register indicates the number of overhead bytes for EST related scheduling.

Offset

Register	Offset
MTL_EST_EXT_CONTROL	C54h

Diagram



Fields

Field	Description
31-6 —	Reserved
5-0 OVHD	Overhead Bytes Value This field indicates the fixed overhead for every packet to account for EST Scheduler Delay, IPG or EIPG, and Preamble bytes.

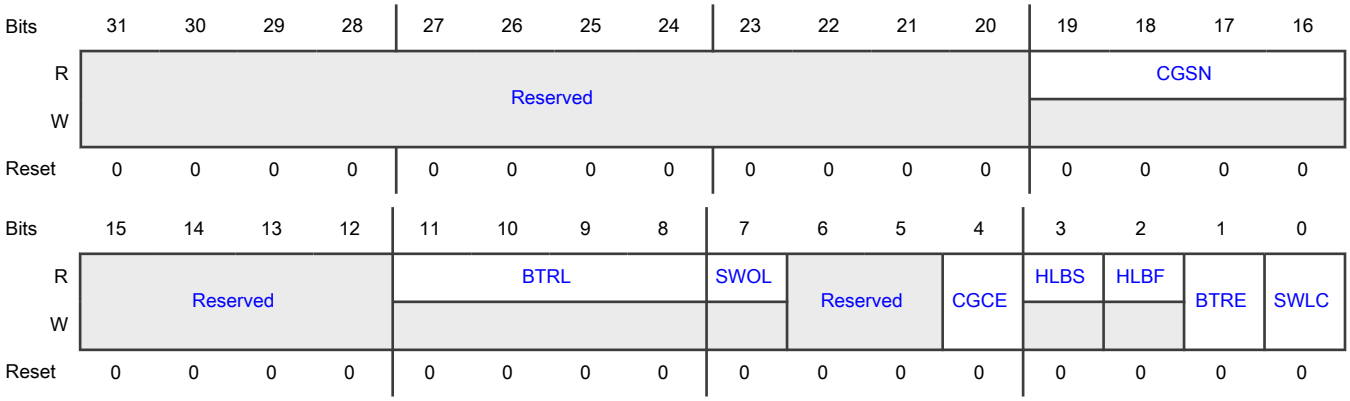
34.8.1.381 Enhancements to Scheduled Transmission Status (MTL_EST_STATUS)

This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Offset

Register	Offset
MTL_EST_STATUS	C58h

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 CGSN	Current GCL Slot Number Indicates the slot number of the GCL list. Current GCL Slot Number Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15-12 —	Reserved
11-8 BTRL	BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "1111" indicates the iterations exceeded the value of 8 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7 SWOL	S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. S/W owned list

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0 - Gate control list number "0" is owned by software 1 - Gate control list number "1" is owned by software
6-5 —	Reserved
4 CGCE	Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the programmed Time Interval (TI) value after the optional Left Shifting is less than or equal to the Cycle Time (CTR). Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the programmed Time Interval (TI) value after the optional Left Shifting is less than or equal to the Cycle Time (CTR). The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Constant Gate Control Error not detected 1 - Constant Gate Control Error detected
3 HLBS	Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_SCH_ERROR register. Bit cleared when MTL_EST_SCH_ERROR register is all zeroes. 0 - Head-Of-Line Blocking due to Scheduling not detected 1 - Head-Of-Line Blocking due to Scheduling detected
2 HLBF	Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_FRM_SIZE_ERROR register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_FRM_SIZE_CAPTURE register. Bit cleared when MTL_EST_FRAME_SIZE_ ERROR register is all zeros.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Head-Of-Line Blocking due to Frame Size not detected 1 - Head-Of-Line Blocking due to Frame Size detected
1 BTRE	BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "1111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "1111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - BTR Error not detected 1 - BTR Error detected
0 SWLC	Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of MTL_EST_CONTROL register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Switch to S/W owned list Complete not detected 1 - Switch to S/W owned list Complete detected

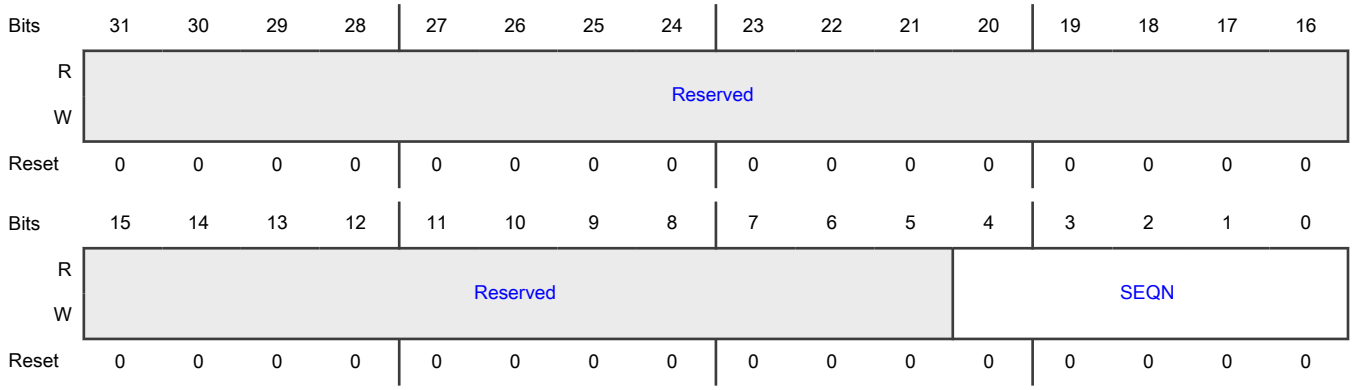
34.8.1.382 EST Scheduling Error (MTL_EST_SCH_ERROR)

This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

Offset

Register	Offset
MTL_EST_SCH_ERROR	C60h

Diagram



Fields

Field	Description
31-5 —	Reserved
4-0 SEQN	Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

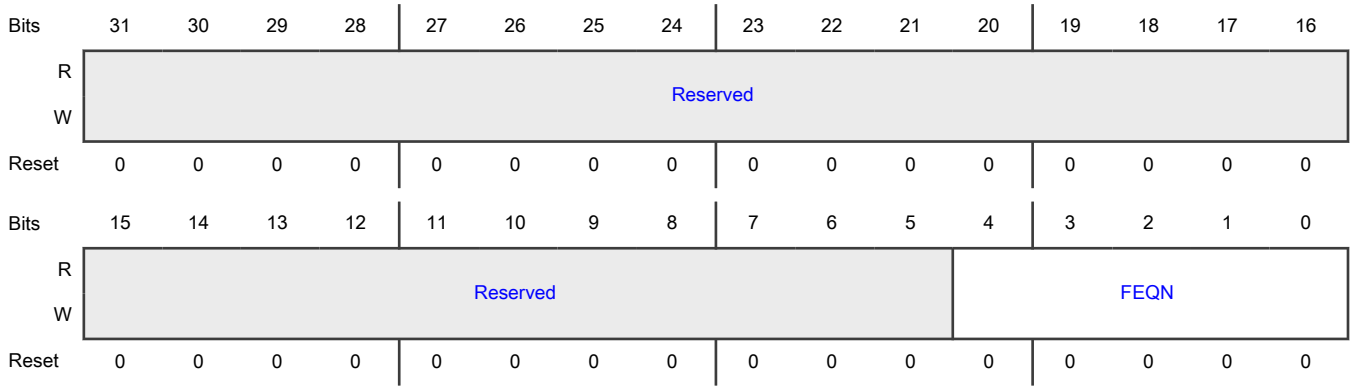
34.8.1.383 EST Frame Size Error (MTL_EST_FRM_SIZE_ERROR)

This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

Offset

Register	Offset
MTL_EST_FRM_SIZE_ERROR	C64h

Diagram



Fields

Field	Description
31-5 —	Reserved
4-0 FEQN	Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

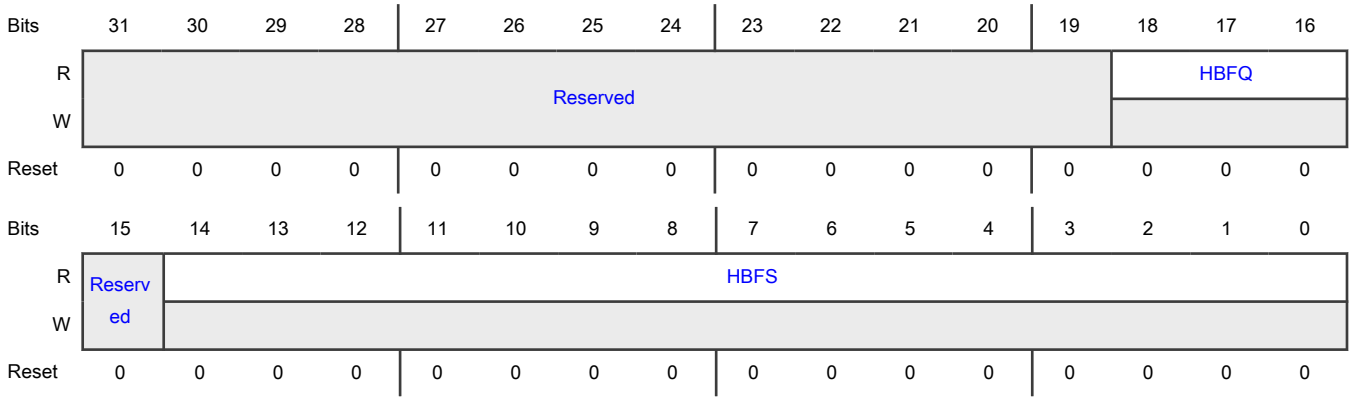
34.8.1.384 EST Frame Size Capture (MTL_EST_FRM_SIZE_CAPTURE)

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

Offset

Register	Offset
MTL_EST_FRM_SIZE_CAPTURE	C68h

Diagram



Fields

Field	Description
31-19 —	Reserved
18-16 HBFQ	Queue Number of HLBF Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Queue Number of HLBF Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLBF error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_FRM_SIZE_ERROR register is all zeros.
15 —	Reserved
14-0 HBFS	Frame Size of HLBF Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Frame Size of HLBF Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_FRM_SIZE_ERROR register is all zeros.

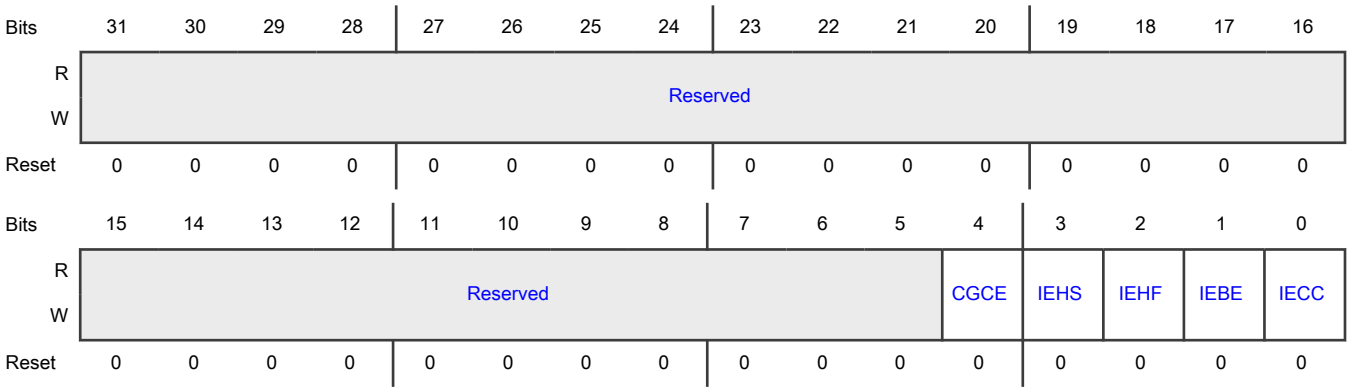
34.8.1.385 EST Interrupt Enable (MTL_EST_INTR_ENABLE)

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_STATUS register.

Offset

Register	Offset
MTL_EST_INTR_ENABLE	C70h

Diagram



Fields

Field	Description
31-5 —	Reserved
4 CGCE	Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt 0 - Interrupt for CGCE is disabled 1 - Interrupt for CGCE is enabled
3 IEHS	Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for HLBS is disabled 1 - Interrupt for HLBS is enabled
2 IEHF	Interrupt Enable for HLBF When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. Interrupt Enable for HLBF

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for HLBF is disabled 1 - Interrupt for HLBF is enabled
1 IEBE	Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0 - Interrupt for BTR Error is disabled 1 - Interrupt for BTR Error is enabled
0 IECC	Interrupt Enable for Switch List When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. Interrupt Enable for Switch List When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt. 0 - Interrupt for Switch List is disabled 1 - Interrupt for Switch List is enabled

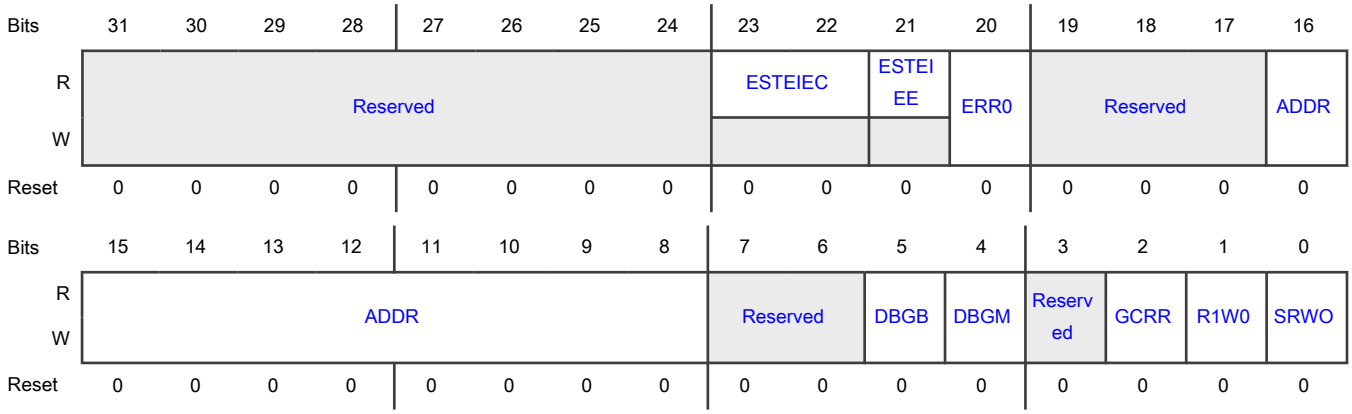
34.8.1.386 EST GCL Control (MTL_EST_GCL_CONTROL)

This register provides the control information for reading/writing to the Gate Control lists.

Offset

Register	Offset
MTL_EST_GCL_CONTROL	C80h

Diagram



Fields

Field	Description

23-22 ESTEIEC	ECC Inject Error Control for EST Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. ECC Inject Error Control for EST Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. This filed will be valid only if DWC_EQOS_ASP_ECC feature is selected during the configuration, else it will be reserved. 00 - Insert 1 bit error 01 - Insert 2 bit errors 10 - Insert 3 bit errors 11 - Insert 1 bit error in address field
21 ESTEIEE	EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_CONTROL register, enables the ECC error injection feature. EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_CONTROL register, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0 - EST ECC Inject Error is disabled 1 - EST ECC Inject Error is enabled
20 ERR0	When set indicates the last write operation was aborted as software writes to GCL and GCL registers is prohibited when SSWL bit of MTL_EST_CONTROL Register is set. When set indicates the last write operation was aborted as software writes to GCL and GCL registers is prohibited when SSWL bit of MTL_EST_CONTROL Register is set. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - ERR0 is disabled 1 - ERR1 is enabled
19-17 —	Reserved
16-8 ADDR	Gate Control List Address: (GCLA when GCRR is "0"). Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_STATUS is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. The width of this field is dependent on DWC_EQOS_EST_DEP; unused bits should be treated as read only. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_STATUS is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) - Others: Reserved
7-6 —	Reserved
5 DBGB	Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. 0 - R/W in debug mode should be directed to Bank 0 1 - R/W in debug mode should be directed to Bank 1
4 DBGM	Debug Mode When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use. 0 - Debug Mode is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Debug Mode is enabled
3 —	Reserved
2 GCRR	Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. 0 - Gate Control Related Registers are disabled 1 - Gate Control Related Registers are enabled
1 R1W0	Read '1', Write '0': When set to '1': Read Operation When set to '0': Write Operation. 0 - Write Operation 1 - Read Operation
0 SRWO	Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_DATA register after this bit is reset Writes: MTL_EST_GCL_DATA should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Start Read/Write Op disabled 1 - Start Read/Write Op enabled

34.8.1.387 EST GCL Data (MTL_EST_GCL_DATA)

This register holds the read data or write data in case of reads and writes respectively.

Offset

Register	Offset
MTL_EST_GCL_DATA	C84h

20 —	Reserved
19-17 —	Reserved
16 WRRDN	Read Write Control When this bit is set to 1 indicates the write operation to the Rx Parser Memory. Read Write Control When this bit is set to 1 indicates the write operation to the Rx Parser Memory. When this bit is set to 0 indicates the read operation to the Rx Parser Memory. 0 - Read operation to the Rx Parser Memory 1 - Write operation to the Rx Parser Memory
15-10 —	Reserved
9-0 ADDR	FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). The X depends on the configurable DWC_EQOS_FRP_ENTRIES If DWC_EQOS_FRP_ENTRIES == 256 , then X = 9 If DWC_EQOS_FRP_ENTRIES = 128 , then X = 8 IF DWC_EQOS_FRP_ENTRIES = 64, then X = 7 This is can be written by the software before issuing any Read/Write command. The hardware auto-increments this field after the read-write operation gets completed.

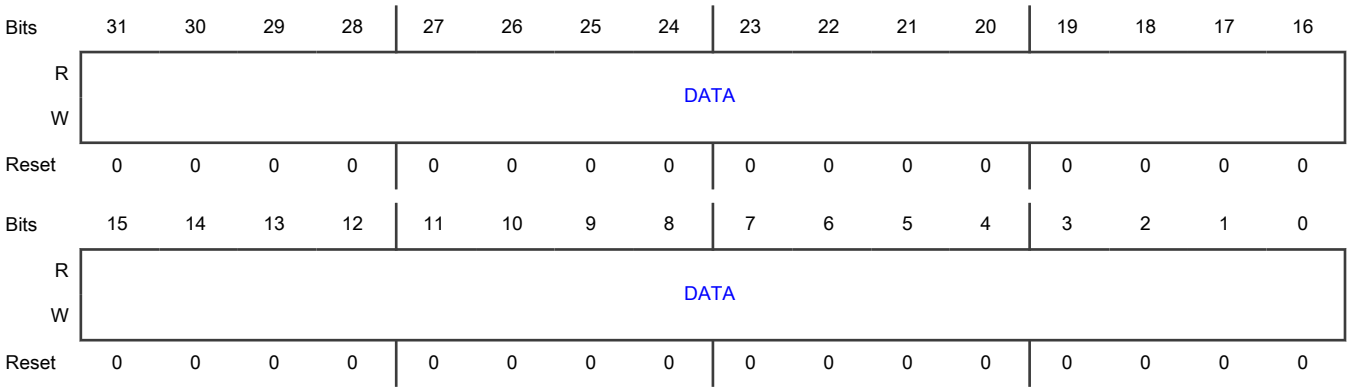
34.8.1.395 RXP Indirect Access Data (MTL_RXP_INDIRECT_ACC_DATA)

The RXP_INDIRECT_ACC_DATA registers holds the data associated to Indirect Access to Rx Parser memory.

Offset

Register	Offset
MTL_RXP_INDIRECT_ACC_DATA	CB4h

Diagram



Fields

Field	Description
31-0 DATA	FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.

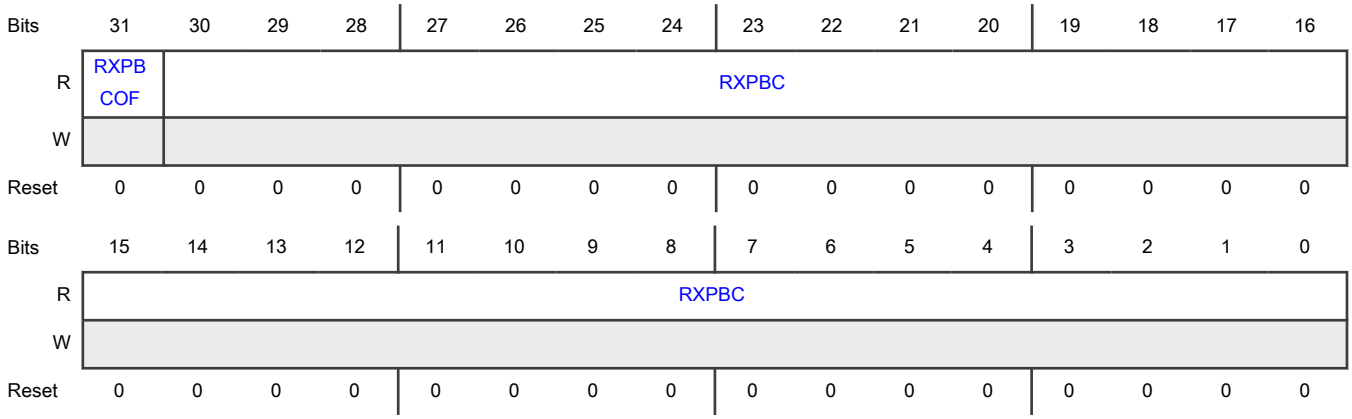
34.8.1.396 MTL_RXP_BYPASS_CNT (MTL_RXP_BYPASS_CNT)

The MTL_RXP_BYPASS_CNT register provides the bypass count of Rx Parser.

Offset

Register	Offset
MTL_RXP_BYPASS_CNT	CB8h

Diagram



Fields

Field	Description
31 RXPBCOF	Rx Parser bypass Counter Overflow Bit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Indicates that MTL_RXP_BYPASS_CNT[RXPBC] counter field has not crossed the maximum limit 1 - Indicates that MTL_RXP_BYPASS_CNT[RXPBC] counter field has crossed the maximum limit
30-0 RXPBC	Rx Parser Bypass Count This 31-bit counter is implemented when a Rx Parser bypass a packet due to AF=1 and RF=1. The counter is cleared when the register is read.

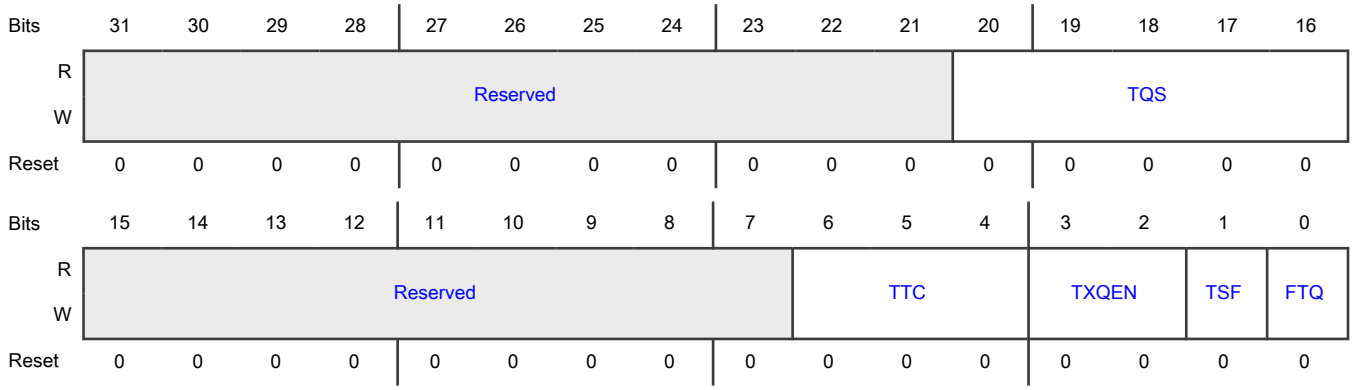
34.8.1.397 Queue 0 Transmit Operation Mode (MTL_TXQ0_OPERATION_MODE)

The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Offset

Register	Offset
MTL_TXQ0_OPERATION_MODE	D00h

Diagram



Fields

Field	Description
31-21 —	Reserved
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192

Table continues on the next page...

Table continued from the previous page...

Field	Description
	101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Reserved - 2'b10: Enabled - 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ0_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights*packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero.

34.8.1.402 Queue 0 Interrupt Control Status (MTL_Q0_INTERRUPT_CONTROL_STATUS)

This register contains the interrupt enable and status bits for the queue 0 interrupts.

Offset

Fields

Field	Description
31-25 —	Reserved
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ...

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ1_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled

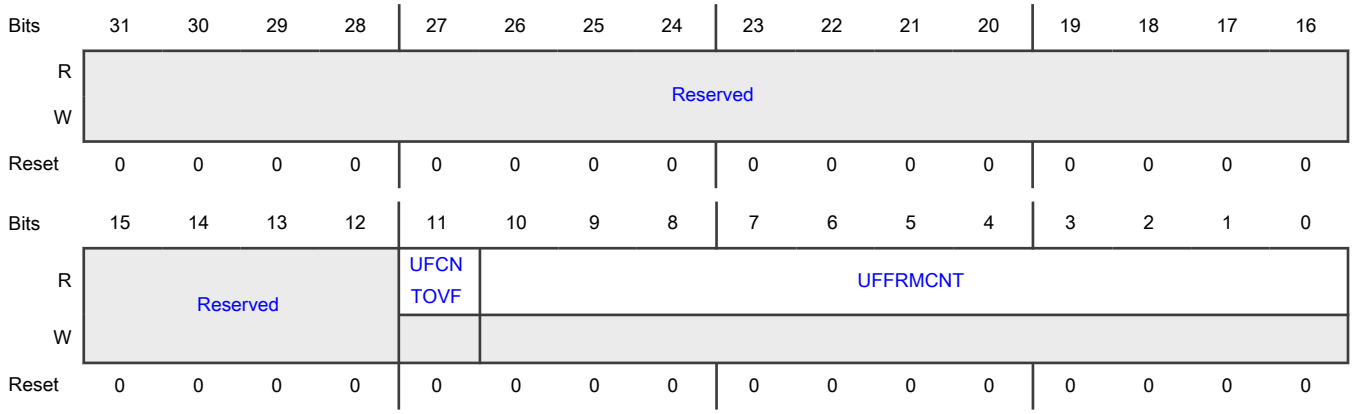
34.8.1.408 Queue 1 Underflow Counter (MTL_TXQ1_UNDERFLOW)

The Queue 1 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Offset

Register	Offset
MTL_TXQ1_UNDERFLOW	D44h

Diagram



Fields

Field	Description
31-12 —	Reserved
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Overflow not detected for Underflow Packet Counter 1 - Overflow detected for Underflow Packet Counter
10-0 UFFRMCNT	Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

34.8.1.409 Queue 1 Transmit Debug (MTL_TXQ1_DEBUG)

The Queue 1 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Offset

Fields

Field	Description
31-23 —	Reserved
22-20 STXSTSF	Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue. Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of OPERATION_MODE register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19 —	Reserved
18-16 PTXQ	Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_OPERATION_MODE register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15-6 —	Reserved
5 TXSTSFSTS	MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0 - MTL Tx Status FIFO Full status is not detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - MTL Tx Status FIFO Full status is detected
4 TXQSTS	MTL Tx Queue Not Empty Status When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0 - MTL Tx Queue Not Empty status is not detected 1 - MTL Tx Queue Not Empty status is detected
3 TWCSTS	MTL Tx Queue Write Controller Status When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0 - MTL Tx Queue Write Controller status is not detected 1 - MTL Tx Queue Write Controller status is detected
2-1 TRCSTS	MTL Tx Queue Read Controller Status This field indicates the state of the Tx Queue Read Controller: 00 - Idle state 01 - Read state (transferring data to the MAC transmitter) 10 - Waiting for pending Tx Status from the MAC transmitter 11 - Flushing the Tx queue because of the Packet Abort request from the MAC
0 TXQPAUSED	Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802. Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0 - Transmit Queue in Pause status is not detected 1 - Transmit Queue in Pause status is detected

34.8.1.410 Queue 1 ETS Control (MTL_TXQ1_ETS_CONTROL)

The Queue 1 ETS Control register controls the enhanced transmission selection operation.

Offset

Register	Offset
MTL_TXQ1_ETS_CONTROL	D50h

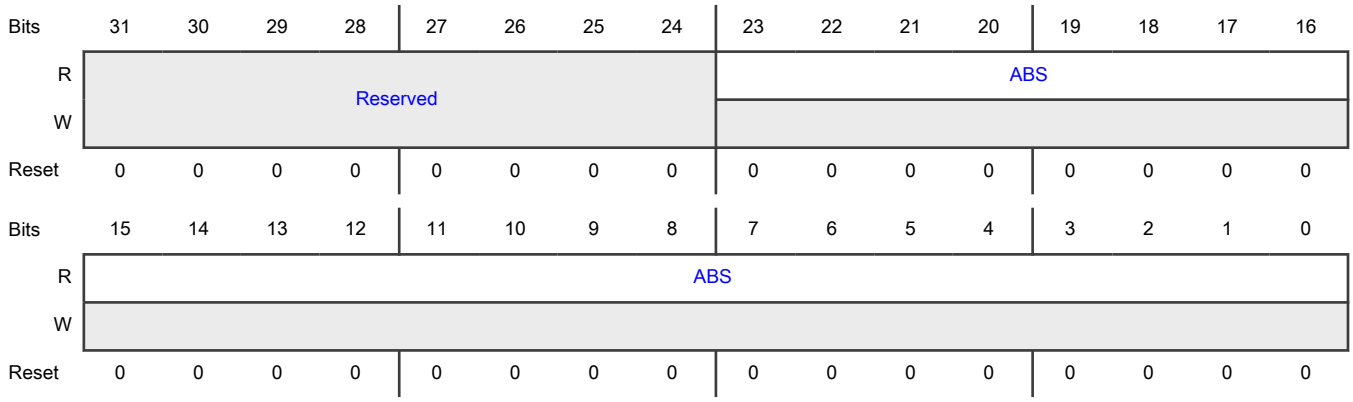
Register	Offset
MTL_TXQ1_ETS_STATUS	D54h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-0	Average Bits per Slot This field contains the average transmitted bits per slot.

Table continues on the next page...

Table continued from the previous page...

Field	Description
ABS	Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ1_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

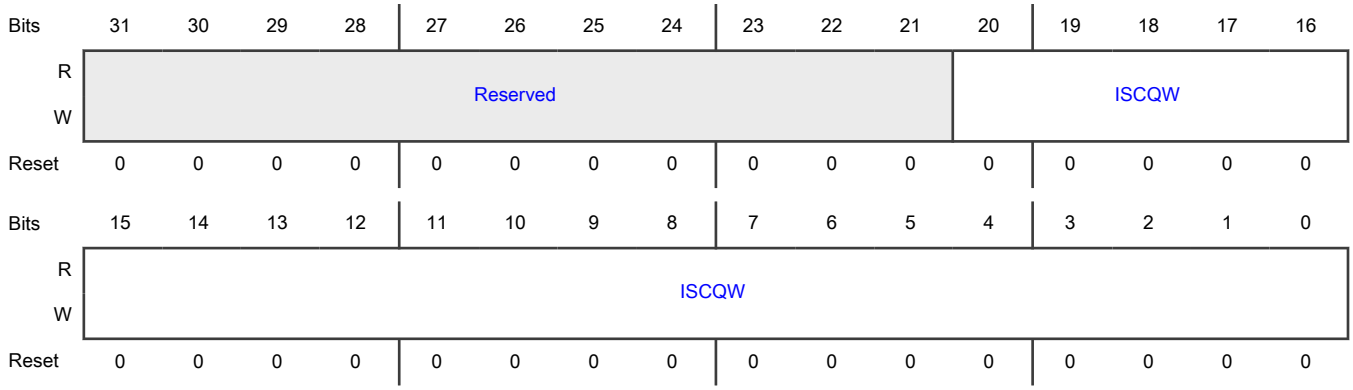
34.8.1.412 Queue 1 idleSlopeCredit, Quantum or Weights (MTL_TXQ1_QUANTUM_WEIGHT)

The Queue 1 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 1.

Offset

Register	Offset
MTL_TXQ1_QUANTUM_WEIGHT	D58h

Diagram



Fields

Field	Description
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. idleSlopeCredit, Quantum or Weights

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

34.8.1.413 Queue 1 sendSlopeCredit (MTL_TXQ1_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Offset

Register	Offset
MTL_TXQ1_SENDSLOPECREDIT	D5Ch

1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Average Bits Per Slot Interrupt Status not detected 1 - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Queue Underflow Interrupt Status not detected 1 - Transmit Queue Underflow Interrupt Status detected

34.8.1.417 Queue 1 Receive Operation Mode (MTL_RXQ1_OPERATION_MODE)

The Queue 1 Receive Operation Mode register establishes the Receive queue operating modes and command.

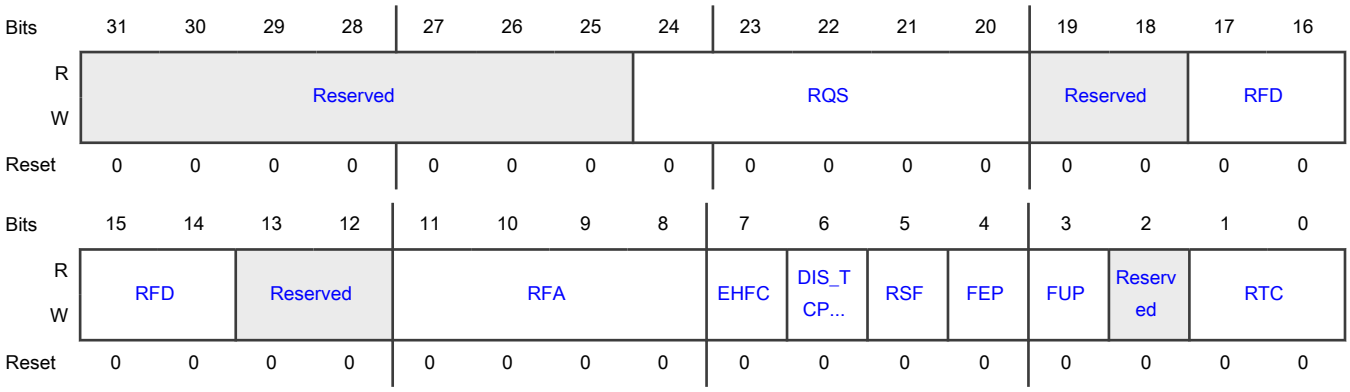
The Queue 1 Receive Operation Mode register establishes the Receive queue operating modes and command.

The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Offset

Register	Offset
MTL_RXQ1_OPERATION_MODE	D70h

Diagram



Fields

Field	Description
31-25 —	Reserved
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes)

Table continues on the next page...

Table continued from the previous page...

Field	Description
	These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128

34.8.1.418 Queue 1 Missed Packet and Overflow Counter (MTL_RXQ1_MISSED_PACKET_OVERFLOW_CNT)

The Queue 1 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Offset

Register	Offset
MTL_RXQ1_MISSED_PACKET_OVERFLOW_CNT	D74h

3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. Receive Queue Packet Arbitration

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0 - Receive Queue Packet Arbitration is disabled 1 - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 1. Receive Queue Weight This field indicates the weight assigned to the Rx Queue 1. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.

34.8.1.421 Queue 2 Transmit Operation Mode (MTL_TXQ2_OPERATION_MODE)

The Queue 2 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Offset

Register	Offset
MTL_TXQ2_OPERATION_MODE	D80h

Fields

Field	Description
31-21 —	Reserved
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ2_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled

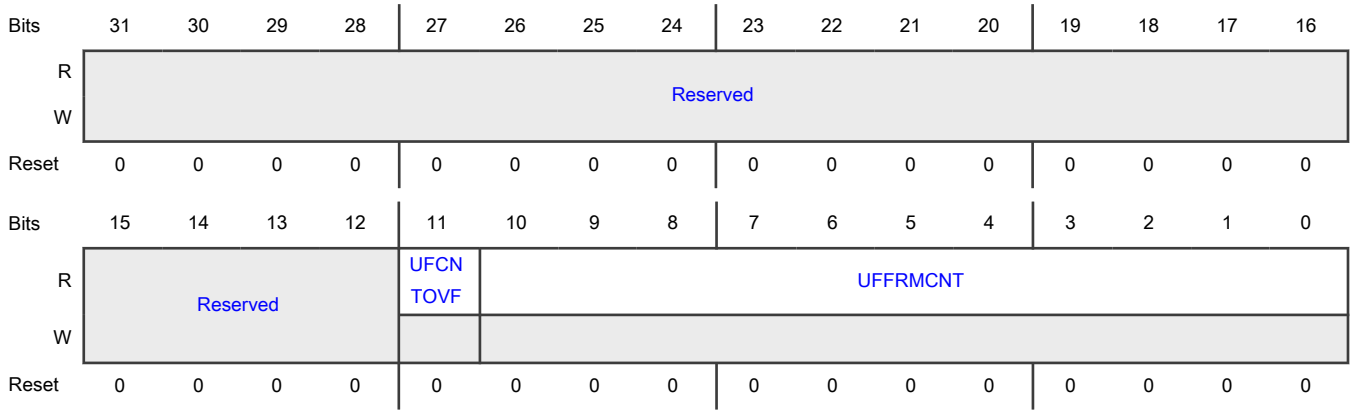
34.8.1.422 Queue 2 Underflow Counter (MTL_TXQ2_UNDERFLOW)

The Queue 2 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Offset

Register	Offset
MTL_TXQ2_UNDERFLOW	D84h

Diagram



Fields

Field	Description
31-12 —	Reserved
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Overflow not detected for Underflow Packet Counter 1 - Overflow detected for Underflow Packet Counter
10-0 UFFRMCNT	Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

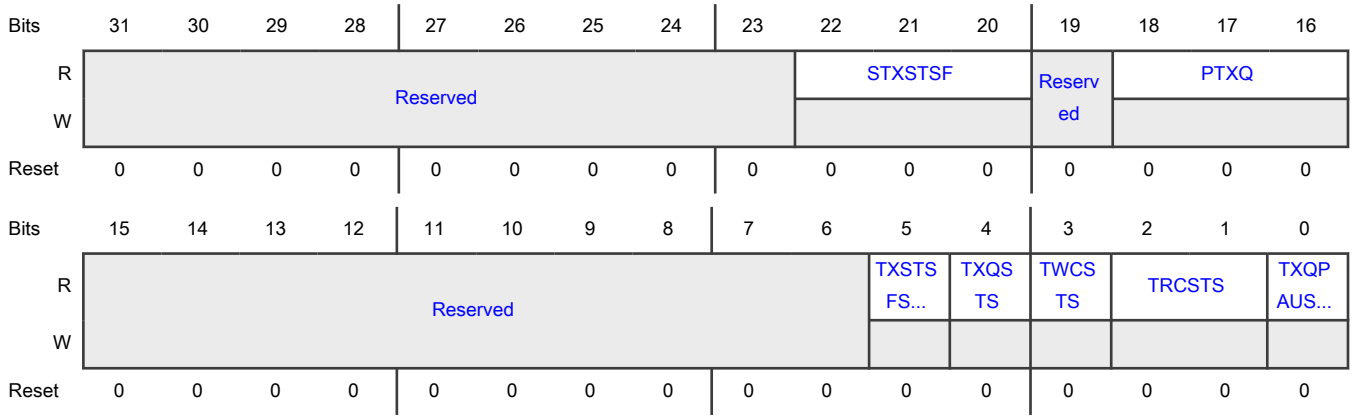
34.8.1.423 Queue 2 Transmit Debug (MTL_TXQ2_DEBUG)

The Queue 2 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Offset

Register	Offset
MTL_TXQ2_DEBUG	D88h

Diagram



Fields

Field	Description
31-24	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ2_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

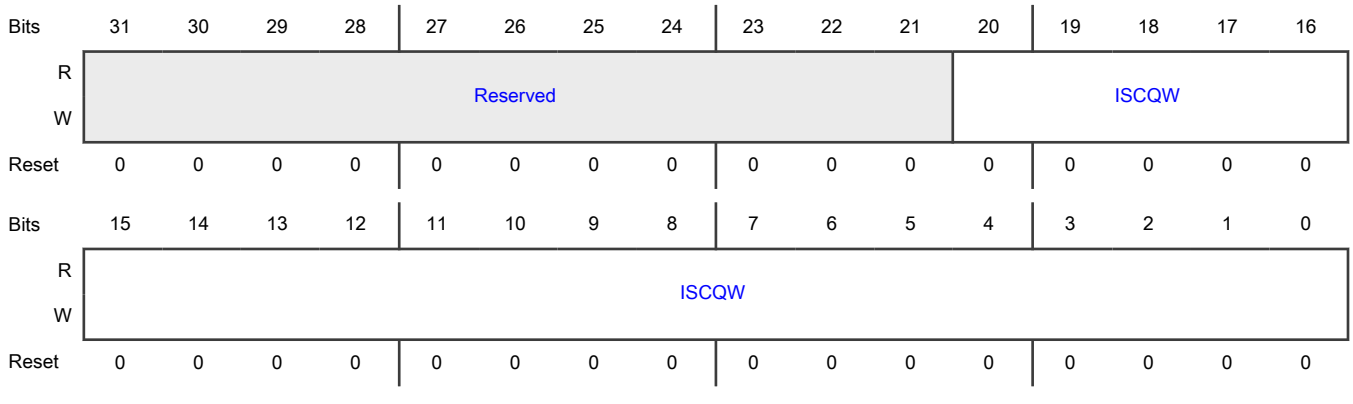
34.8.1.426 Queue 2 idleSlopeCredit, Quantum or Weights (MTL_TXQ2_QUANTUM_WEIGHT)

The Queue 2 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 2.

Offset

Register	Offset
MTL_TXQ2_QUANTUM_WEIGHT	D98h

Diagram



Fields

Field	Description
31-21 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 2. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 2. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 2 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 2 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 2 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

34.8.1.427 Queue 2 sendSlopeCredit (MTL_TXQ2_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Offset

Register	Offset

Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes)

Table continues on the next page...

Table continued from the previous page...

Field	Description
	These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128

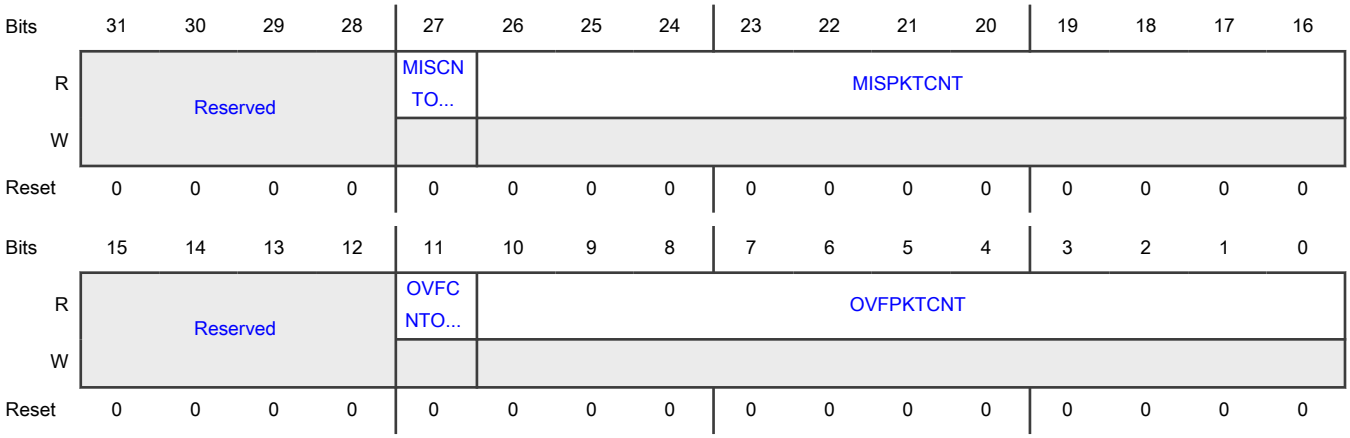
34.8.1.432 Queue 2 Missed Packet and Overflow Counter (MTL_RXQ2_MISSED_PACKET_OVERFLOW_CNT)

The Queue 2 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Offset

Register	Offset
MTL_RXQ2_MISSED_PACKET_OVERFLOW_CNT	DB4h

Diagram



Fields

Field	Description

Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Missed Packet Counter overflow not detected 1 - Missed Packet Counter overflow detected
26-16 MISPKTCNT	Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15-12 —	Reserved
11 OVFCNTOVF	Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Overflow Counter overflow not detected 1 - Overflow Counter overflow detected
10-0 OVFPKTCNT	Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. This counter is incremented each time the DWC_ether_qos discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

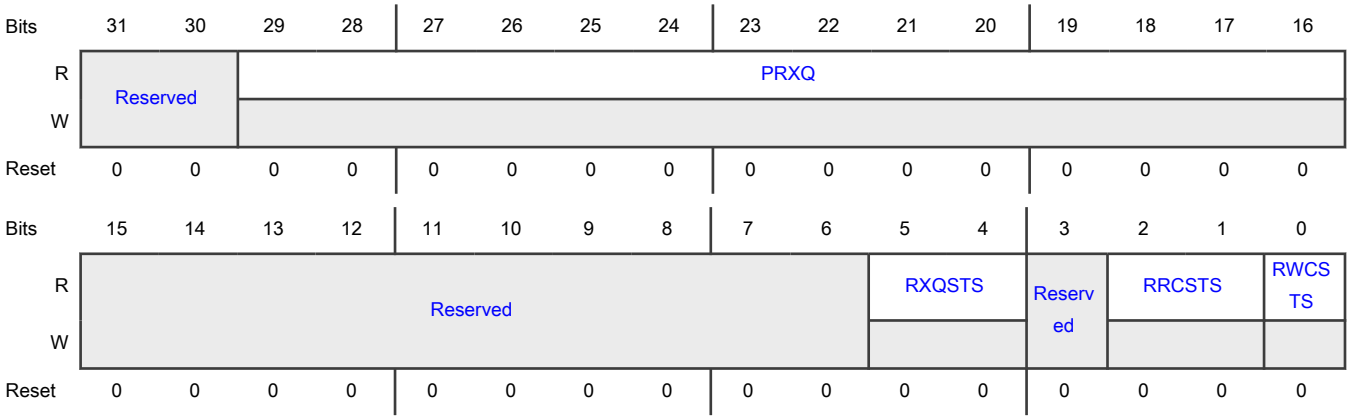
34.8.1.433 Queue 2 Receive Debug (MTL_RXQ2_DEBUG)

The Queue 2 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Offset

Register	Offset
MTL_RXQ2_DEBUG	DB8h

Diagram



Fields

Field	Description
31-30 —	Reserved
29-16 PRXQ	Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved
5-4 RXQSTS	MTL Rx Queue Fill-Level Status This field gives the status of the fill-level of the Rx Queue: 00 - Rx Queue empty 01 - Rx Queue fill-level below flow-control deactivate threshold 10 - Rx Queue fill-level above flow-control activate threshold 11 - Rx Queue full
3 —	Reserved
2-1 RRCSTS	MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: 00 - Idle state

Table continues on the next page...

Table continued from the previous page...

Field	Description
	01 - Reading packet data 10 - Reading packet status (or timestamp) 11 - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0 - MTL Rx Queue Write Controller Active Status not detected 1 - MTL Rx Queue Write Controller Active Status detected

34.8.1.434 Queue 2 Receive Control (MTL_RXQ2_CONTROL)

The Queue 2 Receive Control register controls the receive arbitration and passing of received packets to the application.

Offset

Register	Offset
MTL_RXQ2_CONTROL	DBCh

Fields

Field	Description
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. Receive Queue Packet Arbitration

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0 - Receive Queue Packet Arbitration is disabled 1 - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 2. Receive Queue Weight This field indicates the weight assigned to the Rx Queue 2. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.

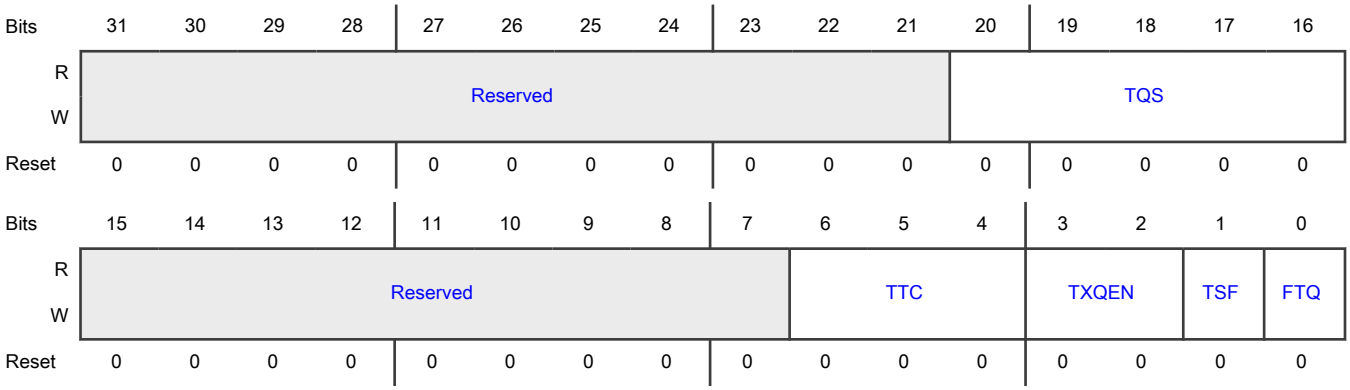
34.8.1.435 Queue 3 Transmit Operation Mode (MTL_TXQ3_OPERATION_MODE)

The Queue 3 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Offset

Register	Offset
MTL_TXQ3_OPERATION_MODE	DC0h

Diagram



Fields

Field	Description
31-21 —	Reserved
20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ3_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled

34.8.1.436 Queue 3 Underflow Counter (MTL_TXQ3_UNDERFLOW)

The Queue 3 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Offset

Register	Offset
MTL_TXQ3_UNDERFLOW	DC4h

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ3_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

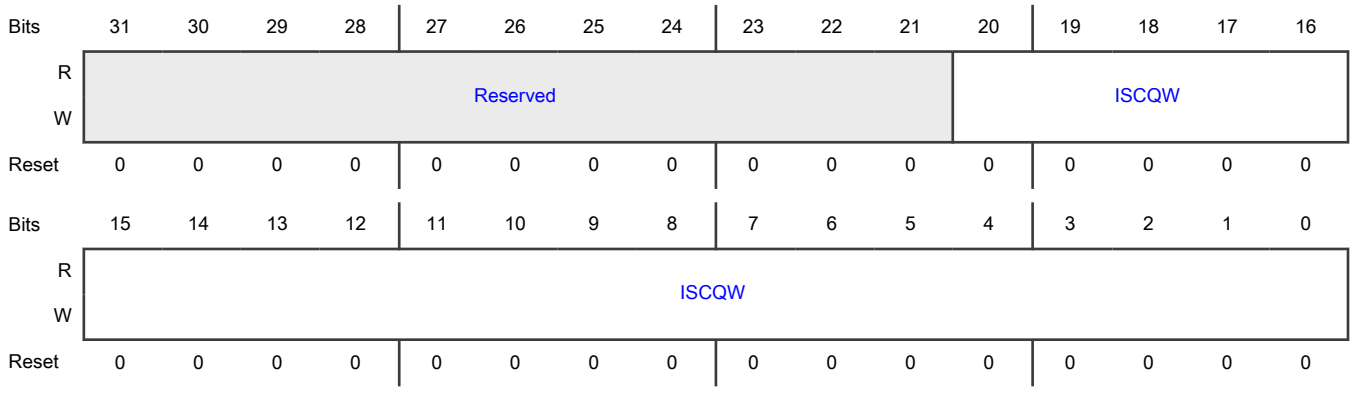
34.8.1.440 Queue 3 idleSlopeCredit, Quantum or Weights (MTL_TXQ3_QUANTUM_WEIGHT)

The Queue 3 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 3.

Offset

Register	Offset
MTL_TXQ3_QUANTUM_WEIGHT	DD8h

Diagram



Fields

Field	Description
31-21 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 3. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 3. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 3 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 3 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 3 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

34.8.1.441 Queue 3 sendSlopeCredit (MTL_TXQ3_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Offset

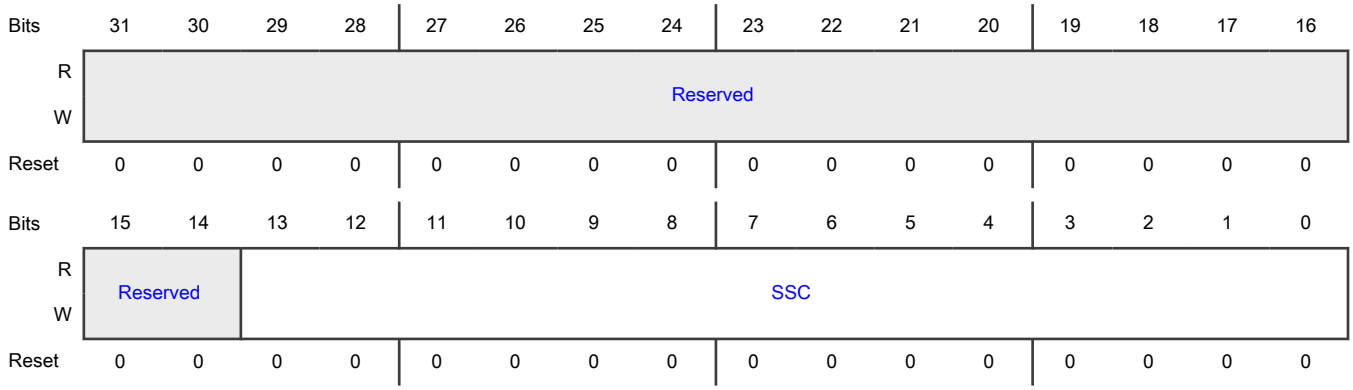
Diagram



Fields

Field	Description
31-25 —	Reserved
24-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19-18 —	Reserved
17-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1. Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes)

Table continues on the next page...

Table continued from the previous page...

Field	Description
	These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128

34.8.1.446 Queue 3 Missed Packet and Overflow Counter (MTL_RXQ3_MISSED_PACKET_OVERFLOW_CNT)

The Queue 3 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Offset

Register	Offset
MTL_RXQ3_MISSED_PACKET_OVERFLOW_CNT	DF4h

3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. Receive Queue Packet Arbitration

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0 - Receive Queue Packet Arbitration is disabled 1 - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 3. Receive Queue Weight This field indicates the weight assigned to the Rx Queue 3. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.

34.8.1.449 Queue 4 Transmit Operation Mode (MTL_TXQ4_OPERATION_MODE)

The Queue 4 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Offset

Register	Offset
MTL_TXQ4_OPERATION_MODE	E00h

20-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000 - 32 001 - 64 010 - 96 011 - 128 100 - 192 101 - 256 110 - 384 111 - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00 - Not enabled 01 - Enable in AV mode (Reserved in non-AV) 10 - Enabled 11 - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0 - Transmit Store and Forward is disabled 1 - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TXQ4_OPERATION_MODE register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (clk_tx_i) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Flush Transmit Queue is disabled 1 - Flush Transmit Queue is enabled

34.8.1.450 Queue 4 Underflow Counter (MTL_TXQ4_UNDERFLOW)

The Queue 4 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Offset

Register	Offset
MTL_TXQ4_UNDERFLOW	E04h

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. Average Bits per Slot This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TXQ4_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

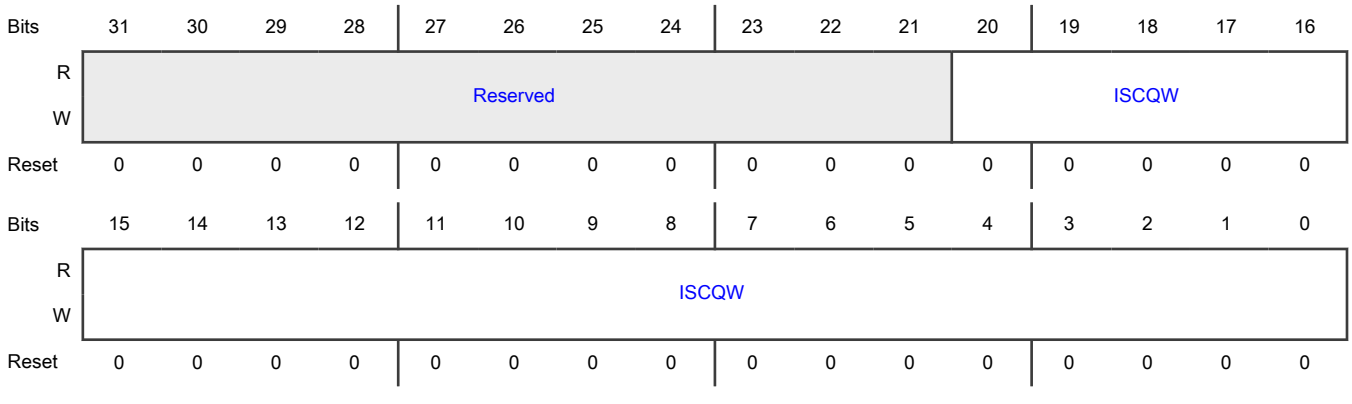
34.8.1.454 Queue 4 idleSlopeCredit, Quantum or Weights (MTL_TXQ4_QUANTUM_WEIGHT)

The Queue 4 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 4.

Offset

Register	Offset
MTL_TXQ4_QUANTUM_WEIGHT	E18h

Diagram



Fields

Field	Description
31-21 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 4. idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 4. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 4 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 4 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 4 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is OPERATION_MODE register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

34.8.1.455 Queue 4 sendSlopeCredit (MTL_TXQ4_SENDSLOPECREDIT)

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 14: Full minus 8 KB, that is, FULL 8 KB - 15: Full minus 8.5 KB, that is, FULL 8.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13-12 —	Reserved
11-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0 - Hardware Flow Control is disabled 1 - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is reset, all error packets are dropped if the FEP bit is reset. 0 - Dropping of TCP/IP Checksum Error Packets is enabled 1 - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0 - Receive Queue Store and Forward is disabled 1 - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. 0 - Forward Error Packets is disabled 1 - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0 - Forward Undersized Good Packets is disabled 1 - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00 - 64 01 - 32 10 - 96 11 - 128

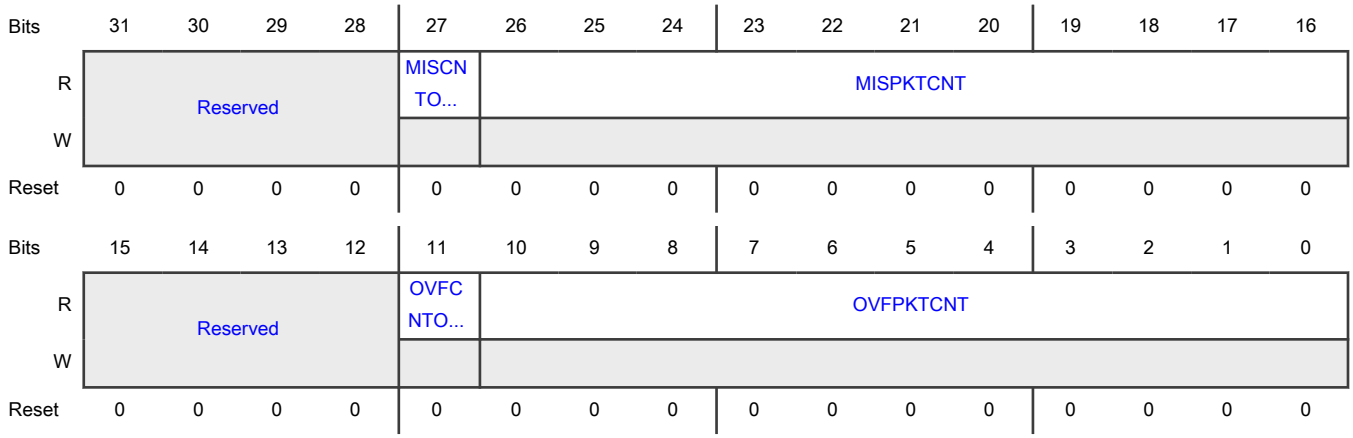
34.8.1.460 Queue 4 Missed Packet and Overflow Counter (MTL_RXQ4_MISSED_PACKET_OVERFLOW_CNT)

The Queue 4 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Offset

Register	Offset
MTL_RXQ4_MISSED_PACKET_OVERFLOW_CNT	E34h

Diagram



Fields

Field	Description
31-28 —	Reserved
27 MISCNTOVF	Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Missed Packet Counter overflow not detected 1 - Missed Packet Counter overflow detected
26-16 MISPKTCNT	Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15-12 —	Reserved
11 OVFCNTOVF	Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0 - Overflow Counter overflow not detected 1 - Overflow Counter overflow detected
10-0 OVFPKTCNT	Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. This counter is incremented each time the DWC_ether_qos discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

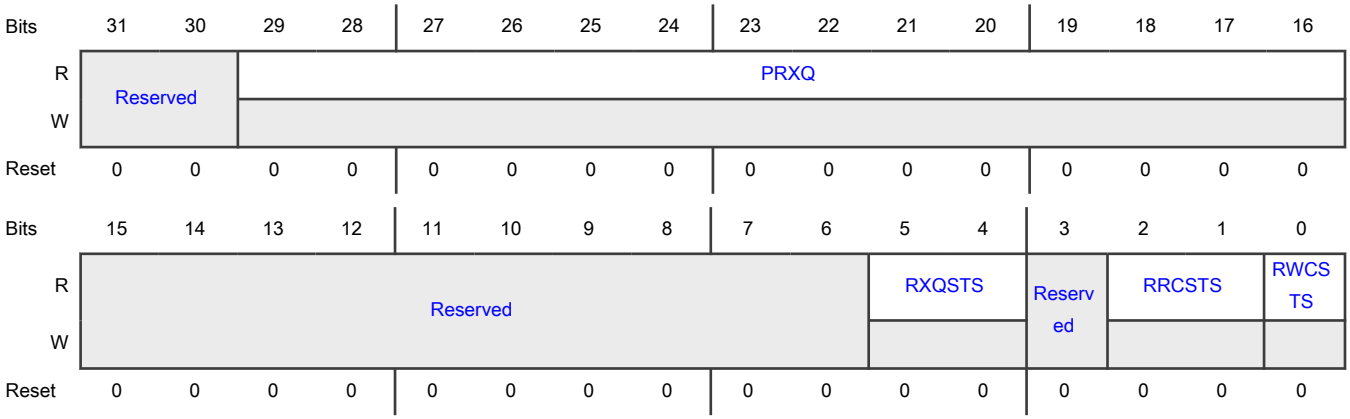
34.8.1.461 Queue 4 Receive Debug (MTL_RXQ4_DEBUG)

The Queue 4 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Offset

Register	Offset
MTL_RXQ4_DEBUG	E38h

Diagram



Fields

Field	Description
31-30 —	Reserved
29-16 PRXQ	Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved
5-4 RXQSTS	MTL Rx Queue Fill-Level Status This field gives the status of the fill-level of the Rx Queue: 00 - Rx Queue empty 01 - Rx Queue fill-level below flow-control deactivate threshold 10 - Rx Queue fill-level above flow-control activate threshold 11 - Rx Queue full
3 —	Reserved
2-1 RRCSTS	MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: 00 - Idle state

Table continues on the next page...

Table continued from the previous page...

Field	Description
	01 - Reading packet data 10 - Reading packet status (or timestamp) 11 - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0 - MTL Rx Queue Write Controller Active Status not detected 1 - MTL Rx Queue Write Controller Active Status detected

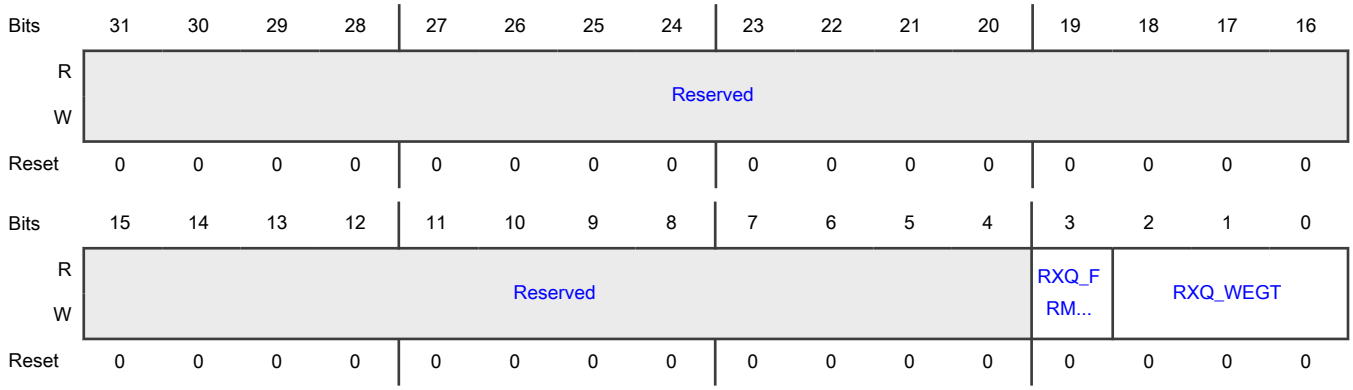
34.8.1.462 Queue 4 Receive Control (MTL_RXQ4_CONTROL)

The Queue 4 Receive Control register controls the receive arbitration and passing of received packets to the application.

Offset

Register	Offset
MTL_RXQ4_CONTROL	E3Ch

Diagram



Fields

Field	Description
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. Receive Queue Packet Arbitration

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0 - Receive Queue Packet Arbitration is disabled 1 - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 4. Receive Queue Weight This field indicates the weight assigned to the Rx Queue 4. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.

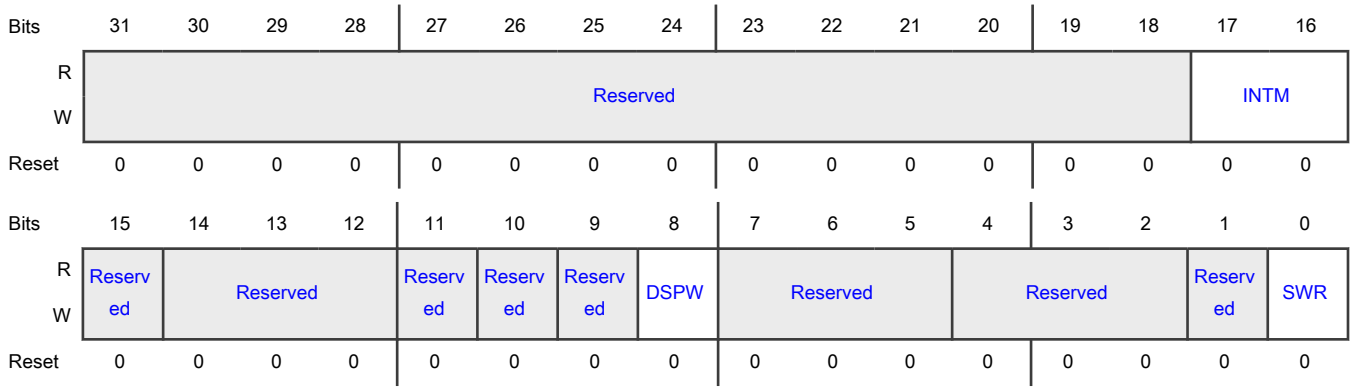
34.8.1.463 DMA Bus Mode (DMA_MODE)

The Bus Mode register establishes the bus operating modes for the DMA.

Offset

Register	Offset
DMA_MODE	1000h

Diagram



Fields

Field	Description
31-18 —	Reserved
17-16 INTM	Interrupt Mode This field defines the interrupt mode of DWC_ether_qos. Interrupt Mode This field defines the interrupt mode of DWC_ether_qos. The behavior of the following outputs changes depending on the following settings: - sbd_perch_tx_intr_o[] (Transmit Per Channel Interrupt) - sbd_perch_rx_intr_o[] (Receive Per Channel Interrupt) - sbd_intr_o (Common Interrupt) It also changes the behavior of the RI/TI bits in the STATUS. - 00: sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corresponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. - 01: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 10: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 11: Reserved For more details please refer Table "DWC_ether_qos Transfer Complete Interrupt Behavior". 00 - See above description 01 - See above description 10 - See above description 11 - Reserved

8 DSPW	Descriptor Posted Write When this bit is set to 0, the descriptor writes are always non-posted. Descriptor Posted Write When this bit is set to 0, the descriptor writes are always non-posted. When this bit is set to 1, the descriptor writes are non-posted only when IOC (Interrupt on completion) is set in last descriptor, otherwise the descriptor writes are always posted. 0 - Descriptor Posted Write is disabled 1 - Descriptor Posted Write is enabled
7-5 —	Reserved
4-2 —	Reserved
1 —	Reserved
0 SWR	Software Reset When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. Software Reset When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all DWC_ether_qos clock domains. Before reprogramming any DWC_ether_qos register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0 - Software Reset is disabled 1 - Software Reset is enabled

34.8.1.464 DMA System Bus Mode (DMA_SYSBUS_MODE)

The System Bus mode register controls the behavior of the AHB or AXI master. It mainly controls burst splitting and number of outstanding requests.

Offset

Register	Offset
DMA_SYSBUS_MODE	1004h

Field	Description
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ0_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command

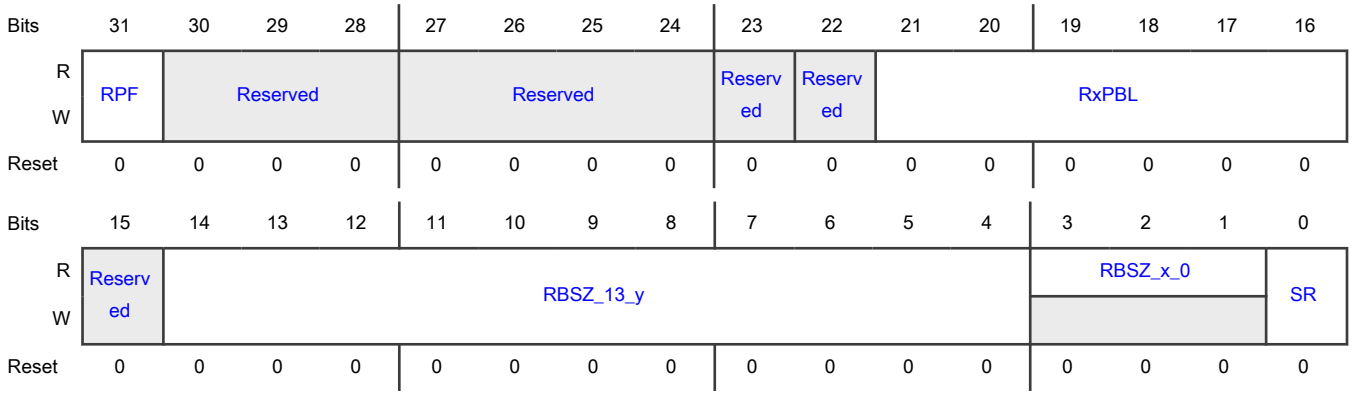
34.8.1.475 DMA Channel 0 Receive Control (DMA_CH0_RX_CONTROL)

The DMA Channel 0 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Offset

Register	Offset
DMA_CH0_RX_CONTROL	1108h

Diagram



Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled
30-28 —	Reserved
27-24 —	Reserved
23 —	Reserved
22 —	Reserved
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application

Table continues on the next page...

Table continued from the previous page...

Field	Description
	bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ0_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

34.8.1.476 Channel 0 Tx Descriptor List Address register (DMA_CH0_TXDESC_LIST_ADDRESS)

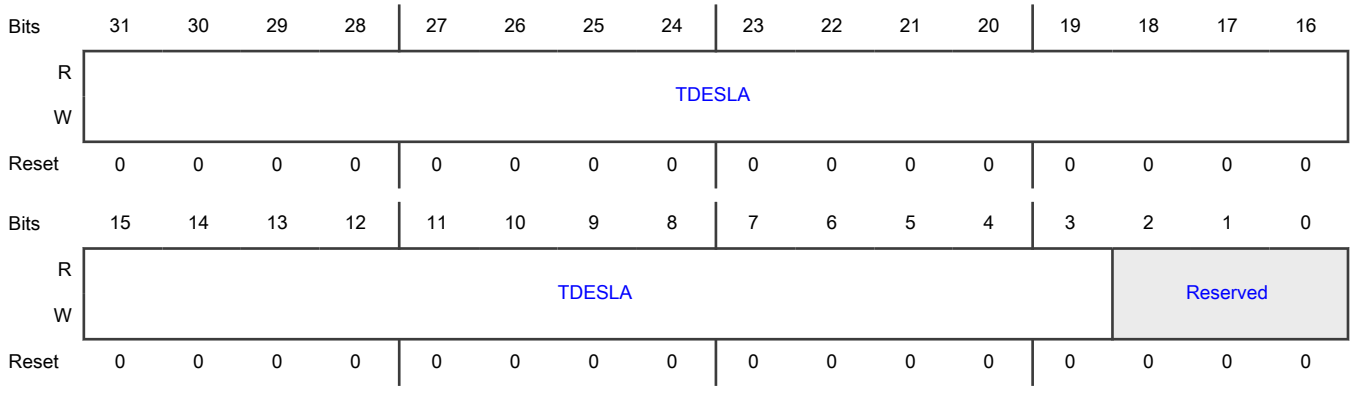
The Channel 0 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Offset

Register	Offset
DMA_CH0_TXDESC_LIST_ADDRESS	1114h

Diagram



Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

34.8.1.477 Channel 0 Rx Descriptor List Address register (DMA_CH0_RXDESC_LIST_ADDRESS)

The Channel 0 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

34.8.1.483 Channel 0 Receive Interrupt Watchdog Timer (DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER)

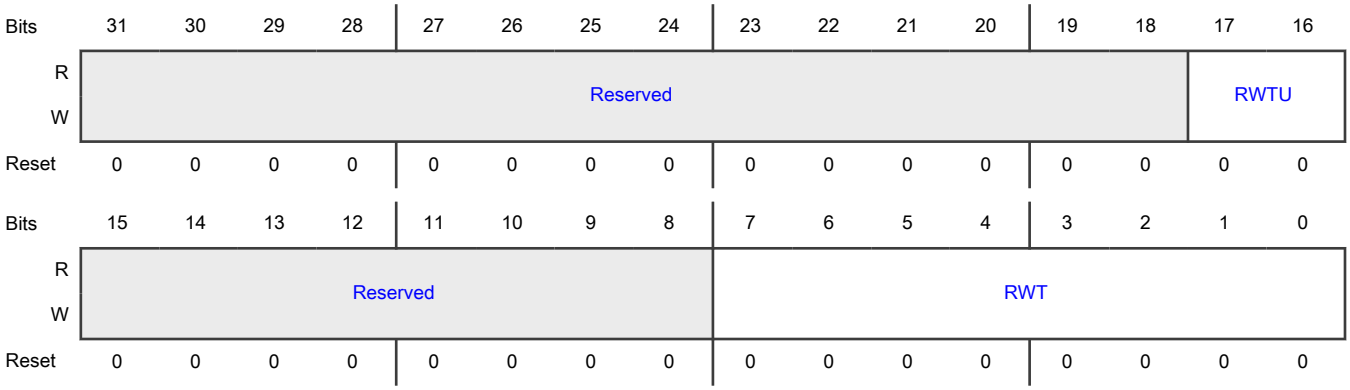
The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA.

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CH0_Status register.

Offset

Register	Offset
DMA_CH0_RX_INTERRUPT_WATCHDOG_TIMER	1138h

Diagram



Fields

Field	Description

17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

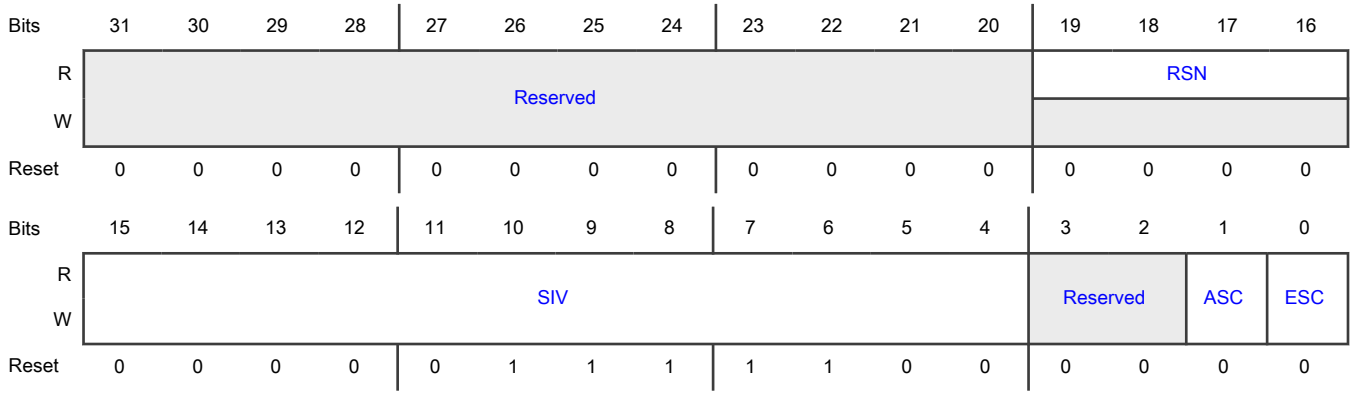
34.8.1.484 Channel 0 Slot Function Control and Status (DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS)

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Offset

Register	Offset
DMA_CH0_SLOT_FUNCTION_CONTROL_STATUS	113Ch

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

34.8.1.485 Channel 0 Current Application Transmit Descriptor (DMA_CH0_CURRENT_APP_TXDESC)

	This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all ones descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all ones descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode,

Table continues on the next page...

Table continued from the previous page...

Field	Description
	the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected

34.8.1.490 Channel 0 Missed Frame Counter (DMA_CH0_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in RX_CONTROL register.

Offset

Register	Offset
DMA_CH0_MISS_FRAME_CNT	1164h

Field	Description
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ1_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1	Reserved

Table continued from the previous page...

Field	Description
—	
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH1_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH1_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH1_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command

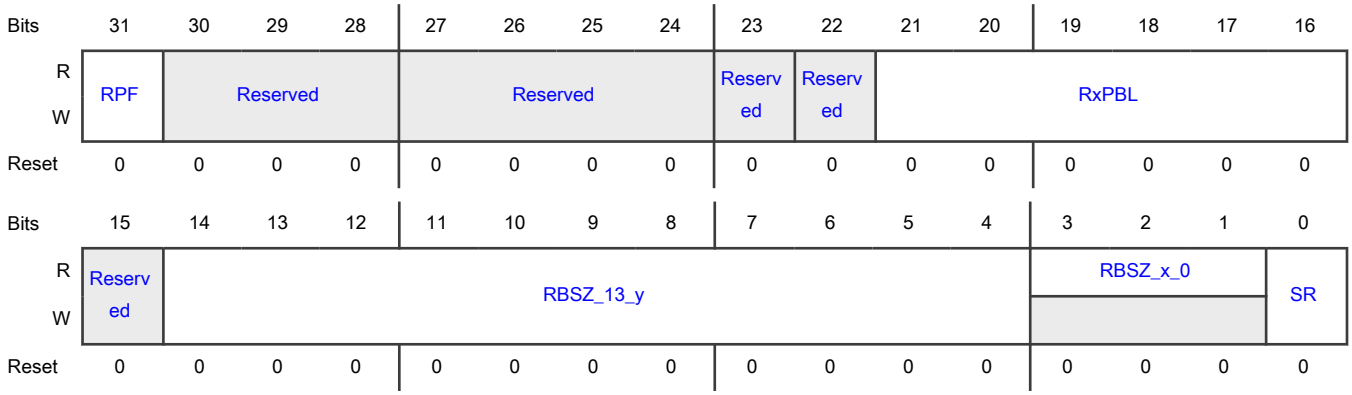
34.8.1.494 DMA Channel 1 Receive Control (DMA_CH1_RX_CONTROL)

The DMA Channel 1 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Offset

Register	Offset
DMA_CH1_RX_CONTROL	1188h

Diagram



Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

Field	Description
	bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ1_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH1_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH1_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH1_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

34.8.1.495 Channel 1 Tx Descriptor List Address (DMA_CH1_TXDESC_LIST_ADDRESS)

The Channel 1 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH1_TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Offset

Register	Offset
DMA_CH1_TXDESC_LIST_ADDRESS	1194h

Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

34.8.1.496 Channel 1 Rx Descriptor List Address (DMA_CH1_RXDESC_LIST_ADDRESS)

The Channel 1 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH1_RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Offset

31-0 CURRBUFAPTR	Application Receive Buffer Address Pointer The DMA updates this pointer during Rx operation. Application Receive Buffer Address Pointer The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

34.8.1.508 DMA Channel 1 Status (DMA_CH1_STATUS)

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Note: The number of STATUS register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Offset

Register	Offset
DMA_CH1_STATUS	11E0h

Field	Description
	This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH1_INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH1_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode,

Table continues on the next page...

Table continued from the previous page...

Field	Description
	the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected

34.8.1.509 Channel 1 Missed Frame Counter (DMA_CH1_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in RX_CONTROL register.

Offset

Field	Description
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH2_CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ2_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1	Reserved

Table continued from the previous page...

Field	Description
—	
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH2_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH2_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH2_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH2_TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command

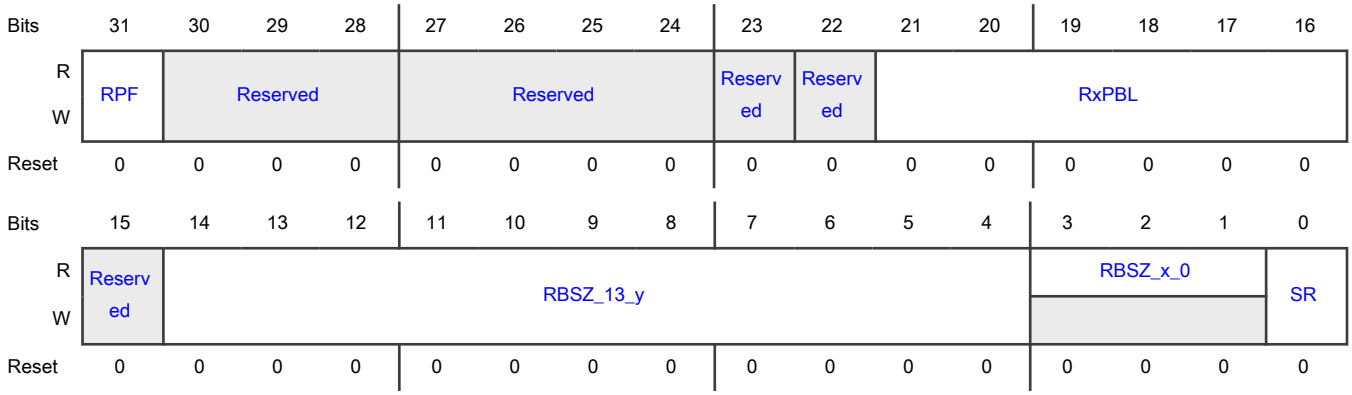
34.8.1.513 DMA Channel 2 Receive Control (DMA_CH2_RX_CONTROL)

The DMA Channel 2 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Offset

Register	Offset
DMA_CH2_RX_CONTROL	1208h

Diagram



Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled
30-28 —	Reserved

Field	Description
	bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH2_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ2_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH2_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH2_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH2_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

34.8.1.514 Channel 2 Tx Descriptor List Address (DMA_CH2_TXDESC_LIST_ADDRESS)

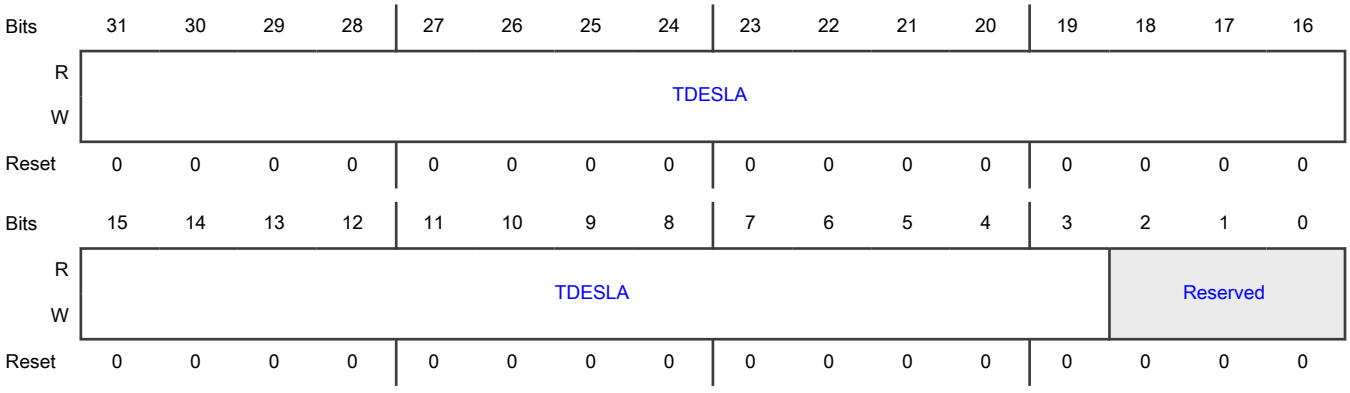
The Channel 2 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Offset

Register	Offset
DMA_CH2_TXDESC_LIST_ADDRESS	1214h

Diagram



Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

34.8.1.515 Channel 2 Rx Descriptor List Address (DMA_CH2_RXDESC_LIST_ADDRESS)

The Channel 2 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Field	Description
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024

Table continues on the next page...

Table continued from the previous page...

Field	Description
	- 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

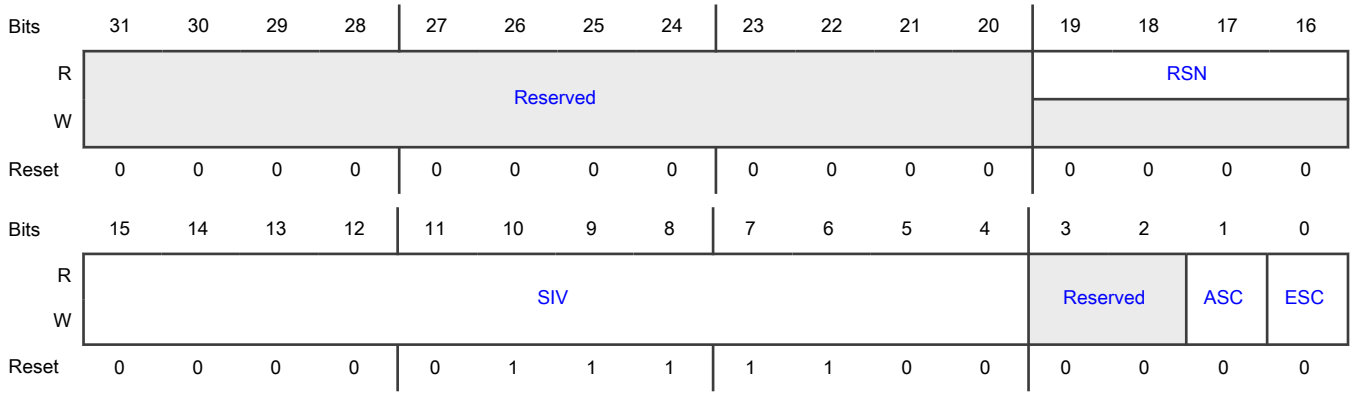
34.8.1.522 Channel 2 Slot Function Control and Status (DMA_CH2_SLOT_FUNCTION_CONTROL_STATUS)

The Channel 2 Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Offset

Register	Offset
DMA_CH2_SLOT_FUNCTION_CONTROL_STATUS	123Ch

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

34.8.1.523 Channel 2 Current Application Transmit Descriptor (DMA_CH2_CURRENT_APP_TXDESC)

Field	Description
	This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH2_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH2_INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH2_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH2_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode,

Table continues on the next page...

Table continued from the previous page...

Field	Description
	the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Interrupt status not detected 1 - Transmit Interrupt status detected

34.8.1.528 Channel 2 Missed Frame Counter (DMA_CH2_MISS_FRAME_CNT)

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH2_RX_CONTROL register.

Offset

Register	Offset
DMA_CH2_MISS_FRAME_CNT	1264h

Field	Description
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH3_CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ3_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved

Field	Description
—	
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH3_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH3_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH3_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH3_TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command

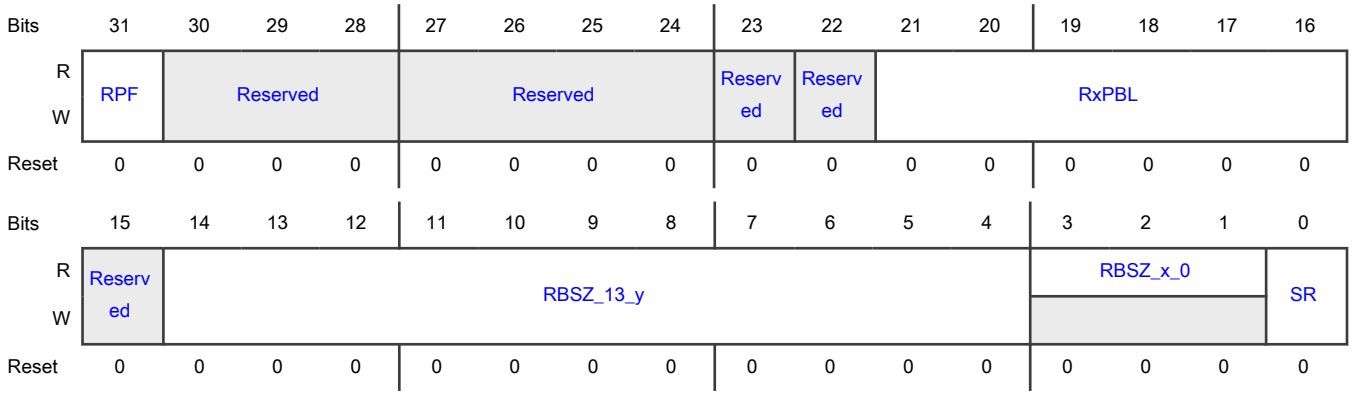
34.8.1.532 DMA Channel 3 Receive Control (DMA_CH3_RX_CONTROL)

The DMA Channel 3 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Offset

Register	Offset
DMA_CH3_RX_CONTROL	1288h

Diagram



Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

Field	Description
	bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ3_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH3_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH3_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH3_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

34.8.1.533 Channel 3 Tx Descriptor List Address (DMA_CH3_TXDESC_LIST_ADDRESS)

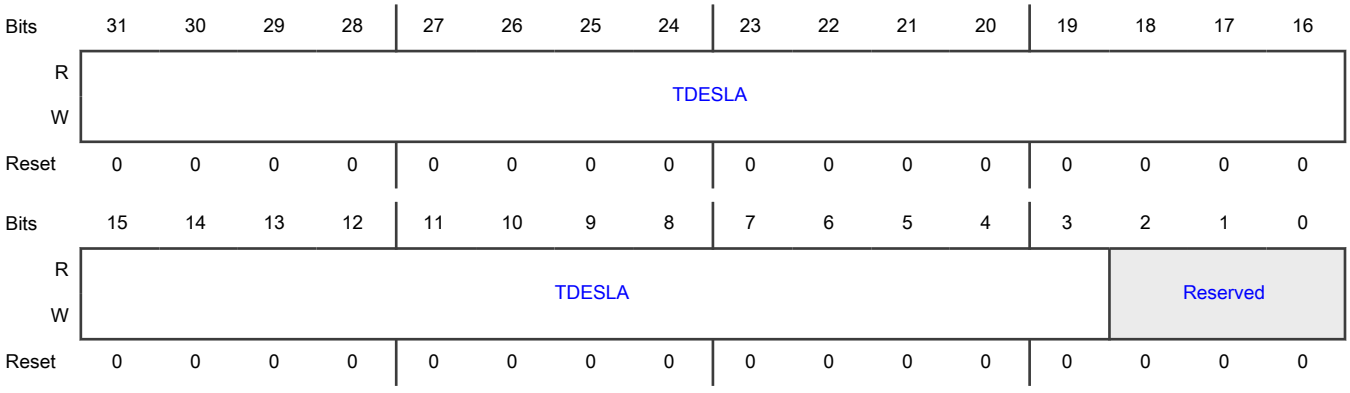
The Channel 3 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Offset

Register	Offset
DMA_CH3_TXDESC_LIST_ADDRESS	1294h

Diagram



Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

34.8.1.534 Channel 3 Rx Descriptor List Address (DMA_CH3_RXDESC_LIST_ADDRESS)

The Channel 3 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Table continued from the previous page...

Field	Description
	- 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

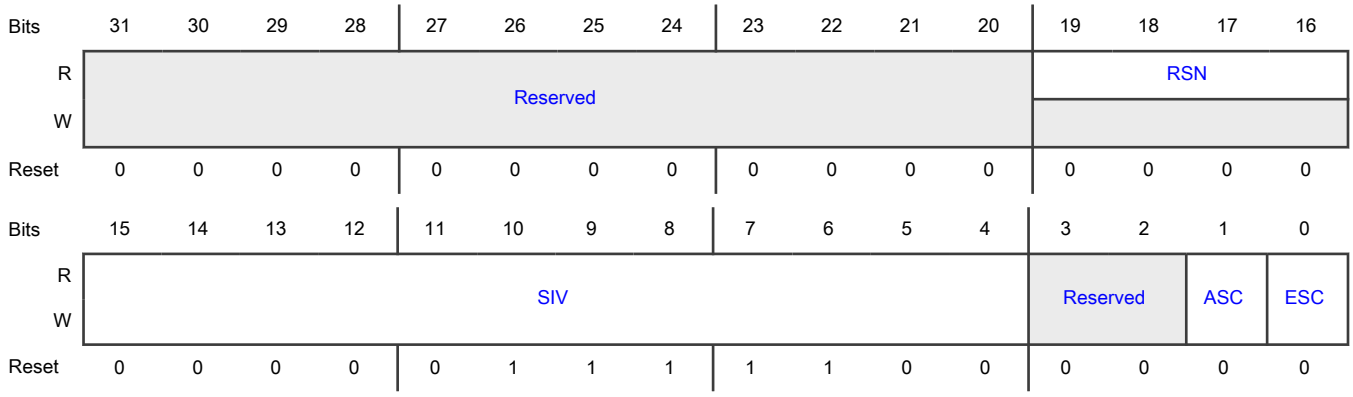
34.8.1.541 Channel 3 Slot Function Control and Status (DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS)

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Offset

Register	Offset
DMA_CH3_SLOT_FUNCTION_CONTROL_STATUS	12BCh

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

Field	Description
	Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH3_INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode,

Table continues on the next page...

Table continued from the previous page...

Field	Description
	the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected

Table continues on the next page...

Field	Description
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in CONTROL register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of TXQ4_OPERATION_MODE register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 IPBL	Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. Ignore PBL Requirement When this bit is set, the DMA does not check for PBL number of locations in the MTL before initiating a transfer. If space is not available, the MTL may use handshaking to slow the DMA. Note: This bit/mode must not be used when multiple Transmit DMA Channels are enabled as it may block other Transmit and Receive DMA Channels from accessing the Read Data Channel of AXI bus until space is available in Transmit Queue for current transfer. 0 - Ignore PBL Requirement is disabled 1 - Ignore PBL Requirement is enabled
14-13 —	Reserved
12 —	Reserved
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0 - Operate on Second Packet disabled 1 - Operate on Second Packet enabled
3-1	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH4_TXDESC_LIST_ADDRESS register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH4_STATUS register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH4_TXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH4_TXDESC_LIST_ADDRESS register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0 - Stop Transmission Command 1 - Start Transmission Command

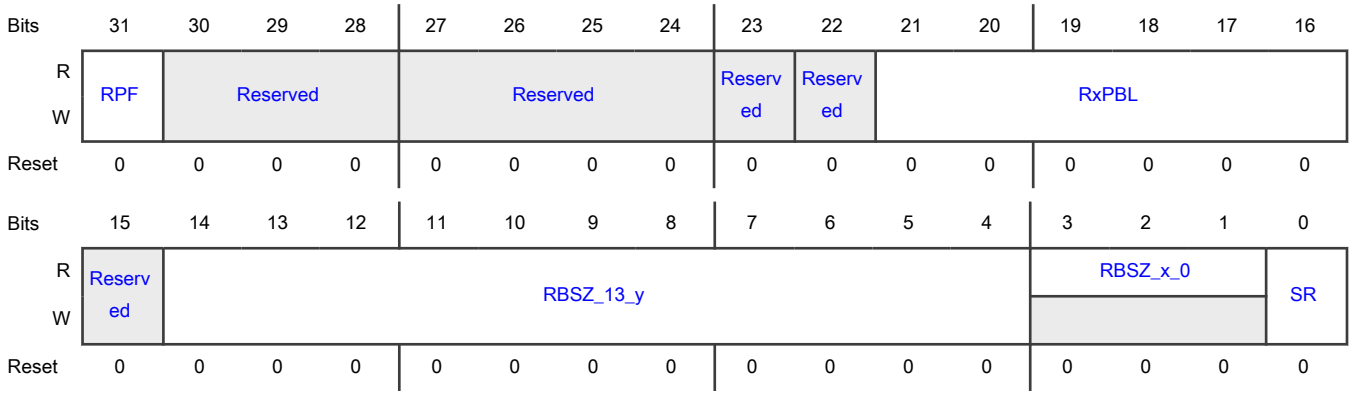
34.8.1.551 DMA Channel 4 Receive Control (DMA_CH4_RX_CONTROL)

The DMA Channel 4 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Offset

Register	Offset
DMA_CH4_RX_CONTROL	1308h

Diagram



Fields

Field	Description
31 RPF	Rx Packet Flush. Rx Packet Flush. When this bit is set to 1, then DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, get flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx Queue. When this bit is set to 0, the DWC_ether_qos not flush the packet in the Rx Queue destined to this RxDMA Channel when it is STOP state. This may in turn cause head-of-line blocking in the corresponding RxQueue. 0 - Rx Packet Flush is disabled 1 - Rx Packet Flush is enabled

Field	Description
	bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH4_CONTROL register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of RXQ4_OPERATION_MODE register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH4_RXDESC_LIST_ADDRESS register. - The position at which the Rx process was previously stopped

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH4_STATUS register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH4_RXDESC_LIST_ADDRESS register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0 - Stop Receive 1 - Start Receive

34.8.1.552 Channel 4 Tx Descriptor List Address (DMA_CH4_TXDESC_LIST_ADDRESS)

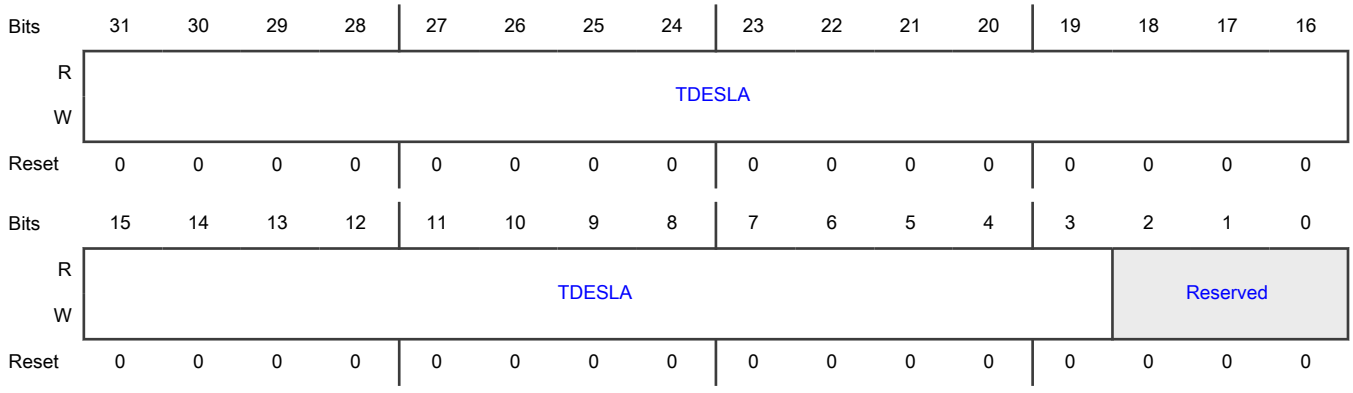
The Channel 4 Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in TX_CONTROL register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Offset

Register	Offset
DMA_CH4_TXDESC_LIST_ADDRESS	1314h

Diagram



Fields

Field	Description
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

34.8.1.553 Channel 4 Rx Descriptor List Address (DMA_CH4_RXDESC_LIST_ADDRESS)

The Channel 4 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in RX_CONTROL register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

	- 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH4_STATUS register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

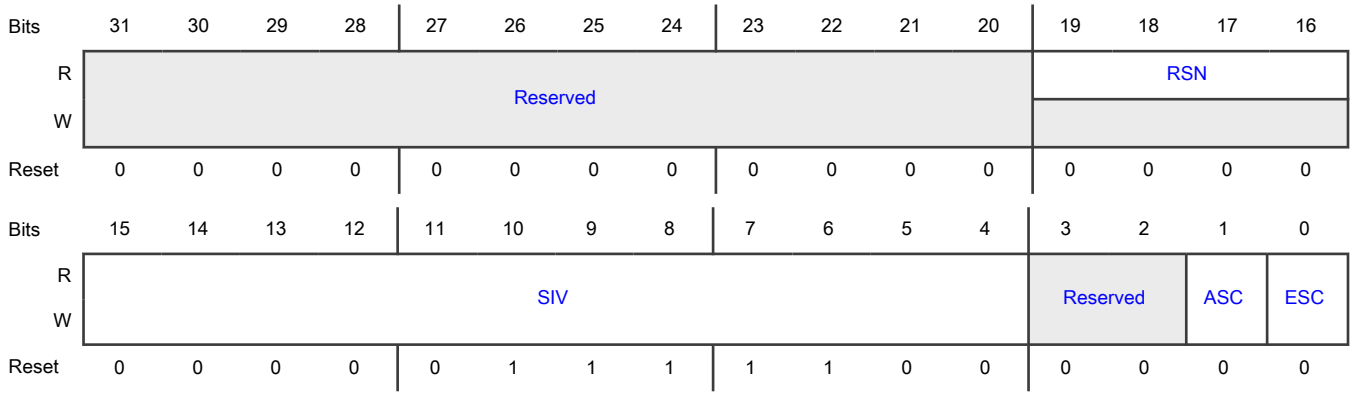
34.8.1.560 Channel 4 Slot Function Control and Status (DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS)

The Channel 4 Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Offset

Register	Offset
DMA_CH4_SLOT_FUNCTION_CONTROL_STATUS	133Ch

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0 - Advance Slot Check is disabled 1 - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0 - Slot Comparison is disabled 1 - Slot Comparison is enabled

This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in INTERRUPT_ENABLE register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Normal Interrupt Summary status not detected 1 - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. Abnormal Interrupt Summary

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the INTERRUPT_ENABLE register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Abnormal Interrupt Summary status not detected 1 - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Context Descriptor Error status not detected 1 - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Fatal Bus Error status not detected 1 - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. Early Receive Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configs supporting ERIC, When ERIC=0, this bit is set only after the Rx DMA has filled up a complete receive buffer with packet data. When ERIC=1, this bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Receive Interrupt status not detected 1 - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configs supporting ETIC: When ETIC=0, this bit is set only after the Tx DMA has transferred a complete packet to MTL. When ETIC=1, this bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC=1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Early Transmit Interrupt status not detected 1 - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0 - Receive Watchdog Timeout status not detected 1 - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Process Stopped status not detected 1 - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode,

Table continues on the next page...

Table continued from the previous page...

Field	Description
	the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Buffer Unavailable status not detected 1 - Receive Buffer Unavailable status detected
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Receive Interrupt status not detected 1 - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_CH4_DEBUG_STATUS0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: 1. Change the ownership of the descriptor by setting Bit 31 of TDES3. 2. Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Buffer Unavailable status not detected 1 - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0 - Transmit Process Stopped status not detected 1 - Transmit Process Stopped status detected

Self-set to 1 on internal event. 0 - Rx Parser Accept Counter overflow not occurred 1 - Rx Parser Accept Counter overflow occurred
30-0 RXPAC	Rx Parser Accept Counter This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. Rx Parser Accept Counter This 31-bit counter is implemented whenever a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

Chapter 35
Ethernet MAC (ENET)

35.1 Chip-specific ENET information

Table 379. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes has two 1G-bit Ethernet with AVB support (ENET).

35.2 Overview

The core implements a triple-speed 10/100/1000-Mbit/s ENET compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s and full-duplex gigabit Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable ENET with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

35.2.1 Block diagram

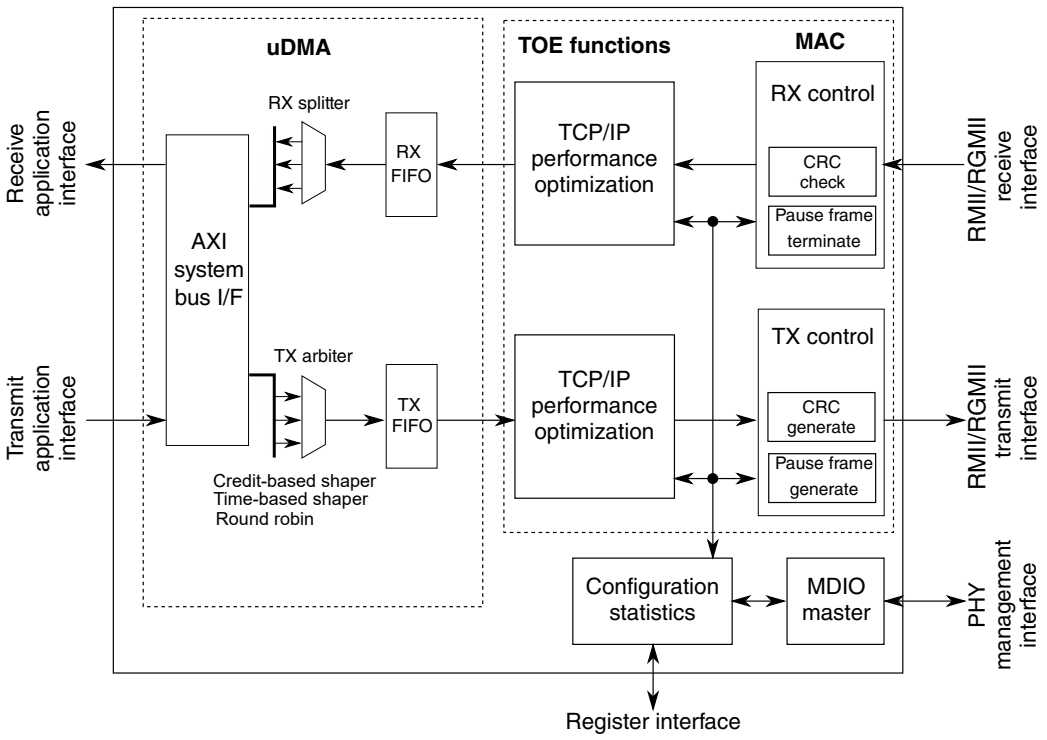

Figure 190. Ethernet MAC-NET core block diagram

35.2.2 Features

The MAC-NET core includes the following features.

35.2.2.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s and gigabit operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial Ethernet PHY devices via one of the following:
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
  - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Supports Ethernet pause frame (802.3 Annex 31A) providing fully automated flow control without any user application overhead

- Pause quanta used to form pause frames, dynamically programmable
- Pause frame generation additionally controllable by user application offering flexible traffic flow control
- Optional forwarding of received pause frames to the user application
- Implements standard flow-control mechanism

- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Supports internal loopback option
- Programmable Clause 22 and Clause 45 MDIO Master interface for PHY device configuration and management
- Supports legacy FEC buffer descriptors
- Supports interrupt coalescing
- Supports credit-based shaping and round robin QoS scheme for traffic shaping bandwidth distribution. Either policy can be combined with time-based shaping.
- AVB (Audio Video Bridging, IEEE 802.1Qav) features:
  - Credit-based bandwidth distribution policy can be combined with time-based shaping
  - AVB endpoint talker and listener support
  - Support for arbitration between different priority traffic (for example, AVB class A, AVB class B, and non-AVB)

35.2.2.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and insertion on transmit. Configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers
- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodifed/unchecked

- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

35.2.2.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

35.3 Functional description

This section provides a complete functional description of the MAC-NET core.

35.3.1 Ethernet MAC frame formats

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

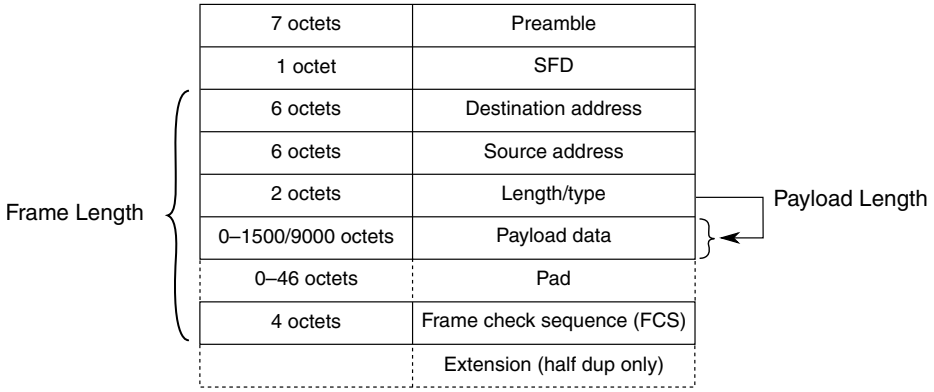

Figure 191. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

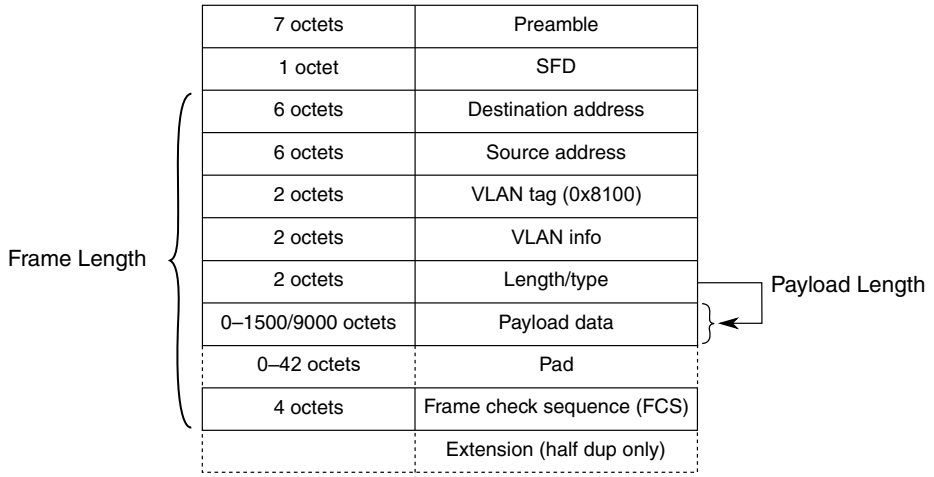

Figure 192. VLAN-tagged MAC frame format overview

Table 380. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. • If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. • If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check.

NOTE

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

35.3.1.1 Pause frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 381. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27 –68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see Full-duplex flow control operation for details).

35.3.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section. Magic packets are received and inspected only under specific conditions as described in Magic packet detection.

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

35.3.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

35.3.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types. The following table lists the types of interest:

Table 382. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

35.3.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 383. IPv4 header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Version	IHL	TOS		Length			
Fragment ID				Flags	Fragment offset		
TTL		Protocol		Header checksum			
Source address							
Destination address							
Options							

Table 384. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.

Table continues on the next page...

Table 384. IPv4 header fields (continued)

Field name	Description
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

35.3.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

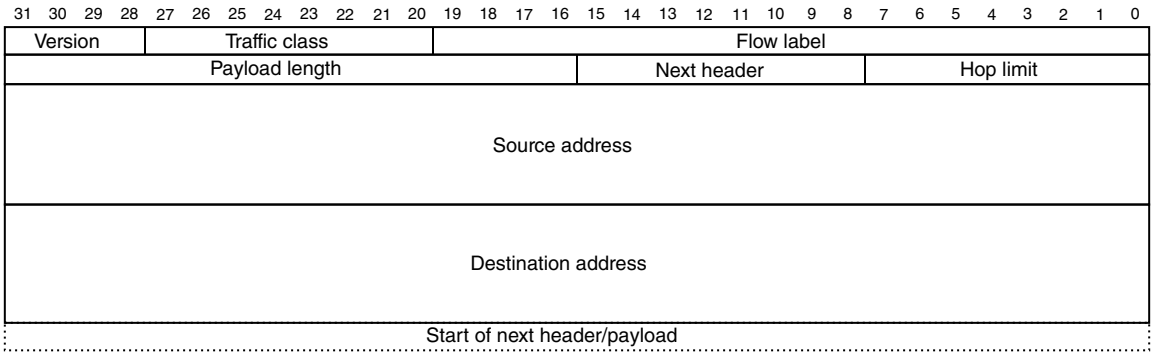

Figure 193. IPv6 header format

Table 385. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.

Table continues on the next page...

Table 385. IPv6 header fields (continued)

Field name	Description
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

35.3.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 386. ICMP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Type		Code		Checksum			
ICMP message data							

Table 387. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

35.3.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 388. UDP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Length				Checksum			

Table 389. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

35.3.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6. The TCP payload immediately follows the TCP header.

Table 390. TCP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10	9 8	7 6 5 4	3 2 1 0

Checksum				Urgent pointer				
Options								

Table 391. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information

Table continues on the next page...

Table 391. TCP header fields (continued)

Field name	Description
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

35.3.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

35.3.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2). Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

35.3.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages. The table below shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 392. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 393. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

35.3.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 394. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

35.3.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message. All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

35.3.3.2.1 PTPv1 header

Table 395. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in Table 396:

Table 396. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

35.3.3.2.2 PTPv2 header

Table 397. Common PTPv2 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

Table 398. PTPv2 message type identification

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message

0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

Table 399. PTPv2 message flags field definitions

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

35.3.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

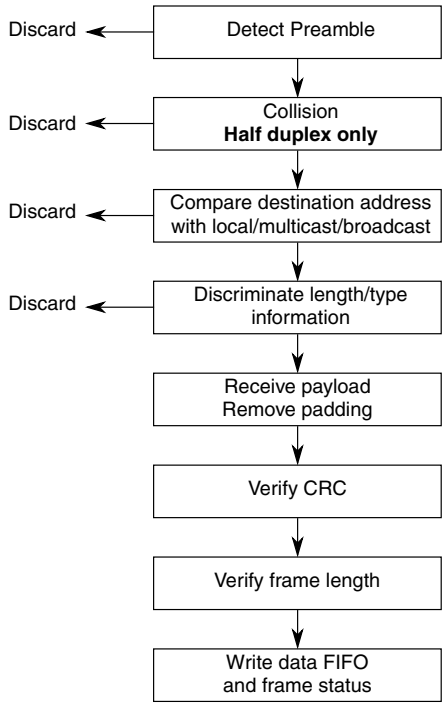

Figure 194. MAC receive flow

35.3.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

35.3.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble. The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

35.3.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

35.3.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers. If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

35.3.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET*n*_GAUR/GALR (group address hash match) or ENET*n*_IAUR/IALR (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET*n*_GAUR (msb = 1) or ENET*n*_GALR (msb = 0).
- The five least significant bits of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- FCS(x) = x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x^{1}+ 1

If Promiscuous mode is enabled (ENET*n*_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET*n*_GAUR/GALR and ENET*n*_IAUR/IALR settings.

35.3.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET*n*_RCR[PROM] is set. If PROM is cleared when ENET*n*_RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 400. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

35.3.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:
  - Node address (PALR[PADDR1] and PAUR[PADDR2])
  - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

35.3.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word RCR[NLC] and interrupt bit EIR[PLR].

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

35.3.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET*n*_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

35.3.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field. VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[VLAN]) indicates that the current frame is VLAN tagged.

35.3.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Valid pause frames are ignored if ENET*n*_RCR[FCE] is cleared and are forwarded to the client interface when ENET*n*_RCR[PAUFWD] is set.

35.3.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET*n*_RCR[CRCFWD] is cleared and ENET*n*_RCR[PADEN] is cleared. When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- FCS(x) = x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x^{1}+ 1

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

35.3.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET*n*_RCR[PADEN].

NOTE

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

35.3.4.10 Frame classification (AVB)

To support protocols such as Audio Video Bridging (AVB, IEEE 802.1Qav), normal traffic is separated from time-sensitive traffic immediately at the application interface to allow storing them in different queues for further processing. For every frame received, a classification based on VLAN priority can be performed. When a frame is received, and it contains a VLAN tag, the priority is compared against the values set in the classification match registers (see RCMR register and the following figure.

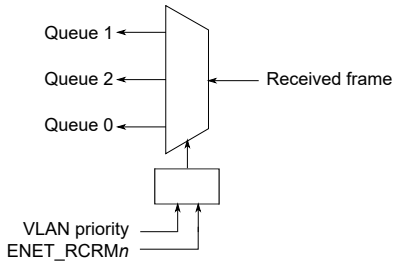

Figure 195. AVB frame classification

35.3.4.11 Receive flushing

RX flushing prevents frames in the RX FIFO from being blocked. Blocking can occur if the frame at the head of the RX FIFO cannot be forwarded because the ring it is associated with cannot accept it. This situation occurs when either the ring's RxBD[EMPTY] is not set or ENET_RDAR*n* is not set. When RX flushing is enabled, via QOS[RX_FLUSHn], the blocking frame will be flushed (discarded).

35.3.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET*n*_TCR[TFC_PAUSE] is set with ENET*n*_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required

- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

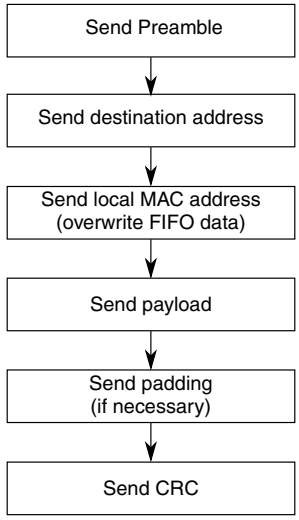

Figure 196. Frame transmit overview

35.3.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes. If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

35.3.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET*n*_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET*n*_TCR[ADDINS] = 0)

35.3.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame. The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

35.3.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET*n*_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII_CRS de-assertion.

35.3.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

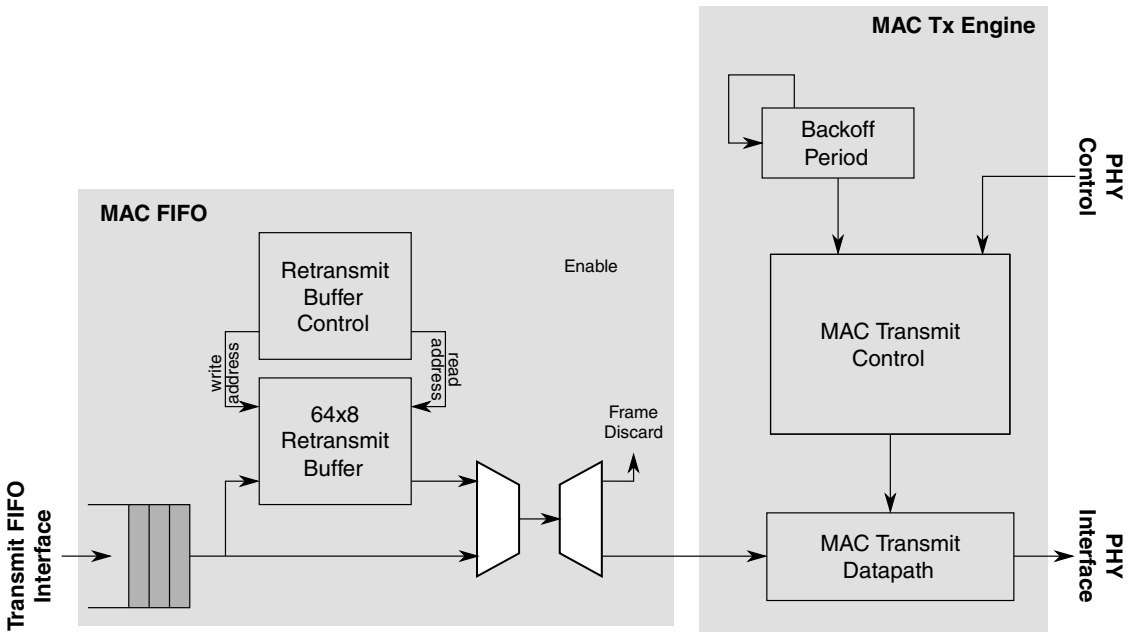

Figure 197. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- k = min(*n*, N); where *n* is the number of retransmissions and N = 10

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by N = 10 as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET*n*_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

warning

Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled, the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

35.3.5.6 Rate limiting / traffic shaping support

The MAC-NET supports two methods to optimize frame traffic for either time-sensitive AVB frames (Class A and Class B) or best-effort non-AVB frames:

- Round-robin scheme
- Credit-based traffic shaping

To ensure that sufficient bandwidth is allocated for the AVB frames, the credit-based shaper must be used. Either method can be combined with a time-based shaper to ensure that a frame is always transmitted in its correct time slot.

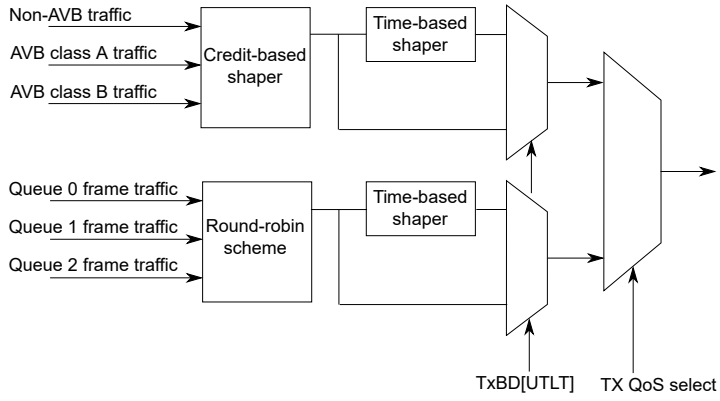

Figure 198. Transmit arbitration schemes

35.3.5.6.1 Round-robin policy

In the round-robin QoS scheme, each queue is given an equal opportunity to transmit one frame. For example, if queue *n* has a frame to transmit, the queue transmits its frame. After queue *n* has transmitted its frame, or if queue *n* does not have a frame to transmit, queue *n*+1 is then allowed to transmit its frame, and so on.

35.3.5.6.2 Credit-based shaper

The AVB credit based shaper acts independently, per class, to control the bandwidth distribution between normal traffic and time-sensitive traffic with respect to the total link bandwidth available. As per the IEEE 802.1Q, the maximum bandwidth distribution that can be allocated for the time-sensitive frames is 75%. The following example uses 70% for AVB frames and 30% for non-AVB frames:

Table 401. Bandwidth allocation example

AVB Class A	50%
AVB Class B	20%

Table continues on the next page...

Table 401. Bandwidth allocation example (continued)

non-AVB frames	30%
Total	100%

See DMACFG register for information on how to allocate bandwidth. The following figure shows how frame traffic is controlled within the MAC-NET core.

35.3.5.6.3 Time-based shaper

The time-based shaper enables the user to specify when a frame can be transmitted. It is always used in combination with either the round-robin scheme or the credit-based shaper. Use of the time-based shaper can ensure that frames are always transmitted in the correct time slot.

35.3.5.6.3.1 Time-based shaper example

Time-based shaping involves the following procedure:

1. Read the current value of the timer. See ATVR register and ATCR register.
2. Calculate the frame launch time and write this value to the TLT field of the frame's TxBD. See Enhanced transmit buffer descriptor.
3. Instruct the ENET to use the TLT by setting TxBD[UTLT].

The frame will be fetched and transmitted only if TxBD[TLT] is less than the current value of the timer. In other words, the timer must be past, that is, be greater than, the transmit launch time before the frame will be fetched and transmitted.

The transmit launch time must not be greater than the current value of ENET_ATVR + (0.5 × ENET_ATPER). This means the application cannot prepare frames with launch times beyond ENET_ATVR + (0.5 × ENET_ATPER). Because ENET_ATVR wraps, calculate TLT using the equation:

(ENET_ATVR + (0.5 × ENET_ATPER)) mod ENET_ATPER

For example, if ENET_ATPER is set to the recommended value of 1,000,000,000 ns (one second), then the user must not prepare future frames with launch times greater than (500,000,000 + ENET_ATVR).

As a specific example, if the current value of ENET_ATVR is 100,000, then you can prepare the following frames:

1. Frame 1 TxBD[TLT] = 100,000ns + 125,000ns
2. Frame 2 TxBD[TLT] = 100,000ns + 250,000ns
3. And so on.

35.3.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

35.3.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if ENET*n*_RCR[FCE] is set, the MAC transmit logic:

- Completes the transfer of the current frame.

- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets ENET*n*_TCR[RFC_PAUSE].

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets RFC_PAUSE to zero.

If ENET*n*_RCR[FCE] cleared, the MAC ignores received pause frames.

Optionally and independent of ENET*n*_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

35.3.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET*n*_TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET*n*_OPD[PAUSE_DUR].

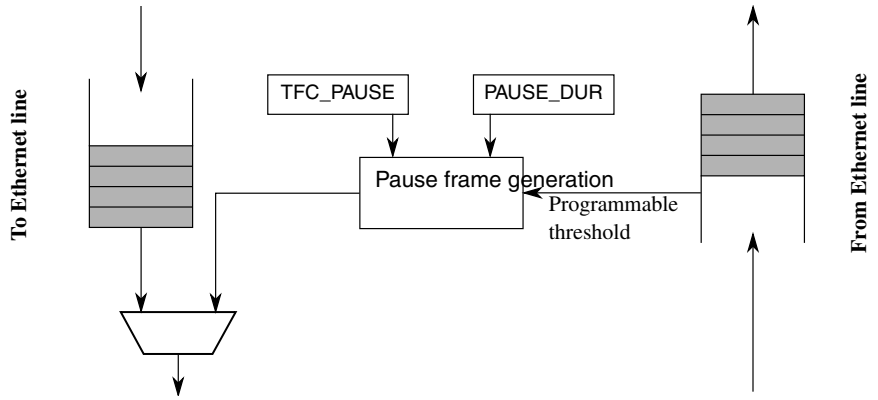

Figure 199. Pause frame generation overview

NOTE

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

35.3.7 IP accelerator functions

The following sections describe the IP accelerator functions.

35.3.7.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 402. IPv4 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10	9 8	7 6 5 4	3 2 1 0
Source address								
Destination address								
Zero		Protocol		TCP/UDP length				

Table 403. IPv6 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10	9 8	7 6 5 4	3 2 1 0
Source address								
Destination address								
TCP/UDP length								
Zero							Next header	

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

35.3.7.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets. The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

35.3.7.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET*n*_TACC and ENET*n*_RACC registers.

When enabled, the valid frame data is arranged as shown in Table 404.

Table 404. 64-bit interface data structure with SHIFT16 enabled

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

35.3.7.3.1 Receive processing

When ENET*n*_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

NOTE

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

35.3.7.3.2 Transmit processing

When ENET*n*_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic. The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

35.3.7.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET*n*_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX_FL
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (RX_ERR asserted during reception)
- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET*n*_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

35.3.7.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

NOTE

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

35.3.7.6 IPv6 support

The following sections describe the IPv6 support.

35.3.7.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see 32-bit Ethernet payload alignment).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

35.3.7.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

35.3.8 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENET*n*_ECR[EN1588] to enable 1588 support.

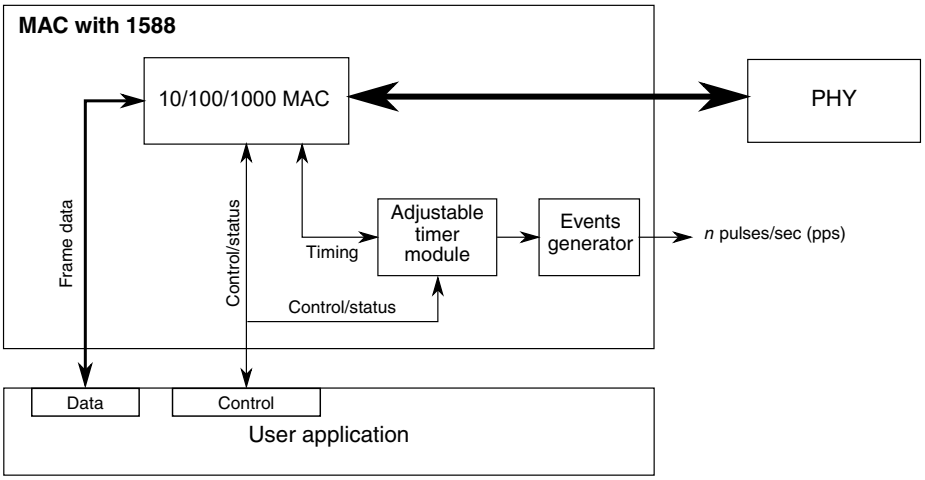

Figure 200. IEEE 1588 functions overview

35.3.8.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to (1×10^9)-1. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

35.3.8.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

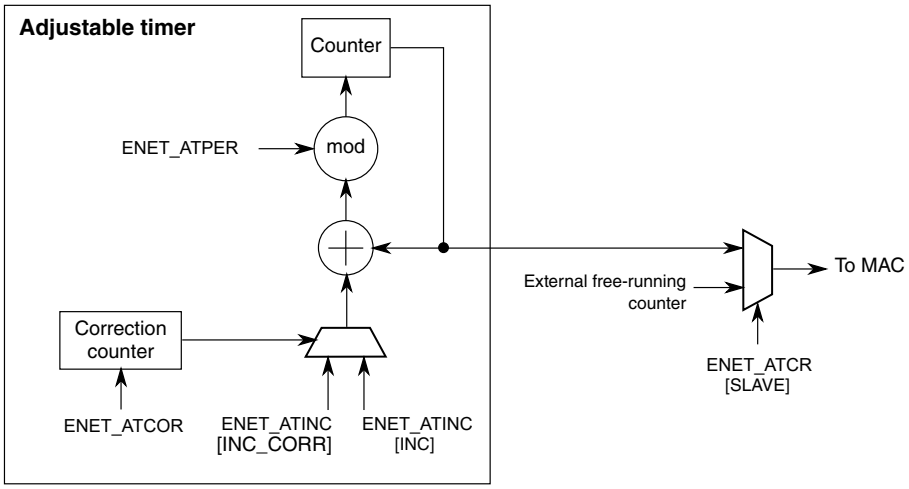

Figure 201. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET*n*_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET*n*_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc $-(1 \times 10^9)$), assuming the period is set to 1×10^9.

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET*n*_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET*n*_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET*n*_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules within the system must operate from a single timer. When slave mode is enabled, you still must set ENET*n*_ATINC[INC] to the value of the master, since it is used for internal comparisons.

35.3.8.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET*n*_ATSTMP. ENET*n*_EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET*n*_EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET*n*_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

35.3.8.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

35.3.8.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to (1×10^9)–1. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9.

35.3.8.5 Input capture and output compare

The input capture and output compare block can be used to provide precise hardware timing for input and output events.

35.3.8.5.1 Input capture

The TCCR*n* capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR*n* signals. An event will cause the corresponding TCSR*n*[TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR*n*[TIE] field, an interrupt can be generated.

35.3.8.5.2 Output compare

The TCCR*n* compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR*n* register, the corresponding flag, TCSR*n*[TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR*n*[TIE], will be generated.The corresponding 1588_TMR*n* output signal will be asserted according to TCSR*n*[TMODE].

NOTE

If TCSR*n*[TMODE] is set to 10X1b or 1010b then the timer output pin toggle-on-overflow will occur only when PINPER, PEREN, and EN bits of the ATCR register are one.

35.3.8.5.3 DMA requests

A DMA request can be enabled by setting TCSR*n*[TDRE]. The corresponding DMA request is generated when the TCSR*n*[TF] timer flag is set. When the DMA has completed, the corresponding TCSRn[TF] flag is cleared.

35.3.9 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 1024 words.

35.3.9.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

Table 405. Receive FIFO thresholds definition

Register	Description
ENET*n*_RSFL [RX_SECTION_FULL]	When the FIFO level reaches the ENET*n*_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET*n*_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again. If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted. To enable store and forward on the receive path, clear ENET*n*_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO. When programming a non-zero value to ENET*n*_RSFL (cut-through operation) it should be greater than ENET*n*_RAEM.
ENET*n*_RAEM [RX_ALMOST_EMPTY]	When the FIFO level reaches the ENET*n*_RAEM value and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. Set ENET*n*_RAEM to a minimum of four.
ENET*n*_RAFL [RX_ALMOST_FULL]	When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow. The corresponding error status is set when the frame is delivered to the application. Set ENET*n*_RAFL to a minimum of 4.
ENET*n*_RSEM [RX_SECTION_EMPTY]	When the FIFO level reaches the ENET*n*_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client. When the FIFO level goes below the value programmed in ENET*n*_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client. Clearing ENET*n*_RSEM disables any pause frame generation.

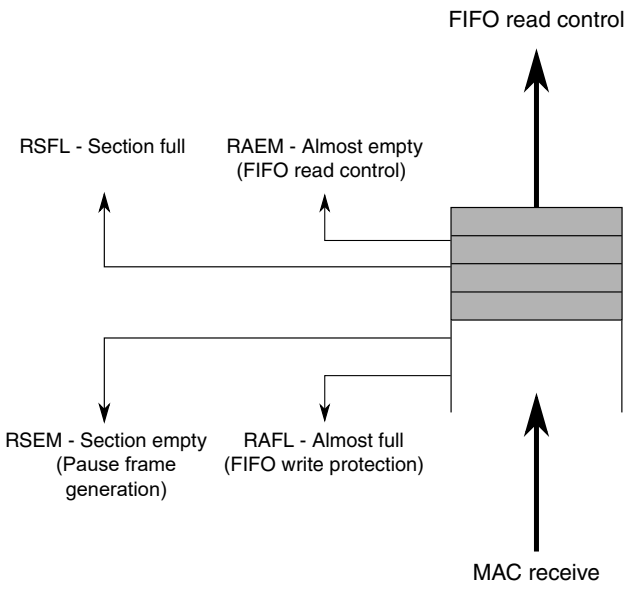

Figure 202. Receive FIFO overview

35.3.9.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 406. Transmit FIFO thresholds definition

Register	Description
ENET*n*_TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET*n*_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET*n*_TAEM to a minimum of 4.
ENET*n*_TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET*n*_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication. Set ENET*n*_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET*n*_TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET*n*_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET*n*_TSEM is 0, the signal is never deasserted.
ENET*n*_TFWR	When the FIFO level reaches the ENET*n*_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table continues on the next page...

Table 406. Transmit FIFO thresholds definition (continued)

Register	Description
	If a complete frame has a size smaller than the ENET*n*_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

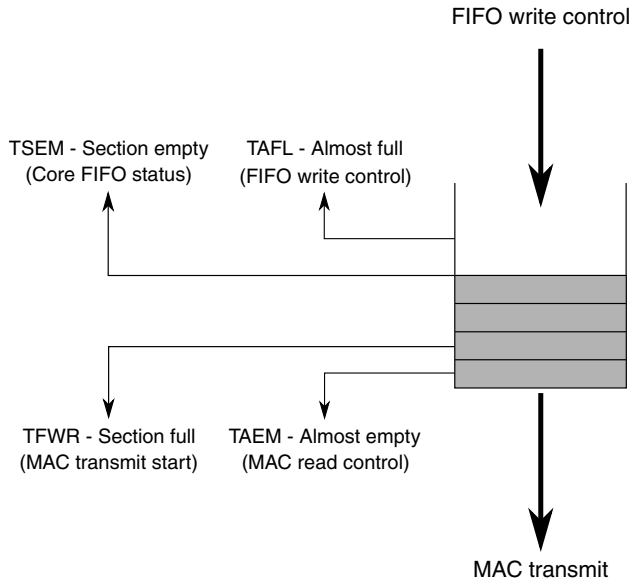

Figure 203. Transmit FIFO overview

35.3.10 Internal loopback option

The core implements internal loopback option. To use internal loopback mode, the RX clock must be provided externally at the RGMII_RCK pin of the PHY interface. The loopback mode is controlled by the following ENET*n*_RCR register field:

Table 407. Loopback option

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces.

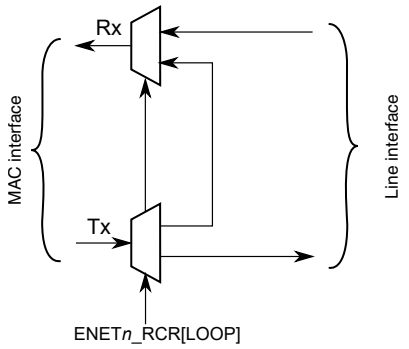

Figure 204. Loopback option

35.3.11 Legacy buffer descriptors

To support the Ethernet controller on previous chips, legacy FEC buffer descriptors are available. To enable legacy support, write 0 to ENET*n*_ECR[1588EN].

NOTE

- Legacy buffer descriptors are used in single-ring mode, that is, when DMA*n*CFG[DMA_CLASS_EN] are zero. In multi-ring mode, legacy TxBDs are used only with the round-robin scheme.
- The legacy buffer descriptor tables show the byte order for little-endian chips. ECR[DBSWP] must be set to 1 after reset to enable little-endian mode.

35.3.11.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 411 contains the descriptions for each field.

Table 408. Legacy FEC receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1. This field is not supported by the uDMA.

35.3.12 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors. It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET*n*_ECR[1588EN].

NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. ECR[DBSWP] must be set to 1 after reset to enable little-endian mode.

35.3.12.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. Table 411 contains the descriptions for each field.

Table 410. Enhanced uDMA receive buffer descriptor (RxBD)

	Byte 1								Byte 0

Table 411. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
Offset + 2	15 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required.
		1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 2	14 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location.
		1 The next buffer descriptor is found at the location defined in ENET*n*_RDSR.
Offset + 2	12 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	11 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame.
		1 The buffer is the last in a frame.
Offset + 2	10–9	Reserved, must be cleared.
Offset + 2	8 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set.

Table continues on the next page...

Table 411. Receive buffer descriptor field definitions (continued)

Word	Field	Description
		0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode.
		The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	6 MC	Set if the DA is multicast and not BC.
Offset + 2	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	3	Reserved, must be cleared.
Offset + 2	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	1 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
0ffset + 6	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword[1]
Offset + 8	15–13 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.

Table continues on the next page...

Table 411. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	12–6	Reserved, must be cleared.
Offset + 8	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	3	Reserved, must be cleared.
Offset + 8	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.
Offset + 8	1 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	0 FRAG	IPv4 Fragment. This is an accelerator option. This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + A	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	14–11	Reserved, must be cleared.
Offset + A	10 PE	PHY Error. This field is written by the uDMA. Set to "1" when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the *dma_int_rxb* / *dma_int_rxfevent*.
Offset + A	6–0	Reserved, must be cleared.
Offset + C	15–0	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.

Table continues on the next page...

Table 411. Receive buffer descriptor field definitions (continued)

Word	Field	Description
	Payload checksum	
Offset + E	15–11 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + E	10–8	Reserved, must be cleared.
Offset + E	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		
Offset + 18 – Offset + 1E	15–0	Reserved, must be cleared.

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

35.3.12.2 Enhanced transmit buffer descriptor

Table 412. Enhanced transmit buffer descriptor (TxBD)

	Byte 1								Byte 0

Table 413. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	15 R	Ready. Written by the MAC and you. 0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 2	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.

Table continues on the next page...

Table 413. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location
		1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 2	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	11 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame
		1 The buffer is the last in the transmit frame
Offset + 2	10 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte
		This field is valid only when the L field is set.
Offset + 2	9 ABC	Append bad CRC. **NOTE** This field is not supported by the uDMA and is ignored.
Offset + 2	8–0	Reserved, must be cleared.
Offset + 4	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. **NOTE** For optimal performance, make the transmit buffer pointer evenly divisible by 64.
Offset + 8	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	14	Reserved, must be cleared.

Table continues on the next page...

Table 413. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.
Offset + 8	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set.
Offset + 8	7–0	Reserved, must be cleared.
Offset + A	15	Reserved, must be cleared.
Offset + A	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.

Table continues on the next page...

Table 413. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + A	10–9	Reserved, must be cleared.
Offset + A	8 UTLT	Use transmit launch time. If set to 1, TLT high and low values are used to determine if frame can be transmitted. This field must only be set in the *first* BD of a frame. TLT is always used in combination with either the round-robin scheme or the credit-based shaper. TLT can be used with a single BD queue. However, at least one DMA class, DMA*n*CFG[DMA_CLASS_ EN] must be enabled. For example, to use TLT with only queue 0, enable one of the DMA*n*CFG[DMA_CLASS_EN] fields and clear both TDAR1 and TDAR2. Although this enables multi-queue, only the single queue 0 is used.
Offset + A	7–4 FTYPE	Type of frame to be transmitted. If a credit-based scheme is used, this field must match the BD ring queue. 0x0 – Non-AVB. Corresponds to ENET_TDSR. 0x1 – AVB Class A. Corresponds to ENET_TDSR1. 0x2 – AVB Class B. Corresponds to ENET_TDSR2. All other values are reserved.
Offset + A	3–0	Reserved, must be cleared.
Offset + C	15–0 TLT low	Transmit launch time low. Low two bytes of time value that specifies when frame can be transmitted.
Offset + E	15–0 TLT high	Transmit launch time high. High two bytes of time value that specifies when frame can be transmitted.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16		
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

35.3.13 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

35.3.13.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 414. FIFO interface data structure

	63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8
...	...							

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

NOTE

On transmit, if ENET*n*_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET*n*_PAUR and ENET*n*_PALR registers.

Table 415. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 416. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

NOTE

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

35.3.13.2 Data structure examples

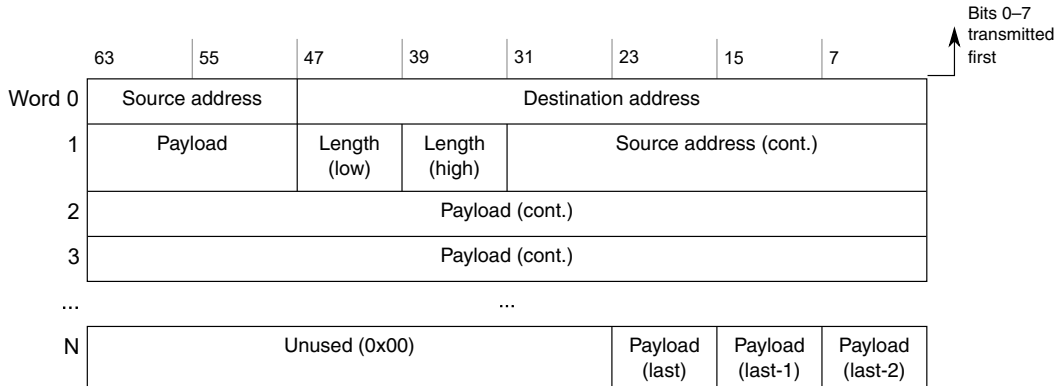

Figure 205. Normal Ethernet frame 64-bit mapping example

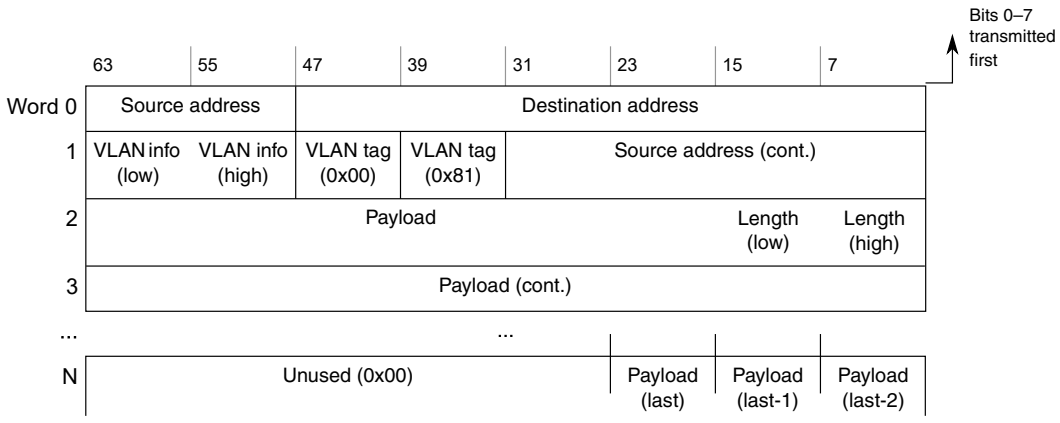

Figure 206. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

35.3.13.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor. See Enhanced buffer descriptors for details. The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

35.3.14 FIFO protection

The following sections describe the FIFO protection mechanisms.

35.3.14.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in Figure 207) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

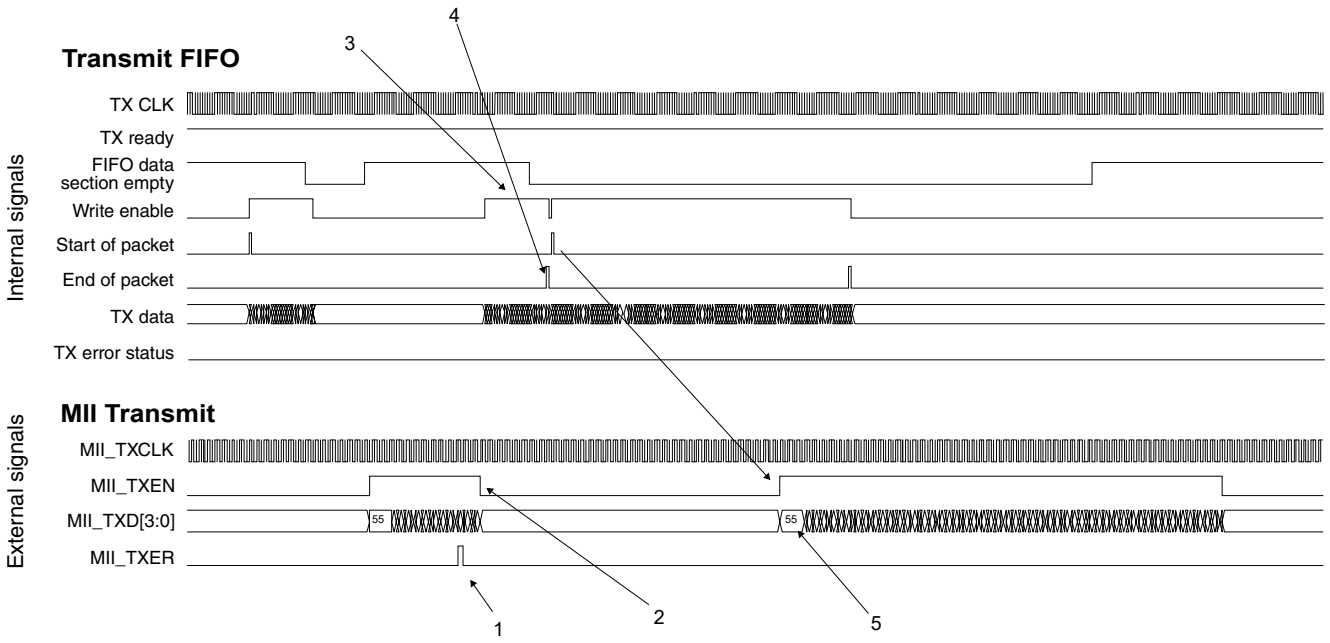

Figure 207. Transmit FIFO underflow protection

35.3.14.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data. However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurence.

NOTE

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET*n*_ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

35.3.14.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow. The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

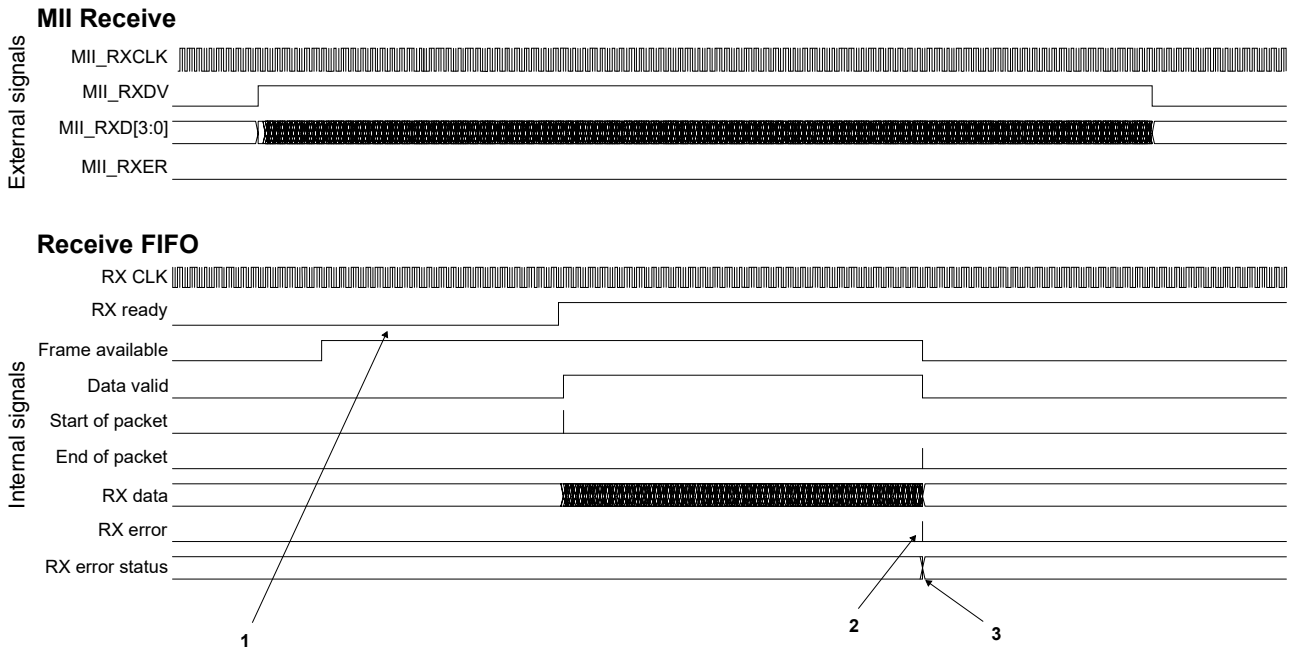

Figure 208. Receive FIFO overflow protection

35.3.15 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers. The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

35.3.15.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 417. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA

Table 418. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET*n*_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET*n*_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET*n*_MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET*n*_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET*n*_MMFR[DATA]. Written to or read from the PHY

35.3.15.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 419. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 420. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET*n*_MMFR[OP]. See Table 421 for more information.

Table continues on the next page...

Table 420. MDIO clause 45 frame field descriptions (continued)

Field	Description
	00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET*n*_MMFR[DATA], written to or read from the PHY.

Table 421. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

35.3.15.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET*n*_MSCR[MII_SPEED].

35.3.15.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET*n*_MMFR) according to the description provided in MII Management Frame Register (ENETn_MMFR). To check when the programmed access completes, read the ENET*n*_EIR[MII] field.

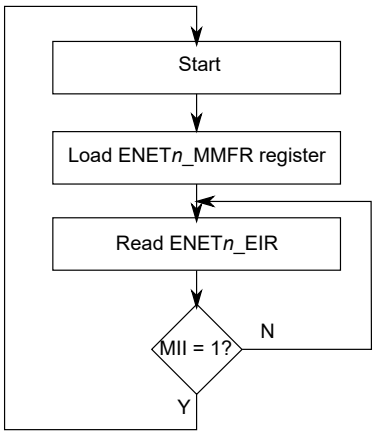

Figure 209. MDIO access overview

35.3.16 Ethernet interfaces

RMII 10/100 is implemented using interface converters/gaskets.

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SPEED]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMII_EN]
RMII - 10 Mbit/s	0	1	1	0
RMII - 100 Mbit/s	0	0	1	0
RGMII - 10 Mbit/s	0	1	0	1
RGMII - 100 Mbit/s	0	0	0	1
RGMII - 1000 Mbit/s	1	—	0	1

35.3.16.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD). The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

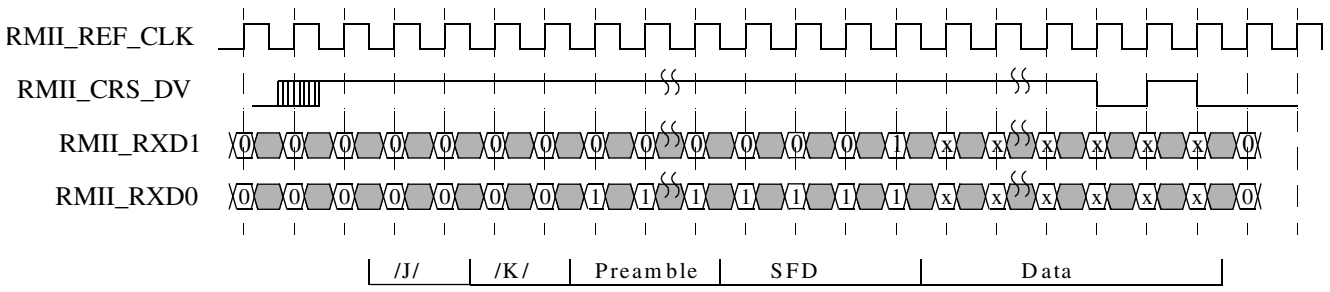

Figure 210. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

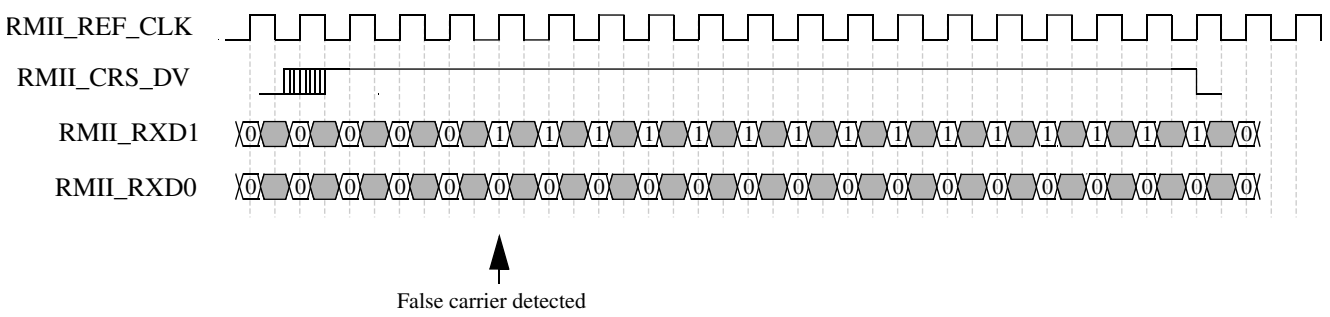

Figure 211. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

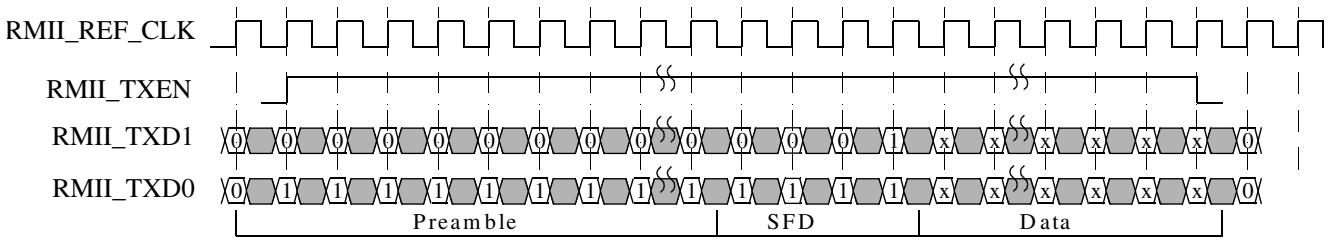

Figure 212. RMII transmit operation

35.3.16.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

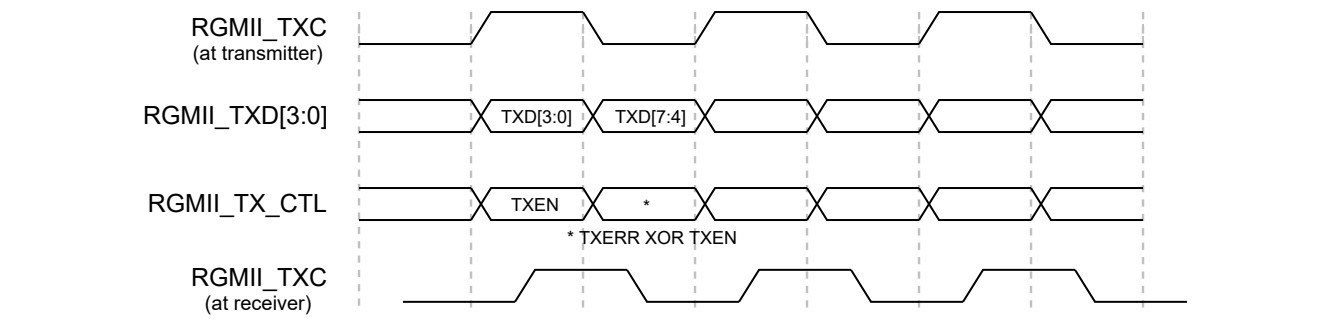

Figure 213. RGMII transmit operation

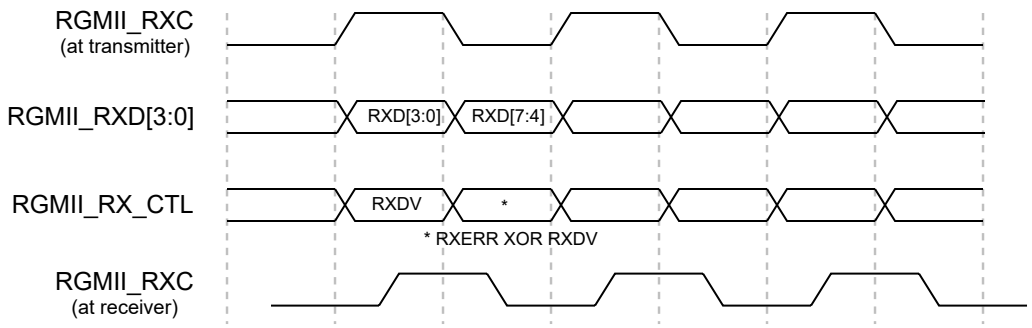

Figure 214. RGMII receive operation

35.3.17 AVB configuration

The following steps give an example of how to initialize the ENET module for AVB.

1. Set up QOS register:
   - Set TX_SCHEME to 000b, credit-based scheme.
   - Set RX_FLUSH0 to 1, enable RX flush for ring 0.
2. Set up TX BD ring and RX BD ring for each queue, 0-2.
   - Program ENET_MRBR, ENET_TDSR, and ENET_RDSR.
   - Program ENET_MRBR1, ENET_TDSR1, and ENET_RDSR1.
   - Program ENET_MRBR2, ENET_TDSR2, and ENET_RDSR2.
   - Program each TX and RX BD ring queue for all classes used in memory.

     NOTE

     If using credit-based scheme, ensure that enhanced transmit buffer descriptor FTYPE field matches BD ring queue, for example:

     — FTYPE = 0h corresponds to ENET_TDSR

     — FTYPE = 1h corresponds to ENET_TDSR1

     — FTYPE = 2h corresponds to ENET_TDSR2
3. Program ENET_DMA1CFG and ENET_DMA2CFG for class 1 and class 2 corresponding to BD ring queue 1 and 2. DMA_CLASS_EN must be set to one for that class to be enabled. See DMACFG register for information on how to program IDLE_SLOPE.
4. Program ENET_RCMR1 and ENET_RCMR2 for class 1 and class 2 matching for receive.

   NOTE

   Even if a match occurs, if ENET_DMA*n*CFG[DMA_CLASS_EN] is zero for the corresponding class, the RX frame will be automatically forwarded to BD ring queue 0.
5. Program the other ENET registers according to application requirements.
6. Program ENET_RDAR, ENET_RDAR1, ENET_RDAR2, ENET_TDAR, ENET_TDAR1, and ENET_TDAR2 to 0100_0000h according to the classes used.
7. Set ENET_ECR[ETHEREN] to one.

35.3.18 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

35.3.18.1 Sleep mode

To put the MAC in Sleep mode, set ENET*n*_ECR[SLEEP]. At the same time ENET*n*_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, if ENET is enabled, write 1 to ENET*n*_ECR[SLEEP] before entering into low power mode.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

35.3.18.2 Magic packet detection

The core is designed to detect magic packets (See "Magic Packets" topics) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

35.3.18.3 Wakeup

When a magic packet is detected, indicated by ENET*n*_EIR[WAKEUP], ENET*n*_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET*n*_ECR[MAGICEN], disabling magic packet detection.

35.3.19 Clocking

The table found here describes the clock sources for ENET. See chip-specific clocking section for clock setting, configuration and gating information.

Table 422. ENET clocks

Clock name	Description
ipg_clk	Module clock
ipg_clk_rmii	Module clock for RMII
ipg_clk_s	Peripheral access clock
ipg_clk_time (ts_clk)	Peripheral clock
txc_sampling_clk	Transmit sampling clock

35.3.19.1 Reference clock

The input clocks to the ENET module must meet the specifications in the following table.

Ethernet speed mode	Ethernet bus clock	Minimum ENET system clock
10 Mbit/s	2.5 MHz	5 MHz
100 Mbit/s	25.0 MHz	50 MHz
1000 Mbit/s	125.0 MHz	133 MHz

35.3.20 Reset

The following sections describe the resets and stop controls.

35.3.20.1 Hardware reset

To reset the Ethernet module, set ENET*n*_ECR[RESET].

35.3.20.2 Soft reset

When ENET*n*_ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

35.3.20.3 Debug mode

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully. The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the RMII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

35.3.20.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required). The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

35.3.20.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission. In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET*n*_TCR[GTS] is set by software.
- ENET*n*_TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.

- MAC is placed in Sleep mode by software or the processor entering Stop mode (see Sleep mode).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped state.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

35.3.20.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO. The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see Magic packet detection). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the RMII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

NOTE

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

35.3.20.4.3 Graceful stop interrupt (GRA)

The graceful stop interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

35.3.21 Interrupts

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing for each queue, these registers are available with the same control and configuration fields.

- Transmit Interrupt Coalescing Register (TXICn) where n=0,1,2 for queue/class 0,1,2.
- Receive Interrupt Coalescing Register (RXICn) where n=0,1,2 for queue/class 0,1,2.

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

35.3.21.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
  - Set the INT bit in the enhanced received buffer descriptor to one.
  - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the RXB, RXB1, and RXB2 fields in the EIMR register.
- Clear the TXB, TXB1, and TXB2 fields in the EIMR register.

35.3.21.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC*n* and TXIC*n* registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

   NOTE

   When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

   NOTE

   The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

35.3.21.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC*n* and TXIC*n* registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

   NOTE

   When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

35.4 External signals

The table found here describes the external signals of ENET.

Table 423. ENET external signals

Signal	Description	Mode	Direction
1588_EVENT_IN/ 1588_EVENT_OUT	Capture/compare block input/output event bus signal. • When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. • When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in the register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	RMII	IO
ENET_1588_CLKIN	Alternate IEEE 1588 Ethernet clock input; Clock period should be an integer number in nanoseconds.	RMII	I
MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	RGMII/RMII	O
MDIO	Transfers control information between the external PHY and the media access controller. Data is synchronous to MDC. This signal is an input after reset.	RGMII/RMII	IO
RXER	When asserted with RXDV, indicates an error detection from the PHY in the current frame.	RMII	I
RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. **NOTE** In RMII mode, this pin also generates the CRS signal.	RMII	I
TXEN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is de-asserted before the first TXCLK following the final nibble of the frame. **NOTE** In RGMII mode, it is present as RGMII_TX_CTL, and contains TXEN on the rising edge of RGMII_TXC, and a logical derivative of TXEN and TXER (TXEN XOR TXER) on the falling edge of RGMII_TXC.	RMII	O
RXD[3:0]	Contains the Ethernet input data transferred from the PHY to the media-access controller when RXEN is asserted.	RMII/RGMII	I

Table continues on the next page...

Table 423. ENET external signals (continued)

Signal	Description	Mode	Direction
	NOTE In RMII mode, bits [1:0] provide the Ethernet input data.		
TXD[3:0]	Serial output Ethernet data. Only valid during TX_EN assertion. **NOTE** In RMII mode, bits [1:0] provide the Serial output Ethernet data.	RMII/RGMII	O
RGMII_RX_CTL	Asserting this input indicates the PHY has valid nibbles present on the MII. RXDV must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RXDV must start no later than the SFD and exclude any EOF. **NOTE** • In RMII mode, this signal is used as RMII_CRS_DV. • In RGMII mode, contains RXDV on the rising edge of RGMII_RXC, and a logical derivative of RXDV and RXER (RXDV XOR RXER) on the falling edge of RGMII_RXC.	RGMII	I
RGMII_RXC	Timing reference for RGMII_RXD[3:0] and RGMII_RX_CTL	RGMII	I
RGMII_TX_CTL	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TXCLK following the final nibble of the frame. **NOTE** In RGMII mode, contains TXEN on the rising edge of RGMII_TXC, and a logical derivative of TXEN and TXER (TXEN XOR TXER) on the falling edge of RGMII_TXC.	RGMII	O
RGMII_TXC	Timing reference for RGMII_TXD[3:0] and RGMII_TX_CTL.	RGMII	O
RMII_REF_CLK	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	RMII	IO
RGMII_REF_CLK	In RGMII mode, this signal provides 125Mhz external reference clock input.	RGMII	I

35.5 Initialization

Initialization is not required for this module.

35.6 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 424. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

35.6.1 ENET register descriptions

35.6.1.1 ENET memory map

ENET base address: 4289_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
4	Interrupt Event (EIR)	32	RW	0000_0000

35.6.1.2 Interrupt Event (EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Offset

Register	Offset
EIR	4h

Fields

Field	Description
31 —	Reserved
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. **NOTE** The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
25 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.

Table continues on the next page...

Table continued from the previous page...

Field	Description
23 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. **NOTE** In situations where the device has various masters generating high traffic, a FIFO underrun can occur on the transmit FIFO. To avoid transmit FIFO underrun, store and forward can be enabled in ENET_TFWR[STRFWD]. See Transmit FIFO Watermark (TFWR). Also, a higher priority can be set for ENET traffic using available means on the central bus fabric connecting the ENET module.
18 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14 RXFLUSH_2	RX DMA Ring 2 flush indication. This ring's RX frame has been flushed due to either RDAR2[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_2] is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Description
13 RXFLUSH_1	RX DMA Ring 1 flush indication. This ring's RX frame has been flushed due to either RDAR1[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_1] is enabled.
12 RXFLUSH_0	RX DMA Ring 0 flush indication. . This ring's RX frame has been flushed due to either RDAR[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_0] is enabled.
11-9 —	This write-only field is reserved. It must always be written with the value 0.
8 —	This write-only field is reserved. It must always be written with the value 0.
7 TXF2	Transmit frame interrupt, class 2 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 2).
6 TXB2	Transmit buffer interrupt, class 2 This field indicates that a transmit buffer descriptor has been updated (ring/class 2).
5 RXF2	Receive frame interrupt, class 2 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 2).
4 RXB2	Receive buffer interrupt, class 2 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 2).
3 TXF1	Transmit frame interrupt, class 1 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 1).
2 TXB1	Transmit buffer interrupt, class 1 This field indicates that a transmit buffer descriptor has been updated (ring/class 1).
1 RXF1	Receive frame interrupt, class 1 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 1).
0 RXB1	Receive buffer interrupt, class 1 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 1).

35.6.1.3 Interrupt Mask (EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Offset

Register	Offset
EIMR	8h

Fields

Field	Description
31 —	This write-only field is reserved. It must always be written with the value 0.
30 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
29 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.

Table continues on the next page...

Table continued from the previous page...

Field	Description
28 GRA	GRA Interrupt Mask Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
27 TXF	TXF Interrupt Mask Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
26 TXB	TXB Interrupt Mask Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
25 RXF	RXF Interrupt Mask Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
24 RXB	RXB Interrupt Mask Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
23	MII Interrupt Mask

Table continues on the next page...

Table continued from the previous page...

Field	Description
MII	Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
22 EBERR	EBERR Interrupt Mask Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
21 LC	LC Interrupt Mask Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
20 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
19 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
18 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
17 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
16 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
15 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
14 RXFLUSH_2	Corresponds to interrupt source EIR[RXFLUSH_2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
13 RXFLUSH_1	Corresponds to interrupt source EIR[RXFLUSH_1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.

Table continues on the next page...

Table continued from the previous page...

Field	Description
12 RXFLUSH_0	Corresponds to interrupt source EIR[RXFLUSH_0] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_0] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
11-9 —	This write-only field is reserved. It must always be written with the value 0.
8 —	This write-only field is reserved. It must always be written with the value 0.
7 TXF2	Transmit frame interrupt, class 2 Corresponds to interrupt source EIR[TXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
6 TXB2	Transmit buffer interrupt, class 2 Corresponds to interrupt source EIR[TXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
5 RXF2	Receive frame interrupt, class 2 Corresponds to interrupt source EIR[RXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
4 RXB2	Receive buffer interrupt, class 2 Corresponds to interrupt source EIR[RXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
3	Transmit frame interrupt, class 1

Table continues on the next page...

Table continued from the previous page...

Field	Description
TXF1	Corresponds to interrupt source EIR[TXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
2 TXB1	Transmit buffer interrupt, class 1 Corresponds to interrupt source EIR[TXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
1 RXF1	Receive frame interrupt, class 1 Corresponds to interrupt source EIR[RXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.
0 RXB1	Receive buffer interrupt, class 1 Corresponds to interrupt source EIR[RXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 - The corresponding interrupt source is masked. 1 - The corresponding interrupt source is not masked.

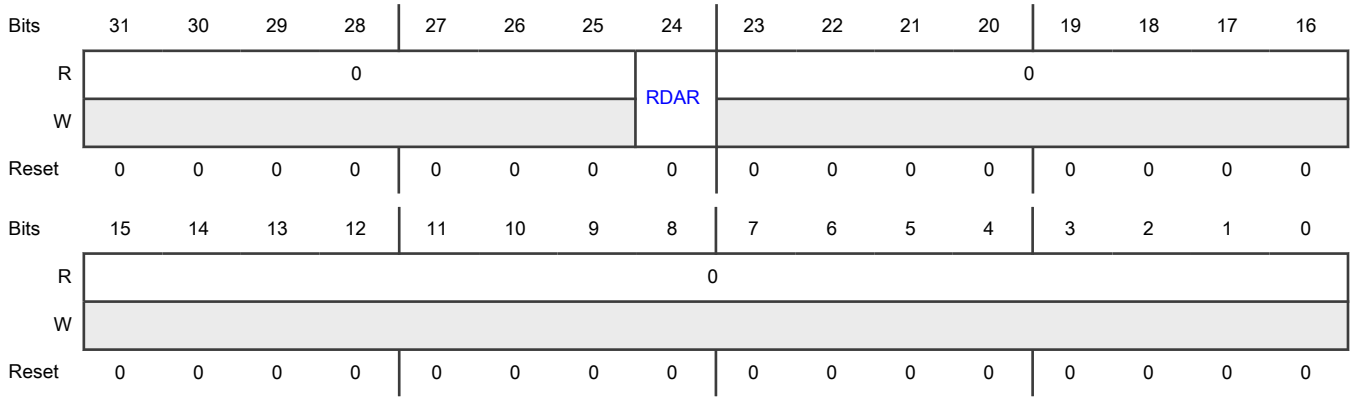
35.6.1.4 Receive Descriptor Active Register - Ring 0 (RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring 0 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Offset

Register	Offset
RDAR	10h

Diagram



Fields

Field	Description
31-25 —	Reserved
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
23-0 —	Reserved

35.6.1.5 Transmit Descriptor Active Register - Ring 0 (TDAR)

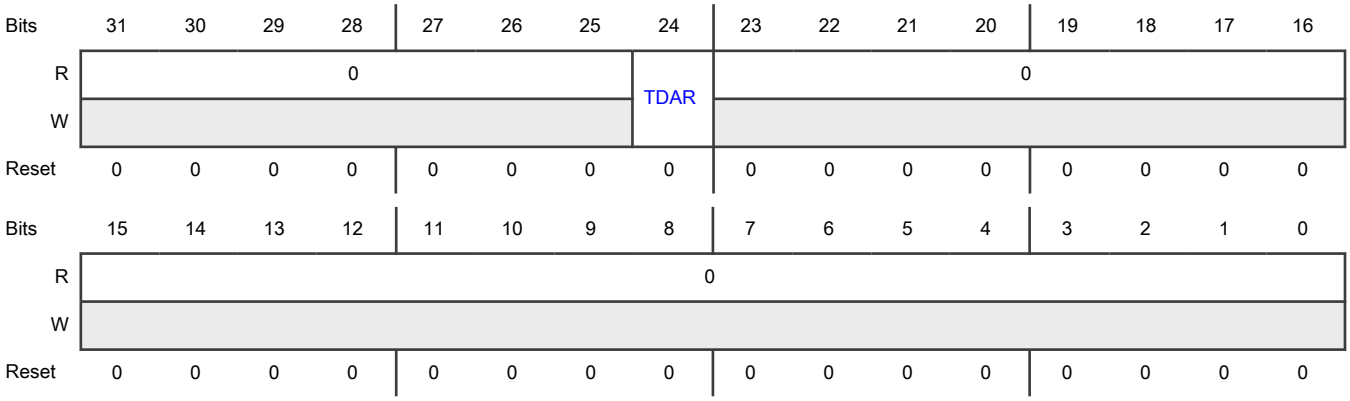
The TDAR is a command register that the user writes to indicate that the transmit descriptor ring 0 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Offset

Register	Offset
TDAR	14h

Diagram



Fields

Field	Description
31-25 —	Reserved
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
23-0 —	Reserved

35.6.1.6 Ethernet Control (ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Offset

Register	Offset
ECR	24h

Diagram

Fields

Field	Description
31-18 —	Always write 01110000000000b to this field.
17 —	Always write 0 to this field.
16 —	Always write 0 to this field.
15-12 —	Always write 0 to this field.
11 SVLANDBL	S-VLAN Double Tag If enabled, S-VLAN detection requires a double-tagged frame to define a frame as being a VLAN frame. The following rules apply: • If the first tag is the S-VLAN type, it must be followed by a second tag with the C-VLAN type to declare the frame as VLAN frame. • If the first tag is the S-VLAN type but no 2nd tag follows, it is not considered a VLAN frame but instead treated as an untagged frame. • If the first tag is the C-VLAN type, it is considered a VLAN frame as normal. **NOTE** VLANUSE2ND can be used to determine from which tag the data should be extracted. This applies only if SVLAN_EN = 1, ignored otherwise. 0 - Disable S-VLAN double tag 1 - Enable S-VLAN double tag
10 VLANUSE2ND	VLAN Use Second Tag 0 - Always extract data from the first VLAN tag if it exists.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - When a double-tagged frame is detected, the data of the second tag is extracted for further processing. A double-tagged frame is defined as: The first tag can be a C-VLAN or a S-VLAN (if SVLAN_ENA = 1) The second tag must be a C-VLAN
9 SVLANEN	S-VLAN Enable Enable additional detection of S-VLAN tag according to IEEE802.1Q. 0 - Only the EtherType 0x8100 will be considered for VLAN detection. 1 - The EtherType 0x88a8 will be considered in addition to 0x8100 (C-VLAN) to identify a VLAN frame in receive. When a VLAN frame is identified, the two bytes following the VLAN type are extracted and used by the classification match comparators, RCMRn.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. **NOTE** This field must be written to 1 after reset. 0 - The buffer descriptor bytes are not swapped to support big-endian devices. 1 - The buffer descriptor bytes are swapped to support little-endian devices.
7 —	Always write 0 to this field.
6 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 - MAC continues operation in debug mode. 1 - MAC enters hardware freeze mode when the processor is in debug mode.
5 SPEED	Selects between 10/100-Mbit/s and 1000-Mbit/s modes of operation. 0 - 10/100-Mbit/s mode 1 - 1000-Mbit/s mode
4 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 - Legacy FEC buffer descriptors and functions enabled. 1 - Enhanced frame time-stamping functions enabled. Has no effect within the MAC besides controlling the DMA control bit ena_1588.
3 SLEEP	Sleep Mode Enable 0 - Normal operating mode. 1 - Sleep mode.
2	Magic Packet Detection Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
MAGICEN	Enables/disables magic packet detection. **NOTE** MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection. **NOTE** EIMR[WAKEUP] must be written to one if Magic packet wakeup is programed to wake up the chip from low power mode. 0 - Magic detection logic disabled. 1 - The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.
1 ETHEREN	Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: • RESET is set by software • An error condition causes the EBERR field to set. **NOTE** • ETHEREN must be set at the very last step during ENET configuration/setup/ initialization, only *after* all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. 0 - Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 - MAC is enabled, and reception and transmission are possible.
0 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

35.6.1.7 MII Management Frame (MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

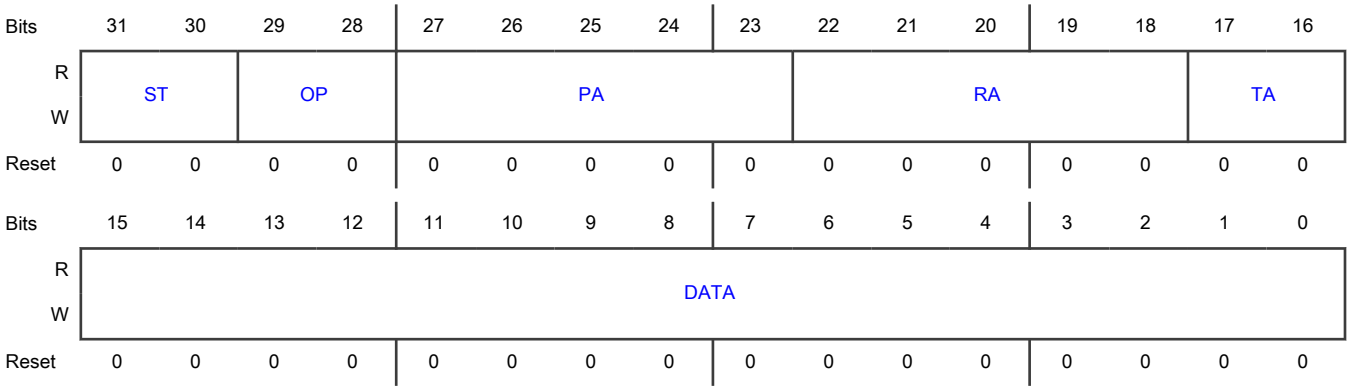
If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Offset

Register	Offset
MMFR	40h

Diagram



Fields

Field	Description
31-30 ST	Start Of Frame Delimiter See Table 417 (Clause 22) or Table 419 (Clause 45) for correct value.
29-28 OP	Operation Code See Table 417 (Clause 22) or Table 419 (Clause 45) for correct value.
27-23 PA	PHY Address See Table 417 (Clause 22) or Table 419 (Clause 45) for correct value.
22-18 RA	Register Address See Table 417 (Clause 22) or Table 419 (Clause 45) for correct value.
17-16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
15-0 DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

35.6.1.8 MII Speed Control (MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (that is, peripheral bus clock) is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

MII clock frequency = 25 MHz / ((4 + 1) x 2) = 2.5 MHz

The following table shows the optimum values for MII_SPEED as a function of IPS bus clock frequency.

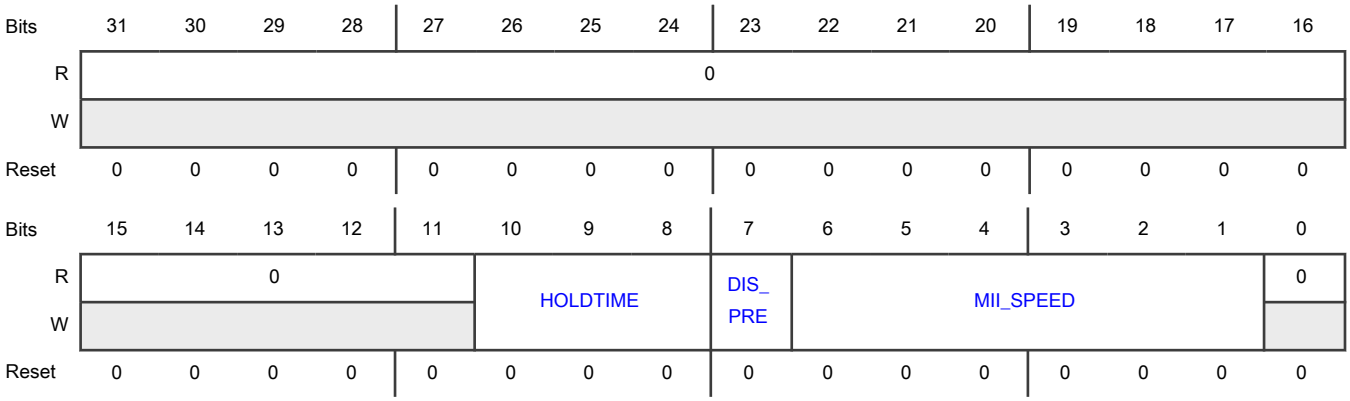
Table 425. Programming Examples for MSCR

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Offset

Register	Offset
MSCR	44h

Diagram



Fields

Field	Description
31-11 —	Reserved
10-8 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 - 1 internal module clock cycle 001 - 2 internal module clock cycles

Table continues on the next page...

Table continued from the previous page...

Field	Description
	010 - 3 internal module clock cycles 111 - 8 internal module clock cycles
7 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 - Preamble enabled. 1 - Preamble (32 ones) is not prepended to the MII management frame.
6-1 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: 1/((MII_SPEED + 1) x 2) of the internal module clock frequency
0 —	Reserved

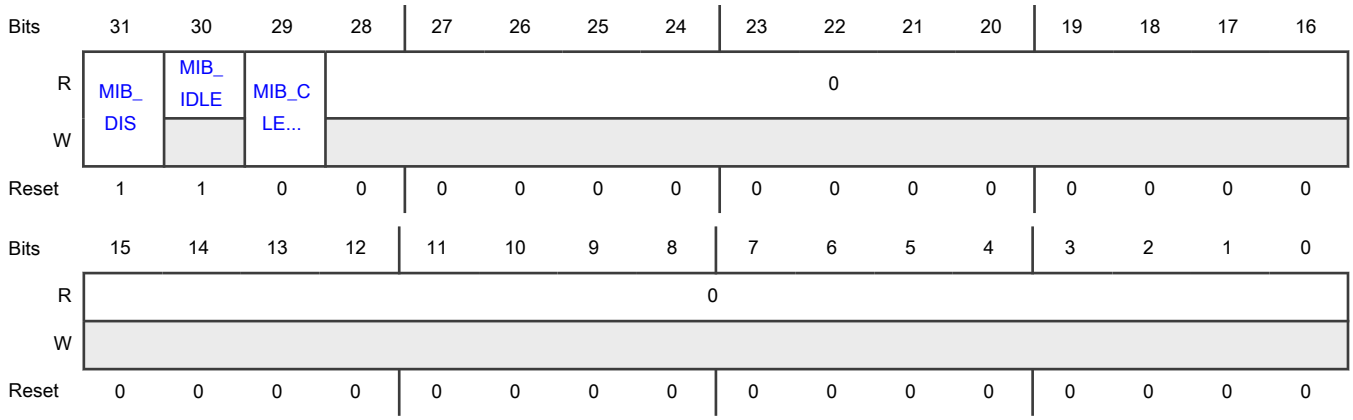
35.6.1.9 MIB Control (MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Offset

Register	Offset
MIBC	64h

Diagram



Fields

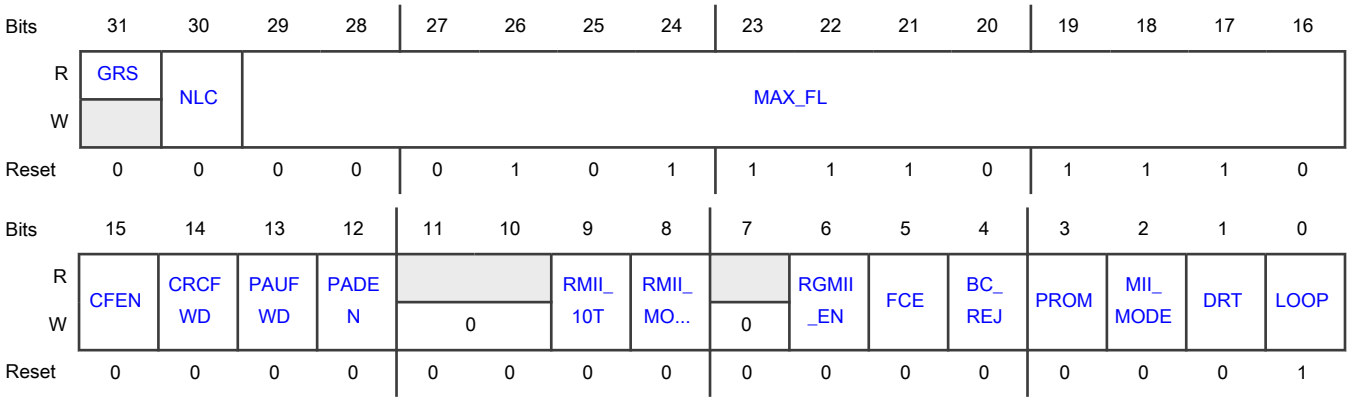
Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 - MIB logic is enabled. 1 - MIB logic is disabled. The MIB logic halts and does not update any MIB counters.
30 MIB_IDLE	MIB Idle 0 - The MIB block is updating MIB counters. 1 - The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear **NOTE** This field is not self-clearing. To clear the MIB counters set and then clear this field. 0 - See note above. 1 - All statistics counters are reset to 0.
28-0 —	Reserved

35.6.1.10 Receive Control (RCR)

Offset

Register	Offset
RCR	84h

Diagram



Fields

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped. 0 - Receive not stopped 1 - Receive stopped
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 - The payload length check is disabled. 1 - The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLR] field.
29-16 MAX_FL	Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 - MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 - MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. **NOTE** If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 - The CRC field of received frames is transmitted to the user application. 1 - The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 - Pause frames are terminated and discarded in the MAC. 1 - Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 - No padding is removed on receive by the MAC.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Padding is removed from received frames.
11-10 —	This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII or RGMII . 0 - 100-Mbit/s or 1-Gbit/s operation. 1 - 10-Mbit/s operation.
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared . **NOTE** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE]. 0 - MAC configured for MII mode. 1 - MAC configured for RMII operation.
7 —	This write-only field is reserved. It must always be written with the value 0.
6 RGMII_EN	RGMII Mode Enable **NOTE** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE]. 0 - MAC configured for non-RGMII operation 1 - MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000-Mbit/s mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100-Mbit/s mode.
5 FCE	Flow Control Enable If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration. 0 - Disable flow control 1 - Enable flow control
4 BC_REJ	Broadcast Frame Reject If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor. 0 - Will not reject frames as described above 1 - Will reject frames as described above
3	Promiscuous Mode

Table continues on the next page...

Table continued from the previous page...

Field	Description
PROM	All frames are accepted regardless of address matching. 0 - Disabled. 1 - Enabled.
2 MII_MODE	Media Independent Interface Mode This field must always be set. 0 - Reserved. 1 - MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	Disable Receive On Transmit 0 - Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 - Disable reception of frames while transmitting. (Normally used for half-duplex mode.)
0 LOOP	Internal Loopback This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0. 0 - Loopback disabled. 1 - Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

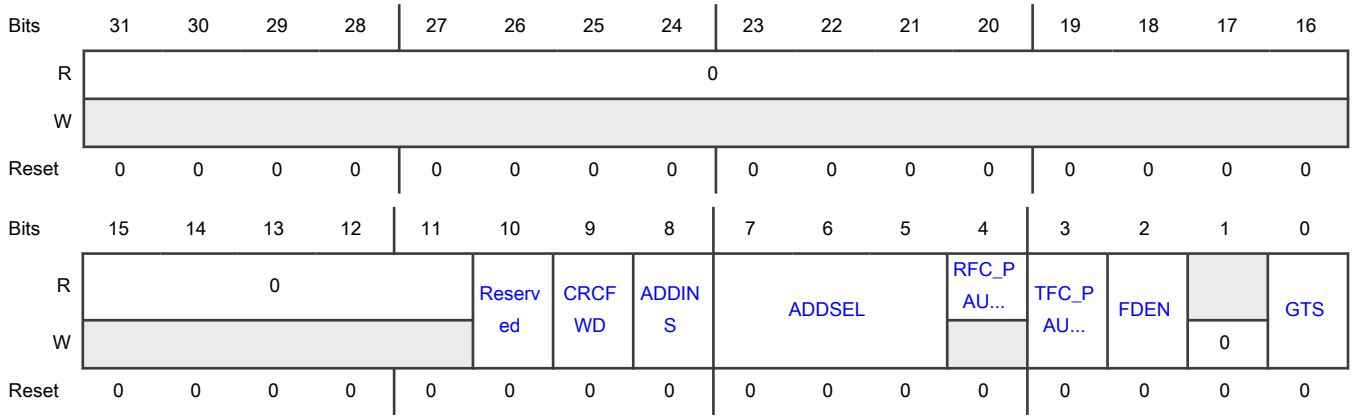
35.6.1.11 Transmit Control (TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Offset

Register	Offset
TCR	C4h

Diagram



Fields

Field	Description
31-11 —	Reserved
10 —	This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC 0 - TxBD[TC] controls whether the frame has a CRC from the application. 1 - The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.
8 ADDINS	Set MAC Address On Transmit 0 - The source MAC address is not modified by the MAC. 1 - The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
7-5 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 - Node MAC address programmed on PADDR1/2 registers. 100 - Reserved. 101 - Reserved. 110 - Reserved.
4 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
3	Transmit Frame Control Pause

Table continues on the next page...

Table continued from the previous page...

Field	Description
TFC_PAUSE	Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 - No PAUSE frame transmitted. 1 - The MAC stops transmission of data frames after the current transmission is complete.
2 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared. 0 - Disable full-duplex 1 - Enable full-duplex
1 —	This write-only field is reserved. It must always be written with the value 0.
0 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt. 0 - Disable graceful transmit stop 1 - Enable graceful transmit stop

35.6.1.12 Physical Address Lower (PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Offset

Register	Offset
PALR	E4h

Fields

Field	Description
31-16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
15-0 TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

35.6.1.14 Opcode/Pause Duration (OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

35.6.1.21 Transmit FIFO Watermark (TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

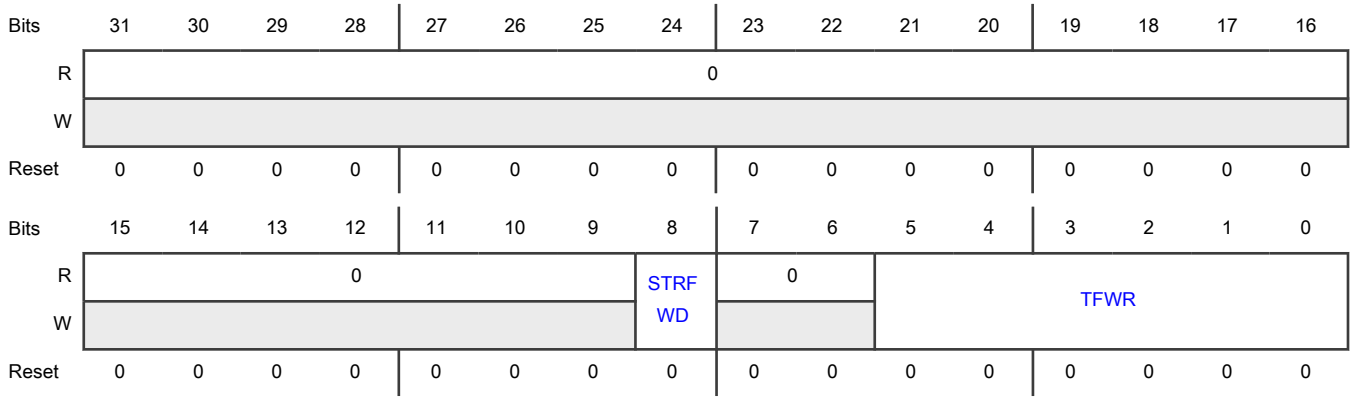
If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Offset

Register	Offset
TFWR	144h

Diagram



Fields

Field	Description
31-9 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
8 STRFWD	Store And Forward Enable 0 - Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 - Enabled.
7-6 —	Reserved
5-0 TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. **NOTE** If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 00_0000 - 64 bytes written. 00_0001 - 64 bytes written. 00_0010 - 128 bytes written. 00_0011 - 192 bytes written. 11_1111 - 4032 bytes written.

35.6.1.22 Receive Descriptor Ring 1 Start (RDSR1)

RDSR1 points to the beginning of circular receive buffer descriptor queue 1 in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

NOTE

This register must be initialized prior to operation.

35.6.1.24 Maximum Receive Buffer Size Register - Ring 1 (MRBR1)

MRBR1 is a user-programmable register that dictates the maximum size of all ring-1 receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- To allow one maximum size frame per buffer, MRBR1 must be set to RCR[MAX_FL] or larger.
- R_BUF_SIZE is concatenated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To properly align the buffer, MRBR1 must be evenly divisible by 64. To ensure this, set the lower two bits of R_BUF_ZIZE to zero. The lower four bits are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR1 greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

31-21 —	Reserved
20-16 STAT_SECTION_EMPTY	RX Status FIFO Section Empty Threshold Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a

Table continues on the next page...

Table continued from the previous page...

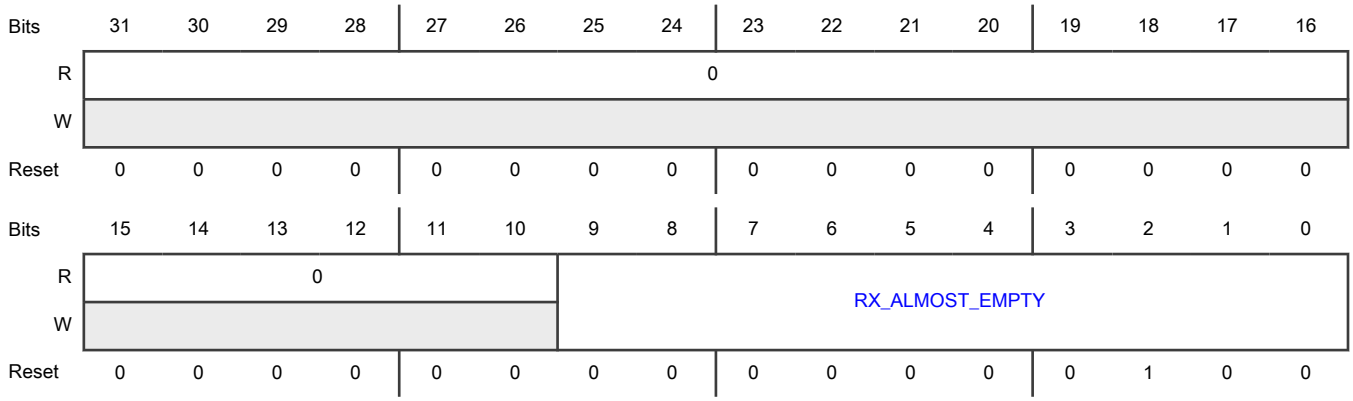
Field	Description
	possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
15-10 —	Reserved
9-0 RX_SECTION_EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued. A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client. **NOTE** The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

35.6.1.33 Receive FIFO Almost Empty Threshold (RAEM)

Offset

Register	Offset
RAEM	198h

Diagram



Fields

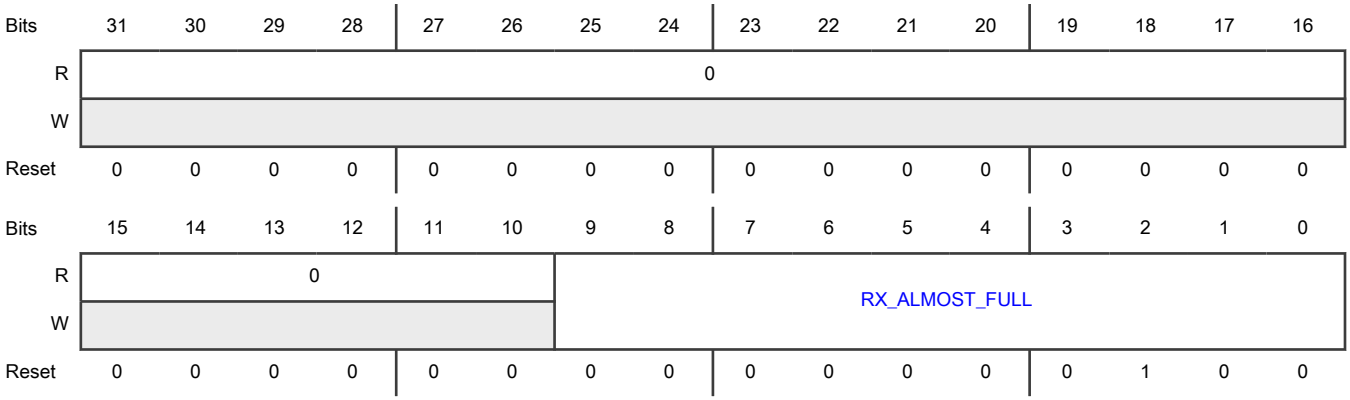
Field	Description
31-10 —	Reserved
9-0 RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

35.6.1.34 Receive FIFO Almost Full Threshold (RAFL)

Offset

Register	Offset
RAFL	19Ch

Diagram



Fields

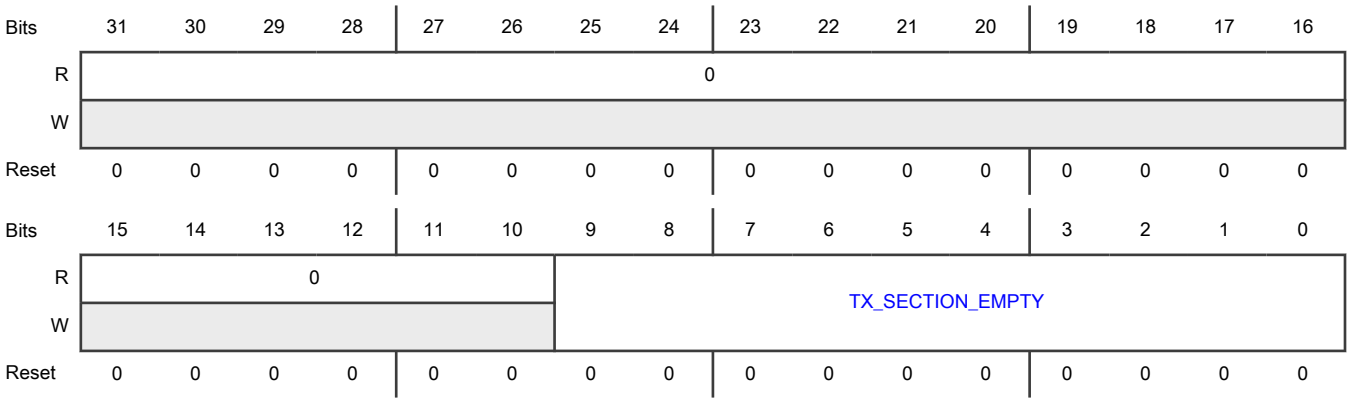
Field	Description
31-10 —	Reserved
9-0 RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

35.6.1.35 Transmit FIFO Section Empty Threshold (TSEM)

Offset

Register	Offset
TSEM	1A0h

Diagram



Fields

Field	Description
31-10 —	Reserved
9-0 TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold Value, in 64-bit words, of the transmit FIFO section empty threshold. See Transmit FIFO for more information.

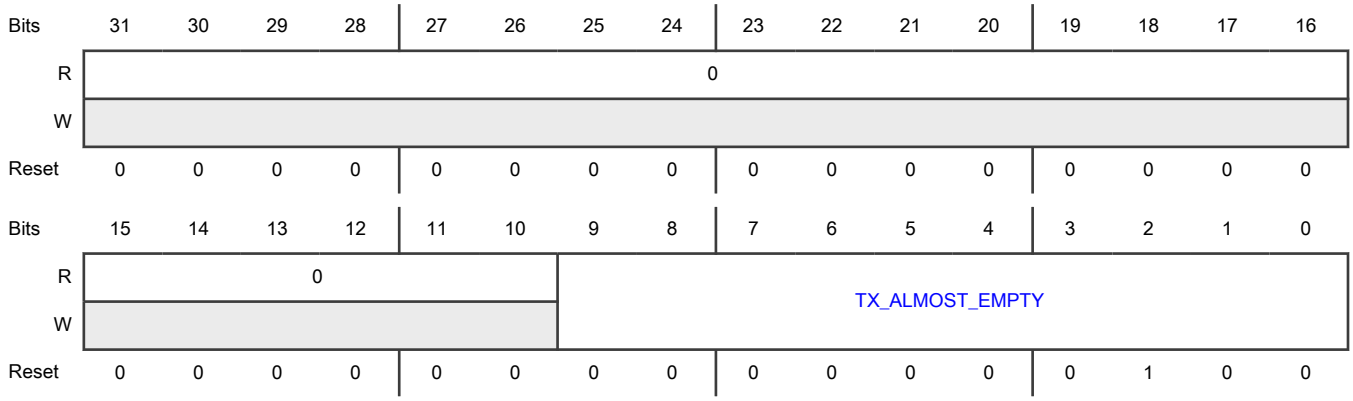
Offset

Register	Offset
TAEM	1A4h

Diagram



Fields

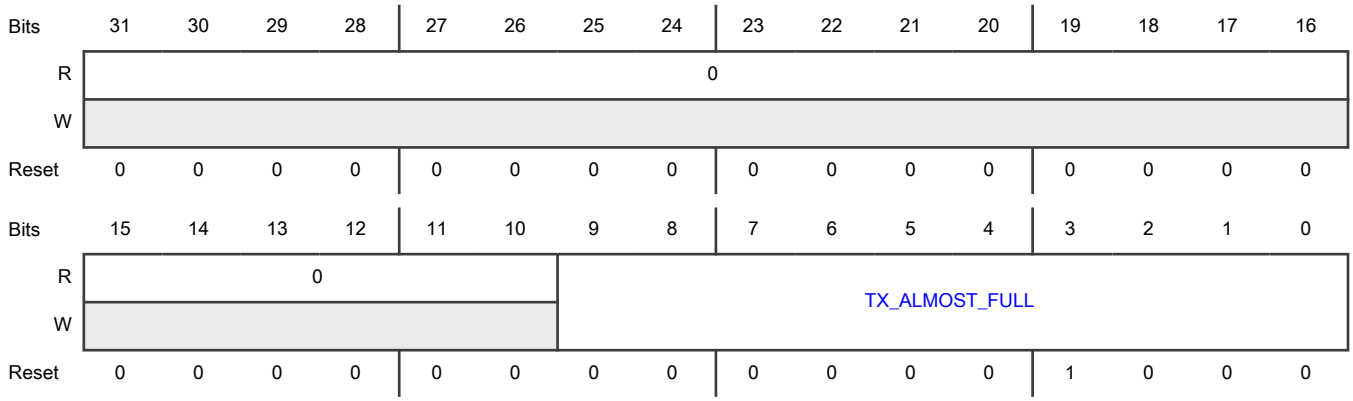
Field	Description
31-10 —	Reserved
9-0 TX_ALMOST_EMPTY	Value of Transmit FIFO Almost Empty Threshold Value, in 64-bit words, of the transmit FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See Transmit FIFO for more information. A minimum value of 4 should be set.

35.6.1.37 Transmit FIFO Almost Full Threshold (TAFL)

Offset

Register	Offset
TAFL	1A8h

Diagram



Fields

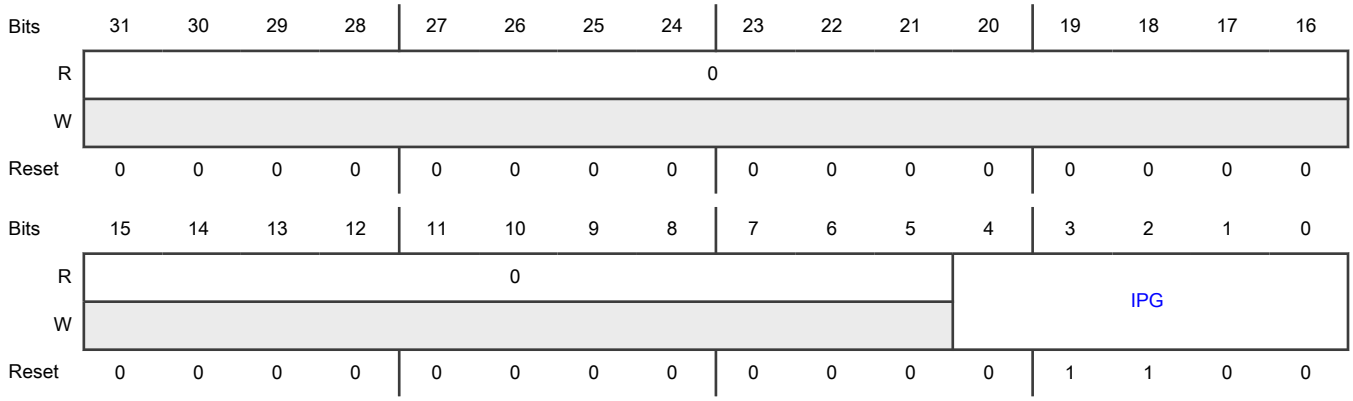
Field	Description
31-10 —	Reserved
9-0 TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5). When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See Transmit FIFO for more information. **NOTE** A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

35.6.1.38 Transmit Inter-Packet Gap (TIPG)

Offset

Register	Offset
TIPG	1ACh

Diagram



Fields

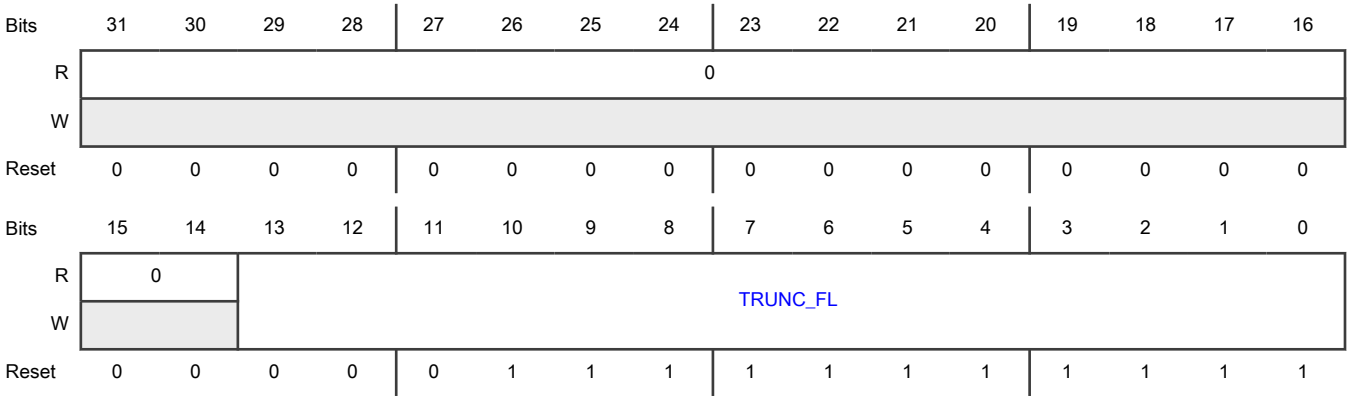
Field	Description
31-5 —	Reserved
4-0 IPG	Transmit Inter-Packet Gap Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12. **NOTE** The IPG value read will be the value that was written, even if it is out of range.

35.6.1.39 Frame Truncation Length (FTRL)

Offset

Register	Offset
FTRL	1B0h

Diagram



Fields

Field	Description
31-14 —	Reserved
13-0 TRUNC_FL	Frame Truncation Length Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL].

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

35.6.1.40 Transmit Accelerator Function Configuration (TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Offset

Register	Offset
TACC	1C0h

Table continues on the next page...

Table continued from the previous page...

Field	Description
7 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. **NOTE** This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 - Disabled. 1 - Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors 0 - Frames with errors are not discarded. 1 - Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
5-3 —	This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 - Frames with wrong checksum are not discarded. 1 - If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 - Frames with wrong IPv4 header checksum are not discarded. 1 - If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames 0 - Padding not removed. 1 - Any bytes following the IP payload section of the frame are removed from the frame.

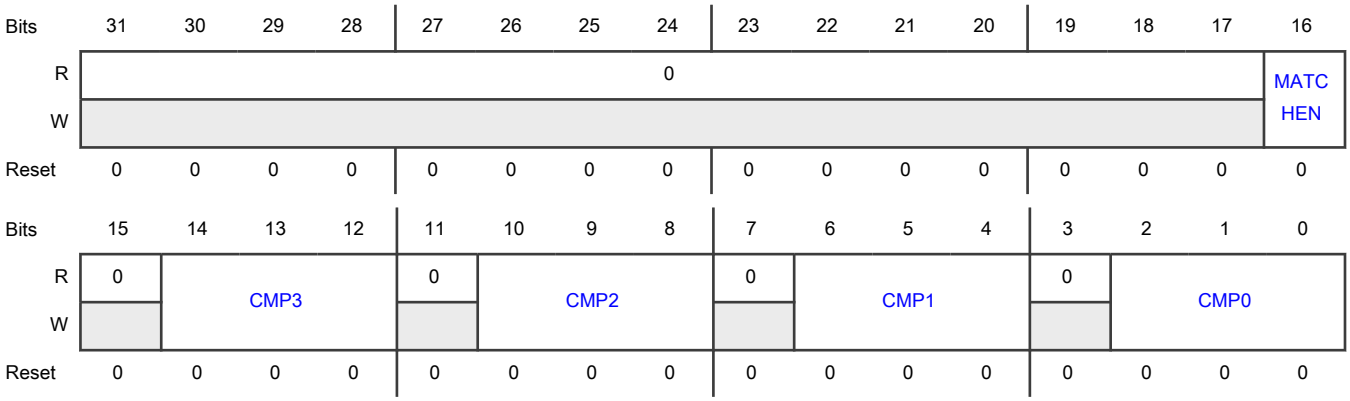
35.6.1.42 Receive Classification Match Register for Class n (RCMR1 - RCMR2)

This match register allows specifying up to four priorities, which are tested (OR'ed) simultaneously. The match detection uses the extracted VLAN field according to the rules for VLAN detection configured through the ECR register. If both match registers, RCMR1 and RCMR2, report a match at the same time, only the class 1 match is indicated as the final result.

Offset

Register	Offset
RCMR1	1C8h
RCMR2	1CCh

Diagram



Fields

Field	Description
31-17 —	This write-only field is reserved. It must always be written with the value 0.
16 MATCHEN	Match Enable **NOTE** A comparison is done only on incoming VLAN frames. If no VLAN frame is received no match will occur. If both match registers have overlapping compare values and hence can match both on the same frame, only class 1 will be indicated and the class 2 match is ignored. 0 - Disabled (default): no compares will occur and the classification indicator for this class will never assert. 1 - The register contents are valid and a comparison with all compare values is done when a VLAN frame is received.
15 —	This write-only field is reserved. It must always be written with the value 0.
14-12 CMP3	Compare 3 Fourth value to compare against. If unused it must be set to the same value as CMP0.
11 —	This write-only field is reserved. It must always be written with the value 0.

Table continues on the next page...

Table continued from the previous page...

Field	Description
10-8 CMP2	Compare 2 Third value to compare against. If unused it must be set to the same value as CMP0.
7 —	This write-only field is reserved. It must always be written with the value 0.
6-4 CMP1	Compare 1 Second value to compare against. If unused it must be set to the same value as CMP0.
3 —	This write-only field is reserved. It must always be written with the value 0.
2-0 CMP0	Compare 0 A three-bit value that will be compared with the frame's VLAN priority field (if a VLAN frame is received). All four compare values, CMP0..3, will be used in parallel. If any of the values match, a match for the class is reported (if MATCHEN is 1). **NOTE** To implement a single priority match, all four compare values must be set to the same value.

35.6.1.43 DMA Class Based Configuration (DMA1CFG - DMA2CFG)

The DMA class based configuration registers are used to configure the DMA controller interface to support the additional class 1 (buffer descriptor ring 1) and class 2 (buffer descriptor ring 2) traffic and define configuration options such as bandwidth allocation as needed.

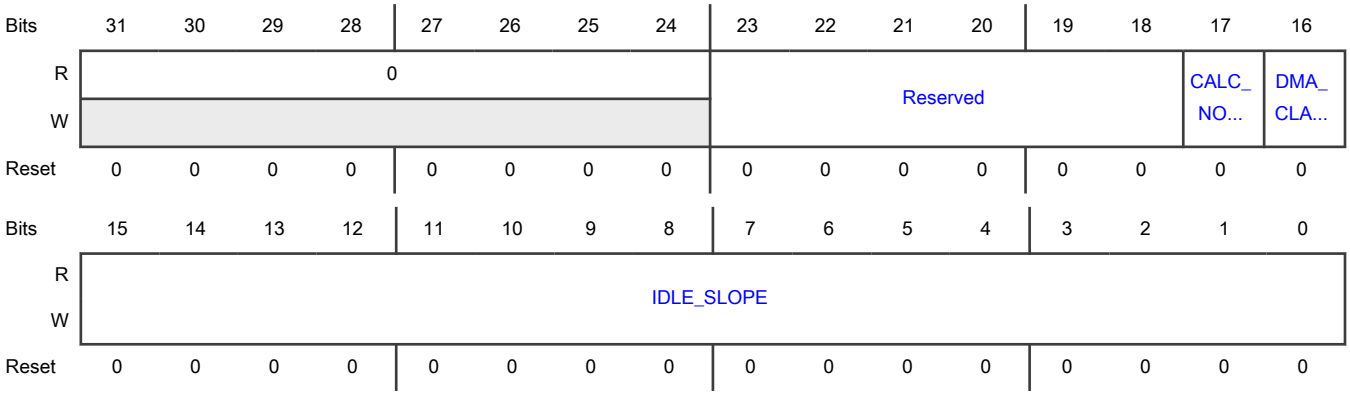
NOTE

The registers are cleared when ECR[ETHEREN] becomes 0.

Offset

Register	Offset
DMA1CFG	1D8h
DMA2CFG	1DCh

Diagram



Fields

Field	Description
31-24 —	Reserved
23-18 —	Write only zeroes to this field **NOTE** Write only zeroes to this field.
17 CALC_NOIPG	Calculate no IPG Disable inclusion of IPG bytes for bandwidth calculations. 0 - The traffic shaper function should consider 12 octets of IPG in addition to the frame data transferred for a frame when doing bandwidth calculations. This is the default. 1 - Addition of 12 bytes for the IPG should be omitted when calculating the bandwidth (for traffic shaping, when writing a frame into the transmit FIFO, the shaper will usually consider 12 bytes of IPG for every frame as part of the bandwidth allocated by the frame. This addition can be suppressed, meaning short frames will become more bandwidth than large frames due to the relation of data to IPG overhead).
16 DMA_CLASS_EN	DMA class enable 0 - The DMA controller's channel for the class is not used. Disabling the DMA controller of a class also requires disabling the class match comparator for the class (see registers RCMRn). When class 1 and class 2 queues are disabled then their frames will be placed in queue 0. 1 - Enable the DMA controller to support the corresponding descriptor ring for this class of traffic.
15-0 IDLE_SLOPE	Idle slope 16-bit value to define the per class idle slope setting used by the credit based shaper defining allocated bandwidth for the class. This value is used to calculate the BW (bandwidth) fraction, given by the equation, BW fraction = 1/(1+512/IDLE_SLOPE). Idle slope is restricted to certain values. For values less than 128, idle slope = 2^n, where n = 0, 1, 2, ...6. For values equal to or greater than 128, idle slope = 128×m, where m = 1, 2, 3, ...12. Example 1. BW fraction = 0.20 = 1/(1+(512/128)); therefore idleslope = 128.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Example 2. BW fraction = 0.33 = 1/(1+(512/256)); therefore idleslope = 256. Example 3. BW fraction = 0.75 = 1/(1+(512/1536)); therefore idleslope = 1536. **NOTE** For AVB applications, the BW fraction of class 1 and class 2 combined must not exceed .75.

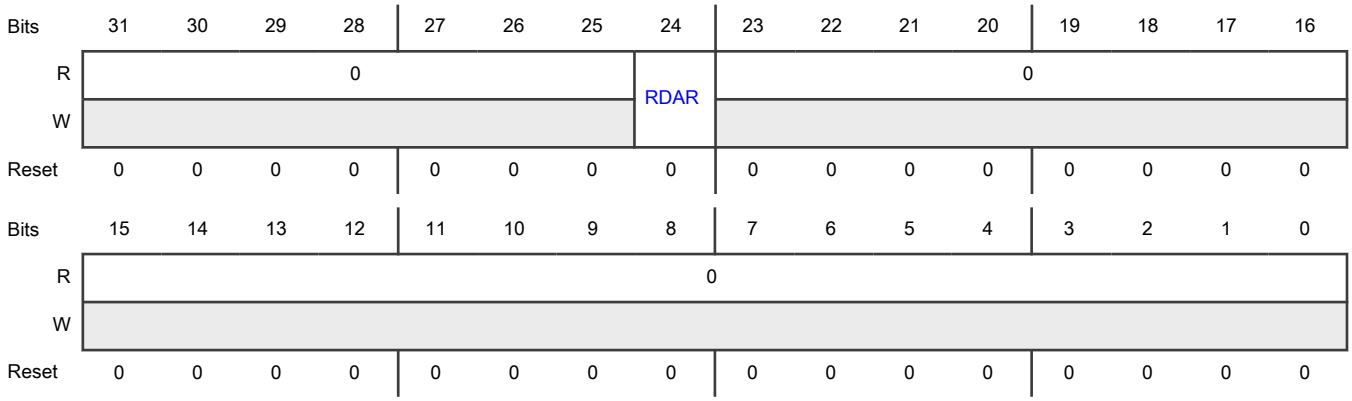
35.6.1.44 Receive Descriptor Active Register - Ring 1 (RDAR1)

RDAR1 is a command register, written by the user, to indicate that the receive descriptor ring 1 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Offset

Register	Offset
RDAR1	1E0h

Diagram



Fields

Field	Description
31-25 —	Reserved
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
23-0 —	Reserved

35.6.1.45 Transmit Descriptor Active Register - Ring 1 (TDAR1)

TDAR1 is a command register that the user writes to indicate that transmit descriptor ring 1 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Offset

35.6.1.100 Adjustable Timer Control (ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

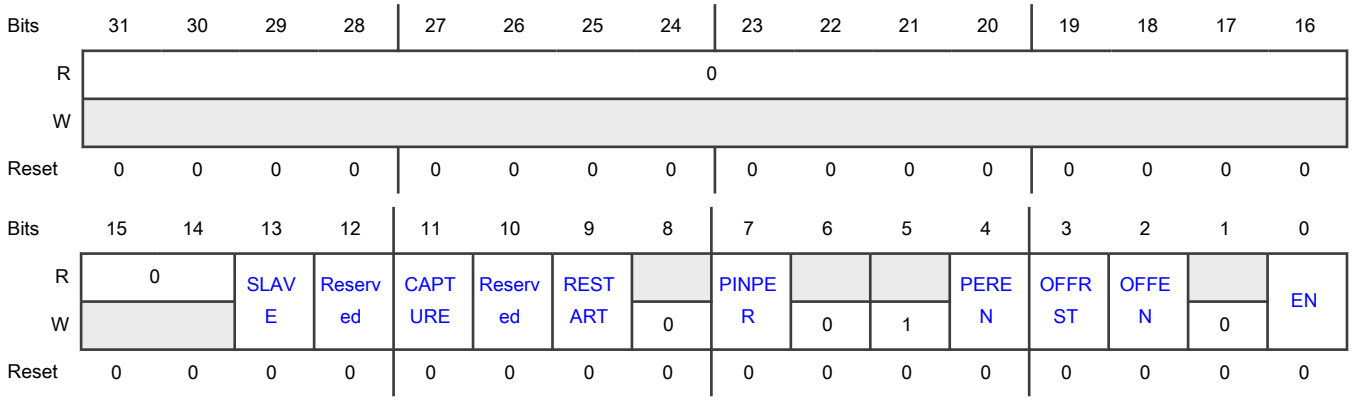
NOTE

The CAPTURE and RESTART fields and bits 12 and 10 must be 0 in order to write to the other fields in this register.

Offset

Register	Offset
ATCR	400h

Diagram



Fields

Field	Description
31-14 —	Reserved
13 SLAVE	Enable Timer Slave Mode 0 - The timer is active and all configuration fields in this register are relevant. 1 - The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 —	Always write 0 to this field Always write 0 to this field.
11 CAPTURE	Capture Timer Value When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. **NOTE** **WARNING:** To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles. 0 - No effect. 1 - The current time is captured and can be read from the ATVR register.
10 —	Always write 0 to this field Always write 0 to this field.
9 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored

Table continues on the next page...

Table continued from the previous page...

Field	Description
	during a write. This field automatically clears to 0 after the command completes. RESTART should be used when the timer is enabled. **NOTE** **WARNING:** The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
8 —	Reserved
7 PINPER	Enables event signal output external pin frc_evt_period assertion on period event Enables event signal output assertion on period event. **NOTE** Not all devices contain the event signal output. See the chip configuration details. 0 - Disable. 1 - Enable.
6 —	Reserved
5 —	This field must be written always with one **NOTE** This field must be written always with one.
4 PEREN	Enable Periodical Event 0 - Disable. 1 - A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event 0 - The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 - If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event 0 - Disable. 1 - The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
0 EN	Enable Timer 0 - The timer stops at the current value. 1 - The timer starts incrementing.

R W	PERIOD															
Reset	1	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0

Fields

Field	Description
31-0	Value for generating periodic events

Table continues on the next page...

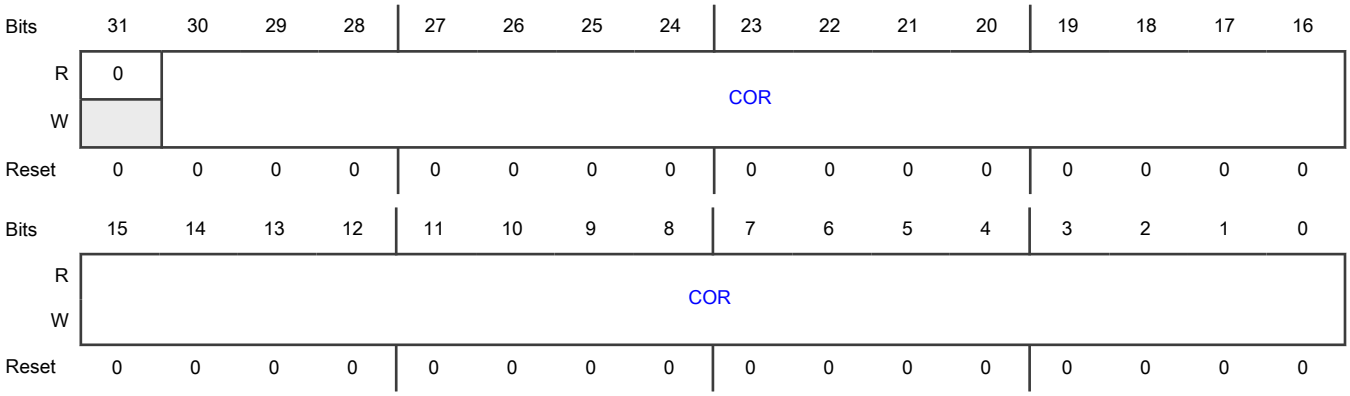
Field	Description
PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. **NOTE** The value of PERIOD has the following constraint: 2^{32} − ENET_ATINC[INC_COR] − 3×ENET_ATINC[INC] ≥ PERIOD > 0.

35.6.1.104 Timer Correction (ATCOR)

Offset

Register	Offset
ATCOR	410h

Diagram



Fields

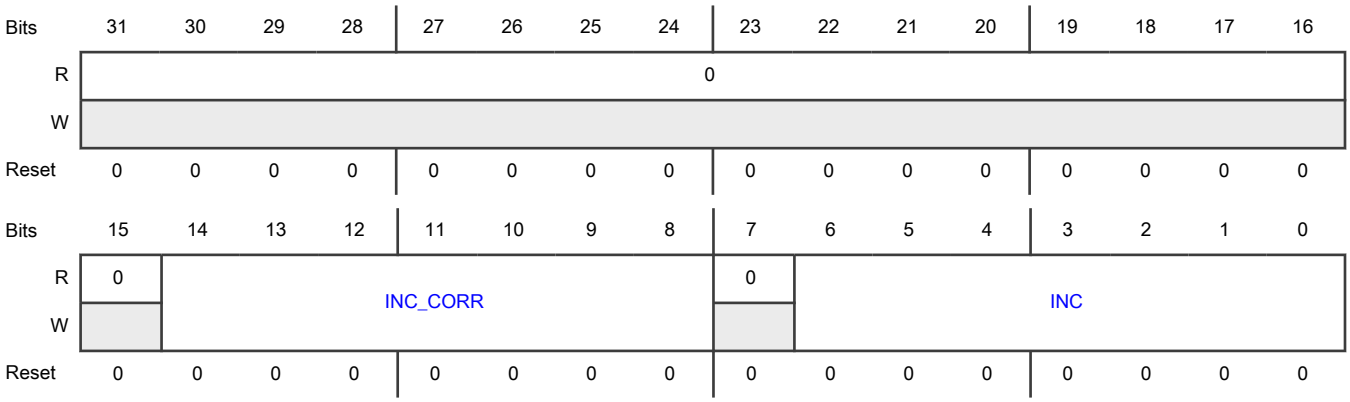
Field	Description
31 —	Reserved
30-0 COR	Correction Counter Wrap-Around Value Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur. **NOTE** This value is given in clock cycles, not in nanoseconds as all other values.

35.6.1.105 Time-Stamping Clock Period (ATINC)

Offset

Register	Offset
ATINC	414h

Diagram



Fields

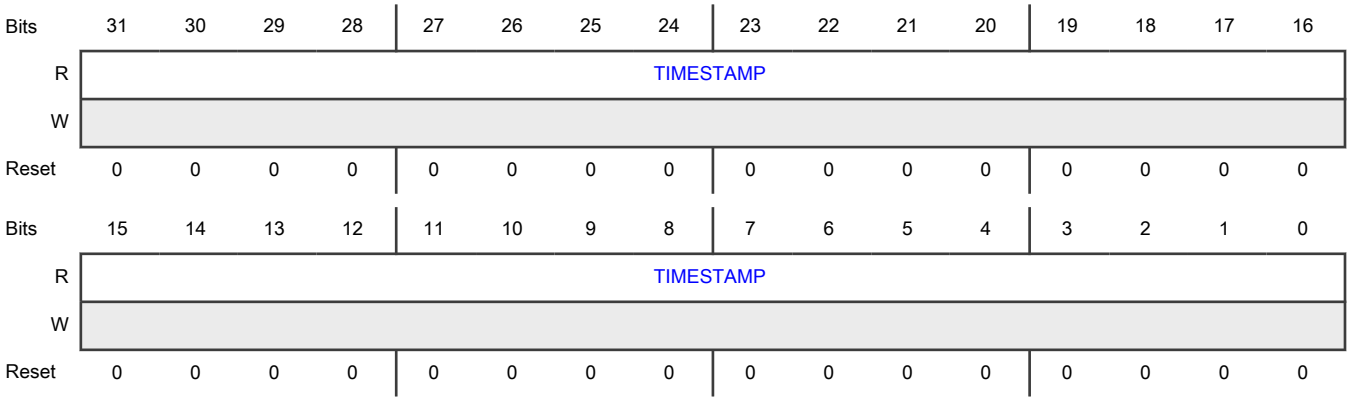
Field	Description
31-15 —	Reserved
14-8 INC_CORR	Correction Increment Value This value is added every time the correction timer expires (every clock cycle given in ATCOR). A value less than INC slows down the timer. A value greater than INC speeds up the timer.
7 —	Reserved
6-0 INC	Clock Period Of The Timestamping Clock (ts_clk) In Nanoseconds The timer increments by this amount each clock cycle. For example, set to 10 for 100 MHz, 8 for 125 MHz, 5 for 200 MHz. **NOTE** For highest precision, use a value that is an integer fraction of the period set in ATPER.

35.6.1.106 Timestamp of Last Transmitted Frame (ATSTMP)

Offset

Register	Offset
ATSTMP	418h

Diagram



Fields

Field	Description
31-0 TIMESTAMP	Timestamp of the last frame transmitted by the core that had TxBD[TS] set the ff_tx_ts_frm signal asserted from the user application Timestamp of the last frame transmitted by the core that had TxBD[TS] set . This register is only valid when EIR[TS_AVAIL] is set.

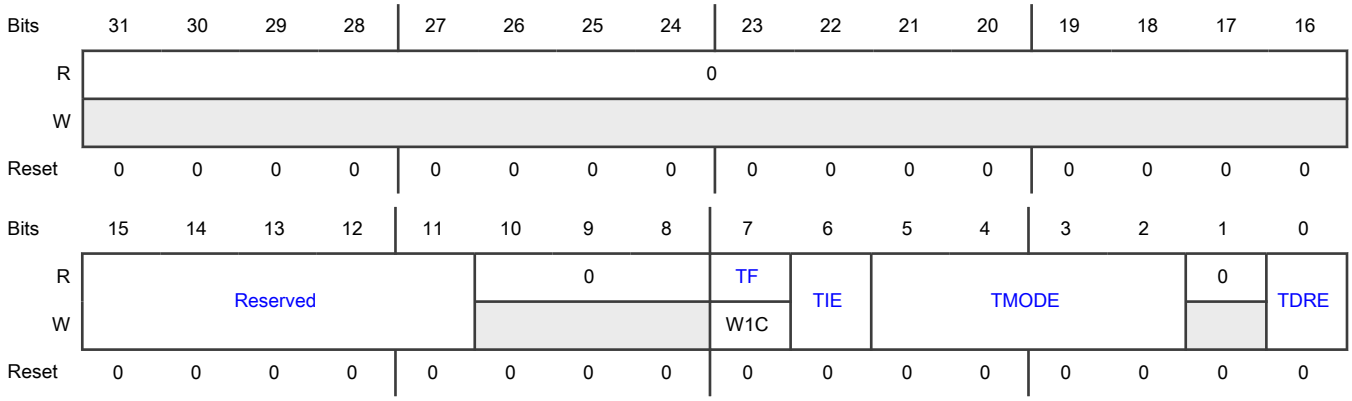
TCSR3	620h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-11 —	This field must be written with 0.
10-8 —	Reserved
7 TF	Timer Flag Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it. 0 - Input Capture or Output Compare has not occurred. 1 - Input Capture or Output Compare has occurred.
6 TIE	Timer Interrupt Enable 0 - Interrupt is disabled 1 - Interrupt is enabled
5-2 TMODE	Timer Mode Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first. 0000 - Timer Channel is disabled. 0001 - Timer Channel is configured for Input Capture on rising edge. 0010 - Timer Channel is configured for Input Capture on falling edge. 0011 - Timer Channel is configured for Input Capture on both edges. 0100 - Timer Channel is configured for Output Compare - software only.

Table continues on the next page...

Table continued from the previous page...

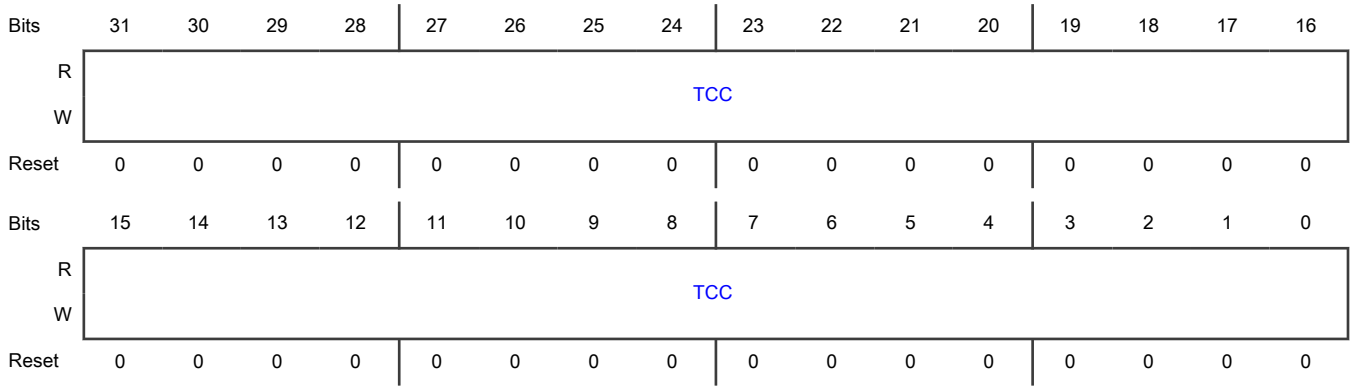
Field	Description
	0101 - Timer Channel is configured for Output Compare - toggle output on compare. 0110 - Timer Channel is configured for Output Compare - clear output on compare. 0111 - Timer Channel is configured for Output Compare - set output on compare. 1000 - Reserved 1010 - Timer Channel is configured for Output Compare - clear output on compare, set output on overflow. 10x1 - Timer Channel is configured for Output Compare - set output on compare, clear output on overflow. 110x - Reserved 1110 - Timer Channel is configured for Output Compare - pulse output low on compare for one 1588-clock cycle. 1111 - Timer Channel is configured for Output Compare - pulse output high on compare for one 1588-clock cycle.
1 —	Reserved
0 TDRE	Timer DMA Request Enable 0 - DMA request is disabled 1 - DMA request is enabled

35.6.1.109 Timer Compare Capture (TCCR0 - TCCR3)

Offset

Register	Offset
TCCR0	60Ch
TCCR1	614h
TCCR2	61Ch
TCCR3	624h

Diagram



Fields

Field	Description
31-0 TCC	Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag. The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow. When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.

Chapter 36
Audio Overview

36.1 Audio Overview

The following audio peripherals are included on this chip.

- Synchronous Audio Interface (SAI)

  The SAI are synchronous serial interfaces used to transfer audio data.

- Pulse Density Modulated Microphone Interface (PDM)

  The PDM Microphone Interface (PDM) is used to receive audio from microphone.

- Sony/Philips digital interface (SPDIF XCVR)

  The audio module is supported through the Audio Transceiver.

- Medium Quality Sound (MQS)

  MQS is used to generate medium quality audio to connect stereo speakers or headphones to a power amplifier.

36.1.1 Audio Interfaces

The audio interfaces are summarized below.

Table 426. Audio Interface Summary

Interface	MIx	Function	RX Lanes	TX Lanes	FIFO size
SAI-1	AONMIX	External audio interface	1	2	64 entries per lane
SAI-2	WAKEUPMIX	External audio interface	1	1	128 entries per lane
SAI-3	WAKEUPMIX	External audio interface	1	1	128 entries per lane
SPDIF	WAKEUPMIX	External audio interface	1	1	128 Rx and 128 Tx entries
PDM (8 channel)	WAKEUPMIX	External microphone interface	-	4 (8 MIC's)	32 entries
MQS1	AONMIX	Medium quality Audio interface	-	-	-
MQS2	WAKEUPMIX	Medium quality Audio interface	-	-	-

36.1.2 Synchronous Audio Interface (SAI)

- SAI1 supports two Tx lanes and one Rx lane
  - SAI2, SAI3 support one TX and one RX lane
- 16-word TX/RX FIFO and up to 32 words per frame
- One set of Tx clocks and frame sync

36.1.3 Sony Philips Digital Interface (SPDIF) Transceiver

It supports raw capture mode that can save all the digital audio bits into audio buffer.

36.1.4 Pulse Density Modulated Microphone Interface (PDM)

The PDM module receives audio from a microphone. It includes the following features:

- Supports up to 8-microphones (4 lanes)
- Supports frame synchronization

36.1.5 Medium Quality Sound (MQS)

MQS is used to generate medium quality audio via a standard GPIO. It provides only simple audio reproduction. Stereo speakers or headphones can be connected to a power amplifier without an additional DAC chip.

- 2-channel, LSB-valid 16 bit, MSB shift-out first serial data (sdata)
- Signals over 10 kHz have worse THD+N values

Chapter 37
PDM Microphone Interface (PDM)

37.1 Chip-specific PDM information

Table 427. Reference links to related information

System Debug		System Debug Overview

This chip includes one instances of PDM in AONMIX.

PDM is clocked by a PDM_CLK_ROOT clock from the CCM or SAI2_MCLK.

37.2 Overview

MICFIL delivers audio from microphones to the processor in several applications, such as mobile telephones. As current digital audio systems use a multi-bit audio signal (also known as multi-bit PCM) to represent the signal, this module implements the required digital interface (a series of filters) to transform a pulse density modulated (PDM) microphone bitstream into a 24-bit PCM signal in the audio band, at a configurable output sampling rate.

The implementation of this digital interface is based on the application of digital signal processing techniques used in hardware. The MICFIL architecture is designed to save gate count and minimize power consumption.

You can implement MICFIL to work in a multi-channel mode. All channels have the same configuration, but you could independently turn on or turn off each input channel.

37.2.1 Block diagram

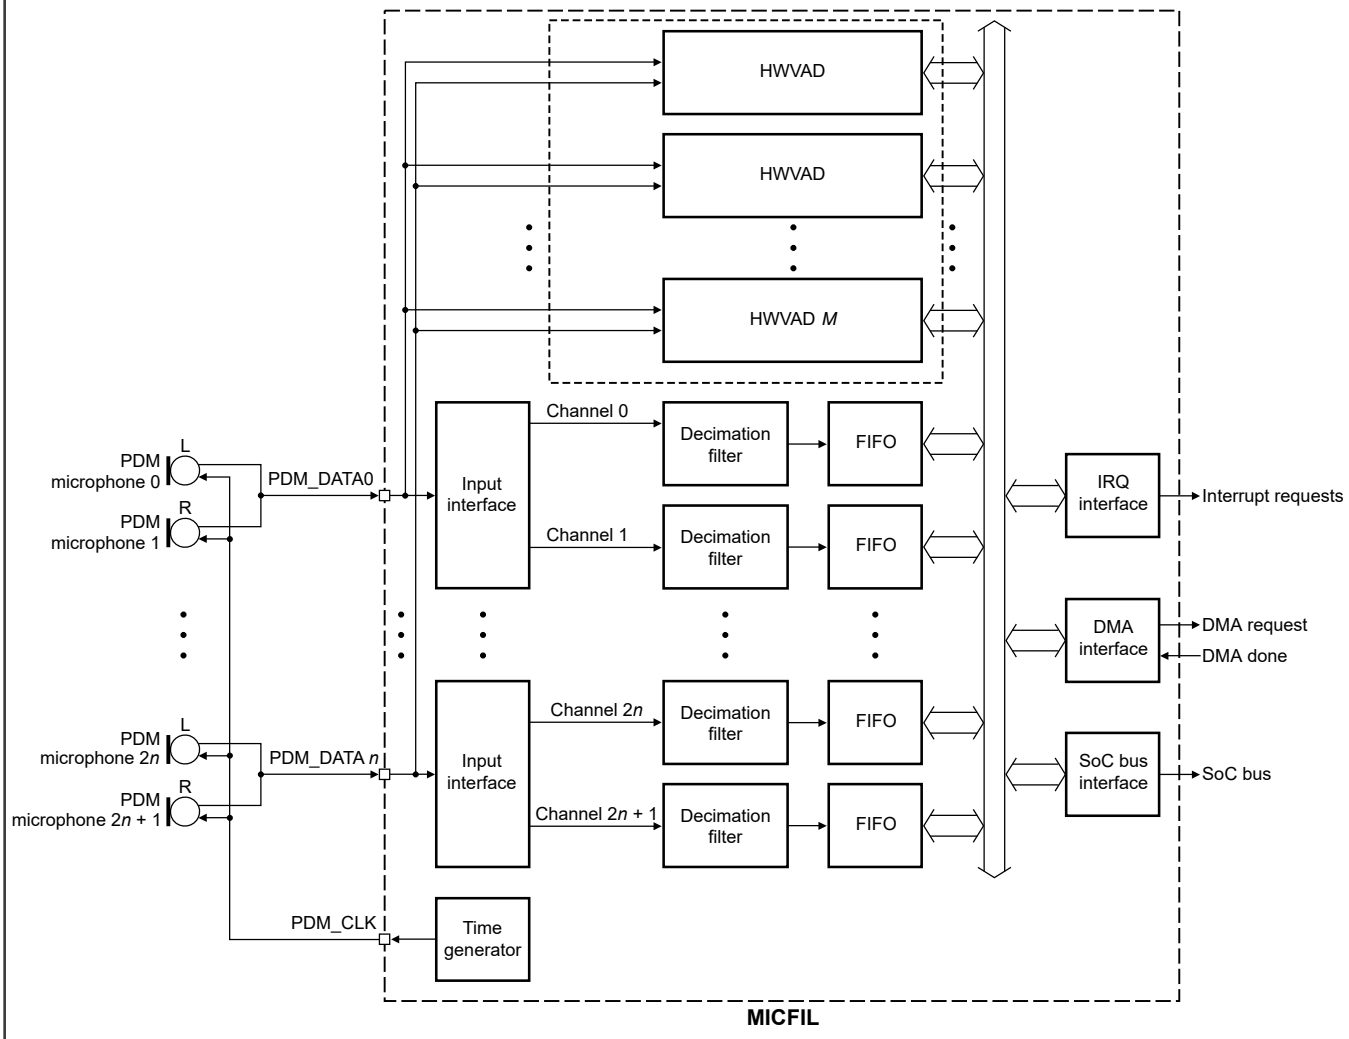

Figure 215. MICFIL block diagram

- HWVAD = hardware voice activity detector

37.2.2 Features

- Decimation filters:
  - Fixed-point filtering
  - 24-bit PCM audio output
  - Internal clock divider for a programmable PDM clock generation:
  - Frame synchronization
  - Full or partial set of channel operations with individual enable controls
  - Programmable decimation rate
  - Programmable DC remover
  - Programmable DC remover at output
  - Range adjustment capability

- FIFOs with interrupt and DMA capability: each FIFO having a length of 32 entries
- Hardware voice activity detector (HWVAD), equipped with:
  - Interrupt capability
  - Zero-crossing detection (ZCD) option

37.3 Functional description

37.3.1 Time generator

The time generator unit:

- Generates the PDM_CLK to microphones. This clock is the same and is active for all the PDM microphones, which means, it is not possible to turn off the PDM_CLK only for one single microphone.
- Delivers the PDM_CLK to all microphones that must operate at the same clock frequency. Each input interface receives a time multiplexed PDM bitstream from two PDM microphones and it separates audio information in two channels: left (0) and right (1). Every decimation filter, corresponding to its channel, does this processing.

NOTE

A soft reset affects the time generator unit (see CTRL_1[SRES]). The PDM_CLK starts with a rising edge after a soft reset is issued.

37.3.1.1 Clock divider

The sampling rate of the microphone input depends on the PDM_CLK rate, which you can trim using an internal clock divider, configuring the quality mode (see Quality modes) or trimming the MICFIL's root clock frequency (MICFIL_CLK_ROOT rate).

The internal clock divider frequency. You must configure CTRL_2[CLKDIV] by using Equation 39.

$$CLKDIV = \frac{MICFIL_CLK_ROOT\ rate}{8 \times OSR \times (output\ rate)}$$

Equation 39. CLKDIV value calculation

After calculating the value of CTRL_2[CLKDIV], you can estimate the generated PDM_CLK rate based on Equation 40, where the "K" factor value depends on the quality mode shown in Table 428 and floor(x) is the function that takes a real number x as input and gives the greatest integer less than or equal to x as output.

$$PDM_CLK\ rate = \frac{MICFIL_CLK_ROOT}{2 \times floor(K \times CLKDIV)}$$

Equation 40. PDM_CLK rate calculation

Table 428. K factor value

Quality mode	K factor
High Quality	1/2
Medium Quality, Very-Low Quality 0	1
Low Quality, Very-Low Quality 1	2
Very-Low Quality 2	4

37.3.1.1.1 Minimum required CLKDIV

NOTE

This minimum CLKDIV condition is required only if any decimation filter channel is enabled and the clock divider is enabled, otherwise this condition should be ignored.

To work properly the CLKDIV value must have a minimum value according to the quality mode configured (see Quality modes), the number of enabled channels (EC), OSR value and K factor (see I/O timing requirements). When this condition is not met, the LOWFREQF bit is asserted and an error interrupt can be issued (in case [ERREN] = 1).

The equations to estimate the minimum required CLKDIV value depending on the configured quality mode are shown in Equation 41 (for medium, high and low quality modes) and Equation 42 (for very low quality modes), on these equations floor(x) is the function that takes as input a real number x and gives as output the greatest integer less than or equal to x.

$$floor(K \times CLKDIV) \geq K \times \frac{10 + 93EC}{8 \times OSR}$$

Equation 41. Minimum required CLKDIV value in Medium, High and Low Quality modes

$$floor(K \times CLKDIV) \geq K \times \frac{10 + 43EC}{8 \times OSR}$$

Equation 42. Minimum required CLKDIV value in Very Low Quality modes

37.3.1.2 MICFIL_CLK_ROOT rate and CLKDIV calculation examples

Example 1:

If it is required an output rate = 16 kHz and enables 4 channels (EC=4). A valid configuration is following:

1. Configure High Quality mode and CIC decimation by 32 (CTRL_2[CICOSR] = 0, then OSR = 16).
2. Check the PDM_CLK rate for High Quality mode in Table 432. PDM_CLK rate = 16 kHz x 8 x OSR = 16 kHz x 8 x 16 = 2.048 MHz.
3. Check the K factor value for High Quality mode in Table 428. K factor is 1/2.
4. Calculate minimum CLKDIV value (see Equation 41): floor(K x CLKDIV) ≥ K x (10 + 93EC)/(8 x OSR) then floor(K x CLKDIV) ≥ 1.4921875. Finally, CLKDIV ≥ 4.
5. Calculate the minimum MICFIL_CLK_ROOT rate:
   - From Equation 39: MICFIL_CLK_ROOT rate = 8 x OSR x CLKDIV x (Output rate)
   - From step 4 result: CLKDIV ≥ 4, then MICFIL_CLK_ROOT rate ≥ 8 x OSR x 4 x 16 kHz.
   - Finally: MICFIL_CLK_ROOT rate ≥ 8.192 MHz
6. Check if selected MICFIL_CLK_ROOT rate and CLKDIV value satisfies the IO timing requirements.
7. Finally, check again if the selected MICFIL_CLK_ROOT rate satisfies Equation 39. If not, adjust CLKDIV or change MICFIL_CLK_ROOT rate accordingly.

Example 2:

If it is required an output rate = 48 kHz and enables 4 channels (EC=4). A valid configuration is following:

1. Configure Medium Quality mode and CIC decimation by 16 (CICOSR = 0, then OSR = 16).
2. Check the PDM_CLK rate for Medium Quality mode in Table 432. PDM_CLK rate = 48 kHz x 4 x OSR = 48 kHz x 4 x 16 = 3.072 MHz.
3. Check the K factor value for Medium Quality mode in Table 428. K factor is 1.
4. Calculate minimum CLKDIV value (see Equation 41): floor(K x CLKDIV) ≥ K x (10 + 93EC)/(8 x OSR) then floor(K x CLKDIV) ≥ 2.984375. Finally, CLKDIV ≥ 3.

5. Calculate the minimum MICFIL_CLK_ROOT rate:
   - From Equation 39: MICFIL_CLK_ROOT rate = 8 x OSR x CLKDIV x (Output rate)
   - From step 4 result: CLKDIV ≥ 3, then MICFIL_CLK_ROOT rate ≥ 8 x OSR x 3 x 48 kHz.
   - Finally: MICFIL_CLK_ROOT rate ≥ 18.432 MHz
   - A different value of CLKDIV may be preferable, CLKDIV = 4 results in MICFIL_CLK_ROOT = 24.576 MHz, a standard audio frequency.
6. Check if selected MICFIL_CLK_ROOT rate and CLKDIV value satisfies the IO timing requirements.
7. Finally, check again if the selected MICFIL_CLK_ROOT rate satisfies Equation 39. If not, adjust CLKDIV or change MICFIL_CLK_ROOT rate accordingly.

37.3.1.3 I/O timing requirements

The PDM microphones must meet the setup and hold timing requirements shown in Table 429 and Figure 216. The "K" factor value in Table 429 depends on the quality mode you select based on Table 428.

NOTE

These timing requirements apply only if the clock divider functionality is enabled (see CTRL_2[CLKDIV]) with ; otherwise, there are no special timing requirements.

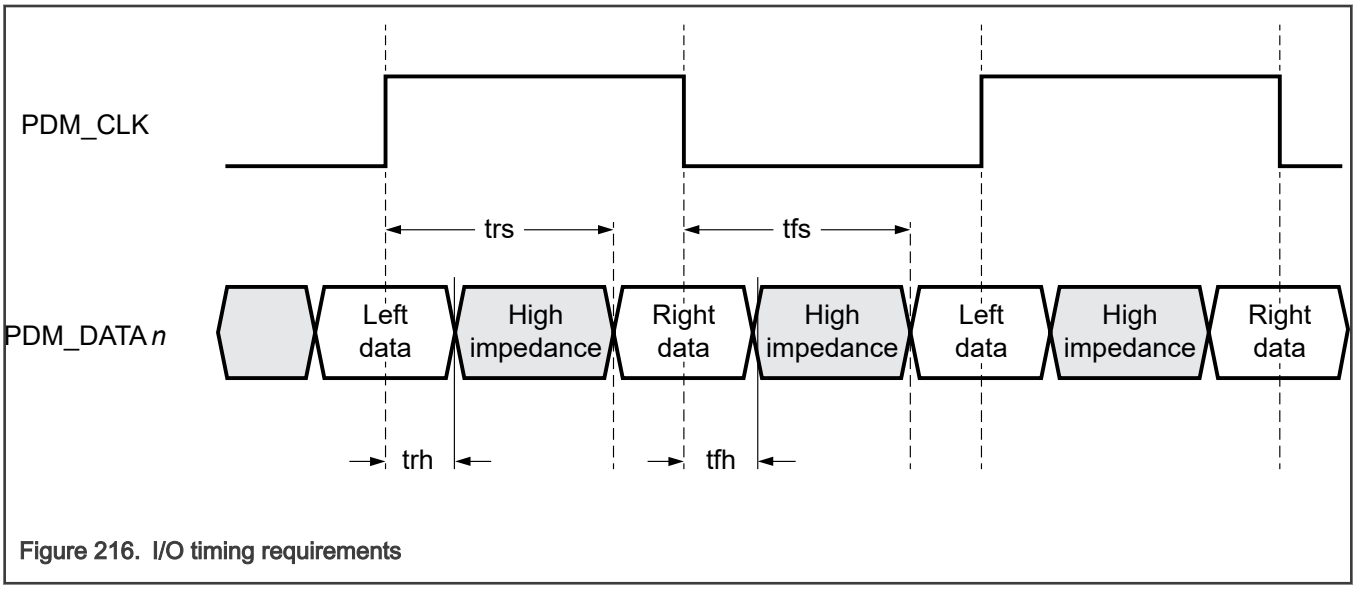

Figure 216. I/O timing requirements

Table 429. Timing parameters

Parameter	Value
trs, tfs	$\leq \frac{floor(K \times CLKDIV) - 1}{MICFIL_CLK_ROOT\ rate}$ Depending on the value of "K," you must ensure that "floor(K x CTRL_2[CLKDIV])" > 1 to avoid timing problems.
trh, tfh	≥ 0

37.3.2 Input interface

Figure 217 shows the timing diagram of the input interface signals . The bitstream incoming from the microphone data input "n" (PDM_DATA*n*) in the first half (right microphone) of the PDM_CLK is directed to channel "2n+1" and the data generated during the last half (left microphone) is directed to channel "2n".

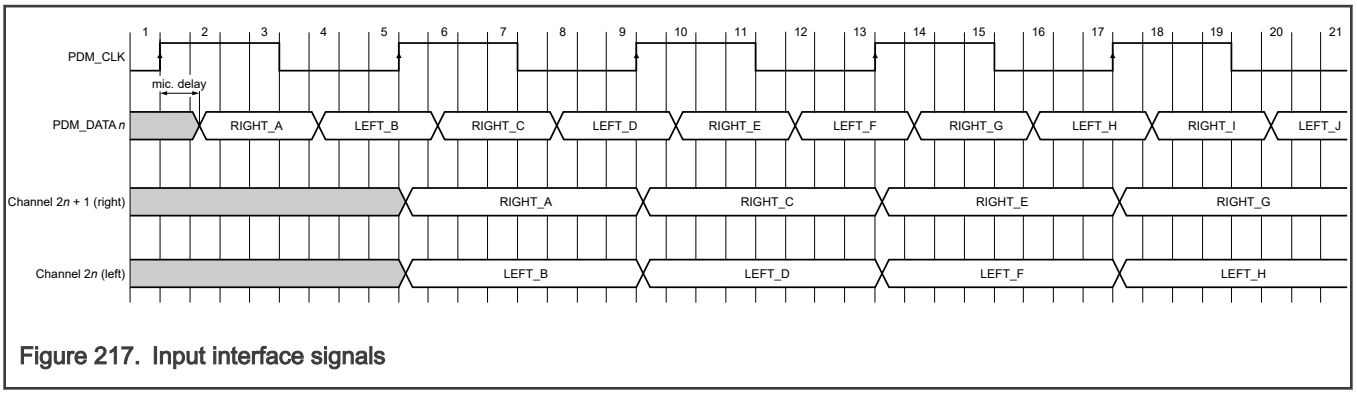

Figure 217. Input interface signals

37.3.3 Decimation filter

A decimation filter facilitates PDM to PCM conversion.

Figure 218 shows the block diagram of the decimation filter. The block consists of:

- A cascade integrator comb (CIC) filter, which is a low-pass filter that you commonly use to filter sigma-delta modulator output signals. The filter is implemented in the audio band (20 Hz–20.0 kHz @48 kHz output sampling rate by default) with a configurable decimation rate. You can implement it using a series of CIC, compensation, and DC remover filters.
- A DC remover, which is a high-pass filter that you use to remove the DC component of the processed signal with a configurable cut-off frequency. Two DC removers exist: one in the input of the decimation filter, embedded in the CIC filter, and another in the last stage of the decimation filter.
- Two compensation filters for each channel, which implement a low-pass digital filter with decimation by 2. You can use them to compensate the high CIC drop in passband. These filters help the FIR filter block to flatten the overall passband response.

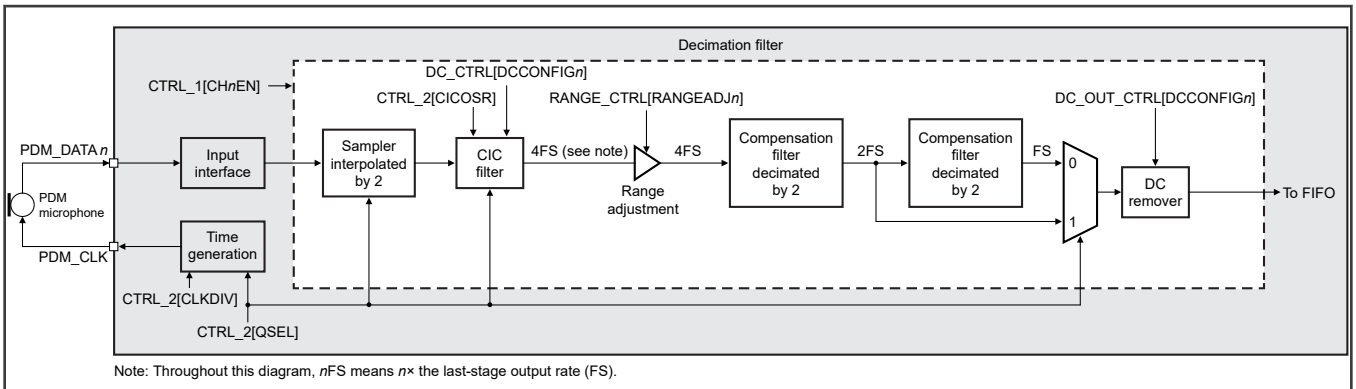
You activate the "Sampler" block depending on the quality mode selected (using CTRL_2[QSEL]). In Low-Quality and Very-Low-Quality 2 modes, the sampling rate is doubled.

The decimation filter output depends on the quality mode that you select by using CTRL_2[QSEL], based on different compensation filter output. You can supply the DC remover with the 2 FS signal, instead of the 1 FS signal, to achieve lower-power consumption, bypassing the second compensation decimation filter. The second compensation filter is bypassed when CTRL_2[QSEL] = 110b, 101b, or 100b (in Very-Low Quality modes).

You can adjust the range of each decimation filter by using a range adjustment block so that you can raise an error interrupt in case an adjustment overflow or underflow is detected.

The output of a decimation filter is stored into a FIFO buffer, and each FIFO is mapped to MICFIL Output Result (DATACH0 - DATACH7). It is possible to generate either an interrupt or a DMA request when, in each FIFO of all enabled channels, the number of data stored surpasses a configured watermark.

Also, independently on decimation filters, there is a hardware voice activity detector (HWVAD) which implements voice-detection algorithms to generate wake-up interrupts. See Hardware voice activity detector (HWVAD).



Note: Throughout this diagram, *n*FS means *n*× the last-stage output rate (FS).

Figure 218. Decimation filter block diagram

37.3.3.1 CIC filter

The CIC filter is an optimized implementation of the low-pass SINC filter, with multiple stages. It is widely used because it requires just adders and subtracters. The CIC filter comprises an integrator and a comb as its sub-blocks. As shown in the following figure, CTRL_2[CICOSR] and the quality mode you select (see Quality modes) define the CIC decimation rate.

$$OSR = 16 - CICOSR$$

$$CIC\ decimation\ rate = \begin{cases} 2 \times OSR\,; If\ HQ,\ VLQ0 \\ OSR\quad\quad ; others \end{cases}$$

Equation 43. CIC decimation rate

37.3.3.2 DC remover

Two DC removers exist in the filter chain, one in the input and another in the output. The former is integrated in the CIC filter, and the latter is placed just before the FIFO. Both can be bypassed independently.

The DC remover eliminates the DC level component of the signal using a high-pass filter with a very low cut-off frequency that you select using DC_CTRL[DCCONFIG*n*]. This filter is bypassed when the value of this field is 11b.

NOTE

See PARAM[DC_OUT_BYPASS] and PARAM[DC_BYPASS] to know whether one of the DC removers is permanently disabled in the chip.

37.3.3.3 Compensation filters

A compensation filter divides the baseband signal into two equal subbands before it could to be decimated by 2. It also compensates the CIC filter drop in passband and helps to flatten the overall passband response. MICFIL includes two compensation filter stages, with the possibility of bypassing the last one.

37.3.3.4 Filter performance

37.3.3.4.1 Overall filter gain

As shown in Equation 44, the overall filter gain depends on:

- The quality mode you select (see Quality modes).
- The CIC decimation rate (see Equation 43).
- Dynamic range adjustment of the CIC filter (see RANGE_CTRL[RANGEADJ*n*]).

NOTE

To get a better audio performance, you must configure and adjust RANGE_CTRL[RANGEADJ*n*] depending on the quality mode selected, as pointed out in the register description.

$$Overall\ filter\ gain\ (dB) = \begin{cases} 120 \times log_{10}(32 - 2 \times CICOSR) + 6.02 \times RANGE_CTRL[RANGEADJn] - 180.60 \ ; \ if\ QSEL \in [HQ,VLQ0] \\ 120 \times log_{10}(16 - CICOSR) + 6.02 \times RANGE_CTRL[RANGEADJn] - 180.60 \quad ; \ others \end{cases}$$

Equation 44. Overall filter gain

Finally, the input and output dBFS levels relate to each other, as shown in Equation 45.

$$Output\ (dBFS) = input\ (dBFS) + overall\ filter\ gain\ (dB)$$

Equation 45. Filter input and output relationship

37.3.3.4.2 Overall passband

The decimation filter passband depends on the quality mode and output rate (FS). For instance, the overall filter passband for different output data rates when MICFIL is in High (HQ), Medium (MQ), and Low-Quality (LQ) modes is shown in Table 430.

Table 430. Filter passband in HQ, MQ, and LQ modes (DC_CTRL[DCCONFIG*n*] = 0)

Output data rate	Overall filter passband
FS	**0.0004FS - 0.4167FS**
16 kHz	6.67 Hz - 6.67 kHz
48 kHz	20 Hz - 20 kHz

The overall filter passband for different output data rates when MICFIL is in Very-Low Quality (VLQ) modes is shown in Table 431.

Table 431. Filter passband in VLQn modes (DC_CTRL[DCCONFIG*n*] = 0)

Output data rate	Overall filter passband
FS	**0.0002FS - 0.2083FS**
16 kHz	3.33 Hz - 3.33 kHz
48 kHz	10.00 Hz - 10.00 kHz
96 kHz	20 Hz - 20 kHz

37.3.3.5 Frame synchronization

If CTRL_1[FSYNCEN] = 1, MICFIL sends data to FIFOs in frame size defined by FSYNC[FSYNCLEN]. In this way, if a channel is enabled while MICFIL is running (CTRL_1[PDMIEN] = 1), MICFIL starts sending data to its respective FIFO after the current frame is sent completely. If the channel is disabled:

- if at least one other channel is still enabled, the corresponding channel stops sending data after the current frame is sent completely.
- if after that no channel is enabled, MICFIL stops sending data immediately, even if the act of sending frames is incomplete.

Below example shows the above behavior when two channels, DATACH0 and DATACH2 are enabled, and then disabled one after the other.

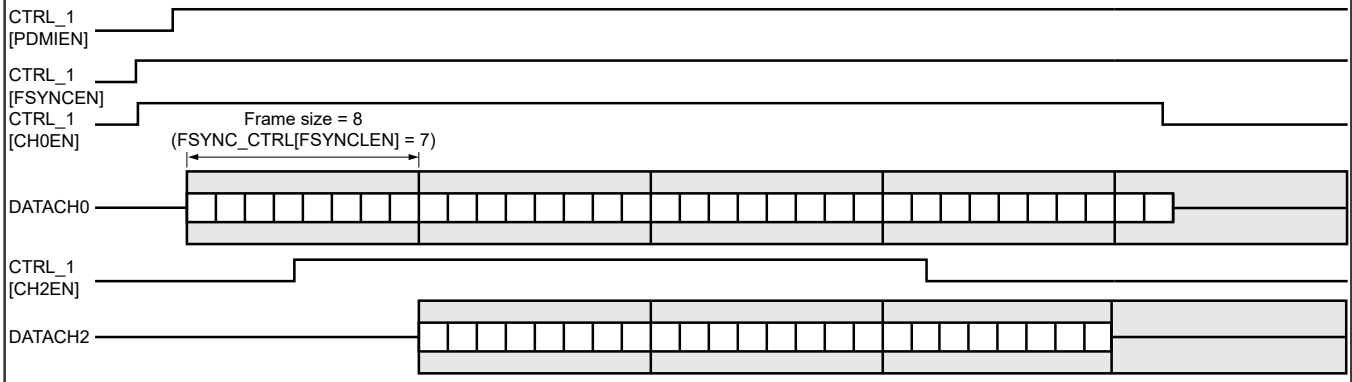


Figure 219. Frame synchronization example

37.3.3.6 Quality modes

If the decimation filter is running independently on the selected power mode, MICFIL can operate in multiple different quality modes that you can select by using CTRL_2[QSEL]. The decimation and interpolation rates in internal blocks are shown in Table 432, where the oversampling rate (OSR) depends on the value of CTRL_2[CICOSR], as shown in the following equation.

$$OSR = 16 - CICOSR$$

Equation 46. OSR

You can configure the selected quality dynamically when the decimation filter is running; the output rate is maintained in every quality selected.

The passband of the decimation filter depends on the quality mode (see Overall passband).

To maintain the same output rate in the decimation filter when the quality is changed, the PDM_CLK rate changes depending on the quality selected. For more on PDM_CLK, see Time generator.

You can enable or disable the sampler and compensation filters according to the selected quality. When they are disabled, you can achieve a low-power consumption. The selected quality also determines whether the CIC filter decimation rate is doubled. For more, see Decimation filter.

With an increase of the clock rate and OSR, you can expect a better signal-to-noise ratio (SNR) performance, which in turn leads to a higher audio quality.

Table 432. Quality modes

Quality mode	CTRL_2[QSEL]	Sampler interpolation	CIC filter decimation	First-compensation filter decimation	Second-compensation filter decimation	PDM_CLK rate	Passband
High Quality	001	—	:(2OSR)	:2	:2	Output rate × 8 × OSR	To ~0.5 × output rate
Medium Quality	000	—	:OSR	:2	:2	Output rate × 4 × OSR	To ~0.5 × output rate
Low Quality	111	× 2	:OSR	:2	:2	Output rate × 2 × OSR	To ~0.5 × output rate

Table continues on the next page...

Table 432. Quality modes (continued)

Quality mode	CTRL_2[QSEL]	Sampler interpolation	CIC filter decimation	First-compensation filter decimation	Second-compensation filter decimation	PDM_CLK rate	Passband
Very-Low Quality 0	110	—	:(2OSR)	:2	—	Output rate × 4 × OSR	To ~0.25 × output rate
Very-Low Quality 1	101	—	:OSR	:2	—	Output rate × 2 × OSR	To ~0.25 × output rate
Very-Low Quality 2	100	× 2	:OSR	:2	—	Output rate × OSR	To ~0.25 × output rate

37.3.3.7 Output rate

The output rate is the sampling rate at the decimation filter output. It depends on the sampling rate of the microphone input and the configured quality mode (see Quality modes). Common audio sampling rates are 48 kHz and 16 kHz. In this chapter, the output rate is sometimes referred to as FS.

37.3.4 Hardware voice activity detector (HWVAD)

HWVAD is a block which detects voice activity in a channel selected by the user as shown in Figure 220 and Figure 221. HWVAD takes data from the input of a selected PDM microphone to detect if there is any voice activity. If HWVAD detects a voice activity, it can issue an interrupt to the system. You can configure HWVAD in Envelope-based or Energy-based mode as described in Initialization.

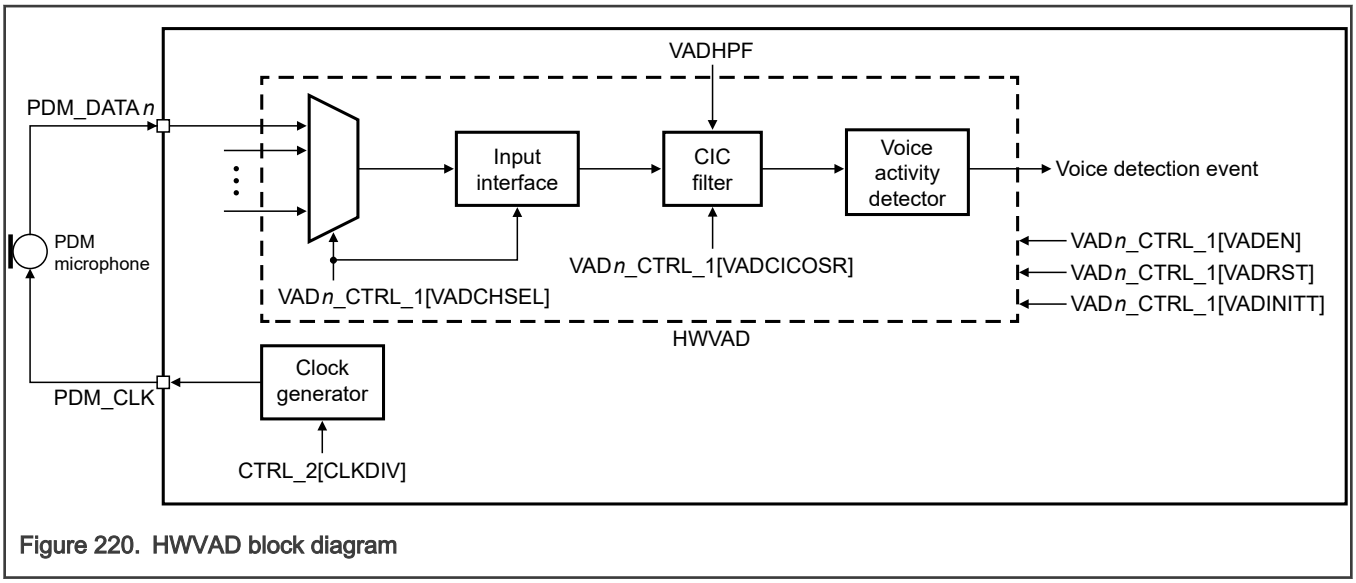

Figure 220. HWVAD block diagram

HWVAD can divide the incoming PCM signal from its internal CIC in frames. The frame energy is used to estimate the background noise. HWVAD examines both frame energy and noise energy. When HWVAD identifies a specific delta between them, it detects a voice activity and then issues an interrupt. Optionally, you can enable a zero-crossing detector (ZCD) to avoid missing of low-energy voiced speech in order to improve the voice detection performance.

You can enable HWVAD by configuring VADn_CTRL_1[VADEN] and reset HWVAD by software through VADn_CTRL_1[VADRST].

NOTE

You can enable or reset HWVAD only when MICFIL isn't running (STAT[BSY_FIL] = 0).

To perform voice detection, HWVAD uses a noise filter and a signal filter as shown in Figure 221. In addition, you can use a minimum block in the output of the noise filter and a maximum block in the output of the signal filter. HWVAD can scale the result of both blocks with gain blocks. Finally, HWVAD compares the estimated signal and noise, and it detects voice when signal is greater than noise .

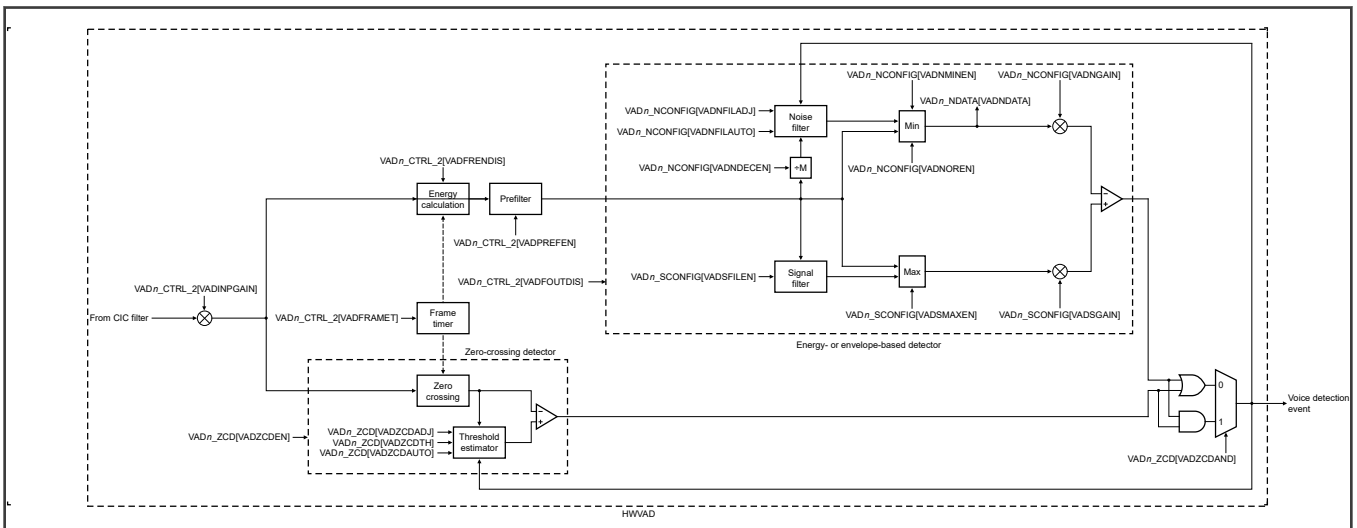

Figure 221. HWVAD block diagram (continued)

37.3.4.1 Input setting

HWVAD input has internally a user-configurable high-pass filter (see VAD*n*_CTRL_2[VADHPF] field description) and a user-configurable gain (see VAD*n*_CTRL_2[VADINPGAIN]). You can use both controls to configure the module based on external noise conditions.

37.3.4.2 Frame time setting

To perform voice detection the signal frames incoming from the CIC filter can be divided in frames whose duration can be configured. The frame time depends on the CIC output rate, the value of VAD*n*_CTRL_2[VADFRAMET] and a constant as defined in Equation 47.

$$frame\ time = \frac{VADFRAMET \times 192}{CIC\ output\ rate}$$

Equation 47. Frame time

For instance, in the typical case of the CIC filter the output rate is 192 kHz, the frame time is 10 ms when [VADFRAMET] is 10.

37.3.4.3 Initialization time

You can configure an initialization by configuring VAD*n*_CTRL_1[VADINITT]. During this initialization time, HWVAD doesn't issue any voice detection event and all detectors are disabled.

$$initialization\ time = (VADINITT + 1) \times frame\ time$$

Equation 48. Initialization time

For instance, in case that frame time is 10 ms and [VADINITT] = 10, the initialization time is 110 ms.

37.3.4.4 Energy calculation

In case VAD*n*_CTRL_2[VADFRENDIS] = 0, HWVAD uses the sum of the absolute values of all the samples of each frame to detect voice. Otherwise, if [VADFRENDIS] = 1, it uses the absolute value of the samples to detect voice, which means that the data incoming from CIC is not divided in frames.

37.3.4.5 Pre-filter

The pre-filter block is a low-pass filter which can be enabled when VAD*n*_CTRL_2[VADPREFEN] = 1.

37.3.4.6 Energy and envelope-based detector

To perform voice detection, HWVAD uses a noise filter and a signal filter as shown in Figure 221. In addition, it can use a minimum block in the output of the noise filter and a maximum block in the output of the signal filter. HWVAD can scale the result of both blocks with gain blocks. Finally, HWVAD compares the estimated signal and noise, and it detects voice when the signal is greater than the noise.

37.3.4.6.1 Noise filter

The noise filter is a low-pass filter . You can configure VAD*n*_NCONFIG[VADNFILADJ] to adjust the filter . In case VAD*n*_NCONFIG[VADNFILAUTO] = 1 the noise filter is enabled only when voice is not detected. When voice is detected the filter output does not change. In case [VADNFILAUTO] = 0 the filter is always enabled.

A decimation stage in the input of the noise filter can be enabled by VAD*n*_NCONFIG[VADNDECEN] field.

37.3.4.6.2 Minimum noise

To estimate the noise, HWVAD uses a block which calculates the minimum value between the input and output of the noise filter. This block can be enabled by VAD*n*_NCONFIG[VADNMINEN], otherwise the output of the noise filter passes directly.

The estimated noise of the output of this block is stored in VAD*n*_NDATA[VADNDATA] for post-processing via software.

37.3.4.6.3 Signal filter

The signal filter is a low-pass filter . This filter is enabled when VAD*n*_SCONFIG[VADSFILEN] = 1, otherwise the filter is bypassed.

37.3.4.6.4 Maximum signal

To estimate the signal, HWVAD uses a block which calculates the maximum value between the input and output of the signal filter. This block can be enabled by VAD*n*_SCONFIG[VADSMAXEN].

37.3.4.6.5 Filter result gain setting

There are two gain adjustment controls, one for the estimated noise (VAD*n*_NCONFIG[VADNGAIN]) and another for estimated signal (VAD*n*_SCONFIG[VADSGAIN]). Both gain adjustments outputs are compared, the comparison result determines whether or not there is voice in the channel.

37.3.4.7 Zero-crossing detector (ZCD)

Optionally, the use of a ZCD circuit can increase the HWVAD performance. It is enabled by VAD*n*_ZCD[VADZCDEN].

The threshold of the ZCD could be static or calculated dynamically depending on VAD*n*_ZCD[VADZCDAUTO]. When it is dynamically determined ([VADZCDAUTO] = 1) the threshold is calculated automatically taking VAD*n*_ZCD[VADZCDTH] as the initial value, otherwise ([VADZCDAUTO] = 0) the threshold is static in [VADZCDTH] user-configurable value.

You can use AND or OR to combine the ZCD result with the energy-based or envelope-based detection, it is selected by VAD*n*_ZCD[VADZCDAND]. The filter coefficient is equal to ([VADZCDADJ] + 1) × 2^{-4}.

37.3.4.8 Interrupt

HWVAD issues an interrupt when voice activity is detected and VAD*n*_CTRL_1[VADIE] is enabled. The voice activity event also sets the VADIF flag in VAD*n*_STAT[VADIF], this flag is cleared when you write 1 to it.

37.3.4.9 Extended operation

You can use VAD*n*_STAT[VADIF] for an HWVAD-extended operation, that is, using VAD*n*_NDATA[VADNDATA] value to determine a more accurate voice detection event by software. Below is the procedure to follow:

1. HWVAD issues an interrupt, [VADIF] is set.
2. Leave [VADIF] asserted while software is processing [VADNDATA] content.
3. When software finishes to process [VADNDATA] and detects voice activity:
   - If Envelope-based detection is used, pulse VAD*n*_CTRL_1[VADST10] by more than 2 cycles and clear the VADIF flag.
   - If Energy-based detection is used, clear the VADIF flag.

37.3.4.10 VAD soft-reset

You can request the VAD soft-reset by writing 1 to VAD*n*_CTRL_1[VADRST]. It resets the following blocks and registers:

- VAD*n*_STAT[VADIF] and VAD*n*_STAT[VADINSATF].
- All internal VAD buffers.

37.3.5 Bus interface

The bus interface manages DMA transactions, interrupt requests, and user register interface with the chip.

MICFIL can deliver an interrupt request or DMA request. Then, the chip or DMA, respectively, could access the filter results stored in FIFOs via the internal bus interface.

For detailed information on DMA transactions and interrupt requests, see DMA and Interrupts.

37.3.5.1 FIFO

This is the first-in, first-out (FIFO) buffer that saves the overall filtering results. The length of each FIFO is 32 entries, and there exists one FIFO for each channel. A push writes data into the FIFO, and a read pops data from FIFO. The push and pop operations from FIFO are in different clock domains. The push operation uses the MICFIL clock while the pop operation uses the CPU clock. The FIFO has a configurable watermark (see FIFO_CTRL[FIFOWMK]). When the amount of data in all FIFOs of the enabled channels is greater than the watermark value (FIFO_CTRL[FIFOWMK]), a DMA or IRQ is requested, depending on the value of CTRL_1[DISEL]. After CTRL_1[PDMIEN] enables the filters, the initial FIR results are discarded and not written into the FIFOs. Approximately 68 initial FIR results are not stored in FIFOs (FIR_RDY=0). After the filter generates valid data, the results are pushed into the FIFO.

A new filtered result is discarded (not stored) when the FIFO is full and CTRL_1[FIFOOVF*n*] becomes 1. Similarly, when trying a pop operation, if the FIFO is empty, no valid data is read and CTRL_1[FIFOUND*n*] becomes 1. In both cases, when overflow or underflow occurs, they are flagged in MICFIL FIFO Status (FIFO_STAT) to the respective channel, and an error interrupt is generated if CTRL_1[ERREN] is 1.

When you reset the FIFO by writing 1 to CTRL_1[SRES], zero values fill all FIFO positions, as well as push and pop pointers are set to their initial positions.

37.3.6 Modes of operation

This section describes the MICFIL operation modes that depend on:

- Whether MICFIL receives a Stop request.
- The chip's Debug mode.

- The configuration of CTRL_1[MDIS], CTRL_1[DBGE], CTRL_1[DBG],and CTRL_1[DOZEN], as summarized in the following table.

Table 433. Mode selection

Mode	Normal	Debug		Low-Power		Disable/Low-Leakage (DLL)		
CTRL_1[MDIS]	0	0		0		0		1
Doze request and CTRL_1[DOZEN] = 1	0	0		0		0	1	Any
Stop request	0	0		1		1		Any
CTRL_1[DOZEN]	Any	Any		0		1		Any
CTRL_1[DECFILS]	Any	Any		1	0	Any		
Debug request or CTRL_1[DBG]	0	1		Any		Any		
CTRL_1[DBGE]	Any	1	0	Any		Any		
CPU clock	Enabled	Enabled		Gated (Externally)		Gated (Externally)	Enabled	Gated (Internally)
MICFIL internal clock	Enabled	Enabled		Enabled		Gated		
Decimation filter state	Run[1]	Run[1]	Stop	Run[1]	Stop	Stop		
HWVAD*n* state	Run[2]	Run[2]	Stop	Run[2]		Stop		

1. Depends on the configuration of CTRL_1[PDMIEN] and CTRL_1[CH*n*EN].
2. Depends on the configuration of CTRL_1[PDMIEN] and CTRL_1[VADEN].

37.3.6.1 Normal mode

This is the default operational mode for MICFIL. In this mode, you can enable the channel functionality to perform the filtering operation.

37.3.6.2 Debug mode

You could use this mode to check the status of the module, when requested. In this mode, you can stop MICFIL after the remaining data processing is complete, depending on the value of CTRL_1[DBGE]. You can activate this mode by writing 1 to CTRL_1[DBG].

If CTRL_1[DBGE] = 0, and CTRL_1[DBG] = 1 when MICFIL is running, MICFIL stops after processing the remaining data. Otherwise, if [DBGE] = 1, MICFIL continues to run.

MICFIL cannot enter Debug mode after entering DLL or Low-Power mode.

The Debug mode affects all channels in MICFIL. Access to output buffers, as well as their related flags, remains operational.

37.3.6.3 Low-Power mode

MICFIL enters Low-Power mode when MICFIL receives a Stop request and CTRL_1[DOZEN] = 0. In Low-Power mode, MICFIL is able to filter the PDM microphone data and perform voice detection such as in Normal mode, and can generate a wake-up event through asynchronous DM or IRQ requests, depending on the values of CTRL_1[CH*n*EN], VAD*n*_CTRL_1[VADEN], and CTRL_1[PDMIEN].

After MICFIL enters Low-Power mode:

- If CTRL_1[DECFILS] = 1, Stop request is acknowledged immediately and the decimation filter keeps running.
- If CTRL_1[DECFILS] = 0, the decimation filter processes the last input sample. After that, Stop request is acknowledged and the filter is stopped from running.

During this mode, VAD*n*_CTRL_1[VADEN] continues running if it was previously enabled ([VADEN] = 1) during Normal mode.

You can generate DMA and IRQ requests asynchronously to wake up the CPU.

NOTE

The asynchronous DMA or interrupt requests are generated only in this mode.

37.3.6.4 Disable/Low-Leakage (DLL) mode

In this mode, MICFIL stops after the remaining data processing is complete. MICFIL is in DLL mode when:

- MICFIL receives a Stop request and CTRL_1[DOZEN] = 1.
- CTRL_1[MDIS] = 1.

If you request DLL mode when MICFIL is running, MICFIL stops after completion to process the remaining data.

You can write only to CTRL_1 and CTRL_2, with the exception of writes to CTRL_1[DBG] and CTRL_1[SRES], which are ignored. However, you can still read these fields.

37.3.7 Clocking

Table 434. MICFIL clocks

Clock name	Description
CPU clock (MICFIL_CLK, MICFIL_CLK_S)	Clock that controls the registers
MICFIL internal clock (MICFIL_CLK_APP)	Application clock that operates the filter

Besides the above clock signals, MICFIL generates PDM_CLK for PDM microphones based on MICFIL internal clock frequency and the value in CTRL_2[CLKDIV].

37.3.8 Interrupts

If CTRL_1[DISEL] = 10b, an interrupt request indicates that filtering results are stored in the FIFOs to be read by the CPU. In this case, you can read the data in DATACH*n*[DATA], and STAT[CH*n*F] becomes 1 for the enabled channels when the CHn FIFO surpasses the watermark level.

When MICFIL is in Low-Power mode, the CPU clock is disabled, but the MICFIL clock remains enabled. In this case, an asynchronous interrupt is delivered to the system. This wakes up the CPU clock, which returns to Normal mode. The system could read the FIFO data, after which it must clear STAT[CH*n*F] to get a new interrupt request.

An error interrupt request can also be generated when an exceptional condition happens, such as an overflow or underflow in a channel output, or an overflow or underflow of a FIFO buffer, or the MICFIL clock rate is not the minimum value required to the MICFIL working (see Minimum required CLKDIV).

CTRL_1[ERREN] enables error interruption and the respective status flag signalizes the type of error:

- OUTOVFn and OUTUNFn for channel outputs errors
- FIFO_STAT[FIFOOVF*n*] and FIFO_STAT[FIFOUND*n*] for FIFO errors
- STAT[LOWFREQF] for MICFIL clock rate

37.3.9 DMA

If CTRL_1[DISEL] = 1, the FIFO stored samples are read through DMA transactions. Then if there is at least one enabled channel and all FIFOs of all enabled channels reach their watermark levels, the output interface makes a request for a DMA transaction.

If CTRL_1[PDMIEN] = 1 and the filters start to operate, you must wait until the filter results stabilize and no filter results are stored in the FIFOs. Therefore, the first DMA request takes longer to occur than the ones that follow.

STAT[CH*n*F] becomes 0 after a DMA transaction is complete.

If MICFIL is in Low-Power mode and the watermark level is surpassed, an asynchronous DMA request is delivered to the system. Then, the system wakes up the CPU clock, returning to Normal mode to read the FIFO data.

37.4 External signals

Table 435. PDM microphone interface external signals

Signal	Description	Direction
PDM_DATA*n*	Data bitstream received from the n^{th} PDM microphone pair throughout the input interface (see Input interface)	I
PDM_CLK	Clock that is delivered to the PDM microphones from the clock generator (see Time generator)	O

NOTE

MICFIL does not provide metastability protection or filtering for input data. You must generate the data using the provided PDM_CLK.

37.5 Initialization

37.5.1 Procedure without HWVAD

Perform this procedure for MICFIL initialization without enabling HWVAD, (that is, by using only decimation filters):

1. Program CTRL_2[CLKDIV], CTRL_1[CH*n*EN], FIFO_CTRL[FIFOWMK], CTRL_1[DISEL], CTRL_1[ERREN], and so on, as required. For more details see MICFIL_CLK_ROOT rate and CLKDIV calculation examples.
2. Start the module operation by writing 1 to CTRL_1[PDMIEN].

The module is ready to receive data from the input ports of the enabled channels.

37.5.2 Initialization procedure with HWVAD

In this section describes the initialization procedures to initialize MICFIL with HWVAD.

HWVAD can work in two modes: Energy-based mode or Envelope-based mode. Optionally, a ZCD can be enabled to improve the voice detection.

The Energy-based method separates the audio signal in frames and estimates the energy of these frames to detect voice activity. On the other hand, the Envelope-based method calculates the audio signal envelope to detect voice.

Both methods have the same detection performance, but the Energy-based is recommended for low-power applications where the chip can be asleep for long periods. Envelope-based detection is recommended for applications where the chip requires faster wake-up and it is not asleep for long periods.

ZCD is recommended to improve detection with fricatives phonemes for example /f/ or /s/) in noisy environments.

37.5.2.1 HWVAD in Energy-based mode

The sequence of steps to initialize MICFIL with HWVAD in Energy-based mode is as follows:

1. Program the control bits as desired for your application (CTRL_2[CLKDIV], CTRL_1[CH*n*EN], FIFO_CTRL[FIFOWMK], CTRL_1[DISEL], CTRL_1[ERREN] etc.). For more details see MICFIL_CLK_ROOT rate and CLKDIV calculation examples.
2. Configure general HWVAD parameters:
    a. CIC oversampling rate (VAD*n*_CTRL_1[VADCICOSR]).
    b. Configure the voice source channel (VAD*n*_CTRL_1[VADCHSEL]).

c. Configure the internal initialization timer (VAD*n*_CTRL_1[VADINITT]) if required. More details in Initialization time.

d. Write 1 to VAD*n*_CTRL_1[VADEN].

3. Configure input, noise and signal gains according to the environmental noise conditions:
   a. Configure the input gain (VAD*n*_CTRL_2[VADINPGAIN]).
   b. Configure the signal gain (VAD*n*_SCONFIG[VADSGAIN]).
   c. Configure the noise gain (VAD*n*_NCONFIG[VADNGAIN]).
4. Enable the high-pass filter if required (VAD*n*_CTRL_2[VADHPF]).
5. Configure VAD*n*_NCONFIG[VADNFILADJ] according to environmental noise conditions ([VADNFILADJ] = 16 is recommended).
6. Put HWVAD in Energy-based mode (default values):
   a. Keep VAD*n*_CTRL_2[VADFRENDIS] = 0.
   b. Keep VAD*n*_CTRL_2[VADPREFEN] = 0.
   c. Keep VAD*n*_SCONFIG[VADSFILEN] = 0.
   d. Keep VAD*n*_SCONFIG[VADSMAXEN] = 0.
   e. Keep VAD*n*_NCONFIG[VADNFILAUTO] = 1.
   f. Keep VAD*n*_NCONFIG[VADNMINEN] = 0.
   g. Keep VAD*n*_NCONFIG[VADNDECEN] = 0.
   h. Keep VAD*n*_NCONFIG[VADNOREN] = 0.
7. Initialize ZCD (ZCD initialization) if required.
8. Enable interrupts if required (VAD*n*_CTRL_1[VADIE] and [VADERIE]).
9. Start the overall module asserting CTRL_1[PDMIEN].
10. The module is ready to receive data from the input ports of the enabled channels and to trigger interrupts when it detects voice.

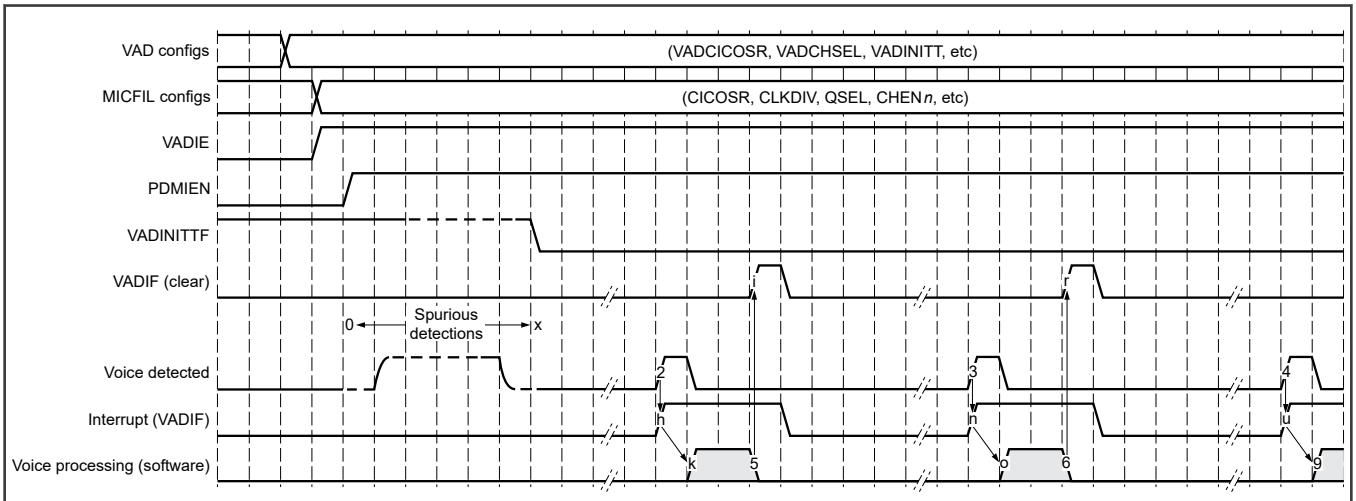

Figure 222. Energy-based initialization sequence

37.5.2.2 HWVAD in Envelope-based mode

The sequence of steps to initialize MICFIL with HWVAD in Envelope-based mode is as follows:

1. Program the control bits as desired for your application (CTRL_2[CLKDIV], CTRL_1[CH*n*EN], FIFO_CTRL[FIFOWMK], CTRL_1[DISEL], CTRL_1[ERREN] etc.). For more details see MICFIL_CLK_ROOT rate and CLKDIV calculation examples.
2. Configure general HWVAD parameters:
    a. CIC oversampling rate (VAD*n*_CTRL_1[VADCICOSR]).
    b. Configure the voice source channel (VAD*n*_CTRL_1[VADCHSEL]).
    c. Configure the internal initialization timer (VAD*n*_CTRL_1[VADINITT]) if required. More details in Initialization time.
    d. Write 1 to VAD*n*_CTRL_1[VADEN] field.
3. Configure input, noise and signal gains according to the environment noise conditions:
    a. Configure the input gain (VAD*n*_CTRL_2[VADINPGAIN]).
    b. Configure the signal gain (VAD*n*_SCONFIG[VADSGAIN]).
    c. Configure the noise gain (VAD*n*_NCONFIG[VADNGAIN]).
4. Enable the high-pass filter if required (VAD*n*_CTRL_2[VADHPF]).
5. Put HWVAD in Envelope-based mode:
    a. Keep VAD*n*_NCONFIG[VADNFILADJ] = 0.
    b. Write 1 to VAD*n*_CTRL_2[VADFRENDIS].
    c. Write 1 to VAD*n*_CTRL_2[VADPREFEN].
    d. Write 1 to VAD*n*_SCONFIG[VADSFILEN].
    e. Write 1 to VAD*n*_SCONFIG[VADSMAXEN].
    f. Write 0 to VAD*n*_NCONFIG[VADNFILAUTO].
    g. Write 1 to VAD*n*_NCONFIG[VADNMINEN].
    h. Write 1 to VAD*n*_NCONFIG[VADNDECEN].
    i. Write 1 to VAD*n*_NCONFIG[VADNOREN].
6. Initialize ZCD (ZCD initialization) if required.
7. Start the overall module asserting the CTRL_1[PDMIEN] bit.
8. Wait until VAD*n*_STAT[VADINITF] becomes 0.
9. Write VAD*n*_CTRL_1[VADST10] three times.
10. Enable interrupts if required (VAD*n*_CTRL_1[VADIE] and [VADERIE]).
11. The module is ready to receive data from the input ports of the enabled channels and to trigger interrupts when it detects voice.

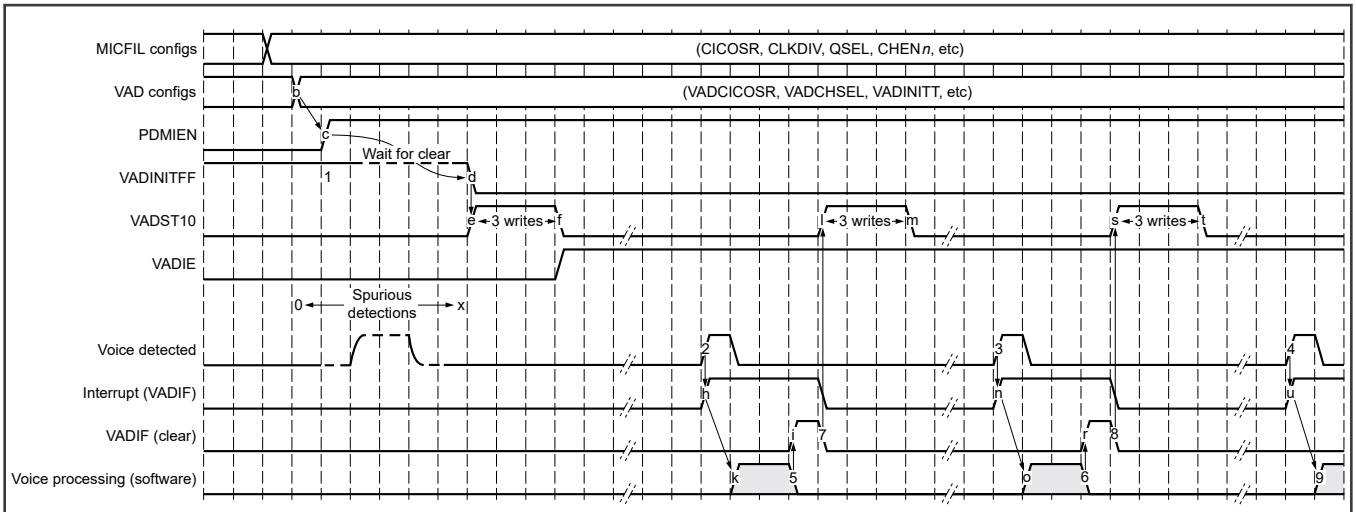

Figure 223. Envelope-based initialization sequence

37.5.2.3 ZCD initialization

The sequence of steps to initialize ZCD in Automatic mode is as follows:

1. Configure VAD*n*_ZCD[VADZCDADJ].
2. Configure an initial threshold in VAD*n*_ZCD[VADZCDTH] according to the environmental noise conditions if required.
3. Configure VAD*n*_ZCD[VADZCDAND].
4. Keep VAD*n*_ZCD[VADZCDAUTO] = 1.
5. Write 1 to VAD*n*_ZCD[VADZCDEN].

The sequence of steps to initialize ZCD in Manual mode is as follows:

1. Configure a threshold in VAD*n*_ZCD[VADZCDTH] according to the environmental noise conditions if required.
2. Configure VAD*n*_ZCD[VADZCDAND].
3. Write 0 to VAD*n*_ZCD[VADZCDAUTO].
4. Write 1 to VAD*n*_ZCD[VADZCDEN].

37.6 Application information

37.6.1 Reconfiguration procedure

Perform this procedure to reconfigure MICFIL:

1. Write 0 to CTRL_1[PDMIEN].
2. Wait until STAT[BSY_FIL] becomes 0.
3. Run a soft-reset cycle.
4. Run an initialization procedure as described in Procedure without HWVAD or Initialization procedure with HWVAD.

37.7 MICFIL register descriptions

This section provides the memory map and detailed description of all MICFIL registers. Any access to reserved areas can issue a target bus error indication.

You must implement the registers allocated in this memory map for up to 4 pairs of microphones, indicating that 8 channels are available.

37.7.1 MICFIL memory map

MICFIL base address: 4452_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	MICFIL Control 1 (CTRL_1)	32	RW	0000_0000
4	MICFIL Control 2 (CTRL_2)	32	RW	0000_0000
8	MICFIL Status (STAT)	32	RW	0000_0000
10	MICFIL FIFO Control (FIFO_CTRL)	32	RW	0000_001F
14	MICFIL FIFO Status (FIFO_STAT)	32	RW	0000_0000
24 - 40	MICFIL Output Result (DATACH0 - DATACH7)	32	R	0000_0000
64	MICFIL DC Remover Control (DC_CTRL)	32	RW	0000_0000
68	MICFIL Output DC Remover Control (DC_OUT_CTRL)	32	RW	0000_0000
74	MICFIL Range Control (RANGE_CTRL)	32	RW	0000_0000
7C	MICFIL Range Status (RANGE_STAT)	32	RW	0000_0000
80	Frame Synchronization Control (FSYNC_CTRL)	32	RW	0000_0000
84	Version ID (VERID)	32	R	020F_0000
88	Parameter (PARAM)	32	R	010B_0154
90	Voice Activity Detector 0 Control (VAD0_CTRL_1)	32	RW	0000_0000
94	Voice Activity Detector 0 Control (VAD0_CTRL_2)	32	RW	000A_0000
98	Voice Activity Detector 0 Status (VAD0_STAT)	32	RW	8000_0000
9C	Voice Activity Detector 0 Signal Configuration (VAD0_SCONFIG)	32	RW	0000_0000
A0	Voice Activity Detector 0 Noise Configuration (VAD0_NCONFIG)	32	RW	8000_0000
A4	Voice Activity Detector 0 Noise Data (VAD0_NDATA)	32	R	0000_0000
A8	Voice Activity Detector 0 Zero-Crossing Detector (VAD0_ZCD)	32	RW	0000_0004

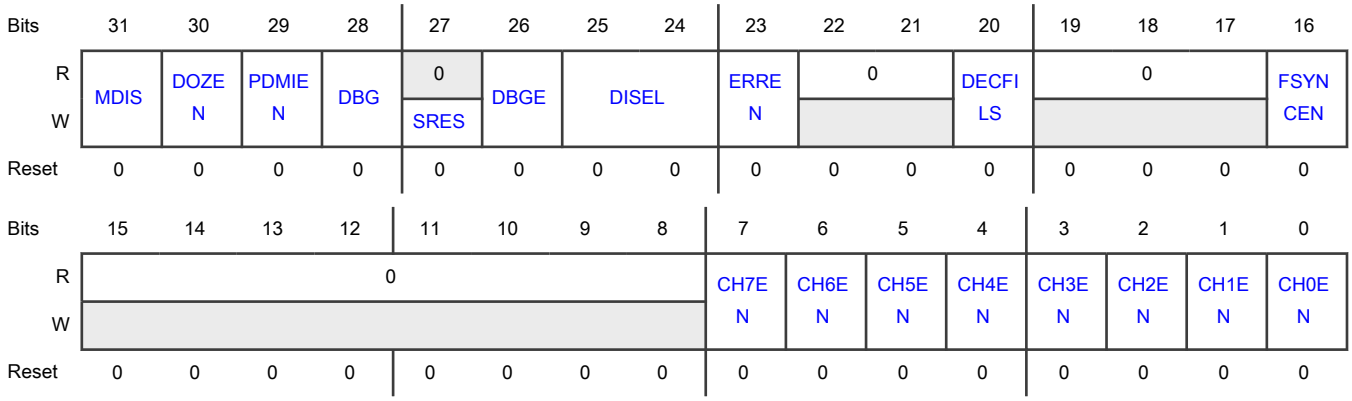
37.7.2 MICFIL Control 1 (CTRL_1)

Contains control fields for MICFIL.

Offset

Register	Offset
CTRL_1	0h

Diagram



Fields

Field	Description
31 MDIS	Module Disable Places MICFIL in DLL mode (see Disable/Low-Leakage (DLL) mode). The generated PDM_CLK stops, and consequently, the microphone generates no data. **NOTE** When this field = 1, only writes to MICFIL Control 1 (CTRL_1) and MICFIL Control 2 (CTRL_2) are allowed with the exception of writes to CTRL_1[DBG] and CTRL_1[SRES]. A target bus error indication is issued if you write to any other register. 0 - Normal mode 1 - DLL mode
30 DOZEN	Stop Enable When MICFIL receives a Stop request and this field is active, MICFIL enters DLL mode (see Disable/Low-Leakage (DLL) mode). 0 - Disables 1 - Enables
29 PDMIEN	MICFIL Enable Starts the module operation. Only the channels that CTRL_1[CH*n*EN] enables or VAD enabled by VADEN start operating. When this field becomes 0, MICFIL stops after it completes the remaining filter processing. **NOTE** You must enable this field as the last step when initializing the module (see Initialization). 0 - Stops MICFIL operation 1 - Starts MICFIL operation
28 DBG	Debug Mode Specifies the mode (Debug or Normal) that MICFIL operates in.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	MICFIL operates in Debug mode, depending on the value of CTRL_1[DBGE]. When Debug mode is disabled, MICFIL operates in Normal mode. See Debug mode for more on Debug mode. **NOTE** You can write to this field only when CTRL_1[MDIS] = 0. 0 - Normal 1 - Debug
27 SRES	Software Reset Provides the CPU with the capability to initialize MICFIL through the target-bus interface. The field always reads 0, and is effective only when CTRL_1[MDIS] = 0. It is a self-clearing field. **NOTE** You must write 1 to this field only when STAT[BSY_FIL] = 0. You can use this field to clear data in all filters. It resets the following blocks and registers: • All internal buffers in decimation filters and voice activity detectors • All FIFOs • STAT[CH*n*F] and LOWFREQF flag and MICFIL FIFO Status (FIFO_STAT) • Time generator 0 - No action 1 - Software reset
26 DBGE	Module Enable in Debug Enables operation in Debug mode (see Debug mode). 0 - Disables after completing the current frame 1 - Enables operation
25-24 DISEL	DMA Interrupt Selection Specifies the type of interrupt requests (DMA or filter) that MICFIL performs when the number of FIFO elements surpasses the configured watermark. Note that requests are only generated from the channels for which CTRL_1[CH*n*EN] = 1. **NOTE** You must not change the value of this field when STAT[BSY_FIL] = 1. 00 - Disables DMA and interrupt requests 01 - Enables DMA requests 10 - Enables interrupt requests 11 - Reserved
23	Error Interruption Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
ERREN	Enables error interrupts (exceptions). The following conditions can lead to errors: • An overflow or underflow in the FIFOs (indicated by FIFO_STAT[FIFOOVF*n*] or FIFO_STAT[FIFOUND*n*], respectively) • An overflow or underflow in the decimations filters (indicated by RANGE_STAT[RANGEOVF*n*] or RANGE_STAT[RANGEUNF*n*], respectively) • not enough MICFIL internal clock frequency (LOWFREQF bit). **NOTE** You must not change the value of this field when STAT[BSY_FIL] = 1. 0 - Disables 1 - Enables
22-21 —	Reserved
20 DECFILS	Decimation Filter Enable in Stop Enables decimation filters to run when MICFIL receives a Stop request. 0 - Stops decimation filter 1 - Keeps decimation filter running
19-17 —	Reserved
16 FSYNCEN	Frame Synchronization Enable Enables frame synchronization (see Frame synchronization). **NOTE** You must not change the value of this field when STAT[BSY_FIL] = 1. 0 - Disables 1 - Enables
15-8 —	Reserved
7-0 CHnEN	Channel n Enable Enables the decimation filter channel n (see Initialization for more information).

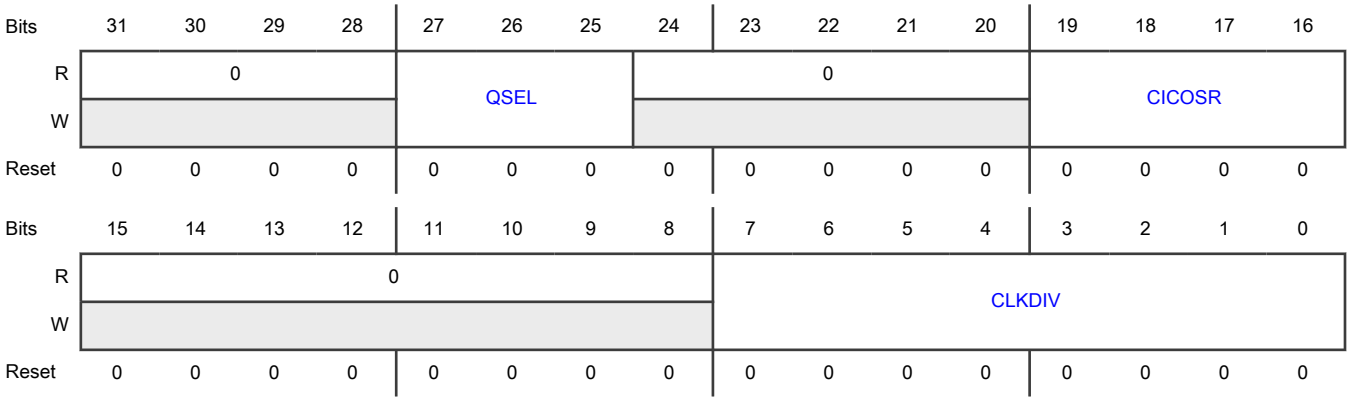
37.7.3 MICFIL Control 2 (CTRL_2)

Contains control fields for MICFIL.

Offset

Register	Offset
CTRL_2	4h

Diagram



Fields

Field	Description
31-28 —	Reserved
27-25 QSEL	Quality Mode Defines the actual quality mode (see Quality modes) of the decimation filter. 000 - Medium-Quality mode 001 - High-Quality mode 100 - Very-Low-Quality 2 mode 101 - Very-Low-Quality 1 mode 110 - Very-Low-Quality 0 mode 111 - Low-Quality mode
24-20 —	Reserved
19-16 CICOSR	CIC Decimation Rate Configures the CIC filter decimation rate (see Equation 43 for more information). **NOTE** You must not change the value of this field when STAT[BSY_FIL] = 1. 0000 - CIC oversampling rate = 0

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0001 - CIC oversampling rate = 1 0010-1110 - ... 1111 - CIC oversampling rate = 15
15-8 —	Reserved
7-0 CLKDIV	Clock Divider Configures the internal clock divider value (see Clock divider for more information) using the following equation: $$PDM_CLK\ rate = \frac{MICFIL_CLK_ROOT}{2 \times floor(K \times CLKDIV)}$$ **NOTE** • You must not change the value of this field when STAT[BSY_FIL] = 1. • [CLKDIV] = 0 has the same effect as [CLKDIV] = 1. In Medium Quality mode and Very-Low Quality 0 mode, [CLKDIV] = 0 or 1 has the same effect as [CLKDIV] = 2. In High Quality mode, [CLKDIV] = 0 or 1 is not allowed. 0000_0000 - Internal clock divider value = 0 0000_0001 - Internal clock divider value = 1 0000_0010-1111_1110 - ... 1111_1111 - Internal clock divider value = 255

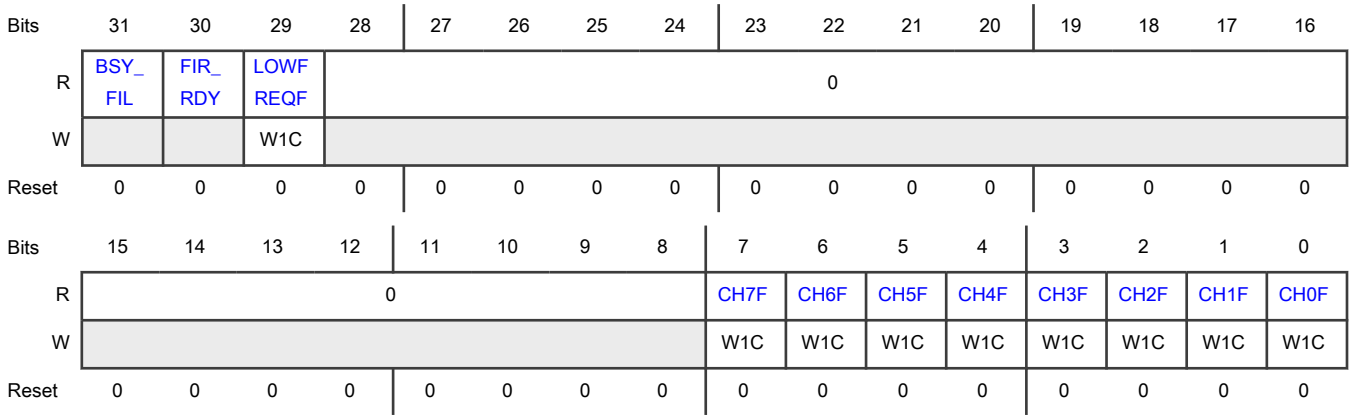
37.7.4 MICFIL Status (STAT)

Contains status flags for MICFIL.

Offset

Register	Offset
STAT	8h

Diagram



Fields

Field	Description
31 BSY_FIL	Busy Flag Signalizes when at least a decimation filter channel or at least a HWVAD is running and the PDM_CLK is being generated. You could use this field as a confirmation that all decimation filters are stopped in a transition to Debug mode (when CTRL_1[DBGE] = 0) or DLL mode. 0 - MICFIL is stopped 1 - MICFIL is running
30 FIR_RDY	Filter Data Ready Indicates whether all the decimation filter buffers are updated, and all filter data provided from now on is reliable. 0 - Not reliable 1 - Reliable
29 LOWFREQF	Low Frequency Flag Indicates that the CLKDIV field value is not high enough to filter all enabled channels , and the compensation filters didn't finish their operations before the next sample arrived. See Minimum required CLKDIV. Write a logic 1 to this field to clear this flag. **NOTE** The filtering results in this condition are unpredictable. 0 - CLKDIV value is OK 1 - CLKDIV value is too low
28-16 —	Reserved
15-8	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
7-0 CHnF	Channel n Output Data Flag Indicates whether this channel's FIFO has surpassed its watermark value and the data is available in MICFIL Output Result (DATACH0 - DATACH7). This flag contributes to generate an interrupt or DMA request if CTRL_1[DISEL] enables it. Write 1 to CTRL_1[DISEL] to clear this flag. If the DMA request is set (CTRL_1[DISEL] = 1), [CHnF] is set according to the watermark level . In other cases (IRQ included), [CHnF] is set according to the watermark level and is cleared when you write 1 to it. **NOTE** If DMA is enabled, this flag clears itself after the DMA transaction is complete. 0 - Not surpassed 1 - Surpassed

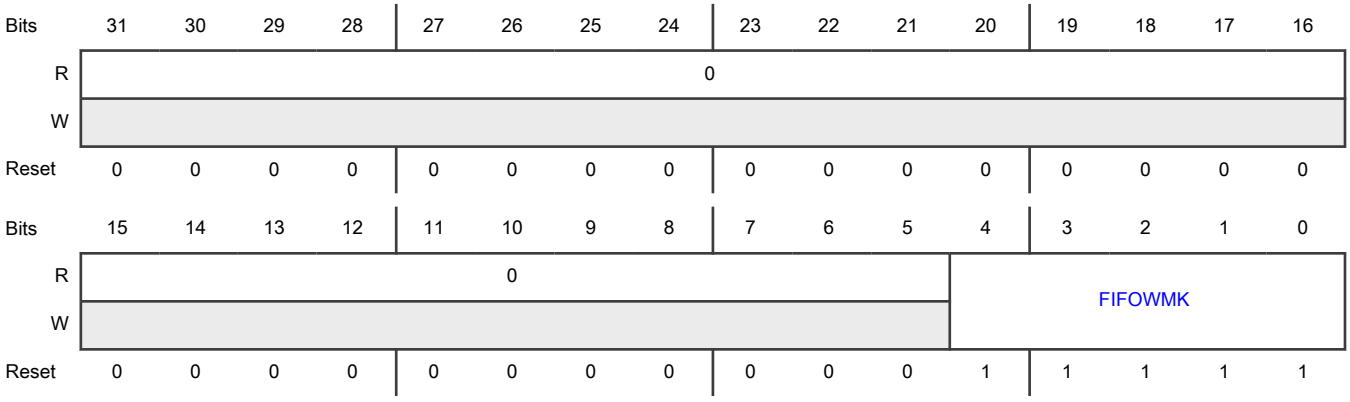
37.7.5 MICFIL FIFO Control (FIFO_CTRL)

Contains MICFIL FIFO control fields.

Offset

Register	Offset
FIFO_CTRL	10h

Diagram



Fields

Field	Description
31-5	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
4-0 FIFOWMK	FIFO Watermark Control Controls the watermark of the FIFO used to set STAT[CH*n*F]. If the number of results in the FIFO is greater than the value of this field, STAT[CH*n*F] is set. A DMA request or interrupt can be also generated according to the configuration of CTRL_1[DISEL]. **NOTE** You must not change the value of this field when STAT[BSY_FIL] = 1. Before changing the watermark value, you must service all filtered data and clear channel flags.

37.7.6 MICFIL FIFO Status (FIFO_STAT)

Contains MICFIL FIFO status flags.

Offset

Register	Offset
FIFO_STAT	14h

1 —	Reserved
0 VADZCDEN	ZCD Enable Enables the ZCD in HWVAD. 0 - Disables 1 - Enables

Chapter 38
Synchronous Audio Interface (SAI)

38.1 Chip-specific SAI information

Table 436. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

This chip includes three instances of SAI (SAI1 in AONMIX, SAI2 and SAI3 in WAKEUPMIX). SAI1 supports two lanes TX and one lane RX. SAI-2 and SAI-3 supports one lane TX and one lane RX.

38.1.1 Audio Clocking

SAI clocking is shown in the following figure.

NOTE

SAI1 is clocked by SAI1_CLK_ROOT or SAI1_MCLK.

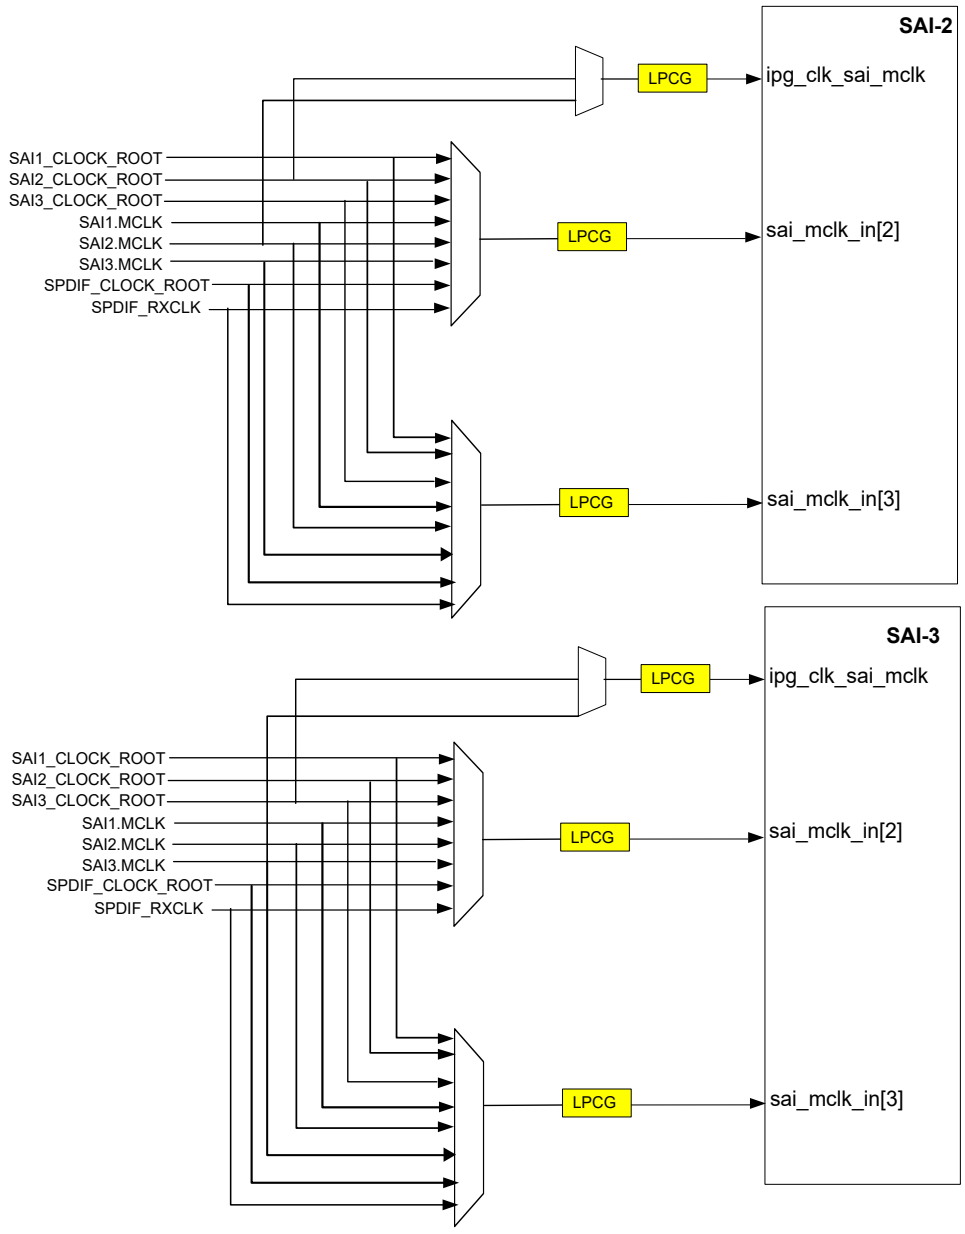

Figure 224. SAI clocking diagram

NOTE

The TX and RX sub-module inside each SAI can independently select one of the clock inputs as its master clock. This allows TX and RX of one SAI to run from different clock source.

38.2 Overview

SAI provides an interface that supports full-duplex serial digital audio interfaces with frame synchronization formats such as I^2S, AC97, TDM, and Codec/DSP interfaces.

38.2.1 Block diagram

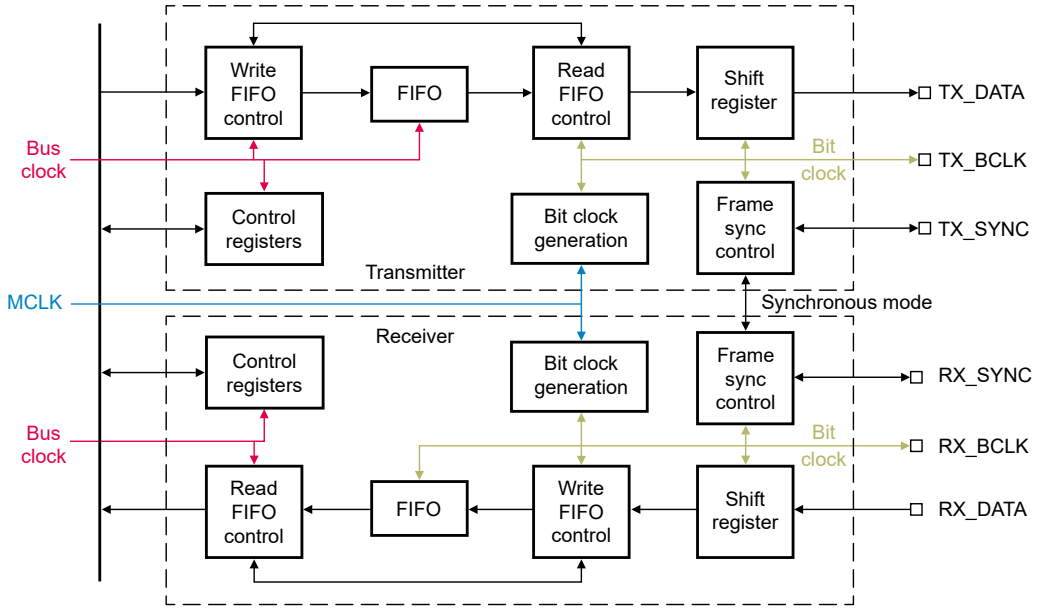

Figure 225. Block diagram

38.2.2 Features

Features can vary among chips and among SAI modules on the same chip. See the chip-specific SAI information at the beginning of this chapter.

- Transmitter with independent bit clock and frame synchronization supporting 1 data line
- Receiver with independent bit clock and frame synchronization supporting 1 data line
- Maximum frame size of 32 words per data line
- Word length of 8 to 32 bits
- Word length configured separately for the first word and remaining words in a frame
- Asynchronous 128 × 32-bit FIFO for each transmit and receive data line supports:
  - Graceful restart after FIFO error.
  - Automatic restart after FIFO error without software intervention.
  - 8-bit and 16-bit data packing into each 32-bit FIFO word.
- Independent 32-bit timestamp counters and bit counters for monitoring transmit and receive progress

38.3 Functional description

This section provides a complete functional description of SAI.

38.3.1 Modes of operation

- Run mode
- Stop mode
- Debug mode

38.3.1.1 Run mode

In Run mode, the SAI transmitter and receiver operate normally.

38.3.1.2 Stop mode

There are two situations in which you can configure the SAI transmitter or receiver to continue operating in Stop mode:

- The SAI transmitter or receiver uses an externally generated bit clock.
- The SAI transmitter or receiver uses an audio clock (MCLK) that operates when the chip is in Stop mode.

Write 1 to TCSR[STOPE] to configure the transmitter to run in Stop mode, and write 1 to RCSR[STOPE] to configure the receiver to run in Stop mode.

The SAI transmitter and receiver can generate an asynchronous interrupt to wake the CPU from Stop mode.

When the chip enters Stop mode, if TCSR[STOPE] = 0, the transmitter is disabled after completing the current transmit frame. Similarly, when the chip enters Stop mode, if RCSR[STOPE] = 0, the receiver is disabled after completing the current receive frame. Entry into Stop mode is blocked (not acknowledged) when waiting for the transmitter and receiver to be disabled at the end of the current frame.

38.3.1.3 Debug mode

You can configure either or both the SAI transmitter and receiver to continue operating in Debug mode:

- Write 1 to TCSR[DBGE] to configure the transmitter to run in Debug mode.
- Write 1 to RCSR[DBGE] to configure the receiver to run in Debug mode.

When TCSR[DBGE] and RCSR[DBGE] are 0 and the chip enters Debug mode, SAI is disabled after completing the current transmit or receive frame. Debug mode does not affect the transmitter and receiver bit clocks.

38.3.2 Synchronous modes

The SAI transmitter and receiver can operate synchronously to each other. You can configure the SAI transmitter and receiver to operate with a synchronous bit clock and frame sync (see TCR2[SYNC] and RCR2[SYNC]).

If both the transmitter and receiver use the transmitter bit clock and frame sync:

- Configure the transmitter for asynchronous operation and the receiver for synchronous operation.
- Enable the receiver in Synchronous mode only after configuring both the transmitter and receiver.
- Enable the transmitter last and disable the transmitter first.

If both the transmitter and receiver use the receiver bit clock and frame sync:

- Configure the receiver for asynchronous operation and the transmitter for synchronous operation.
- Enable the transmitter in Synchronous mode only after configuring both the receiver and transmitter.
- Enable the receiver last and disable the receiver first.

When operating in Synchronous mode, the transmitter and receiver share only the bit clock, frame sync, and transmitter and receiver enable. Otherwise, the transmitter and receiver operate independently, although the configuration register settings must be consistent across both the transmitter and receiver.

38.3.3 Frame sync configuration

When enabled, SAI continuously transmits and receives frames of data. Each frame consists of a fixed number of words, with each word consisting of a fixed number of bits. Within each frame, you can mask any word, causing the receiver to ignore that word and the transmitter to 3-state during that word.

The frame sync signal indicates the start of a frame. A valid frame sync requires the detection of a rising edge (if active high) or falling edge (if active low). The transmitter or receiver cannot be busy with a previous frame. SAI ignores a valid frame sync

(in Target mode) or does not generate one (in Controller mode) for the first four bit-clock cycles after enabling the transmitter or receiver.

You can configure the transmitter and receiver frame sync independently by using any of the following options:

- Generate externally or internally
- Configure to be active high or active low
- Assert with the first bit in the frame or one bit early
- Assert for a duration between one bit-clock cycle and the first word length
- Configure the frame length from 1 to 32 words
- Configure the word length from 8 to 32 bits, with separate configurations for the length of the first word and that of the remaining words
- Transmit or receive words MSB first or LSB first

You cannot change these configuration options after enabling the SAI transmitter or receiver.

38.3.4 Data FIFO

Each transmit and receive channel includes a 128 × 32-bit FIFO. Use Transmit Data (TDR0 - TDR1) and Receive Data (RDR0) to access FIFO data.

38.3.4.1 Data alignment

Data in the FIFO can be aligned anywhere within the 32-bit-wide register via the First Bit Shifted (FBT) configuration field. This field selects the bit index (between 31 and 0) of the first bit shifted.

Examples of supported data alignment and the required FBT configuration are shown in Figure 226 for LSB-first configurations and Figure 227 for MSB-first configurations.

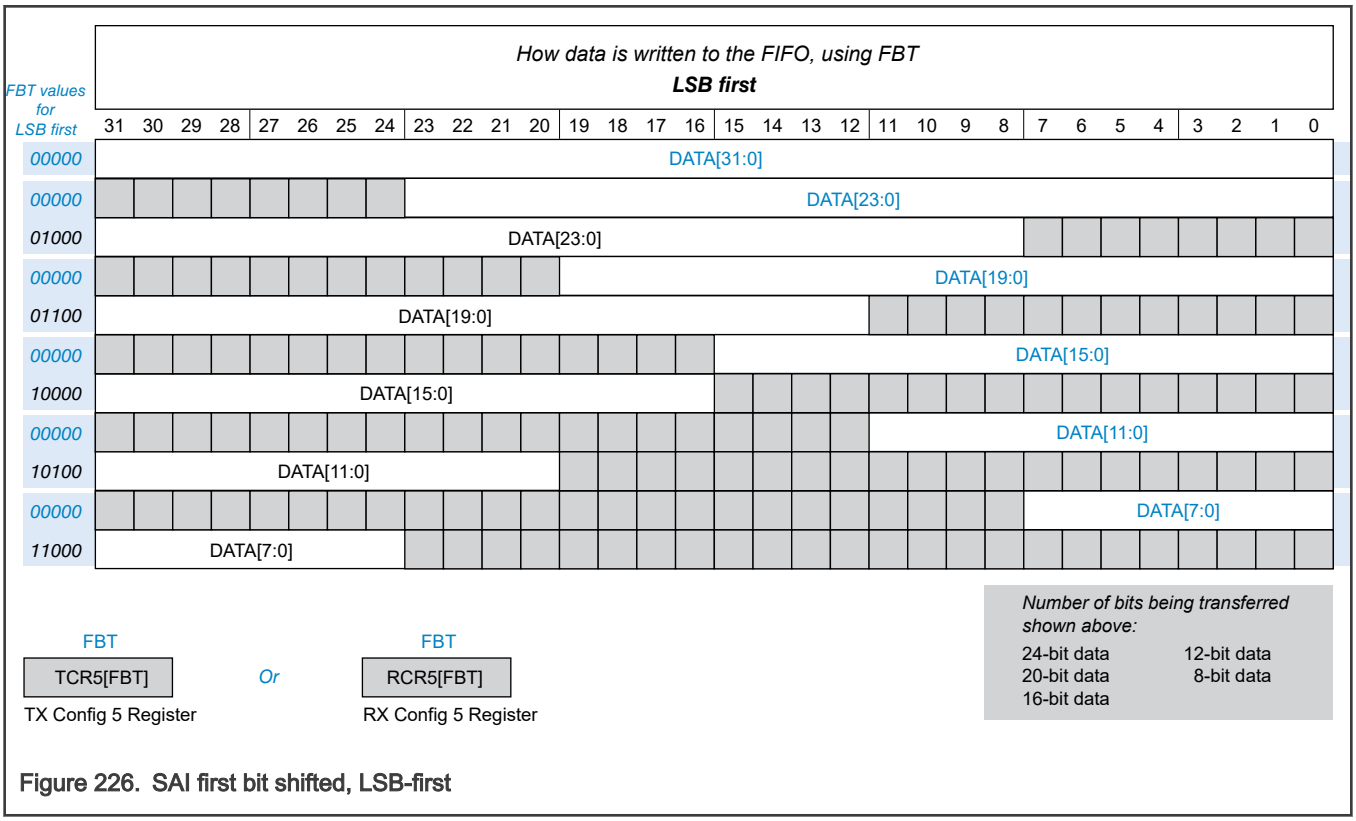

Figure 226. SAI first bit shifted, LSB-first

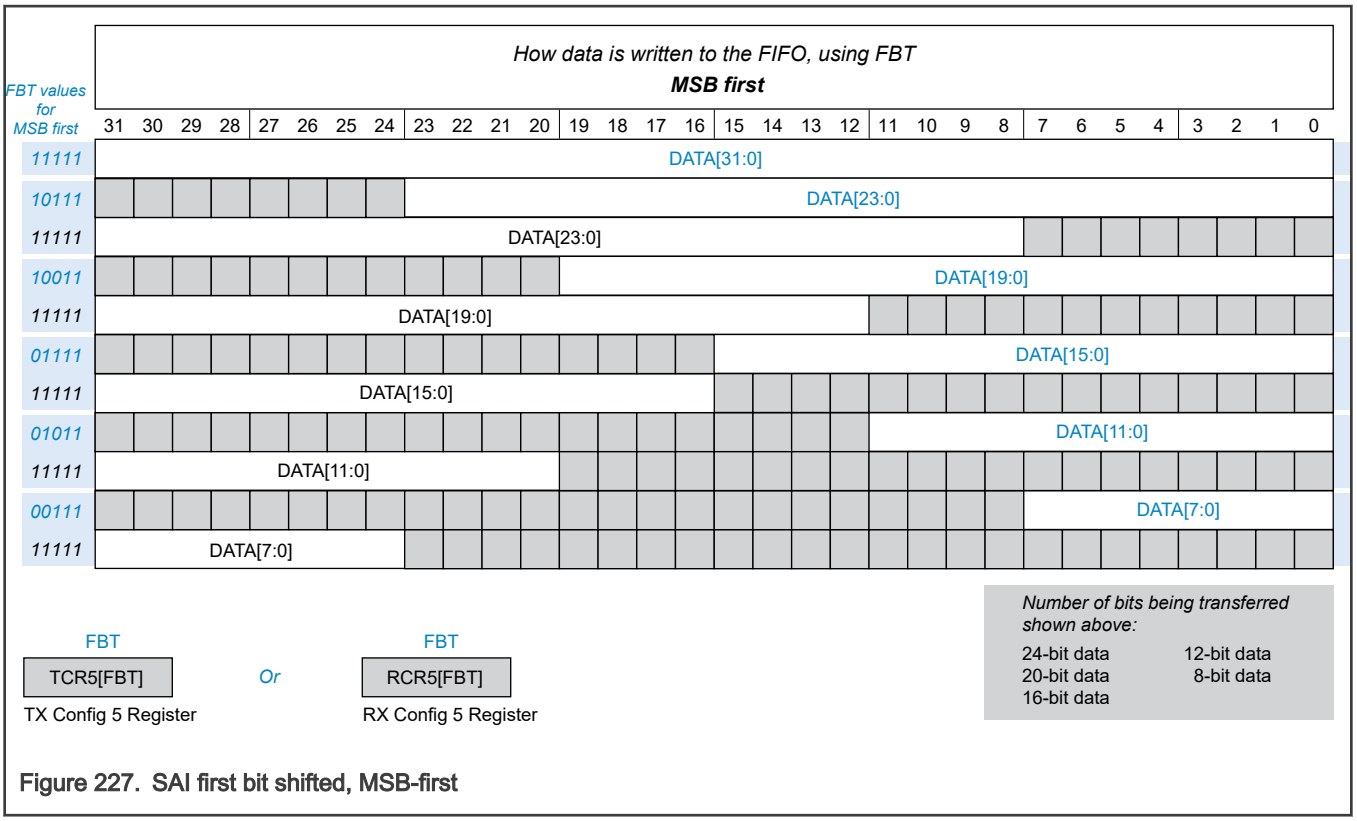

Figure 227. SAI first bit shifted, MSB-first

38.3.4.2 FIFO pointers

When writing to one of the Transmit Data (TDR0 - TDR1) registers, the write FIFO pointer of the corresponding Transmit FIFO register (TFR*n*[WFP]) increments after each valid write. SAI supports 8-bit, 16-bit, and 32-bit writes to TDR*n*, and the FIFO pointer increments after each individual write. Use only 8-bit writes when transmitting up to 8-bit data, and use only 16-bit writes when transmitting up to 16-bit data:

- If the transmit FIFO is full, SAI ignores writes to TDR*n*.
- If the transmit FIFO is empty, write to TDR*n* at least three bit-clock cycles before the start of the next unmasked word. This write avoids a FIFO underrun.
- Before enabling the transmitter, initialize the transmit FIFO with data. The transmitter starts a new frame after enabling the transmitter. If no data is in the FIFO, the transmitter immediately generates an error.

When reading one of the Receive Data (RDR0) registers, the read FIFO pointer of the corresponding Receive FIFO register (RFR*n*[RFP]) increments after each valid read. SAI supports 8-bit, 16-bit, and 32-bit reads from RDR*n*, and the FIFO pointer increments after each individual read. Use only 8-bit reads when receiving up to 8-bit data, and use only 16-bit reads when receiving up to 16-bit data:

- If the receive FIFO is empty, SAI ignores reads to RDR*n*.
- If the receive FIFO is full, read RDR*n* at least three bit-clock cycles before the end of an unmasked word. This read avoids a FIFO overrun.

38.3.4.3 FIFO packing

Using FIFO packing, you can store multiple 8-bit or 16-bit data words in one 32-bit FIFO word for the transmitter or receiver. You could emulate this feature by adjusting the number of bits per word and number of words per frame. FIFO packing, however, does not require even multiples of words per frame, and it fully supports word masking.

When FIFO packing is enabled, the FIFO pointers only increment when the full 32-bit FIFO word has been written (transmit) or read (receive). In this way, FIFO packing supports scenarios where different words within each frame are stored in different areas of memory.

Using 16-bit FIFO packing for transmitting, the transmit shift register loads at the start of each frame and after every second unmasked transmit word. The first transmitted word is taken from the 16-bit word at byte offset 0h. (The first bit is selected by TCR5[FBT], and you must configure it within this 16-bit word.) The second transmitted word is taken from the 16-bit word at byte offset 2h. (The first bit is selected by TCR5[FBT][3:0].) After the 16-bit word has been transmitted, the transmitter transmits logic zeroes until the start of the next word.

Using 16-bit FIFO packing for receiving, the receive shift register is stored after every second unmasked received word. If there is an odd number of unmasked-received words in each frame, the receive register is also stored, at the end of each frame. The first received word is stored in the 16-bit word at byte offset 0h. (The first bit is selected by RCR5[FBT], and you must configure it within this 16-bit word.) The second received word is stored in the 16-bit word at byte offset 2h. (The first bit is selected by RCR5[FBT][3:0].) The receiver ignores received data until the start of the next word after the 16-bit word has been received.

8-bit FIFO packing is similar to 16-bit packing, except four words are loaded or stored into each 32-bit FIFO word. The first word is stored in byte offset 0h, the second word in byte offset 1h, and so on. You must configure TCR5[FBT], RCR5[FBT], or both within byte offset 0h.

38.3.5 Word mask register

The SAI transmitter and receiver each have a word mask register (Transmit Mask (TMR) and Receive Mask (RMR)) that you can use to mask any word in the frame. The word mask register is double buffered. You can update it before the end of each frame to mask a particular word in the next frame.

TMR causes the transmit data pin to be 3-stated for the length of each selected word; the transmit FIFO is not read for masked words.

RMR causes the received data for each selected word to be discarded and not written to the receive FIFO.

38.3.6 Timestamp counter

The transmitter and receiver implement separate timestamp counters and bit counters. The bit counter increments at the end of each bit in a frame when the transmitter or receiver is enabled. The bit counter continues to increment if a word is masked or a FIFO underrun or overrun condition occurs. The bit counter does not increment if an external frame sync is configured and no frame sync is detected. You can reset the bit counter via software. Due to synchronization delays it can take up to 3 bit-clock cycles for the bit clock counter to continue incrementing after a bit counter reset.

The timestamp counter increments on the bus interface clock when it is enabled. You can configure it to synchronize to the bit counter by waiting for the bit counter to increment first (if configured, this synchronization is performed after the time counter is reset). The current value of the timestamp counter is latched whenever the bit counter increments. Reading the bit counter register causes the latched timestamp value to be saved in the bit counter timestamp register. You can reset the timestamp counter via software; a reset via software also resets the latched timestamp value and the bit counter timestamp register.

The timestamp counter can be synchronized between the transmitter and receiver; it can also be synchronized with the transmitter or receiver of another instance. When synchronizing timestamp counters, the controlling timestamp counter must be the last one enabled and the first one disabled. The timestamp counter software reset is not synchronized.

You can use the timestamp counter and bit counter to track the progress of the transmitter and receiver. You can also use it to calculate the relative frequency of the bit clock compared to the bus interface clock.

38.3.7 Clocking

- Audio clock
- Bit clock
- Bus clock

38.3.7.1 Audio clock

The audio clock (MCLK) generates the bit clock when you configure the receiver or transmitter for an internally generated bit clock. The transmitter and receiver can independently select between the bus clock and up to three audio clocks to generate the bit clock.

The SAI peripheral controls the pin direction and postdivider of an audio clock. The postdivider can divide down the clock output on the MCLK signal pin without affecting the audio clock that the transmitter and receiver use.

The audio clock generation and selection is chip-specific. See chip-specific clocking information about how the audio clocks are generated.

38.3.7.2 Bit clock

The SAI transmitter and receiver support asynchronous free-running bit clocks that an audio clock can generate internally or an external source can supply. SAI can also have synchronous bit clock and frame sync operation between the receiver and transmitter, or between multiple SAI peripherals. The transmitter and receiver configuration affects the bit clock and frame sync in the following ways:

- If you configure both the transmitter and receiver for asynchronous operation, each uses its own bit clock and frame sync.
- If you configure the transmitter for asynchronous operation and the receiver for synchronous operation, both use the transmitter bit clock and frame sync.
- If you configure the receiver for asynchronous operation and the transmitter for synchronous operation, both use the receiver bit clock and frame sync.

Your choice of synchronous or asynchronous operation selects the bit clock and frame sync used.

Externally generated bit clocks must be:

- Enabled before the SAI transmitter or receiver is enabled.
- Disabled after the SAI transmitter or receiver is disabled and completes its current frames.

In asynchronous operation, a SAI transmitter or receiver can use a bit clock externally generated by a SAI module instance that is disabled in Stop mode. In this case, disable the transmitter or receiver before entering Stop mode. This issue does not apply when the transmitter or receiver is in synchronous operation because all synchronous SAI modules are enabled and disabled simultaneously.

38.3.7.3 Bus clock

The control and configuration registers use the bus clock to generate synchronous interrupts and DMA requests.

NOTE

Although no minimum bus clock frequency is specified, the frequency must be fast enough (relative to the bit clock frequency) to serve the FIFOs. You must meet this requirement without generating a transmitter FIFO underrun or receiver FIFO overflow condition.

38.3.8 Reset

SAI is asynchronously reset on system reset. SAI has a Software reset and a FIFO reset.

38.3.8.1 Software reset

The SAI transmitter includes a software reset that resets all transmitter internal logic, including the bit clock generation, status flags, and FIFO pointers. The SAI receiver includes a software reset that resets all receiver internal logic, including bit clock generation, status flags, and FIFO pointers.

These software resets do not reset the configuration registers. The software resets remain asserted until you clear them via software.

38.3.8.2 FIFO reset

The SAI transmitter includes a FIFO reset that synchronizes the FIFO write pointer to the value of the FIFO read pointer. This FIFO reset empties the FIFO contents. Use this reset after TCSR[FEF] becomes 1, and before SAI reinitializes the FIFO and TCSR[FEF] becomes 0. SAI asserts the FIFO reset for one cycle only.

The SAI receiver includes a FIFO reset that synchronizes the FIFO read pointer to the value of the FIFO write pointer. This FIFO reset empties the FIFO contents. Use this reset after RCSR[FEF] becomes 1 and SAI reads any remaining data from the FIFO, and before RCSR[FEF] becomes 0. SAI asserts the FIFO reset for one cycle only.

38.3.9 Interrupts and DMA requests

In SAI, the transmitter and receiver generate separate interrupts and DMA requests, but use the same status flags. SAI generates asynchronous versions of the transmitter and receiver interrupts to wake the CPU from Stop mode. SAI only generates asynchronous interrupts when the system clock is gated but the corresponding BCLK signal is active.

38.3.9.1 FIFO request flag

SAI sets the transmit FIFO request flag (TCSR[FRF]) when the number of entries in any enabled transmit FIFO is less than or equal to the transmit FIFO watermark configuration (TCR1[TFW]). SAI clears this flag when the number of entries in each enabled transmit FIFO is greater than TCR1[TFW].

SAI sets the receive FIFO request flag (RCSR[FRF]) when the number of entries in any enabled receive FIFO is greater than the receive FIFO watermark configuration (RCR1[RFW]). SAI clears this flag when the number of entries in each enabled receive FIFO is less than or equal to RCR1[RFW].

The FIFO request flag can generate an interrupt when TCSR[FRIE] = 1. It can generate a DMA request when TCSR[FRDE] = 1.

38.3.9.2 FIFO warning flag

SAI sets the transmit FIFO warning flag (TCSR[FWF]) when the number of entries in any of the enabled transmit FIFOs is empty. SAI clears this flag when the number of entries in each enabled transmit FIFO is not empty.

SAI sets the receive FIFO warning flag (RCSR[FWF]) when the number of entries in any of the enabled receive FIFOs is full. SAI clears this flag when the number of entries in each enabled receive FIFO is not full.

The FIFO warning flag can generate an interrupt when TCSR[FWIE] = 1. The flag can generate a DMA request when TCSR[FWDE] = 1.

38.3.9.3 FIFO error flag

SAI sets the transmit FIFO error flag (TCSR[FEF]) when any enabled transmit FIFOs underrun. After the error flag is set, all enabled transmit channels transmit zero data before SAI clears TCSR[FEF].

When you write 1 to TCR4[FCONT], the FIFO continues transmitting data following an underrun without software intervention. To ensure that data transmits in the correct order, the transmitter continues from the same word number in the frame that caused the FIFO to underrun. It continues only after new data is written to the transmit FIFO. In this case, clear TCSR[FEF] without reinitializing the transmit FIFOs.

SAI sets the receive FIFO error flag (RCSR[FEF]) when any enabled receive FIFO overflows. After the flag is set, all enabled receive channels discard their received data until SAI clears RCSR[FEF] and the next receive frame starts. Empty all enabled receive FIFOs before SAI clears RCSR[FEF].

When you write 1 to RCR4[FCONT], the FIFO continues receiving data following an overflow without software intervention. To ensure that data is received in the correct order, the receiver continues from the same word number in the frame that caused the FIFO to overflow. It continues only after data has been read from the receive FIFO. In this case, clear RCSR[FEF] without emptying the receive FIFOs.

TCSR[FEF] and RSCR[FEF] can only generate an interrupt.

38.3.9.4 Sync error flag

SAI sets a sync error flag (TCSR[SEF] or RCSR[SEF]) when both of these conditions are true:

- The frame sync is generated externally.
- The external frame sync asserts when the transmitter or receiver is busy with the previous frame.

SAI ignores the external frame sync assertion and sets the sync error flag. When this flag is set, the transmitter or receiver continues checking for frame sync assertion when idle or at the end of each frame.

TCSR[SEF] and RCSR[SEF] can only generate an interrupt.

38.3.9.5 Word start flag

SAI sets the word start flag (TCSR[WSF]) at the start of the second bit-clock cycle for the selected word. You can select this word via TCR3[WDFL].

TCSR[WSF] can only generate an interrupt.

38.4 External signals

Name	Function	I/O
TX_BCLK	Transmit bit clock: the bit clock is an input when externally generated and an output when internally generated.	I/O
TX_SYNC	Transmit frame sync: the frame sync is an input sampled synchronously by the bit clock when externally generated. It is an output generated synchronously by the bit clock when internally generated.	I/O
TX_DATA	Transmit data: the bit clock synchronously generates the transmit data; this signal is 3-stated when not transmitting a word.	O
RX_BCLK	Receive bit clock: the bit clock is an input when externally generated and an output when internally generated.	I/O
RX_SYNC	Receive frame sync: the frame sync is an input sampled synchronously by the bit clock when externally generated. It is an output generated synchronously by the bit clock when internally generated.	I/O
RX_DATA	Receive data: the bit clock synchronously samples the receive data.	I
MCLK	Audio clock: the audio clock is an input when externally generated and an output when internally generated.	I/O

38.5 Initialization

To initialize SAI:

1. Enable the clock to SAI.

2. Reset the internal transmitter logic and receiver logic by writing 1 to TCSR[SR] and RCSR[SR], respectively.

38.6 Memory map and register definition

A read or write access to an address from offset 108h and above results in a bus error.

38.6.1 SAI register descriptions

SAI provides an interface that supports full-duplex serial digital audio interfaces with frame synchronization formats.

Fields

Field	Description
31 —	Reserved
30 SYNC	Synchronous Mode Configures Asynchronous and Synchronous modes of operation. When configured for Synchronous mode, you must configure the receiver for asynchronous operations.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Asynchronous mode 1 - Synchronous with receiver
29 BCS	Bit Clock Swap Swaps the bit clock used by the transmitter. When you configure the transmitter in Asynchronous mode and this field is 1, the receiver bit clock (RX_BCLK) clocks the transmitter. This configuration allows the transmitter and receiver to share a bit clock, while the transmitter continues to use the transmit frame sync (TX_SYNC). When you configure the transmitter in Synchronous mode, you must write the same value to the transmitter BCS field and the receiver BCS field. When both are 1, the transmitter and receiver are both clocked by the transmitter bit clock (TX_BCLK) but both use the receiver frame sync (RX_SYNC). 0 - Use the normal bit clock source 1 - Swap the bit clock source
28 BCI	Bit Clock Input Enables the internal logic to be clocked as if the bit clock is generated externally. When this field is 1 while using an internally generated bit clock in Synchronous or Asynchronous mode, the bit clock used by the transmitter is delayed by the pad output delay. (The pad input clocks the transmitter as if the clock is externally generated.) This setting decreases the data input setup time, but increases the data output valid time. Use the Target mode timing from the data sheet for the transmitter when this field is 1. In Synchronous mode, this field allows the transmitter to use the Target mode timing from the data sheet, while the receiver uses the Controller mode timing. This field has no effect when configured for an externally generated bit clock. **NOTE** When BCI = 1, both the input buffer and output buffer must be enabled for the BCLK pad. 0 - Disable 1 - Enable
27-26 MSEL	MCLK Select Selects the audio clock option used to generate an internally generated bit clock. This field has no effect when SAI is configured for an externally generated bit clock. **NOTE** Depending on the chip, some audio clock options might not be available. See the chip-specific information for the meaning of each option. 00 - Bus clock 01 - Audio clock (MCLK) option 1 10 - Audio clock (MCLK) option 2 11 - Audio clock (MCLK) option 3

Table continues on the next page...

Table continued from the previous page...

Field	Description
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. If you write 0 to this field, the bit clock becomes active high with drive outputs on rising edge and sample inputs on falling edge. If you write 1 to this field, the bit clock becomes active low with drive outputs on falling edge and sample inputs on rising edge. 0 - Active high 1 - Active low
24 BCD	Bit Clock Direction Configures the direction of the bit clock. 0 - Generate externally in Target mode 1 - Generate internally in Controller mode
23 BYP	Bit Clock Bypass Bypasses the bit clock divider. When bypassed, the internal bit clock is divide-by-one of the audio clock. When not bypassed, the internal bit clock is generated from the bit clock divider. 0 - Disable 1 - Enable
22-8 —	Reserved
7-0 DIV	Bit Clock Divide Determines the value by which SAI divides down the audio clock to generate the bit clock (when configured for an internal bit clock). The division value is (DIV + 1) × 2.

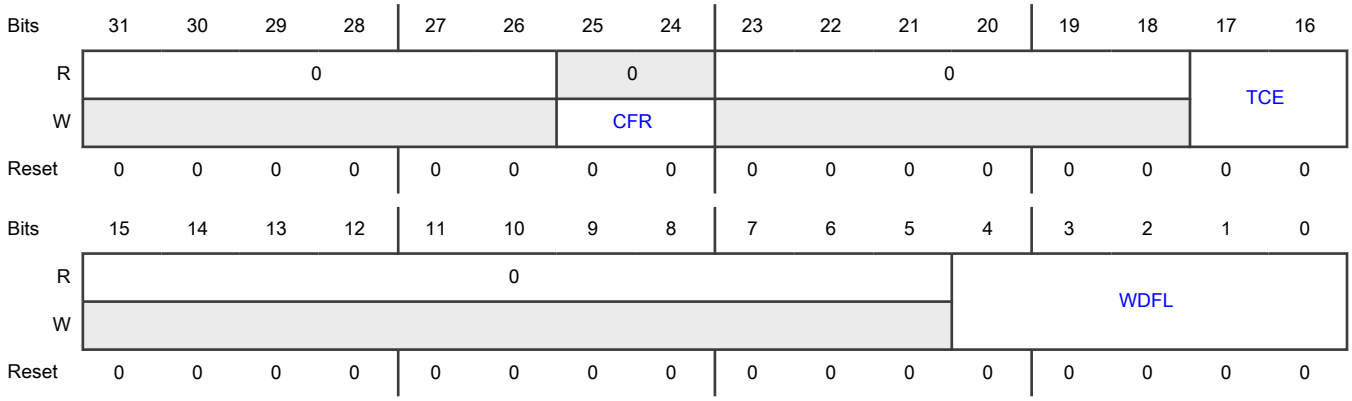
38.6.1.7 Transmit Configuration 3 (TCR3)

Contains the transmit channel settings.

Offset

Register	Offset
TCR3	14h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field always returns zero. You must reset FIFO pointers only when a channel is disabled or the FIFO error flag is set. The width of this field = the number of transmit channels (call it *n*). For example, if this field is 2 bits wide, bit position 24 refers to the transmit channel 1 FIFO pointer and bit position 25 refers to the transmit channel 2 FIFO pointer. Writing 1 to bit 24 resets the transmit channel 1 FIFO pointer, and writing 1 to bit 25 resets the transmit channel 2 FIFO pointer. Writing 1 to bit *n* resets the transmit channel *n* FIFO pointer. **NOTE** When there is only one channel, you do not need the individual channel FIFO reset (TCR3[CFR]). For a single channel, use the global FIFO reset (TCSR[FR]). • 0b – No effect • 1b – Reset transmit data channel *n* FIFO **NOTE** This field is not supported in every instance. The following table includes only supported registers.
23-18	Reserved

Table continued from the previous page...

Field	Description
—	
17-16 TCE	Transmit Channel Enable Enables the corresponding data channel for transmit operations. Changing this field takes effect immediately for generating the FIFO request and warning flags. It takes effect at the end of each frame for transmit operations. The width of this field = the number of transmit channels (call it *n*). For example, if this field is two bits wide, bit position 16 refers to transmit channel 1 and bit position 17 refers to transmit channel 2. Writing 1 to bit 16 enables transmit channel 1, and setting bit 17 enables transmit channel 2. Writing 1 to bit *n* enables transmit channel *n*. For each transmit data channel: • 0b – Disable • 1b – Enable **NOTE** This field is not supported in every instance. The following table includes only supported registers.
15-5 —	Reserved
4-0 WDFL	Word Flag Configuration Selects the word that sets the word start flag (TCSR[WSF]). The value must be one less than the word number. For example, writing 0 selects the first word in the frame. When you configure this field with a value greater than TCR4[FRSZ], TCSR[WSF] is never set.

Instance	Field supported in	Field not supported in
SAI1	TCR3	—
SAI2	TCR3[16]	TCR3[17]
SAI3	TCR3[16]	TCR3[17]

38.6.1.8 Transmit Configuration 4 (TCR4)

Contains the transmit fields for FIFO Combine mode, FIFO Packing mode, and frame sync settings.

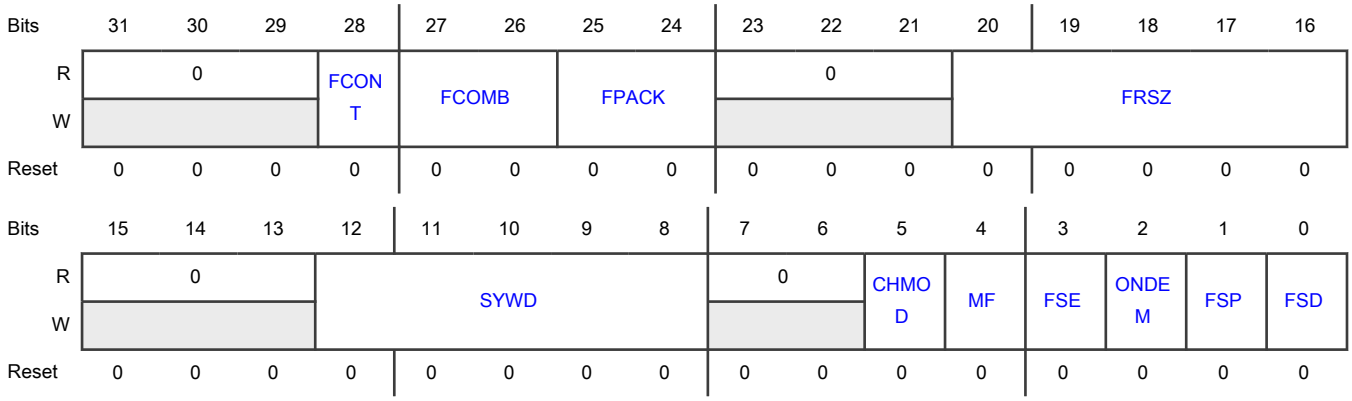
NOTE

Do not alter this register when TCSR[TE] is 1.

Offset

Register	Offset
TCR4	18h

Diagram



Fields

Field	Description
31-29 —	Reserved
28 FCONT	FIFO Continue on Error Configures when SAI must continue transmitting after a FIFO error is detected. When this field is 0 and a FIFO error occurs, SAI continues from the start of the next frame after the FIFO error flag clears. When this field is 1 and a FIFO error occurs, SAI continues from the same word that caused the FIFO error after the FIFO warning flag clears. 0 - Continue from the start of the next frame 1 - Continue from the same word that caused the FIFO error
27-26 FCOMB	FIFO Combine Mode Enables FIFO Combine mode for specified operations. When FIFO Combine mode is enabled for FIFO writes, software writing to any FIFO data register alternates the write among the enabled data channel FIFOs. For example, if two data channels are enabled: • The first write is performed to the first enabled data channel FIFO. • The second write is performed to the second enabled data channel FIFO. Resetting the FIFO or disabling FIFO Combine mode for FIFO writes resets the pointer back to the first enabled data channel. When FIFO Combine mode is enabled for FIFO reads from the transmit shift registers, the transmit data channel output alternates between the enabled data channel FIFOs. For example, if two data channels are enabled: • The first unmasked word is transmitted from the first enabled data channel FIFO. • The second unmasked word is transmitted from the second enabled data channel FIFO. Because the first word of the frame is always transmitted from the first enabled data channel FIFO, NXP recommends that the number of unmasked words per frame is evenly divisible by the number of enabled data channels.

00 - Disable
01 - Enable on FIFO reads (from transmit shift registers)
10 - Enable on FIFO writes (by software)
11 - Enable on FIFO reads (from transmit shift registers) and writes (by software)
</td></tr>
<tr><td>25-24
FPACK</td><td>FIFO Packing Mode
Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8 bits or 16 bits, only the first 8 bits or 16 bits are loaded from the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO write pointer only increments when you write the full 32-bit FIFO word.
00 - Disable FIFO packing
01 - Reserved
10 - Enable 8-bit FIFO packing
11 - Enable 16-bit FIFO packing</td></tr>
<tr><td>23-21
—</td><td>Reserved</td></tr>
<tr><td>20-16
FRSZ</td><td>Frame Size
Configures the number of words in each frame. The value must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.</td></tr>
<tr><td>15-13
—</td><td>Reserved</td></tr>
<tr><td>12-8
SYWD</td><td>Sync Width
Configures the length of the frame sync in number of bit-clock cycles. The value must be one less than the number of bit-clock cycles. For example, write 0 for the frame sync to assert for one bit-clock cycle only. You cannot configure the sync width to be longer than the first word of the frame.</td></tr>
</table>

Table continues on the next page...

Table continued from the previous page...

Field	Description
7-6 —	Reserved
5 CHMOD	Channel Mode Specifies the mode of transmit data pins. In TDM mode, transmit data pins are 3-stated when slots are masked or channels are disabled. In Output mode, transmit data pins are never 3-stated, and they output zero when slots are masked or channels are disabled. 0 - TDM mode 1 - Output mode
4 MF	MSB First Configures what is transmitted first: LSB or MSB. 0 - LSB 1 - MSB
3 FSE	Frame Sync Early Determines when frame sync is asserted. 0 - First bit of the frame 1 - One bit before the first bit of the frame
2 ONDEM	On-Demand Mode Determines when the internal frame sync is generated. When this field is 1, and the frame sync is generated internally, a frame sync is only generated after the FIFO warning flag is cleared. 0 - Generated continuously 1 - Generated after the FIFO warning flag is cleared
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0 - Active high 1 - Active low
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0 - Generated externally in Target mode 1 - Generated internally in Controller mode

38.6.1.9 Transmit Configuration 5 (TCR5)

Contains transmit word width and bit index settings.

NOTE

Do not alter this register when TCSR[TE] is 1.

22-16 WFP	Write FIFO Pointer Indicates the FIFO write pointer for the transmit data channel.
15-7 —	Reserved
6-0 RFP	Read FIFO Pointer Indicates the FIFO read pointer for the transmit data channel.

38.6.1.13 Transmit Mask (TMR)

Contains the mask for the transmit word. This register is double-buffered and updates:

- When TCSR[TE] first becomes 1.

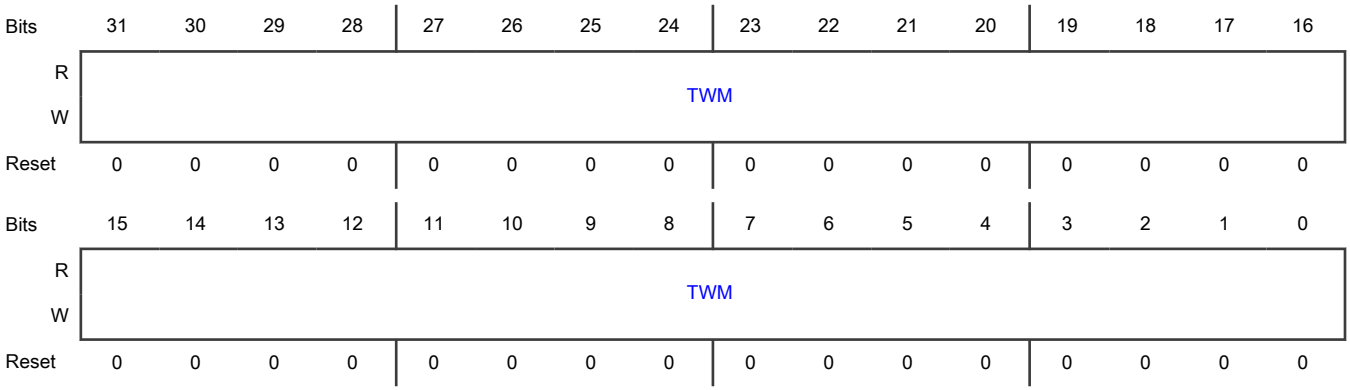
- At the end of each frame.

This setup allows the masked words in each frame to change from frame to frame.

Offset

Register	Offset
TMR	60h

Diagram



Fields

Field	Description
31-0 TWM	Transmit Word Mask Configures whether the transmit word *n* is masked for the corresponding word in the frame. In this case, being masked means that transmit data pins are 3-stated or driven zero and transmit data is not read from the FIFO. 0000_0000_0000_0000_0000_0000_0000_0000 - Enable 0000_0000_0000_0000_0000_0000_0000_0001 - Mask

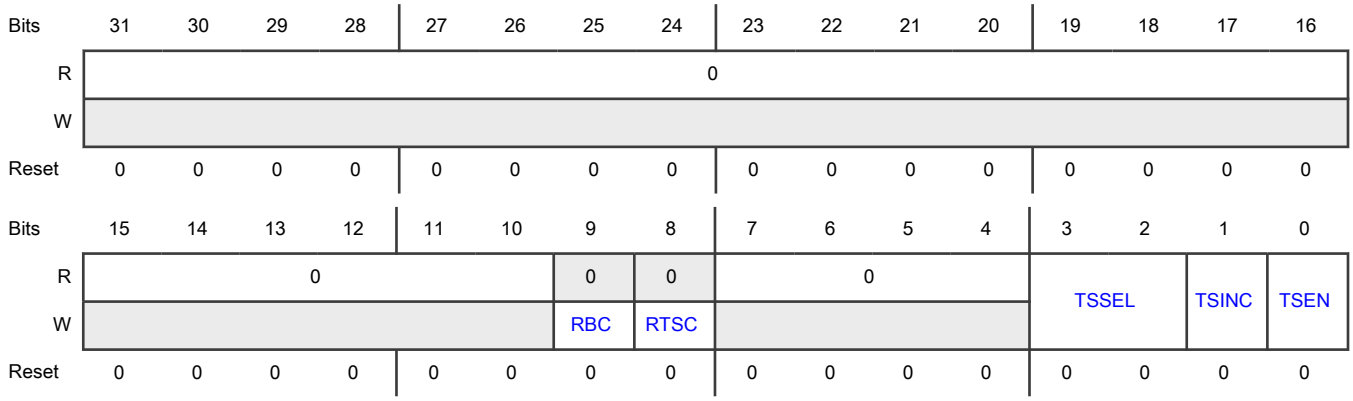
38.6.1.14 Transmit Timestamp Control (TTCR)

Controls the transmit timestamp counter and bit clock counter.

Offset

Register	Offset
TTCR	70h

Diagram



Fields

Field	Description
31-10 —	Reserved
9 RBC	Reset Bit Counter Resets the bit counter. 0 - No effect 1 - Reset
8 RTSC	Reset Timestamp Counter Resets the timestamp counter. 0 - No effect 1 - Reset
7-4 —	Reserved
3-2 TSSEL	Timestamp Select Configures whether the timestamp counter is synchronized with another timestamp counter. 00 - Increment when enabled 01 - Increment when the receive timestamp counter is enabled 10 - Increment when the transmit timestamp counter on another instance is enabled 11 - Increment when the receive timestamp counter on another instance is enabled
1 TSINC	Timestamp Increment Configures when the timestamp counter starts incrementing. 0 - When enabled and after the bit counter has incremented 1 - When enabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
0 TSEN	Timestamp Enable Enables the timestamp counter to increment on the bus interface clock. 0 - Disable 1 - Enable

38.6.1.15 Transmit Timestamp (TTSR)

Indicates the current value of the transmit timestamp counter.

Offset

Register	Offset
TTSR	74h

Fields

Field	Description
31 RE	Receiver Enable Enables the receiver. When you write 0 to this field, the receiver remains enabled and the field remains 1 until the end of the current frame. 0 - Disable 1 - Enable (or receiver disabled and not yet reached end of frame)
30 STOPE	Stop Enable Enables receiver operation in Stop mode. 0 - Disable 1 - Enable
29	Debug Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
DBGE	Enables receiver operation in Debug mode, which does not affect the receive bit clock. 0 - Disable after completing the current frame 1 - Enable
28 BCE	Bit Clock Enable Enables the receive bit clock, separately from RCSR[RE]. This field becomes 1 automatically when RCSR[RE] becomes 1. When you write 0 to this field, the receive bit clock remains enabled, and this field remains 1 until the end of the current frame. 0 - Disable 1 - Enable
27-26 —	Reserved
25 FR	FIFO Reset Empties the FIFO, and sets the FIFO read and write pointers to the same value, which can be zero. Reading this field always returns zero. **NOTE** The FIFO reset is asserted for one cycle only. You must reset FIFO pointers only when the receiver is disabled or the FIFO error flag is 1. 0 - No effect 1 - Reset
24 SR	Software Reset Resets the internal receiver logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. **NOTE** The software reset remains asserted until you clear it. 0 - No effect 1 - Software reset
23-21 —	Reserved
20 WSF	Word Start Flag Indicates whether SAI has detected the start of the configured word. **NOTE** This field behaves differently for register reads and writes.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When reading 0 - Not detected 1 - Detected When writing 0 - No effect 1 - Clear the flag
19 SEF	Sync Error Flag Indicates whether SAI has detected an error in the externally generated frame sync. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not detected 1 - Detected When writing 0 - No effect 1 - Clear the flag
18 FEF	FIFO Error Flag Indicates whether an enabled receive FIFO has overflowed. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Receive overflow detected When writing 0 - No effect 1 - Clear the flag
17 FWF	FIFO Warning Flag Indicates whether an enabled receive FIFO is full. 0 - Not full 1 - Full
16 FRF	FIFO Request Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Indicates whether the number of words in an enabled receive channel FIFO is greater than the receive FIFO watermark. 0 - Watermark not reached 1 - Watermark reached
15-13 —	Reserved
12 WSIE	Word Start Interrupt Enable Enables word start interrupts. 0 - Disable 1 - Enable
11 SEIE	Sync Error Interrupt Enable Enables sync error interrupts. 0 - Disable 1 - Enable
10 FEIE	FIFO Error Interrupt Enable Enables FIFO error interrupts. 0 - Disable 1 - Enable
9 FWIE	FIFO Warning Interrupt Enable Enables FIFO warning interrupts. 0 - Disable 1 - Enable
8 FRIE	FIFO Request Interrupt Enable Enables FIFO request interrupts. 0 - Disable 1 - Enable
7-5 —	Reserved
4-2 —	Reserved
1	FIFO Warning DMA Enable

Table continues on the next page...

Table continued from the previous page...

38.6.1.20 Receive Configuration 2 (RCR2)

Contains the SYNC mode and clock setting fields.

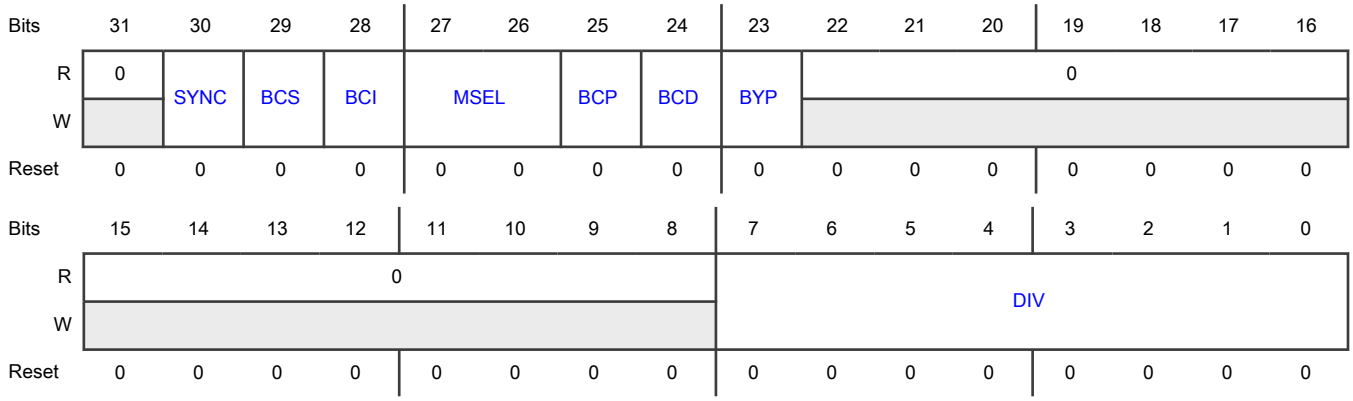
NOTE

Do not alter this register when RCSR[RE] is 1.

Offset

Register	Offset
RCR2	90h

Diagram



Fields

Field	Description
31 —	Reserved
30 SYNC	Synchronous Mode Configures Asynchronous and Synchronous modes of operation. When configured for a Synchronous mode of operation, you must configure the transmitter for asynchronous operation. 0 - Asynchronous mode 1 - Synchronous with transmitter
29 BCS	Bit Clock Swap Swaps the bit clock used by the receiver. When the receiver is configured in Asynchronous mode and this field is 1, the transmitter bit clock (TX_BCLK) clocks the receiver. This setting allows the transmitter and receiver to share one bit clock, while the receiver continues to use the receiver frame sync (RX_SYNC). When you configure the receiver in Synchronous mode, you must write the same value to the transmitter BCS field and receiver BCS field. When both are 1, the transmitter and receiver are both clocked by the receiver bit clock (RX_BCLK) but both use the transmitter frame sync (TX_SYNC). 0 - Use the normal bit clock source 1 - Swap the bit clock source
28 BCI	Bit Clock Input Enables the internal logic to be clocked as if the bit clock is generated externally. When this field is 1 and when using an internally generated bit clock in Synchronous or Asynchronous mode, the bit clock used by the receiver is delayed by the pad output delay. (The pad input clocks the receiver as if the clock is externally generated.) This setting decreases the data input setup time, but increases the data output valid time. Use the Target mode timing from the data sheet for the receiver when this field is 1. In Synchronous mode, this field allows the receiver to use the Target mode timing from the data sheet, while the transmitter uses the Controller mode timing. This field has no effect when configured for an externally generated bit clock.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE When this field is 1, both the input buffer and output buffer must be enabled for the BCLK pad. 0 - Disable 1 - Enable
27-26 MSEL	MCLK Select Selects the audio clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock. **NOTE** Some audio clock options are not available for some chips. See the chip-specific information for the availability and chip-specific meaning of each option. 00 - Bus clock 01 - Audio clock (MCLK) option 1 10 - Audio clock (MCLK) option 2 11 - Audio clock (MCLK) option 3
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. If you write 0 to this field, the bit clock becomes active high with drive outputs on the rising edge and sample inputs on the falling edge. If you write 1 to this field, the bit clock becomes active low with drive outputs on the falling edge and sample inputs on the rising edge. 0 - Active high 1 - Active low
24 BCD	Bit Clock Direction Configures the direction of the bit clock. 0 - Generated externally in Target mode 1 - Generated internally in Controller mode
23 BYP	Bit Clock Bypass Enables the bypass of the bit clock divider. When enabled, the internal bit clock is divide-by-one of the audio clock. When disabled, the internal bit clock is generated from the bit clock divider. 0 - Disable 1 - Enable
22-8 —	Reserved
7-0	Bit Clock Divide

Table continues on the next page...

Table continued from the previous page...

Field	Description
DIV	Determines the value by which the audio clock is divided to generate the bit clock, when configured for an internal bit clock. The division value is (DIV + 1) × 2.

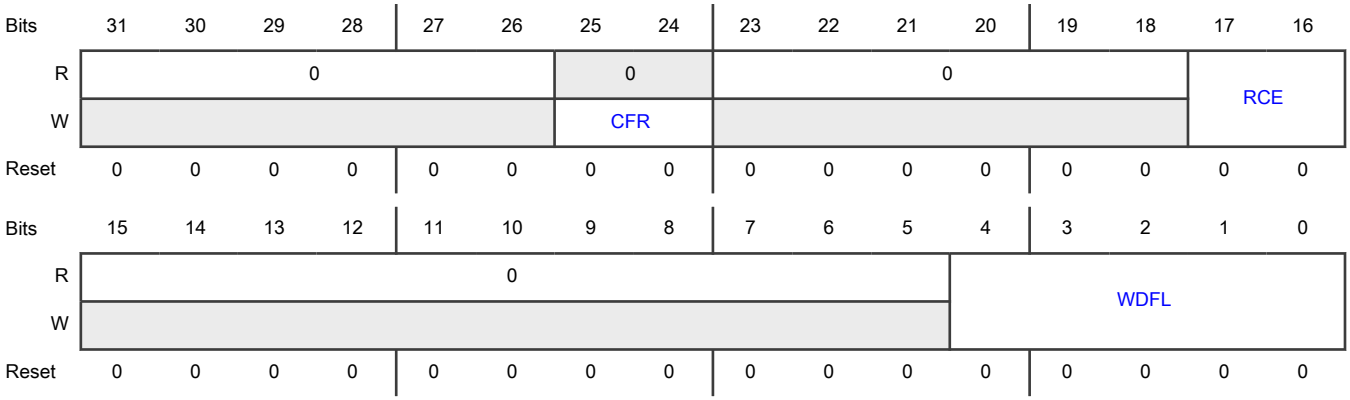
38.6.1.21 Receive Configuration 3 (RCR3)

Contains the receive channel settings.

Offset

Register	Offset
RCR3	94h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field always returns zero. Reset FIFO pointers only when a channel is disabled or the FIFO error flag is set. The width of this field = the number of receive channels (call it *n*). For example, if this field is two bits wide, bit position 24 refers to the receive channel 1 FIFO pointer and bit position 25 refers to the receive channel 2 FIFO pointer. Writing 1 to bit 24 resets the receive channel 1 FIFO pointer, and writing 1 to bit 25 enables the receive channel 2 FIFO pointer. Writing 1 to bit *n* resets receive channel *n* FIFO pointer. • 0b – No effect • 1b – Reset receive data channel *n* FIFO

Field	Description
—	
4-0 WDFL	Word Flag Configuration Configures which word sets the word start flag (RCSR[WSF]). The value must be one less than the word number (for example, write zero to select the first word in the frame). If you configure this field to a value greater than RCR4[FRSZ], RCSR[WSF] is never set. 0_0000 - Word 1 0_0001 - Word 2 0_0010-1_1110 - Word (WDFL value + 1) 1_1111 - Word 32

38.6.1.22 Receive Configuration 4 (RCR4)

Contains the receive fields for FIFO Combine mode, FIFO Packing mode, and frame sync settings.

NOTE

Do not alter this register when RCSR[RE] is 1.

Offset

Register	Offset

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>—</td><td></td></tr>
<tr><td>28
FCONT</td><td>FIFO Continue on Error
Configures when SAI continues receiving data after a FIFO error is detected.
0 - From the start of the next frame after the FIFO error flag is cleared
1 - From the same word that caused the FIFO error to become 1 after the FIFO warning flag is cleared</td></tr>
<tr><td>27-26
FCOMB</td><td>FIFO Combine Mode
Enables FIFO Combine mode for specified operations.
When FIFO Combine mode is enabled for FIFO reads, software reading any FIFO data register alternates the read among the enabled data channel FIFOs. For example, if two data channels are enabled:
• The first read is performed to the first enabled data channel FIFO.
• The second read is performed to the second enabled data channel FIFO.
Resetting the FIFO or disabling FIFO Combine mode for FIFO reads resets the pointer back to the first enabled data channel.
When FIFO Combine mode is enabled for FIFO writes from the receive shift registers, the first enabled data channel input alternates between the enabled data channel FIFOs. For example, if two data channels are enabled:
• The first unmasked received word is stored in the first enabled data channel FIFO.
• The second unmasked received word is stored in the second enabled data channel FIFO.
Because the first word of the frame is always stored in the first enabled data channel FIFO, NXP recommends that the number of unmasked words per frame is evenly divisible by the number of enabled data channels.
NOTE
This field is not supported in every instance. The following table includes only supported registers.

Table continued from the previous page...

Field	Description
25-24 FPACK	FIFO Packing Mode Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8 bits or 16 bits, only the first 8 bits or 16 bits are stored in the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO read pointer only increments when software reads the full 32-bit FIFO word. 00 - Disable 01 - Reserved 10 - Enable 8-bit FIFO packing 11 - Enable 16-bit FIFO packing
23-21 —	Reserved
20-16 FRSZ	Frame Size Configures the number of words in each frame. The value must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words. 0_0000 - 1 0_0001 - 2 0_0010-1_1110 - (FRSZ value + 1) 1_1111 - 32
15-13 —	Reserved
12-8 SYWD	Sync Width Configures the length of the frame sync in number of bit-clock cycles. The value must be one less than the number of bit-clock cycles. For example, write 0 for the frame sync to assert for one bit-clock cycle only. You cannot configure this field to be longer than the first word of the frame. 0_0000 - 1 0_0001 - 2 0_0010-1_1110 - (SYWD value + 1) 1_1111 - 32
7-6 —	Reserved
5 —	Reserved Write only zero to this field.
4	MSB First

Table continues on the next page...

Table continued from the previous page...

Field	Description
MF	Configures what is received first: LSB or MSB. 0 - LSB 1 - MSB
3 FSE	Frame Sync Early Determines when frame sync is asserted. 0 - First bit of the frame 1 - One bit before the first bit of the frame
2 ONDEM	On-Demand Mode Determines when the internal frame sync is generated. When this field is 1, and the frame sync is generated internally, a frame sync is only generated when the FIFO warning flag is 0. 0 - Generated continuously 1 - Generated when the FIFO warning flag is 0
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0 - Active high 1 - Active low
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0 - Generated externally in Target mode 1 - Generated internally in Controller mode

38.6.1.23 Receive Configuration 5 (RCR5)

Contains receive word and bit index settings.

7-4 —	Reserved
3-2 TSSEL	Timestamp Select Configures whether the timestamp counter is synchronized with another timestamp counter. 00 - Increment when enabled 01 - Increment when the transmit timestamp counter is enabled 10 - Increment when the receive timestamp counter on another instance is enabled 11 - Increment when the transmit timestamp counter on another instance is enabled
1 TSINC	Timestamp Increment Configures when the timestamp counter starts incrementing. 0 - When enabled and after the bit counter has incremented 1 - When enabled
0 TSEN	Timestamp Enable Enables the timestamp counter to increment on the bus interface clock. 0 - Disable 1 - Enable

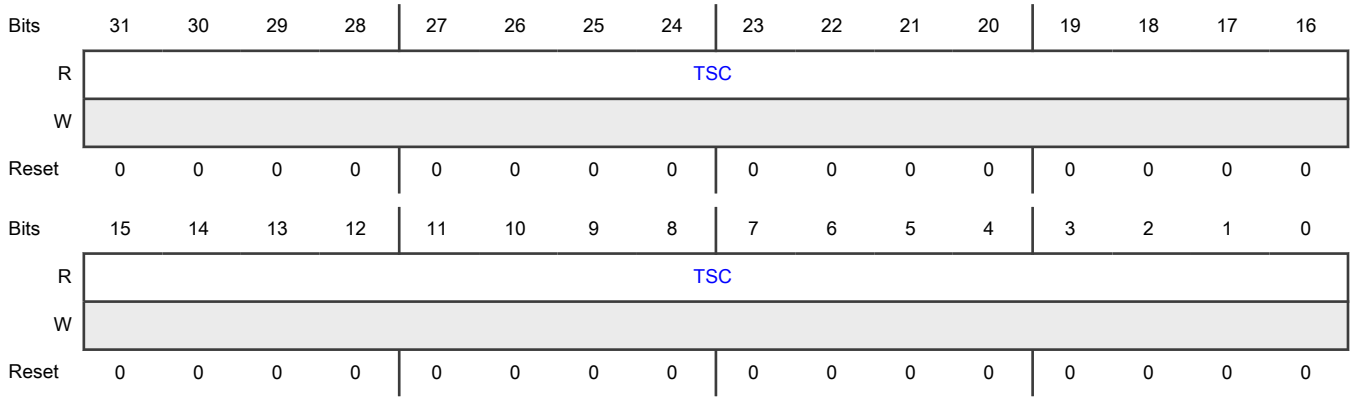
38.6.1.30 Receive Timestamp (RTSR)

Indicates the current value of the receive timestamp counter.

Offset

Register	Offset
RTSR	F4h

Diagram



Fields

Field	Description
31-0 TSC	Timestamp Counter Indicates the current value of the timestamp counter.

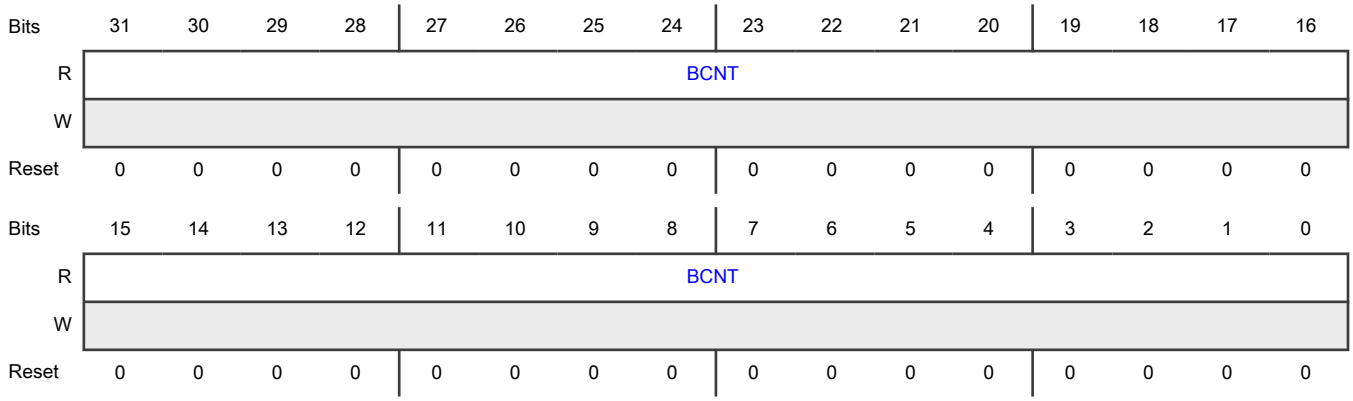
38.6.1.31 Receive Bit Count (RBCR)

Indicates the current value of the receive bit counter. The bit counter increments for each bit in a frame when the SAI receiver is enabled. Reading this register causes Receive Bit Count Timestamp (RBCTR) to update with the value of the timestamp counter that corresponds to the bit count register value.

Offset

Register	Offset
RBCR	F8h

Diagram



Fields

Field	Description
31-0 BCNT	Bit Counter Indicates the current value of the bit counter.

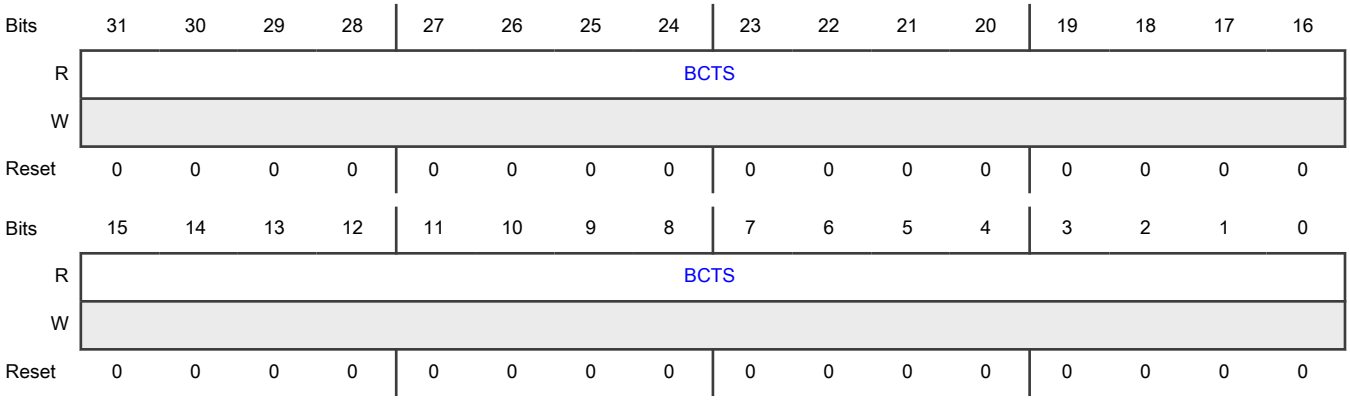
38.6.1.32 Receive Bit Count Timestamp (RBCTR)

Indicates the value of the timestamp register that corresponds to the value last read from Receive Bit Count (RBCR).

Offset

Register	Offset
RBCTR	FCh

Diagram



Fields

Field	Description
31-0 BCTS	Bit Timestamp Indicates the timestamp counter value that matches the last value read from Receive Bit Count (RBCR).

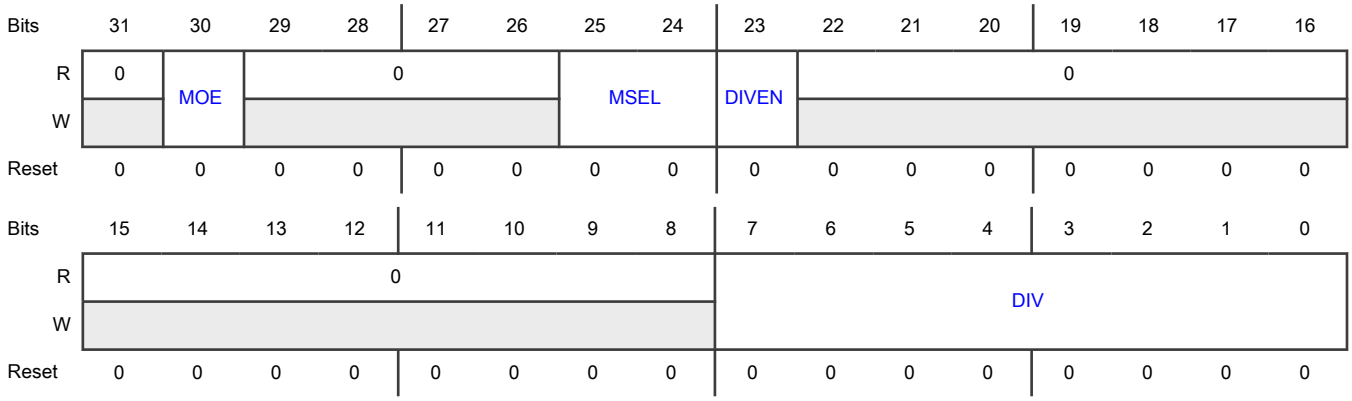
38.6.1.33 MCLK Control (MCR)

Controls the audio clock.

Offset

Register	Offset
MCR	100h

Diagram



Fields

Field	Description
31 —	Reserved
30 MOE	MCLK Output Enable Configures the MCLK signal pin as an input or output. 0 - Input 1 - Output
29-26 —	Reserved
25-24 MSEL	MCLK Select Selects the clock used by the MCLK postdivider. You cannot change this field when the MCLK postdivider is enabled. See the chip-specific information for the connections to these inputs. 00 - Audio clock (MCLK) option 1 01 - Reserved 10 - Audio clock (MCLK) option 2 11 - Audio clock (MCLK) option 3
23 DIVEN	MCLK Post Divide Enable Enables the postdivider that is output on the MCLK signal pin. When enabled, the output on the MCLK signal pin is a postdivided version of the audio clock. When disabled, the output is the audio clock. The output divider does not impact the audio clock used by the transmitter or receiver. 0 - Disable 1 - Enable
22-8	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
7-0 DIV	MCLK Post Divide Specifies the postdivide value for the audio clock that only divides the output to the MCLK signal pin. The division value is (DIV + 1) × 2.

38.7 Glossary

FIFO	First-in first-out
LSB	Least significant bit
MSB	Most significant bit

Chapter 39
Audio Transceiver (SPDIF XCVR)

39.1 Overview

SPDIF_XCVR module supports SPDIF TX and RX functions in full duplex mode.

39.1.1 Block diagram

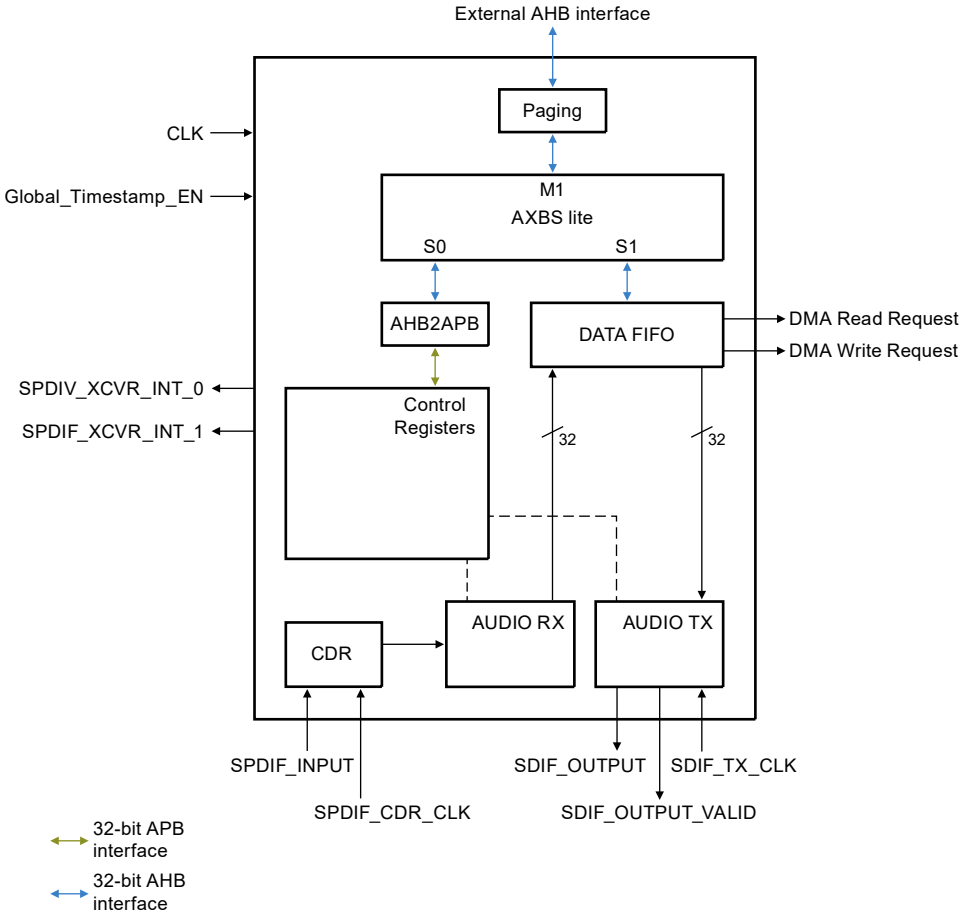


Figure 228. SPDIF_XCVR block diagram

39.1.2 Features

SPDIF_XCVR module can operate in one or both of the following modes:

- SPDIF Receiver:
  - Support for 32 kHz - 192 kHz sample rate
- SPDIF Transmitter:
  - Support for 32 kHz - 192 kHz data TX rate

39.2 Functional description

This section describes functional details of the SPDIF_XCVR.

39.2.1 Audio data format support

All SPDIF_XCVR message formats use IEC60958 framing. Data is stored in the FIFO either in sub-frame format or raw data format programmed in RX_DATAPATH_CTRL.RX_DATA_FMT or TX_DATAPATH_CTRL.TX_FORMAT

1. IEC60958 data in big endian format:
   - 31:28 - Preamble. For TX, the preamble can be added by HW or stored in the FIFO with the correct value. For RX, the 3rd bit will be replaced by MUTE and 4th bit will be replaced by Parity error.
   - 27:4 - TX data
   - 3:0 - V,U,C and P. For TX, these bits can be added by HW or stored in the FIFO with the correct value.

   Each sub-frame can be stored in memory in the reverse order, bit 31 is stored in position 0 and so on using register bit : FRM_FMT in TX_DATAPATH_CTRL and STORE_FMT in RX_dATAPATH_CTRL.
2. Raw data format:
   - 23:0 / 19:0 / 15:0 - Raw data for each audio data format is stored in these bits for TX and RX.

SPDIF_XCVR supports L-PCM and compressed audio within the IEC60958-1 framing structure.

Table 437. Supported data formats

Interface	Type	Channels	Payload Size	Frame Format
SPDIF_XCVR	2-ch LPCM	2	16, 20, or 24	IEC60958
	IEC61937	N/A	16	

39.2.2 SPDIF_XCVR data rates

SPDIF_XCVR supports the following audio bit rates.

- Uncompressed audio at 2.048Mbps to 12.288Mbps for 2-ch
- Compressed audio up to 12.288Mbps

Maximum audio bit rates is 12.288Mbps, or 192kHz IEC60958-1 Frame rate.

NOTE

- The table uses permissible Fs values for SPDIF_XCVR
- L-PCM and compressed audio sample rates are maximum 192kHz

Table 438. Supported SPDIF_XCVR Data Rates

Type	Channels	Fs (kHz)	Data (Mbps)
2-ch LPCM	2	32	2.048
		44.1	2.8224
		48	3.072
		64	4.096
		88.2	5.6448
		96	6.144
		128	8.192
		176.4	11.2896

Table continues on the next page...

Table 438. Supported SPDIF_XCVR Data Rates (continued)

Type	Channels	Fs (kHz)	Data (Mbps)
		192	12.288
IEC61937 Compressed	N/A	32	2.048
		44.1	2.8224
		48	3.072
		64	4.096
		88.2	5.6448
		96	6.144
		128	8.192
		176.4	11.2896
		192	12.288

39.2.3 Operation

SW will need to release the TX and or RX datapaths from reset to enable SPDIF TX / RX datapaths. Control registers will have to be programmed based on the mode needed.

SPDIF_XCVR can be operated in SPDIF TX and/or RX modes. In order to set up the Control registers refer to various options available in RX_DATAPATH_CTRL and TX_DATAPATH_CTRL registers.

- SPDIF TX mode: In order to use the SPDIF_XCVR in SPDIF TX mode, set the input tx_clk to frequency = 2*TX data rate clock. Once the clock is available, release the TX datapath from reset by writing to EXT_CTRL.TX_DPATH_RESET. Once the datapath is out of reset, other control registers can be set. Refer to Audio Transmitter Overview for more information on the control registers. Out of reset, the TX datapath is programmed to have the IEC60958 bit 0 in bit position 31. Insertion of Channel status, user data, presample and parity are disabled. The sub-frame in the TX FIFO is considered to be a complete IEC60958 sub-frame.
- SPDIF RX mode: In order to use the SPDIF_XCVR in SPDIF RX mode, release the RX datapath from reset by writing to EXT_CTRL.RX_DPATH_RESET. Once the datapath is out of reset, other control registers can be set. Refer to Audio Receiver Overview for more information on the control registers. Ou of reset, the RX datapath is programmed to sync to the first recognized B preamble, and store the complete received sub-frame in receive FIFO. Bit 0 of the received sub-frame is stored in bit position 0 of the FIFO data.

39.2.4 SPDIF_XCVR Low power mode

SPDIF_XCVR low power mode is when the SPDIF_XCVR input is used as a wakeup source. Follow the below steps to use SPDIF input as a wakeup source:

- Set SPDIF_XCVR toggle count to the value desired in RX_DATAPATH_CTRL. Default is 4 toggles. Max is 7.
- Enable the interrupt either in IER0 or IER1.
- Enable SPDIF_XCVR wakeup function using : EXT_CTRL.EN_SPDIF_WAKEUP
- Switch ipg_clk source to 24MHz clock source.

39.2.5 Test mode

The main test mode that is supported by SPDIF_XCVR controller is the digital loopback mode. It can be enabled by setting TX_DATAPATH_CTRL.SPDIF_LOOPBACK_EN. Enable RX datapath first, followed by setting the TX control registers and then as a final step, enable data transmit using TX_DATAPATH_CTRL.STRT_DATA_TX.

39.2.5.1 SPDIF_XCVR loopback mode

The SPDIF TX and RX datapaths can be set up as required. The registers ideally should be set as follows: Transmitter should be set to insert parity, and preamble before transmitting data. The receiver will receive the complete sub-frame out of reset. This is the desired format for accurate loopback testing.

- Start out by enabling the transmit PLL for the desired transmit data rate.
- Release TX and RX datapaths from reset. EXT_CTRL_CLR = 0x18000000.
- Program the TXDATAPAT_CTRL registers.
- If a shorter test time is desired, enable RX datapath to start storing entries starting the first recognized preamble compared to storing entries starting with a B preamble match. This can be programmed in RX_DATAPATH_CTRL.FSM
- Load the transmit FIFO with transmit data, by writing to offset 0xE00. This location will accept upto 128 entries of transmit data. Since SPDIF_XCVR DLL will take a while to lock to the input data rate, SW will need to program at least 2 blocks worth of sub-frames. Dma_wr_req can be used to add more data to the transmit FIFO.
- Once the data is written to the transmit FIFO, start transmit of data using TX_DATAPATH_CTRL.STRT_DATA_TX
- Once 64 entries are available in the receive FIFO, SDMA_RD_REQ will be asserted and the received data can be checked against the transmitted data, by reading it from address 12'hC00.

39.2.6 Clocking

This section describes clocks and special clocking requirements of the SPDIF_XCVR module.

SPDIF_XCVR clock inputs are:

- CLK - This clock should be around 400 MHz, though it can depend on the Subsystem.
- SPDIF_TX_CLK - This is clock source from Audio PLL.

39.2.7 Reset

The SPDIF_XCVR block has one input reset It is also combined with the software reset to allow of power saving in "low power mode" when certain parts of the HW are held in reset.

39.2.8 Interrupts

This section describes all the interrupts that the SPDIF_XCVR module generates.

- RX_NEW_CH_STAT- New channel status was received. This interrupt is asserted if the Channel status for the current block does not match the channel status received for the last block of data.
- RX_USR_DATA - Non Zero user data received. This interrupt is set if a non-zero user data is received. If all 0 user data is received, it doe snot need to be acknowledged by SW.
- MUTE_DET - Interrupt to indicate change in mute channel status was detected.
- PREAMBLE_MISMATCH - Asserted when there is an unexpected preamble received / when a preamble was expected but one was not received.
- FIFO_OFLOW_UFLOW_ERR - This interrupt is asserted if the RX / TX FIFO overflows / underflows.
- RX_NO_DATA_REC - Set after valid frames were received, but then valid data was not received for over 1us.

- DMA_RD_REQ - Asserted when RX FIFO entries reaches the programmed threshold. (Default = half full)
- DMA_WR_REQ - Asserted when TX FIFO entries reaches the programmed threshold. (Default = half empty)
- RX_BME_BIT_ERR - This interrupt indicates there was BME violation other than for a recognized preamble.
- PREAMBLE_MATCH_INT - This interrupt is asserted every time a PA PB / CD match is received in compressed data. The information for packet count when this was received and which match occurred can be read from
- M_W_PRE_MISMATCH - Asserted when there is a preamble error in the received sub-frame. e.g.: M was expected and W was received.
- B_PRE_MISMATCH - Asserted when there is a B preamble error in the received sub-frame. Set when an unexpected B is received or an expected B is not received.
- UNEXP_PRE_REC - This interrupt is set if an unexpected preamble is received in the middle of a sub-frame. If this is received, Host software should reset the RX datapath and wait for the next B preamble to be received.
- CS_OR_UD_OFLOW - Asserted when received Channel Status / user data is not acknowledged by SW and HW will have to drop the new channel status received as the alternate buffer is full.
- NEW_BLK_RCVD - Asserted every time a new block of data is received.
- SPDIF_WAKEUP_REC - Asserted when SPDIF_XCVR is used as a wakeup source. Once cleared, the clock source should be switched to 400MHz for ipg_clk and datapaths should be release from reset.

39.3 External signals

This table describes the SPDIF_XCVR module signals.

Signal	Description
CLK	Clock
SPDIF_XCVR_0_INT	Audio XCVR has 2 programmable interrupts. Any of the 32 interrupts can be steered to one of the 2 outputs. This is one of the output interrupts.
SPDIF_XCVR_1_INT	Audio XCVR has 2 programmable interrupts. Any of the 32 interrupts can be steered to one of the 2 outputs. This is one of the output interrupts.
DMA Read Request	DMA read request. Asserted when number of entries in FIFO is greater than programmed threshold. This is a level triggered event.
DMA Write Request	DMA write request. Asserted when number of entries in FIFO is less than programmed threshold. This is a level triggered event.
SPDIF_OUTPUT	SPDIF TX data
SPDIF_OUTPUT_VALID	SPDIF TX data valid. Can be used if needed to indicate SPDIF data is being transmit.

39.4 Initialization

To initialize the SPDIF_XCVR mode use the following sequence:

39.4.1 PLL Programming Sequence

PLL programmed frequency value will be:

$$PLLfrequency = 24 \cdot I(Integer) + \frac{N(Numerator)}{D(DEnominator)}$$

PLL can be programmed using the below sequence.

1. Set the frequency values
   - If eARC mode,(1.8 GHz) then AV_PLL_DIV_ADDR (0x0060) = 0x00962002
   - If SPDIF_XCVR mode,(198MHz) then AV_PLL_DIV_ADDR (0x0060) = 0x00842010
2. Wait for 5 us.
3. Power up PLL - PLL_CTRL[0]
   - AV_PLL_CTRL_ADDR (0x0000) = 0x00000001
4. Wait 100 us OR poll on PLL lock. (PLL_STATUS[0] (0x00F0))
5. Enable output clock, PLL_Ctrl[1]
   - AV_PLL_CTRL_ADDR (0x0000) = 0x00000003

39.5 Application information

This section describes the applications supported by the SPDIF_XCVR and how to program the registers to support these features.

39.5.1 Audio Receiver Overview

The Audio RX datapath is held in reset until host core decides to release the HW out of reset to start receiving IEC60958 data. This feature helps save power when specific datapaths are not being used.

- FSM: The input data stream can be received when aligned to either the B preamble, M preamble, or the M/W preambles. By default, the input stream is set to sync to the B preamble. Change this register setting to align to M/W input preamble.
- STORE_FMT: Format to store the received data in memory. If this bit is 0, the first bit received in a sub frame is stored in bit position 31. Else, it is stored in bit position 0. The rest of the bits follow the first bit.
- RX_DATA_FMT : These bits control the format of data stored in FIFO memory. Default value of 2'00 indicates the data will be stored in the raw sub-frame received. Other combinations possible are 24-bit audio, 20-bit audio and 16-bit audio.
- EN_PARITY_CALC: This bit enables parity evaluation. If Parity evaluation fails, bit 4 of the preamble is replaced with 1.
- MUTE_MODE: Mute mode selects between HW detection of MUTE mode and FW enabling Mute. By default, HW mode is set. In this mode, mute is detected by looking at channel status of frame number programmed in MBIT. If SW control is enabled, mute is asserted using MUTE_CTRL. Preamble bit 1 is replaced by
- Performance counter: The Audio Receiver path supports a performance/progress counter. This is essentially 2 counters, one running at the highest clock speed available to the block and the other at the audio bit rate. The high speed counter is latched twice, once on every bit clock transition and again when the bit clock counter is read to guarantee a synchronized read.
- Packet counter: The packet counter keeps track of all the sub-frames written to the output FIFO. It is a rolling counter used to keep a reference of the number of frames received.

Channel status and user data buffers are stored per block. An interrupt to the host core is asserted if the Channel status does not match the last channel status value. Since user data is infrequent, an interrupt is only asserted if the value received is non-zero. Zero value of previous user data received can be found in the EXT_STATUS register.

39.5.2 Audio Transmitter Overview

The Audio transmitter can output data in the SPDIF_XCVR format. In order to transmit data, the spdif_tx_clk frequency needs to be programmed to data TX rate. If transmit datapath needs to be enabled, it should be released from reset using EXT_CTRL.TX_DPATH_RESET. If TX datapath is not released from reset, data entries should not be written to the TX FIFO. TX can now be enabled using TX_DATAPATH_CTRL.STRT_DATA_TX. Once this bit is set, HW will start transmitting data in the TX FIFO. If the FIFO does not have watermark number of entries, HW will assert a dma_wr_req. Care should be taken to make sure the FIFO does not under run.

The Audio transmitter consists of the following features that can be enabled in TX_DATAPATH_CTRL register.

- EN_PREAMBLE: If this bit is set, preamble matching the frame count is inserted in the TX sub-frame. TX always starts with a B preamble.
- CS_MOD and UD_MOD: These register bits are used to modify the channel status and user data values programmed in the TX FIFO. The channel status and user data replacement values should be programmed in TX_CS_DATA_BITS and TX_USER_DATA_BITS buffers on a block boundary. These registers have an ACK value in UD_ACK and CS_ACK. FW should not write to the data buffers if the ACK bits are not 0. Once FW writes to the registers, the ACK bits should be set so HW can read the new values when it starts transmitting the next block of data. These bits will be cleared by HW when the value in TX_CS_DATA_BITS and TX_USER_DATA_BITS have been moved to a secondary register.
- VLD_MOD and FRM_VLD: These register bits are used to modify the valid field programmed in the TX FIFO. If VLD_MOD is set, Valid bit in the TX frames is replaced by the value in FRM_VLD.
- EN_PARITY: This bit is used to calculate the parity over the data and VUC bits and replace the parity bit of the frame.
- FRM_FMT: This bit indicates if the preamble is stored in bits 3:0 or 31:28
- TX_FORMAT: This bit indicates if the data stored in the transmit FIFO has been formatted to a match a sub-frame or the data is in raw data format

Since Channel Status is fairly static, a new value is not expected every block and the same Channel status will be transmitted unless the value in the registers is updated. A new value is not expected for every block.

39.6 Memory Map and register definition

This section includes the SPDIF_XCVR module memory map and detailed descriptions of all registers.

39.6.1 SPDIF_XCVR register descriptions

39.6.1.1 SPDIF_XCVR memory map

SPDIF base address: 4268_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)

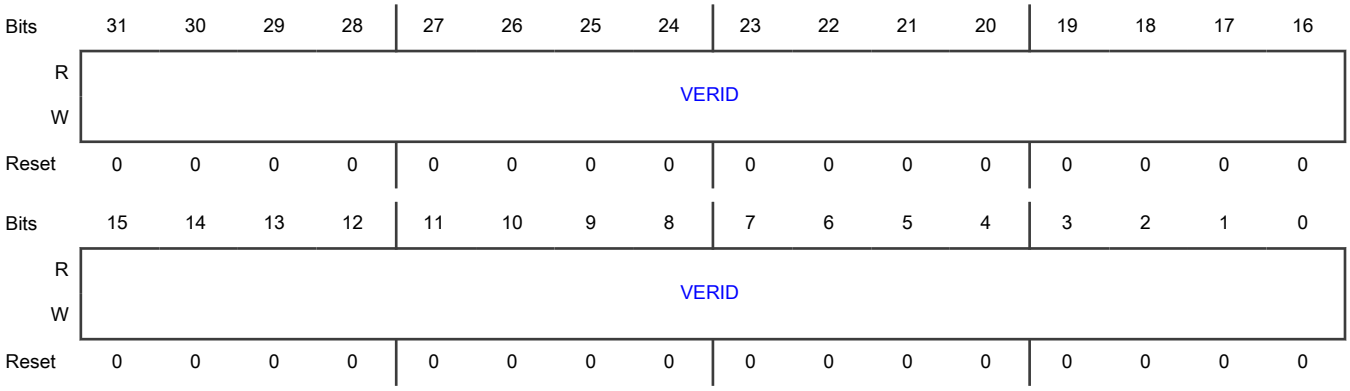
39.6.1.2 Version control register (VERSION)

Indicates the version of Audio XCVR

Offset

Register	Offset
VERSION	0h

Diagram



Fields

Field	Description
31-0 VERID	Version ID Indicates the version of SPDIF XCVR

39.6.1.3 External control register (EXT_CTRL)

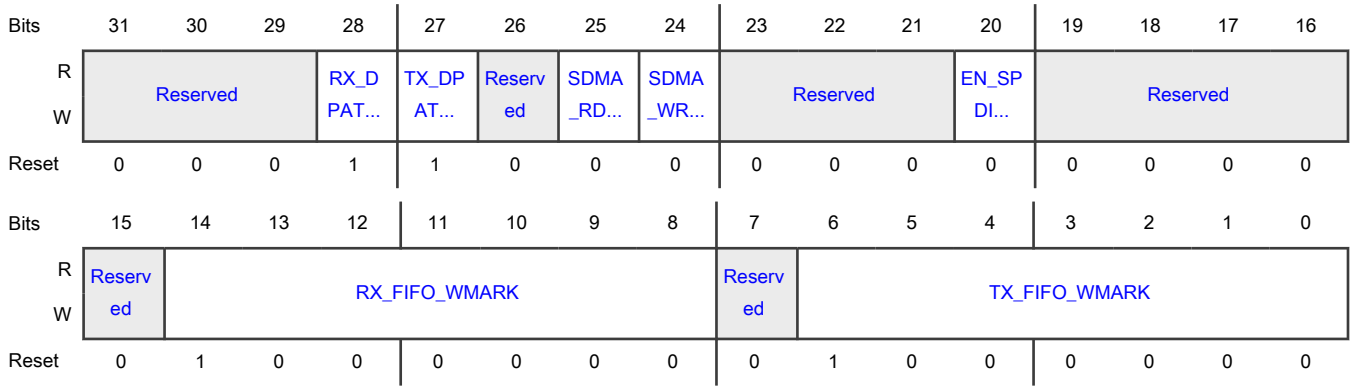
This register provides host control registers for the Audio XCVR

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
EXT_CTRL	10h	External control register
EXT_CTRL_SET	14h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_CTRL is 1
EXT_CTRL_CLR	18h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_CTRL is 0
EXT_CTRL_TOG	1Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in EXT_CTRL

Diagram



Fields

Field	Description
31-29 —	Reserved
28 RX_DPATH_RESET	Soft reset to SPDIF Receive datapath Receive datapath is reset when '1' is written to this bit. Software must allow 8 or more clock cycles before writing a '0' to this bit to allow for reset synchronization and propagation.
27 TX_DPATH_RESET	Soft reset to SPDIF Transmit datapath Transmit datapath is reset when '1' is written to this bit. Software must allow 8 or more clock cycles before writing a '0' to this bit to allow for reset synchronization and propagation.
26 —	Reserved
25 SDMA_RD_REQ_DIS	SDMA RD REQ disable This bit field is used to disable SDMA read requests.
24 SDMA_WR_REQ_DIS	SDMA WR REQ disable This bit field is used to disable SDMA write requests.
23-21 —	Reserved
20 EN_SPDIF_WAKEUP	Enable SPDIF wakeup interrupt If this bit is set, when SPDIF_TGL_CNT number of input toggles are received, the SPDIF wakeup interrupt is asserted.
19-15	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
14-8 RX_FIFO_WMARK	Audio Receive FIFO Watermark Level Indicates the watermark level (number of 32-bit words) at and above which a FIFO read request will be generated Reset to 1/2 the FIFO size. • 0 - Not Applicable • 1 - 127 - Valid values
7 —	reserved
6-0 TX_FIFO_WMARK	Audio Transmit FIFO Watermark Level Indicates the watermark level (number of 32-bit words) at and below which a FIFO write request will be generated. Reset to 1/2 the FIFO size. • 0 - Not Applicable • 1 - 127 - Valid values

39.6.1.4 External Status register (EXT_STATUS)

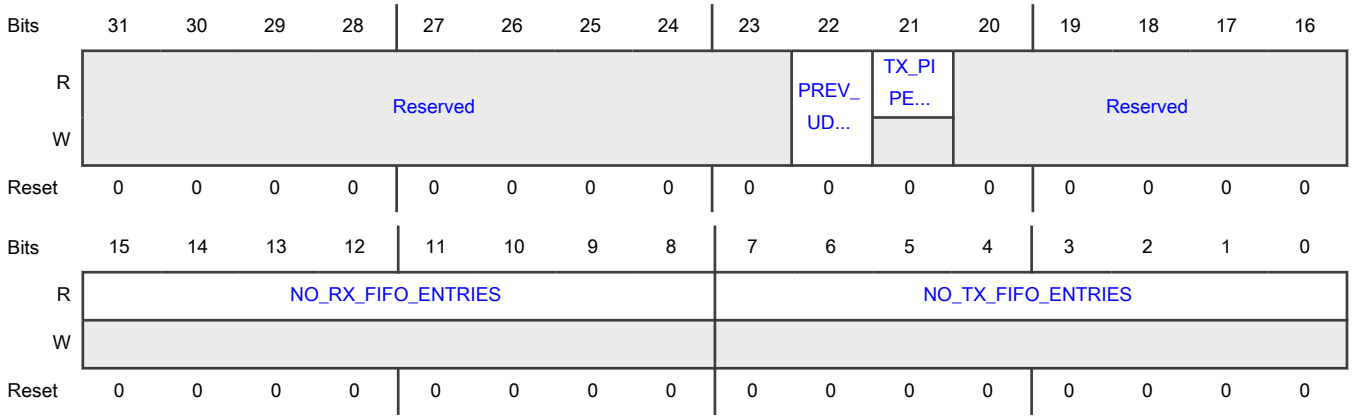
This register provides status to the host controller

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
EXT_STATUS	20h	External Status register
EXT_STATUS_SET	24h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_STATUS is 1
EXT_STATUS_CLR	28h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_STATUS is 0
EXT_STATUS_TOG	2Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in EXT_STATUS

Diagram



Fields

Field	Description
31-23 —	Reserved
22 PREV_UD_0	Last User data received was all 0 This bit indicates If the last user data received was all 0. SW can clear this bit if needed.
21 TX_PIPE_EMPTY	Indicates TX pipe status. This status bit is used to indicate TX pipeline is empty. This can be used to determine if new block of data can be sent / Frequency can be updated.
20-16 —	Reserved
15-8 NO_RX_FIFO_ENTRIES	RX FIFO entries This status provides the number of entries in the receiver FIFO
7-0 NO_TX_FIFO_ENTRIES	TX FIFO entries This status provides the number of entries in the transmit FIFO

39.6.1.5 Interrupt enables for interrupt 0 (EXT_IER0)

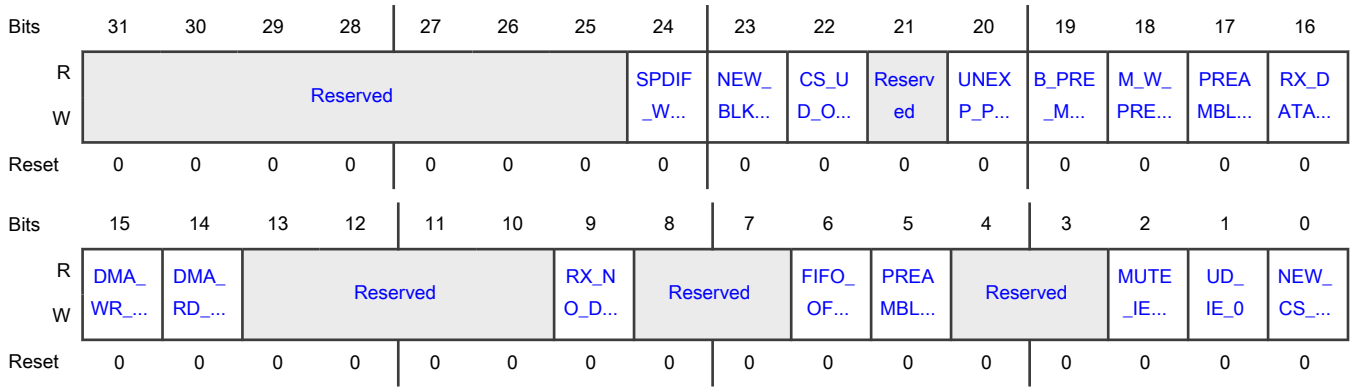
Provides enable bits to enable interrupt 0 generation. All enables are active high. Interrupt enables for bits 25 - 31 are reserved for future use

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
EXT_IER0	30h	Interrupt enables for interrupt 0
EXT_IER0_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_IER0 is 1
EXT_IER0_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_IER0 is 0
EXT_IER0_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in EXT_IER0

Diagram



Fields

Field	Description
31-25 —	Reserved
24 SPDIF_WAKEUP_IE_0	SPDIF Wakeup interrupt enable. This interrupt enable allows asserting SPDF wakeup interrupt. When this interrupt is enabled, SPDIF should be in low power mode, and clock input should be a 24MHz low frequency clock to reduce power. Refer to EXT_CTRL.SPDIF_WAKEUP_CNT for how many toggles will be detected, before an interrupt is asserted.
23 NEW_BLK_RCVD_IE_0	New block of data was received. This interrupt enable allows asserting an interrupt when a block of data is received.
22 CS_UD_OFLOW_IE_0	Channel status or used data could not be stored. This interrupt enables channel status or user data overflow interrupt. This interrupt is asserted when HW is unable to store user data or channel status because the previous entries were not acknowledged.
21 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
20 UNEXP_PRE_REC_IE_0	Interrupt enable for Unexpected preamble received. This enables the interrupt to be asserted everytime HW detects a preamble was not received when expected or more than 8 bits were received before a preamble was detected.
19 B_PRE_MISMATCH_IE_0	Interrupt enable for sub-frame B preamble mismatch received. This enables the interrupt to be asserted everytime HW detects a B sub-frame preamble mismatch.
18 M_W_PRE_MISMATCH_IE_0	Interrupt enable for sub-frame M/W preamble mismatch received. This enables the interrupt to be asserted everytime HW detects a M/W sub-frame preamble mismatch.
17 PREAMBLE_MATCH_IE_0	Interrupt enable for preamble match received. This enables the interrupt to be asserted everytime HW detects a preamble match.
16 RX_DATA_BME_ERR_IE_0	Bi-phase mark encoding error This enables the interrupt to be asserted everytime Bi-phase mark encoded data received has an error. i.e. No toggle after 2 bits during data phase of sub-frame.
15 DMA_WR_REQ_IE_0	Request to write data to FIFO. This enables the interrupt to be asserted everytime only Watermark number of sub-frames are available to be transmitted in the tx FIFO.
14 DMA_RD_REQ_IE_0	Request to read data from FIFO. This enables the interrupt to be asserted everytime Watermark number of entries are available to be read.
13-10 —	Reserved
9 RX_NO_DATA_REC_IE_0	Indicates no data is received. No input data received for over 2 ms.
8-7 —	Reserved
6 FIFO_OFLOW_UFLOW_ERR_IE_0	Receive FIFO overflow error interrupt enable. Enables assertion of interrupt when FIFO underflows (in TX mode) / overflows (in RX mode).
5	Preamble mismatch interrupt enable.

Table continues on the next page...

Table continued from the previous page...

Field	Description
PREAMBLE_MISMATCH_IE_0	Enables assertion of interrupt when the expected preamble is not received. Usually when a W does not follow an M / an unexpected B preamble is received. Once an unexpected preamble is received, the curent block of data is dropped and sub-frame data is synced to the next input B preamble.
4-3 —	Reserved
2 MUTE_IE_0	Enable for Mute detected interrupt Enables assertion of interrupt when HW mute bit is set for received channel status.
1 UD_IE_0	Enable for user data received interrupt Enables assertion of interrupt when non-0 user data is received.
0 NEW_CS_IE_0	Enable for New channel status block received interrupt Enables assertion of interrupt when a new channel status block is received.

39.6.1.6 Interrupt enables for interrupt 1 (EXT_IER1)

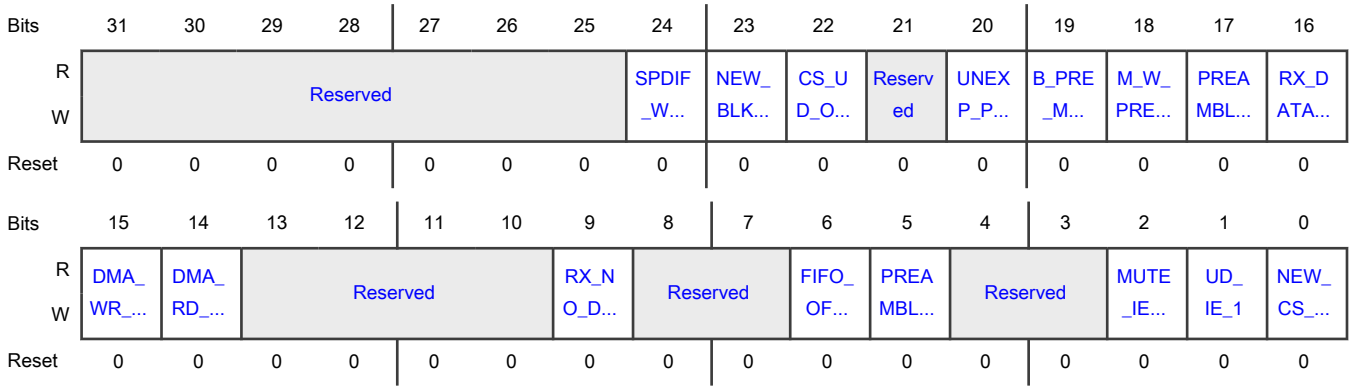
Provides enable bits to enable interrupt 1 generation. All enables are active high. Interrupt enables 25 - 31 are reserved for future use

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
EXT_IER1	40h	Interrupt enables for interrupt 1
EXT_IER1_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_IER1 is 1
EXT_IER1_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_IER1 is 0
EXT_IER1_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in EXT_IER1

Diagram



Fields

Field	Description
31-25 —	Reserved
24 SPDIF_WAKEUP_IE_1	SPDIF Wakeup interrupt enable. This interrupt enable allows asserting SPDF wakeup interrupt. When this interrupt is enabled, SPDIF should be in low power mode, and clock input should be a 24MHz low frequency clock to reduce power. Refer to RX_DATAPATH.SPDIF_TGL_CNT for how many toggles will be detected, before an interrupt is asserted.
23 NEW_BLK_RCVD_IE_1	New block of data was received. This interrupt enable allows asserting an interrupt when a block of data is received.
22 CS_UD_OFLOW_IE_1	Channel status or used data could not be stored. This interrupt enables channel status or user data overflow interrupt. This interrupt is asserted when HW is unable to store new user data or channel status because the previous entries were not acknowledged.
21 —	Reserved
20 UNEXP_PRE_REC_IE_1	Interrupt enable for Unexpected preamble received. This enables the interrupt to be asserted everytime HW detects a preamble was not received when expected or more than 8 bits were received before a preamble was detected.
19 B_PRE_MISMATCH_IE_1	Interrupt enable for sub-frame B preamble mismatch received. This enables the interrupt to be asserted everytime HW detects a B sub-frame preamble mismatch.
18 M_W_PRE_MISMATCH_IE_1	Interrupt enable for sub-frame M/W preamble mismatch received. This enables the interrupt to be asserted everytime HW detects a M/W sub-frame preamble mismatch.

Table continues on the next page...

Table continued from the previous page...

Field	Description
17 PREAMBLE_MATCH_IE_1	Interrupt enable for preamble match received. This enables the interrupt to be asserted everytime HW detects a preamble match.
16 RX_DATA_BME_ERR_IE_1	Bi-phase mark encoding error This enables the interrupt to be asserted everytime Bi-phase mark encoded data received has an error. i.e. No toggle after 2 bits during data phase of sub-frame.
15 DMA_WR_REQ_IE_1	Request to write data to FIFO. This enables the interrupt to be asserted everytime only Watermark number of sub-frames are available to be transmitted in the tx FIFO.
14 DMA_RD_REQ_IE_1	Request to read data from FIFO. This enables the interrupt to be asserted everytime Watermark number of entries are available to be read.
13-10 —	Reserved
9 RX_NO_DATA_REC_IE_1	Indicates no data is received. No input data for over 2 ms.
8-7 —	Reserved
6 FIFO_OFLOW_UFLOW_ERR_IE_1	Receive FIFO overflow error interrupt enable. Enables assertion of interrupt when FIFO underflows (in TX mode) / overflows (in RX mode).
5 PREAMBLE_MISMATCH_IE_1	Preamble mismatch interrupt enable. Enables assertion of interrupt when the expected preamble is not received. Usually when a W does not follow an M / an unexpected B preamble is received. Once an unexpected preamble is received, the curent block of data is dropped and sub-frame data is synced to the next input B preamble.
4-3 —	Reserved
2 MUTE_IE_1	Enable for Mute detected interrupt Enables assertion of interrupt when the channel status mute bit is set for received channel status.
1 UD_IE_1	Enable for user data received interrupt Enables assertion of interrupt when non-0 user data is received.

Table continues on the next page...

Table continued from the previous page...

Field	Description
0 NEW_CS_IE_1	Enable for New channel status block received interrupt Enables assertion of interrupt when a new channel status block is received.

39.6.1.7 External Interrupt Status register (EXT_ISR)

Interrupt status for the host core

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
EXT_ISR	50h	External Interrupt Status register
EXT_ISR_SET	54h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_ISR is 1
EXT_ISR_CLR	58h	Writing 1 to a bit in this register ensures that the corresponding bit in EXT_ISR is 0
EXT_ISR_TOG	5Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in EXT_ISR

Fields

Field	Description
31-25 —	Reserved
24	SPDIF Wakeup received.

Table continues on the next page...

Table continued from the previous page...

Field	Description
SPDIF_WAKEUP_REC	This interrupt allows HW to wake up the core when new toggle on the input is detected in low power mode.
23 NEW_BLK_RCVD	New block of data was received. This interrupt is asserted when a block of data is received, i.e. a new B preamble is detected.
22 CS_OR_UD_OFLOW	Channel status or used data could not be stored. This interrupt indicates channel status or user data previous entries were not acknowledged and so, HW was unable to store a new channel status or User data received..
21 —	Reserved
20 UNEXP_PRE_REC	Set when SPDIF preamble was received after unexpected number of input bits. This interrupt indicates SPDIF subframe received has a preamble error. i.e, a preamble was expected and not received or a preamble was detected before the required number of data bits were received for a sub-frame.
19 B_PRE_MISMATCH	Set when SPDIF B preamble has an error. This interrupt indicates SPDIF subframe received has a B preamble error. i.e, B preamble expected and was not received / B preamble received and was not expected.
18 M_W_PRE_MISMATCH	Set when SPDIF preamble of M/W has an error. This interrupt indicates SPDIF subframe received has a preamble error. M/W sub-frame was nbot detected in teh correct order.
17 PREAMBLE_MATCH_INT	Interrupt to indicate PA PB / DTC CD preamble match was detected. This interrupt is asserted every time a PA PB match is detected by HW. Host core will neeed to go read the Preamble register to find out more information about the sub frame number.
16 RX_BME_BIT_ERR	Set when RX BME data has an error. This interrupt indicates BME data received has an error. After a preamble was received, the input data did not toggle after every 2 bits. This interrupt will have to be cleared.
15 DMA_WR_REQ	Set when DMA write request is asserted. This interrupt indicates Watermark number of entries are available to be filled with new sub-frames. This interrupt will have to be cleared.
14 DMA_RD_REQ	Set when DMA read request is asserted. This interrupt indicates Watermark number of entries are avaialble to be read. This interrupt will have to be cleared.
13-10 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
9 RX_NO_DATA_REC	No data is received for 1us. This interrupt indicates input hasn't toggled in 1us. This is 4* the slowest data rate. This can either indicate a format change / other issue in the data pipe.
8-7 —	Reserved
6 FIFO_OFLOW_UFLOW_ERR	Receive FIFO overflow error interrupt This interrupt indicates the data receive FIFO is full, or the TX fifo is empty. In RX mode, the new frames will be dropped until the fifo has room for more sub-frames. In TX mode, no data will be sent out on the TX path.
5 PREAMBLE_MISMATCH	Preamble mismatch interrupt This interrupt indicates an unexpected preamble is received. When this interrupt is set, HW clears the RX pipe and waits for a new B preamble to start receiving a fresh block of data.
4-3 —	Reserved
2 MUTE_DET	Interrupt to indicate HW mute bit was detected. This interrupt indicates mute bit was detected in HW or set by FW.
1 RX_USR_DATA	Received User data Information This interrupt indicates user data received for last block of data wasn't all 0's.
0 RX_NEW_CH_STAT	Received new channel status block This interrupt indicates channel status for new block received did not match previous channel status.

39.6.1.8 Audio XCVR datapath status (DPATH_STATUS)

Provides the status for datapath

Offset

Register	Offset
DPATH_STATUS	A8h

Reset	0	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1

Fields

Field	Description
31-10 —	Reserved
9-0 CLKDIV	Clock divider value Clock divide value to generate the 1 MHz clock rate from the peripheral clock. All internal timers use this as the reference for counting time. Reset value is for 400 MHz peripheral clock.

39.6.1.10 Data path control register (RX_DATAPATH_CTRL)

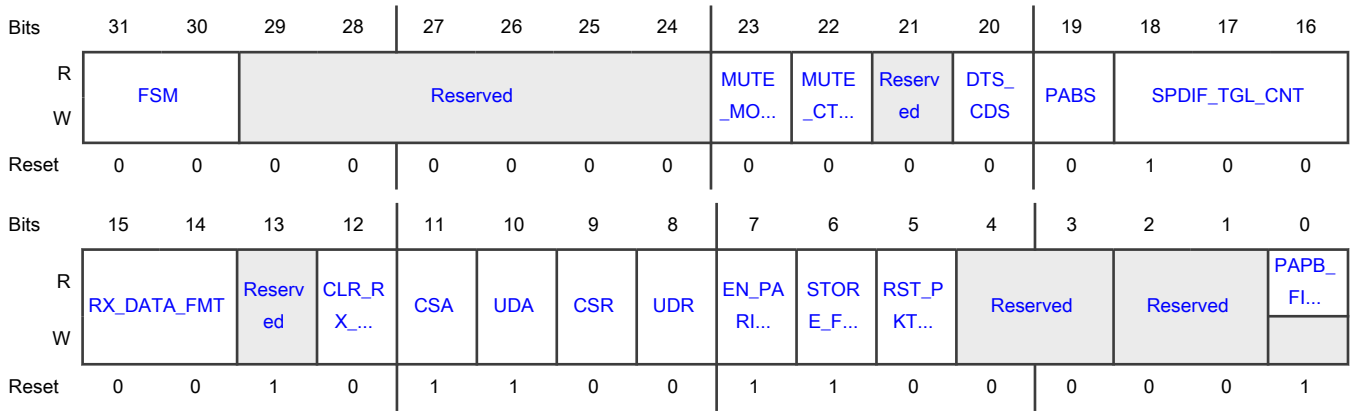
Configuration and control bist for the Receive audio block.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
RX_DATAPATH_CTRL	180h	Data path control register
RX_DATAPATH_CTRL_SET	184h	Writing 1 to a bit in this register ensures that the corresponding bit in RX_DATAPATH_CTRL is 1
RX_DATAPATH_CTRL_CLR	188h	Writing 1 to a bit in this register ensures that the corresponding bit in RX_DATAPATH_CTRL is 0
RX_DATAPATH_CTRL_TOG	18Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in RX_DATAPATH_CTRL

Diagram



Fields

Field	Description
31-30	IEC60958-1 Frame Synchronization Mode

Table continues on the next page...

Table continued from the previous page...

Field	Description
FSM	Selects between frame sync or immediate capture of data. • 00 - Normal, Sync to block using B preamble • 01 - Debug mode • 10 - Sync to B or M preamble • 11 - Start with the first received preamble.
29-24 —	reserved
23 MUTE_MODE	Mute mode control Selects between SW or HW control for enabling Mute detection. • 0 - Channel Status control. MBIT field is used to select the bit that will control the mute request • 1 - SW Control
22 MUTE_CTRL	M0+ mute request If M0+ is used to control MUTE assertion, this bit is used to set mute mode. • 0 - Normal operation • 1 - Assert mute request
21 —	reserved
20 DTS_CDS	Enable DTS CD 14 preamble search Enable Preamble Pa Pb search which matches DTS CD 14 format.
19 PABS	Enable preamble search Enable Preamble Pa,Pb search
18-16 SPDIF_TGL_CNT	SPDIF wakeup source toggle count. When SPDIF is identified as a wakeup source, HW will look for the programmed number of toggles before asserting wakeup interrupt
15-14 RX_DATA_FMT	Indicates format of data stored in memory. • 00 - Store complete sub frame • 01 - Store 24 audio data bits of sub-frame. • 10 - Store 20 audio data bits of sub-frame. • 11 - Store 16 audio data bits of sub-frame.
13 —	reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
12 CLR_RX_FIFO	Clear Receive FIFO Clear receive FIFO. This is a self clear register bit.
11 CSA	Channel Status Acknowledge channel status acknowledge that should be set once channel status is processed.
10 UDA	User Data Acknowledge User data acknowledge that should be set once user data is processed.
9 CSR	Channel Status reset Reset channel status gathering and storage. This is an active high reset.
8 UDR	User data reset Reset user data gathering and storage. This is an active high reset.
7 EN_PARITY_CALC	Enable Parity calculation. This bit enables parity calculation. • 0 - Do not calculate Parity for un-compressed data • 1 - Calculate Parity for un-compressed data
6 STORE_FMT	Receive Data store format. This bit describes the format to store the received data in memory. • 0 - Store data with bit 0 of subframe at bit position 31 in sub-frame. • 1 - Store data with bit 0 of subframe at bit position 0 in sub-frame.
5 RST_PKT_CNT_FIFO	Resets the packet count fifo. This bit when enabled, resets the preamble match packet number FIFO • 0 - Do not reset the FIFO • 1 - Reset FIFO.
4-3 —	reserved
2-1 —	reserved
0 PAPB_FIFO_STATUS	This bit is an empty fifo indicator for PaPb match.

39.6.1.11 Channel staus bits (RX_CS_DATA_BITS_0 - RX_CS_DATA_BITS_5)

Holds the 192 bit channel status for the last received block. The channel status value is updated when a new block is received only if the current value read is acknowledged using RX_DATAPATH_CTRL.CSA.

Offset

Register	Offset
RX_CS_DATA_BITS_0	190h
RX_CS_DATA_BITS_1	194h
RX_CS_DATA_BITS_2	198h

39.6.1.13 Receive Datapath counter control register (RX_DPATH_CNTR_CTRL)

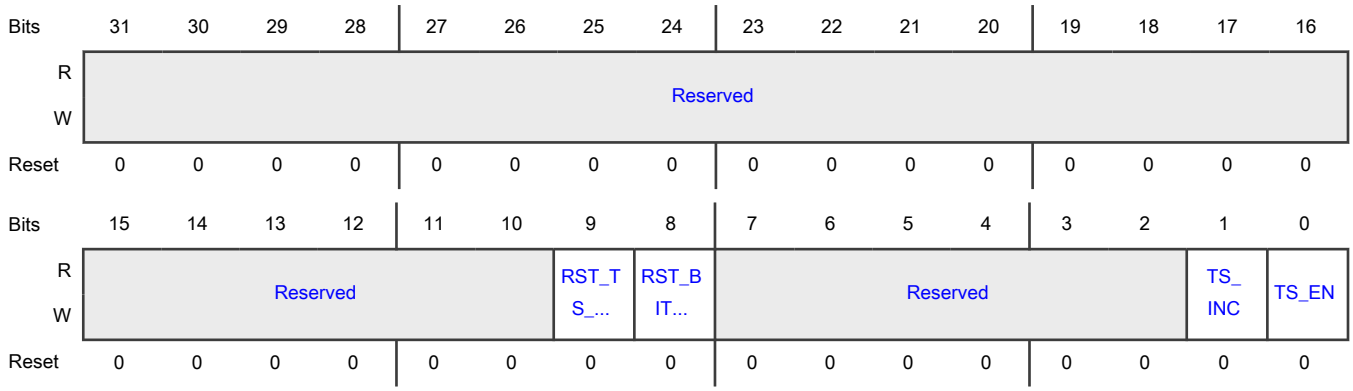
Controls the functioning of the RX datapath internal counters for time stamp and bit count.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
RX_DPATH_CNTR_CTRL	1C0h	Receive Datapath counter control register
RX_DPATH_CNTR_CTRL_SET	1C4h	Writing 1 to a bit in this register ensures that the corresponding bit in RX_DPATH_CNTR_CTRL is 1
RX_DPATH_CNTR_CTRL_CLR	1C8h	Writing 1 to a bit in this register ensures that the corresponding bit in RX_DPATH_CNTR_CTRL is 0
RX_DPATH_CNTR_CTRL_TOG	1CCh	Writing 1 to a bit in this register inverts the value of the corresponding bit in RX_DPATH_CNTR_CTRL

Diagram



Fields

Field	Description
31-10 —	reserved
9 RST_TS_CNTR	Reset timestamp counter. • 0 - Timestamp counter is not reset. • 1 - Timestamp counter is reset.
8 RST_BIT_CNTR	Reset bit counter. • 0 - Bit counter is not reset. • 1 - Bit counter is reset.
7-2 —	reserved
1 TS_INC	Timestamp Increment • 0 - Timestamp counter starts to increment when enabled and the bit counter has incremented.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	• 1 - Timestamp counter increments when enabled.
0 TS_EN	Timestamp counter enable • 0 - Timestamp counter is disabled • 1 - Timestamp counter is enabled.

39.6.1.14 Receive Datapath Timestamp Counter Register (RX_DPATH_TSCR)

Current value of the timestamp counter.

Offset

Register	Offset
RX_DPATH_TSCR	1D0h

Diagram

Fields

Field	Description
31-0 BCT_VAL	Bit count timestamp value This counter is updated every time the the bit counter is read.

39.6.1.18 Preamble match value register (PRE_MATCH_VAL)

Holds the values for IEC61937 Preamble match.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
PRE_MATCH_VAL	1E0h	Preamble match value register
PRE_MATCH_VAL_SET	1E4h	Writing 1 to a bit in this register ensures that the corresponding bit in PRE_MATCH_VAL is 1
PRE_MATCH_VAL_CLR	1E8h	Writing 1 to a bit in this register ensures that the corresponding bit in PRE_MATCH_VAL is 0
PRE_MATCH_VAL_TOG	1ECh	Writing 1 to a bit in this register inverts the value of the corresponding bit in PRE_MATCH_VAL

R W	PB_VAL															
Reset	1	1	1	1	1	0	0	0	0	1	1	1	0	0	1	0

Fields

Field	Description
31-16 PA_VAL	Preamble PA value Holds the PA value for PA PB match.
15-0 PB_VAL	Preamble PB value Holds the PB value for PA PB match.

39.6.1.19 Preamble match value register (DTS_PRE_MATCH_VAL)

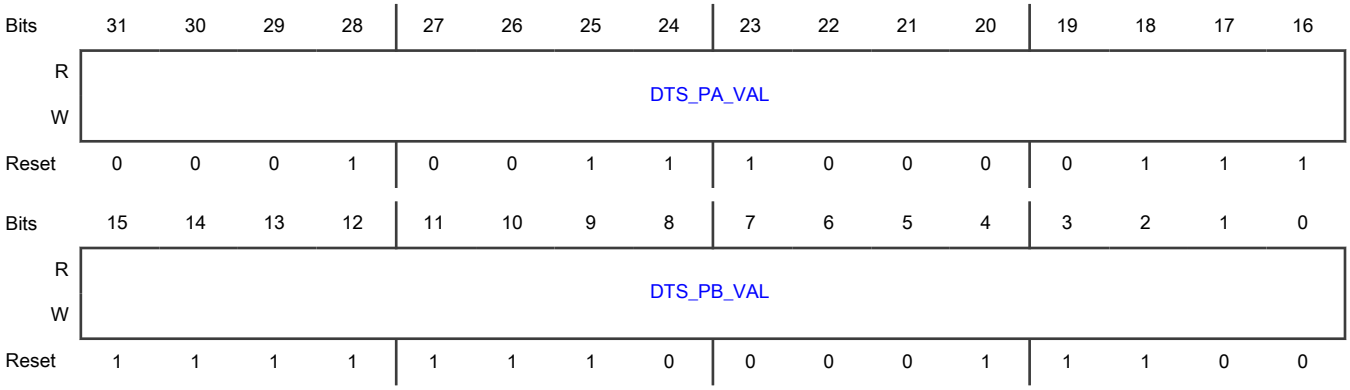
Holds the values for DTS CD 14 IEC61937 Preamble match.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DTS_PRE_MATCH_VAL	1F0h	Preamble match value register
DTS_PRE_MATCH_VAL _SET	1F4h	Writing 1 to a bit in this register ensures that the corresponding bit in DTS_PRE_MATCH_VAL is 1
DTS_PRE_MATCH_VAL _CLR	1F8h	Writing 1 to a bit in this register ensures that the corresponding bit in DTS_PRE_MATCH_VAL is 0
DTS_PRE_MATCH_VAL _TOG	1FCh	Writing 1 to a bit in this register inverts the value of the corresponding bit in DTS_PRE_MATCH_VAL

Diagram



Fields

Field	Description
31-16 DTS_PA_VAL	Preamble value Holds the odd sub-frame match value.
15-0 DTS_PB_VAL	Preamble value Holds the even sub-frame match value.

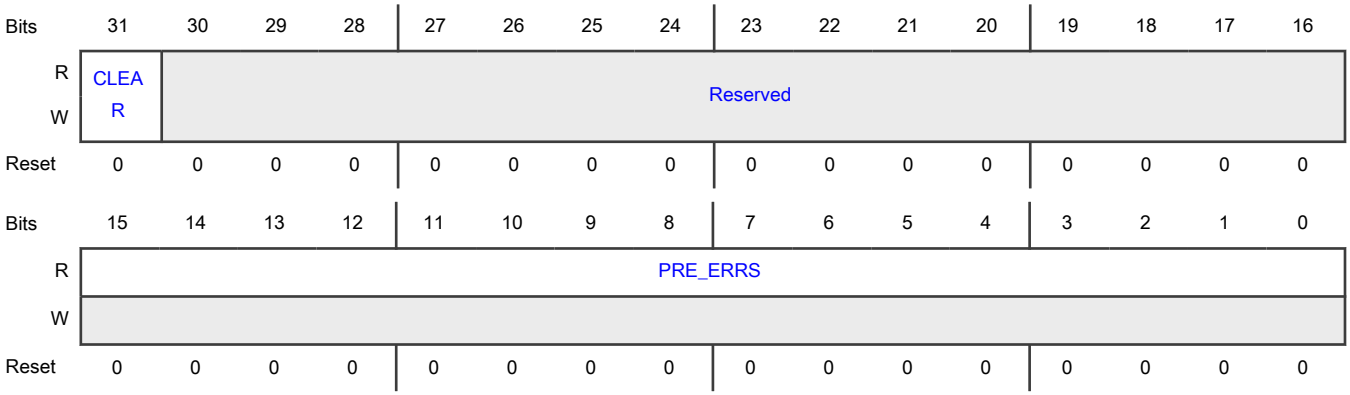
39.6.1.20 Error count for IEC60958-1 Block Synchronization. (RX_DPATH_PRE_ERR)

Error count for IEC60958-1 Block Synchronization. It is incremented when an unexpected B,M or W preamble is detected. Writing to bit 31 will clear this register

Offset

Register	Offset
RX_DPATH_PRE_ERR	200h

Diagram



Fields

Field	Description
31 CLEAR	Clear bit for error counter. When this bit is set, the preamble error counter will be reset.
30-16 —	reserved
15-0 PRE_ERRS	Preamble Error counter This counter is incremented when an unexpected Preamble is detected

39.6.1.21 Parity Error count for IEC60958-1 Blocks. (RX_DPATH_PARITY_ERR)

Parity error count for IEC60958-1 Block Synchronization. It is incremented when a parity error is received. Writing a 1 to bit 31 will clear this register. SW will have to clear bit 31 after writing to it.

Offset

Register	Offset
RX_DPATH_PARITY_ERR	204h

Fields

Field	Description
31 —	Reserved
30-0 VAL	Data packet counter This status provides the number of received packets.

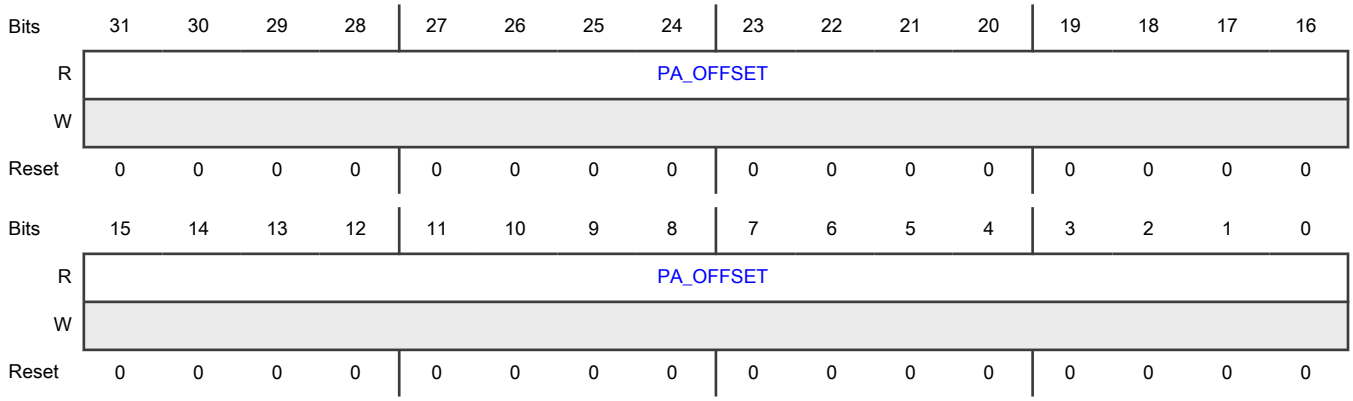
39.6.1.23 Preamble match offset value register (PRE_MATCH_OFFSET)

When an IEC61937 burst preamble is matched the current sample count shall be committed to a FIFO read from this register.

Offset

Register	Offset
PRE_MATCH_OFFSET	218h

Diagram



Fields

Field	Description
31-0 PA_OFFSET	Sample count value for PA offset match This reflects the value of a 32 bit counter that will count all samples received.

39.6.1.24 Transmit Data path control register (TX_DATAPATH_CTRL)

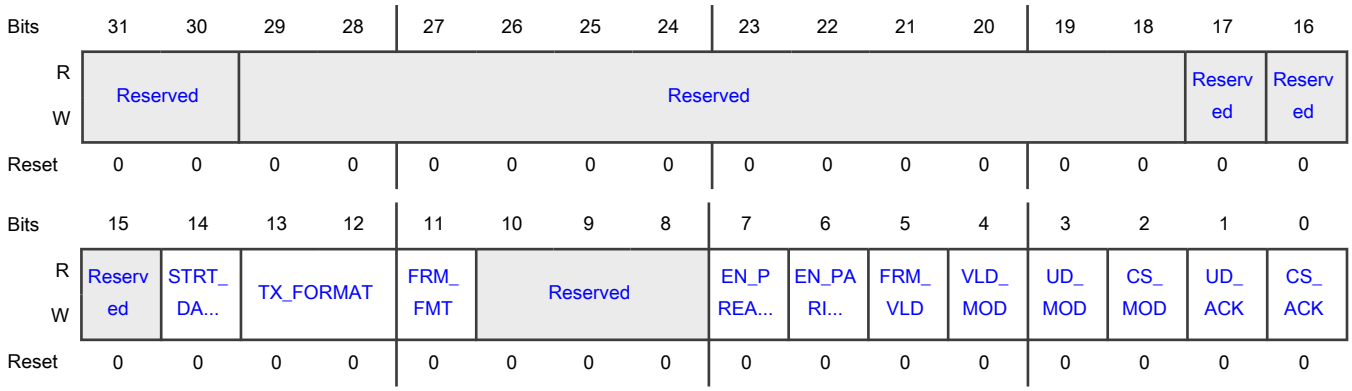
Configures and controls operations for the transmit of 60958 audio block.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
TX_DATAPATH_CTRL	220h	Transmit Data path control register
TX_DATAPATH_CTRL_SET	224h	Writing 1 to a bit in this register ensures that the corresponding bit in TX_DATAPATH_CTRL is 1
TX_DATAPATH_CTRL_CLR	228h	Writing 1 to a bit in this register ensures that the corresponding bit in TX_DATAPATH_CTRL is 0
TX_DATAPATH_CTRL_TOG	22Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in TX_DATAPATH_CTRL

Diagram



Fields

Field	Description
31-30 —	reserved
29-18 —	reserved
17 —	reserved
16-15 —	reserved
14 STRT_DATA_TX	Start transmit of data. • 0 - Even though TX FIFO has data, do not transmit it right now. • 1 - As soon as TX_FIFO has data, enable transmitting audio sub-frames.
13-12 TX_FORMAT	Transmit data format

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This field describes the number of bits to be transmitted / audio sub-frame. Each FIFO entry only represents one sub-frame worth of data. Bit reversal is indicated by TX_DATAPATH_CTRL.FRM_FMT • 0 - 32 bit data format. The audio data will be positioned within the subframe by SW. • 1 - 24 bit input data stored in bits 23:0 of TX FIFO • 2 - 20 bit input data stored in bits 19:0 of TX FIFO • 3 - 16 bit input data stored in bits 15:0 of TX FIFO
11 FRM_FMT	Frame format of input data • 0 - Frame data will be considered to be aligned to the MSB. i.e, 60958 frame bit 0 is at bit position 31 of the TX data FIFO. • 1 - Output 60958 frame format data will be considered to be aligned to the LSB. i.e, 60958 frame bit 0 is at bit position 0 of the TX data FIFO.
10-8 —	reserved
7 EN_PREAMBLE	Enable preamble insertion If this bit is set, Preamble matching the frame count will be inserted in the TX data path.
6 EN_PARITY	Enable parity insertion If this bit is set, parity will be calculaed and inserted in the TX data path.
5 FRM_VLD	Valid bit value If VLD_MOD bit is set, Valid bit will be replaced in the TX data path with the value in this bit.
4 VLD_MOD	Enable Valid bit insertion If this bit is set, Valid bit will be inserted in the TX data path from the FRM_VLD register bit.
3 UD_MOD	Enable User Data insertion If this bit is set, User data will be inserted in the TX data path from the UD buffer.
2 CS_MOD	Enable Channel Status insertion If this bit is set, Channel status will be inserted in the TX data path from the CS buffer.
1 UD_ACK	User Data ACK The user data registers are double buffered. HW sets this ack to let the host know that new values can be written in the UD buffer. Once the Buffer is updated, host should clear this value.
0 CS_ACK	Channel Status ACK The Channel status registers are double buffered. HW sets this ack to let the host know that new values can be written in the CS buffer. Once the Buffer is updated, host should clear this value.

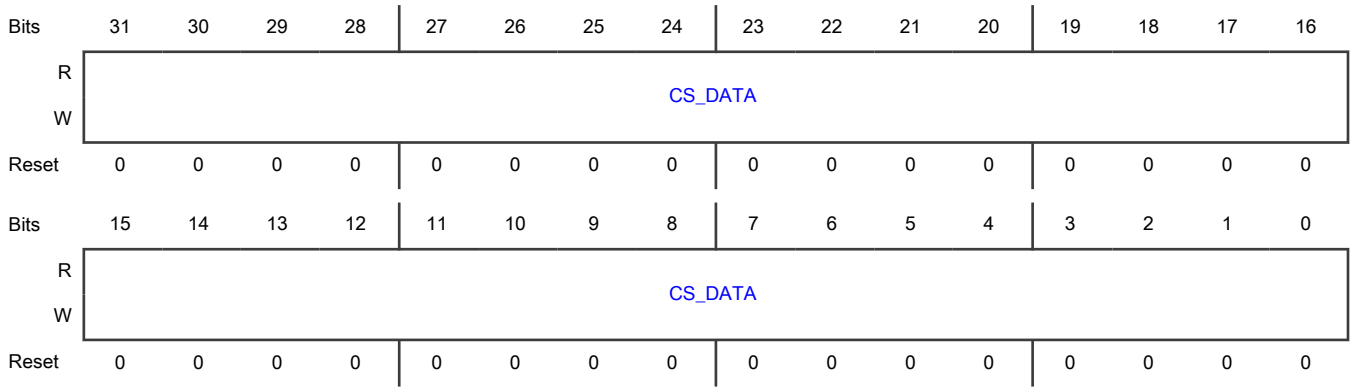
39.6.1.25 Channel staus bits (TX_CS_DATA_BITS_0 - TX_CS_DATA_BITS_5)

Holds the 192 bit channel status for the current block to transmit.

Offset

Register	Offset
TX_CS_DATA_BITS_0	230h
TX_CS_DATA_BITS_1	234h
TX_CS_DATA_BITS_2	238h
TX_CS_DATA_BITS_3	23Ch
TX_CS_DATA_BITS_4	240h
TX_CS_DATA_BITS_5	244h

Diagram



Fields

Field	Description
31-0 CS_DATA	Channel Status bits / block 192-bit channel status field per block of audio data. The value can be updated when TX_DATAPTH_CTRL.CS_ACK is set to 1. It does not need to be updated for every block. The same value will be transmitted if the registers are not updated.

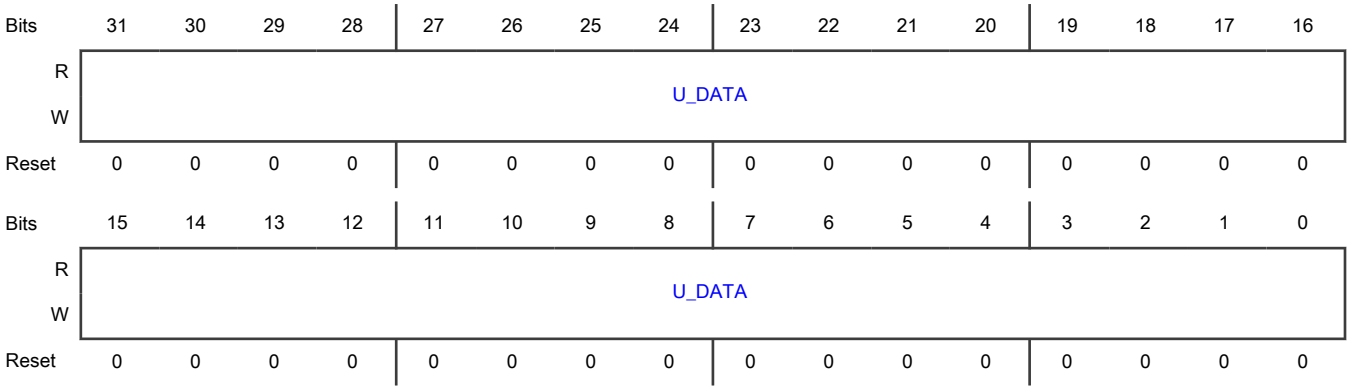
39.6.1.26 User data bits (TX_USER_DATA_BITS_0 - TX_USER_DATA_BITS_5)

Holds the 192 bit user data for the current block to transmit. It can be updated / block of data after the acknowledge field TX_DATAPATH_CTRL.UD_ACK is cleared. Setting this field indicates new user data block is available.

Offset

Register	Offset
TX_USER_DATA_BITS_0	248h
TX_USER_DATA_BITS_1	24Ch
TX_USER_DATA_BITS_2	250h
TX_USER_DATA_BITS_3	254h
TX_USER_DATA_BITS_4	258h
TX_USER_DATA_BITS_5	25Ch

Diagram



Fields

Field	Description
31-0 U_DATA	User data bits/block 192-bit User Data field / block of audio data.

39.6.1.27 Transmit datapath counter control register (TX_DPATH_CNTR_CTRL)

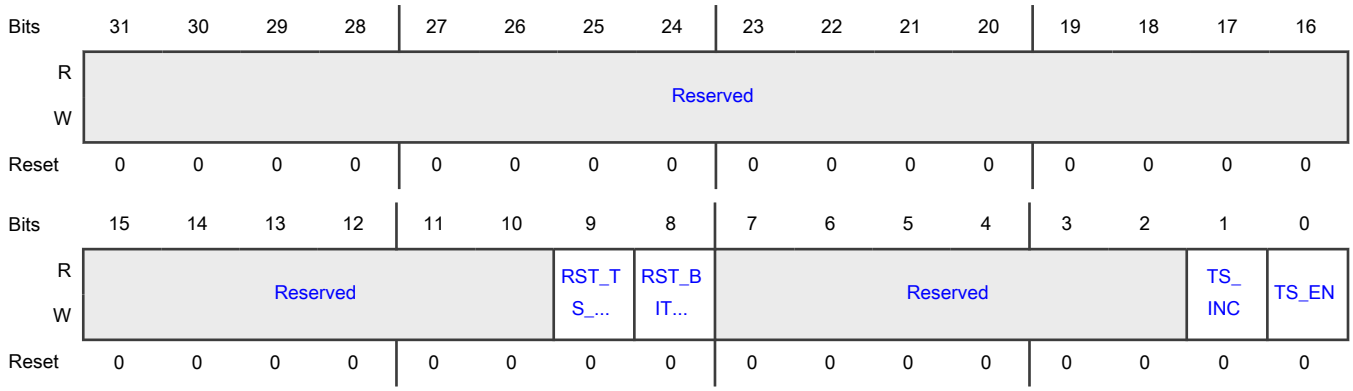
Controls the functioning of the transmit datapath internal counters for time stamp and bit count.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
TX_DPATH_CNTR_CTRL	260h	Transmit datapath counter control register
TX_DPATH_CNTR_CTRL_SET	264h	Writing 1 to a bit in this register ensures that the corresponding bit in TX_DPATH_CNTR_CTRL is 1
TX_DPATH_CNTR_CTRL_CLR	268h	Writing 1 to a bit in this register ensures that the corresponding bit in TX_DPATH_CNTR_CTRL is 0
TX_DPATH_CNTR_CTRL_TOG	26Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in TX_DPATH_CNTR_CTRL

Diagram



Fields

Field	Description

Chapter 40
Medium Quality Sound (MQS)

40.1 Chip-specific MQS information

Table 439. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

This chip includes two instances of MQS (MQS1 in AONMIX and MQS2 in WAKEUPMIX).

MQS1 settings register is in AONMIX and MQS2 settings register is in WAKEUPMIX.

40.2 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

40.2.1 Block Diagram

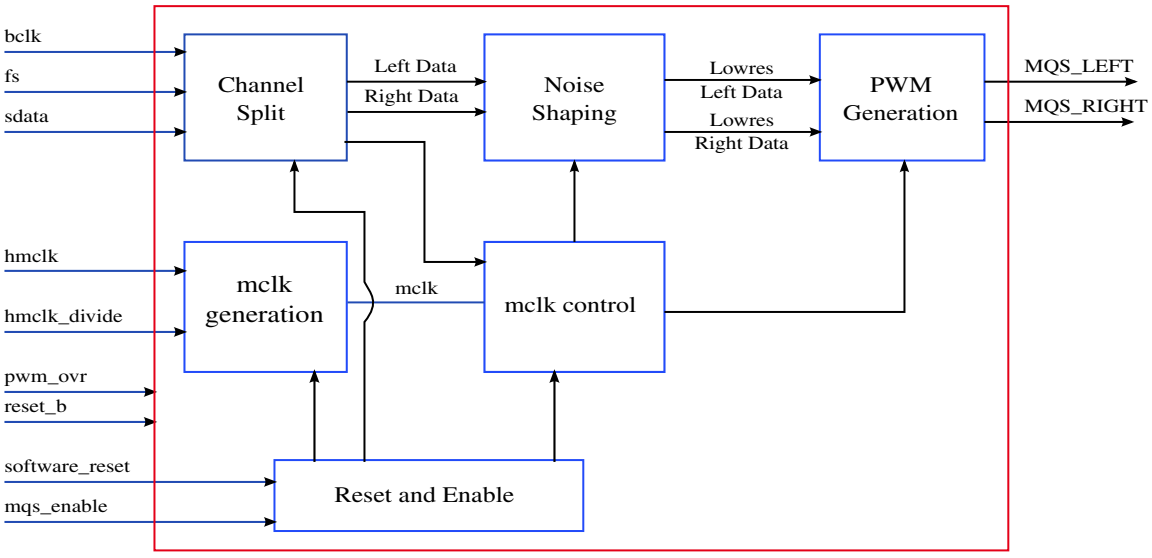

Figure 229. Block Diagram

40.2.2 Features

MQS has the following sub-modules:

- Channel Split
- Noise Shaping
- PWM Generation
- MCLK Generation
- MCLK Control
- Reset and Enable

40.3 Functional Description

MQS accepts the following inputs:

- 2-channel, LSB-valid 16-bit, MSB shift-out first serial data (sdata)
- Frame sync asserting with the first bit of the frame (fs)
- Bit clock used to shift data out on the negative clock edge (bclk)

The signals from the SAI1 are in left_justified format. MQS provides the SNR target as no more than 20dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

The following sections provides brief descriptions of the MQS sub-blocks.

40.3.1 Channel Split

The Channel Split sub-block splits the I2S signals into separate left channel and right channel audio data.

40.3.2 Noise Shaping

The Noise Shaping sub-block uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.

40.3.3 PWM Generation

Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.

40.3.4 MCLK Generation

The MCLK Generation sub-block is used to generate the master clock (mclk). The frequency of mclk is determined by hmclk_divide (IOMUXC_GPR2[MQS_CLK_DIV]).

40.3.5 MCLK Control

The MCLK Control sub-block is used as a metronome to co-ordinate the different functional blocks working synchronously.

40.3.6 Reset and Enable

The Reset and Enable sub-block is used to generate the reset and enable logic to different clock domains.

40.3.7 Clocking

The following table lists the MQS clocks. See Interface Signals for more information.

Table 440.

Clock Name	Description
hmclk	Maximum bit clock
bclk	Bit clock from I2S signal

40.4 External Signals

The following table describes the external signals of MQS:

Table 441. MQS External Signals

Signal	Description	Direction
MQS_LEFT	Left signal output	O
MQS_RIGHT	Right signal output	O

40.4.1 Interface Signals

MQS module has the following interface signals.

Table 442.

Signal Name	In/Out	Bit Width	Description	Comments
reset_b	In	1	asynchronous reset	
software_reset	In	1	Software reset	From IOMUXC_GPR2
mqs_enable	In	1	module enable	From IOMUXC_GPR2
pwm_ovr	In	1	PWM oversampling ratio 1=64, 0=32	From IOMUXC_GPR2
hmclk	In	1	Maximum bit clock, used to generate the mclk, divider ratio is controlled by mqs_hmclk_divide	Max 66.5MHzTypical 24.576MHz
hmclk_divide	In	8	Divider ratio control for mclk from hmclk	From IOMUXC_GPR2
bclk	In	1	bit clock from I2S signal	
fs	In	1	frame sync from I2S signal	
sdata	In	1	serial audio data from I2S signal	

40.5 Initialization

The user needs to program the SAI1 to output 2-channel LSB-16 bit active left-justified signal, and then program the related IOMUXC_GPR2 bits.

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, the user needs choose the appropriate MQS_CLK_DIV and MQS_OVERSAMPLE values for the best audible effects.

40.6 Application Information

MQS has no internal programmable registers. But it does have some programmability from **IOMUXC_GPR2**.

Register Bitfields	Description
MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64, 0—32.
MQS_EN	MQS enable. 1—Enable MQS, 0—Disable MQS
MQS_SW_RST	MQS software reset. 1—Enable software reset for MQS 0—Exit software reset for MQS
MQS_CLK_DIV	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = ½*hmclk frequency; 2—mclk frequency = 1/3*hmclk frequency; …; n—mclk frequency = 1/(n+1)*hmclk frequency

Chapter 41
Multimedia Overview

41.1 Multimedia Overview

The display and camera subsystem consists of modules below:

- LCDIF
- Image Sensor Interface (ISI)
- Parallel Camera Interface

41.1.1 LCD Interface (LCDIF)

The chip includes one instance of LCDIF.

- One layer can support a parallel display output path:
- Parallel Display (up to 1366x768p60 or 1280x800p60)
- AXI data bus width (128-bit)
- Support 8-bit / 16-bit / 18-bit / 24-bit / 32-bit pixel depth
- Support DOTCLK mode

41.1.2 Image Sensor Interface

The chip supports one instance of ISI configured to support one camera. The ISI is a simple camera interface that supports image processing and transfer via a bus master interface. One camera input can be connected to Parallel camera input.

Some features included are :

- Many standard pixel formats commonly used in many camera inputs protocols.
- Programmable resolutions consistent with what may be supported with a parallel camera interface.
- Image processing for
  - 1 processed camera streams at 1080p30.
- Image down scaling via decimation and bi-phase filtering.
- Color space conversion.
- Interlaced to progressive conversions.

41.1.2.1 Parallel Camera Interface

The Parallel Camera Interface module consists of the following:

- Configurable interface logic to support most commonly used parallel CMOS sensors
- Supports up to 80MHz input clock from sensor
- Supports the following input data formats
  - 8-bit/10-bit Camera Sensor Interface (CSI)
  - 8-bit data port for RGB, YCbCr, and YUV data input
  - 8-bit/10-bit data ports for Bayer data input
- Parallel Camera Interface is hooked to the Imaging subsystem via the Pixel Link

42.2 Overview

The LCD Interface (LCDIF) is a system master that fetches graphics stored in memory and display them on a TFT LCD panel. A wide range of panel sizes is supported and the timing of the interface signals is highly configurable. Graphics are read directly from memory. Graphics may be encoded in a variety of formats to optimize memory usage.

42.2.1 Block diagram

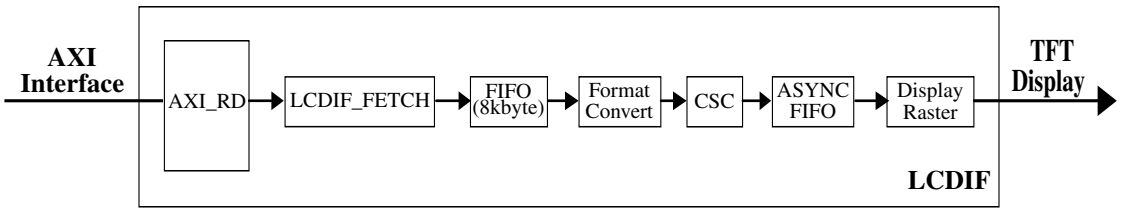

Figure 230. LCDIF block diagram

The above block diagram shows the LCDIF architecuture.

The input source can be configured with:

- Horizontal and vertical size of graphic
- Address of graphic in memory
- Color formats

The values in the registers can be changed at any time, the panel content will be updated automatically in the panel refresh cycle when SHADOW_EN bit is set.

42.2.2 Features

The LCDIF includes the following features:

- The display mode supports DOTCLK mode only.
- One layer can support:
  - Programmable plane size(Width/Height/Pitch) on the panel.

42.3 Functional description

The LCDIF is a master on the bus fabric; it fetches graphic source information directly from memory and sends data to a TFT LCD pannel.

As the LCDIF is a master on the NIC, it can access directly any memory or device connected to the NIC as a slave. Therefore, any compatiable graphic stored anywhere on-chip can be displayed on the connected TFT LCD panel with no further intervention from CPU.

42.3.1 Graphics and data format

The memory location of the graphic that is displayed on the layer is defined by register in the control descriptor for the layer .

This 36-bit value can contain the address of any memory location in the memory map of the system.

The format of the data that describes the graphic is defined by the BPP bit field in the control descriptor for the layer . By choosing an appropriate format, it is possible to optimize the memory required by the graphics in use.

The CSC module receives pixels in any color space and can convert the pixels into any of RGB, YCbCr color spaces.

All coefficients are programmable and in the two's compliment notation.

The following equations indicate the CSC modules ALU architecture.

Selecting RGB output in CSC0_CTRL[CSC_MODE] configures the ALU in the following manner:

R = A1(Y-D1) + A2(U-D2) + A3(V-D3)

G = B1(Y-D1) + B2(U-D2) + B3(V-D3)

B = C1(Y-D1) + C2(U-D2) + C3(V-D3)

Selecting YCbCr output configures the ALU in the alternate manner:

Y = A1*R + A2*G + A3*B + D1

U = B1*R + B2*G + B3*B + D2

V = C1*R + C2*G + C3*B + D3

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0xFF and underflow is saturated at 0x00.

42.3.2 Clocks

The table below shows the clocks described in this module:

Table 444. Clocks

Clocks	Description
pix_clk	Pixel Clock This clock should be configured according to TFT panel specification for supported display resolution
apb_clk	System Bus access clock
b_clk	LCDIF peripheral access bus clock

42.3.3 Reset

There is one asynchronous chip reset input to LCDIF, all the internal registers should be forced into their reset state when reset_n is active low.

There is one software reset bit (CTRL[SW_RESET]), which can reset all the internal registers except user configured registers.

42.3.4 Interrupts

This section describes all the interrupts that the LCDIF module generates.

The VSYNC interrupt flag indicates that the LCDIF has begun the next panel refresh period.

The UNDERRUN interrupt flag indicates the TXFIFO for display in underrun condition.

The VS_BLANK interrupt flag gives indication of the start of the vertical blanking period.

There are FIFO_EMPTY, DMA_DONE and DMA_ERR interrupt flags for each layer which indicate the status of pixel FIFO, frame buffer fetch and AXI interface respectively.

42.3.5 External Signals

Table 445. External Signals

Signal	Direction	Description
DOTCLK	OUTPUT	Pixel clock used to drive the display panel.
VSYNC	OUTPUT	Vertical Sync signal, indicating the beginning of a new frame.
HSYNC	OUTPUT	Horizontal Sync signal, indicating the beginning of a new line.
ENABLE	OUTPUT	Data Enable. Indicates when there is valid pixel data.
DATA[23:0]	OUTPUT	Red, green and blue data output.

42.3.6 Application information

The figure below shows the details of software flow for the LCDIF module.

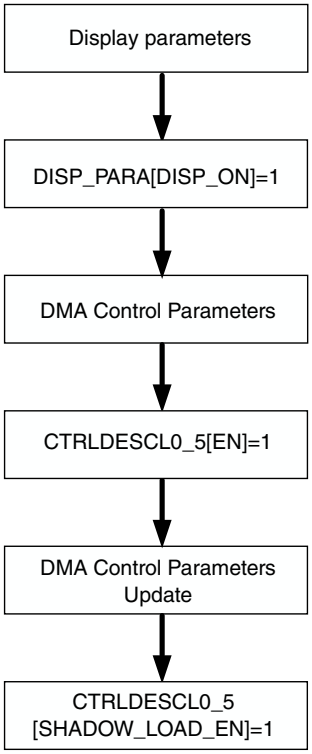

Figure 231. Software flow diagram

42.4 Memory Map and register definition

This section includes the LCDIF module memory map and detailed descriptions of all registers.

42.4.1 LCDIF register descriptions

42.4.1.2 LCDIF display control Register (CTRL)

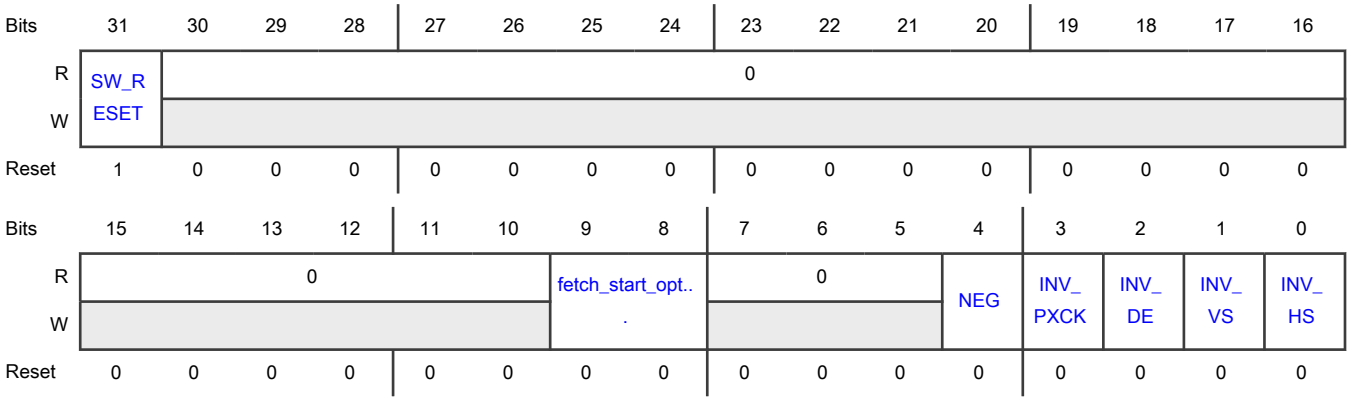
This register control the polarity for HSYNC/VSYNC/DE of display.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
CTRL	0h	LCDIF display control Register
CTRL_SET	4h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 1
CTRL_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 0
CTRL_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL

Diagram



Fields

Field	Description
31 SW_RESET	SW_RESET Software reset, high active. When write 1 ,all logical will be reset. 0 - No action 1 - All LCDIF internal registers are forced into their reset state. User registers are not affected.
30-10 —	Reserved
9-8 fetch_start_option	Indicates when to start fetching for new frame. This signals also decide the shadow load, fifo clear time 00 - fetch start as soon as FPV begins(as the end of the data_enable) 01 - fetch start as soon as PWV begins 10 - fetch start as soon as BPV begins 11 - fetch start as soon as RESV begins(still have hsync blanking for margin)
7-5 —	Reserved
4 NEG	Indicates if value at the output (pixel data output) needs to be negated. 0 - Output is to remain same 1 - Output to be negated
3 INV_PXCK	Polarity change of Pixel Clock. 0 - Display samples data on the falling edge 1 - Display samples data on the rising edge
2 INV_DE	Invert Data Enable polarity 0 - Data enable is active high 1 - Data enable is active low

Table continues on the next page...

Table continued from the previous page...

Field	Description
1 INV_VS	Invert Vertical synchronization signal. 0 - VSYNC signal not inverted (active HIGH). 1 - Invert VSYNC signal (active LOW).
0 INV_HS	Invert Horizontal synchronization signal. 0 - HSYNC signal not inverted (active HIGH). 1 - Invert HSYNC signal (active LOW).

42.4.1.3 Display Parameter Register (DISP_PARA)

Offset

Register	Offset
DISP_PARA	10h

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Description
31 DISP_ON	Display panel On/Off mode. 0 - Display Off. 1 - Display On.
30 SWAP_EN	output data swap enable. 0 - swap disable 1 - swap enbale, output data will swap the high 16bits with the low 16bits.
29-26	LCDIF line output order.

Table continues on the next page...

Table continued from the previous page...

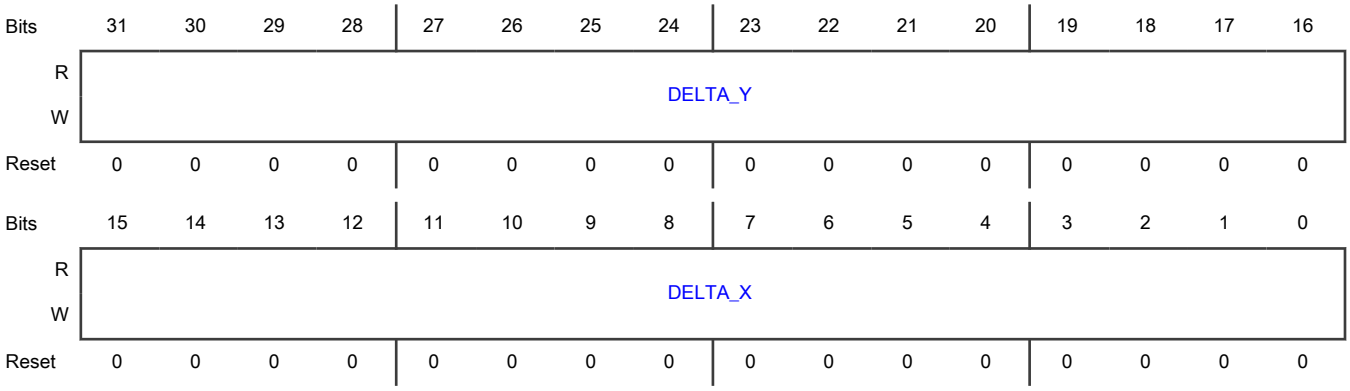
Field	Description
LINE_PATTERN	0000 - RGB/YUV. 0001 - RBG. 0010 - GBR. 0011 - GRB/UYV. 0100 - BRG. 0101 - BGR. 0110 - RGB555. 0111 - RGB565. 1000 - YUYV at [15:0]. For line pattern with "1000 - YUYV at [15:0]，Y is [15:8], U is [7:0], and next 16th bit is Y and V. 1001 - UYVY at [15:0]. 1010 - YVYU at [15:0]. 1011 - YUYV at [15:0]. 1100 - YUYV at [23:8]. 1101 - UYVY at [23:8]. 1110 - YVYU at [23:8]. 1111 - YUYV at [23:8].
25-24 DISP_MODE	LCDIF operating mode. 00 - Normal mode. Panel content controlled by layer configuration. 01 - display Mode1.(BGND Color Display) 10 - display Mode2.(Column Color Bar) 11 - display Mode3.(Row Color Bar)
23-16 BGND_R	Background Red component value in display Mode 1.
15-8 BGND_G	Background Green component value in display Mode 1.
7-0 BGND_B	Background Blue component value in display Mode 1.

42.4.1.4 Display Size Register (DISP_SIZE)

Offset

Register	Offset
DISP_SIZE	14h

Diagram



Fields

Field	Description
31-16 DELTA_Y	Sets the display size vertical resolution in pixels.
15-0 DELTA_X	Sets the display size horizontal resolution in pixels.

42.4.1.5 Horizontal Sync Parameter Register (HSYN_PARA)

HSYN_PARA register sets timing parameters related to the horizontal synchronization signal generation for the TFT. The fields FP_H, BP_H, and PW_H stand for HSYNC signal front-porch, back-porch, and active pulse width, respectively.

Offset

Register	Offset
HSYN_PARA	18h

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	FP_V															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Fields

Field	Description
31-16 BP_V	VSYNC back-porch pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.
15-0 FP_V	VSYNC front-porch pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.

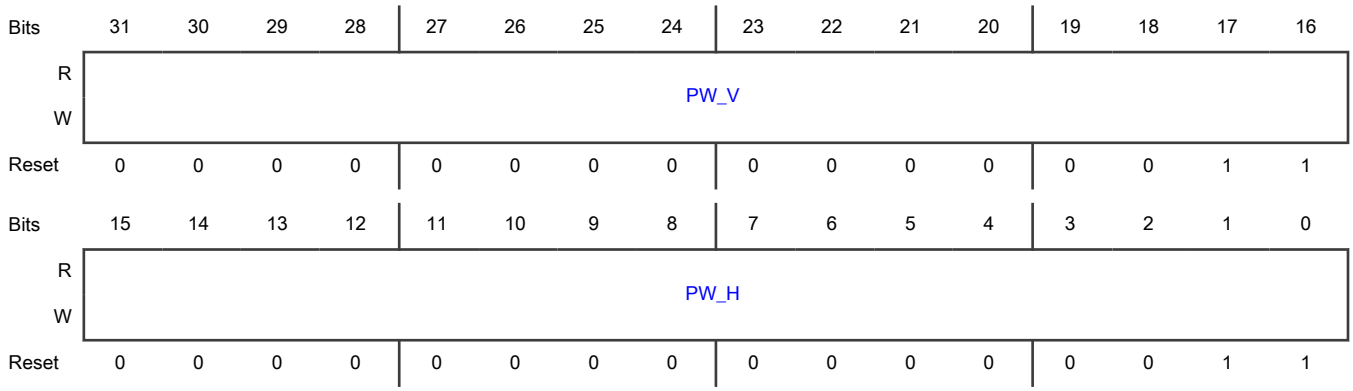
42.4.1.7 Vertical and Horizontal Pulse Width Parameter Register (VSYN_HSYN_WIDTH)

VSYN_PARA register sets timing parameters of the TFT related to the vertical synchronization signal generation. The fields FP_V, BP_V, and PW_V stand for VSYNC signal front-porch, back-porch, and active pulse width, respectively.

Offset

Register	Offset
VSYN_HSYN_WIDTH	20h

Diagram



Fields

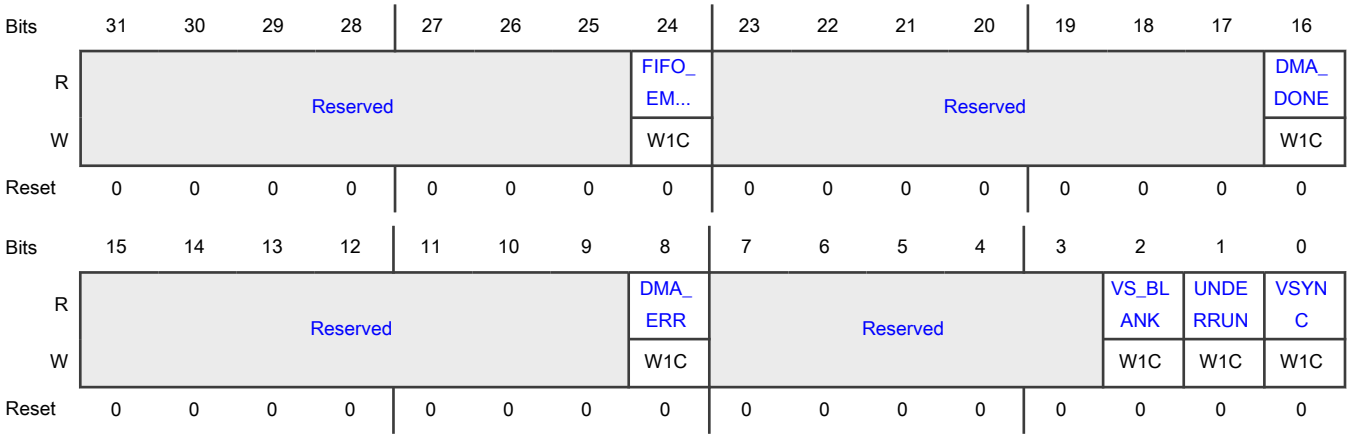
Field	Description
31-16 PW_V	VSYNC active pulse width (in horizontal line cycles). Pulse width has a minimum value of 1.
15-0 PW_H	HSYNC active pulse width (in pixel clock cycles). Pulse width has a minimum value of 1.

42.4.1.8 Interrupt Status Register for domain 0 (INT_STATUS_D0)

Offset

Register	Offset
INT_STATUS_D0	24h

Diagram



Fields

Field	Description
31-25 —	Reserved
24 FIFO_EMPTY	Interrupt flag to indicate that which FIFO in the pixel blending underflowed. Write a logic 1 to this field to clear this flag. • 0b: Did not occur • 1b: Occurred
23-17 —	Reserved
16 DMA_DONE	Interrupt flag to indicate that which PLANE has fetched the last pixel from memory. Write a logic 1 to this field to clear this flag. • 0b: Not finished • 1b: Finished
15-9 —	Reserved
8 DMA_ERR	Interrupt flag to indicate that which PLANE has Read Error on the AXI interface. Write a logic 1 to this field to clear this flag.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	• 0b: Did not occur • 1b: Occurred
7-3 —	Reserved
2 VS_BLANK	Interrupt flag to indicate vertical blanking period. Write a logic 1 to this field to clear this flag. • 0b: Not detected • 1b: Detected
1 UNDERRUN	Interrupt flag to indicate the output buffer underrun condition. Write a logic 1 to this field to clear this flag. • 0b: Did not occur • 1b: Occurred
0 VSYNC	Interrupt flag to indicate that the vertical synchronization phase(The beginning of a frame). Write a logic 1 to this field to clear this flag. • 0b: Not detected • 1b: Detected

42.4.1.9 Interrupt Enable Register for domain 0 (INT_ENABLE_D0)

Offset

Register	Offset
INT_ENABLE_D0	28h

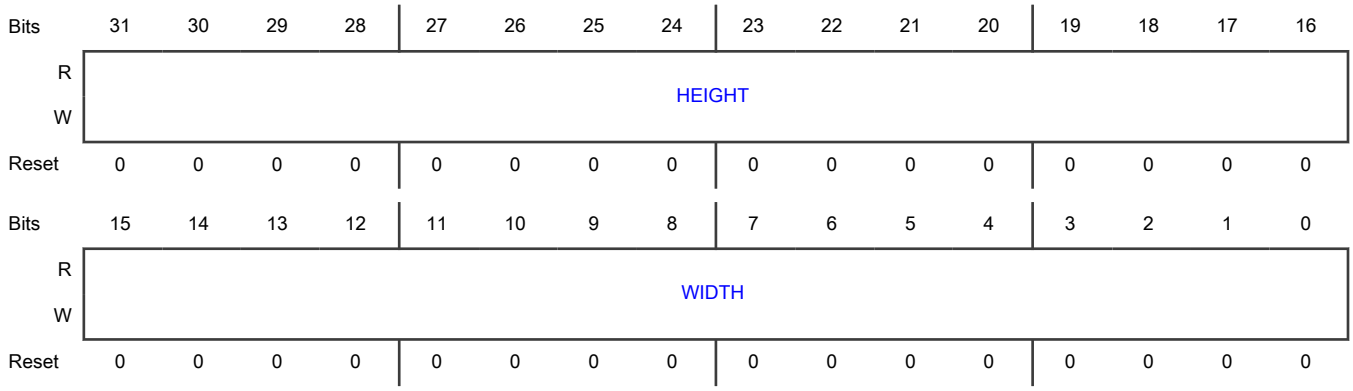
42.4.1.12 Control Descriptor Layer Register 1 (CTRLDESCL0_1)

This register sets the height and width of the layer associated with the register.

Offset

Register	Offset
CTRLDESCL0_1	200h

Diagram



Fields

Field	Description
31-16 HEIGHT	Height of the layer in pixels.
15-0 WIDTH	Width of the layer in pixels. The layer width must be in multiples of the number of pixels that can be stored in 32 bits, and therefore differs depending on color encoding. For example, if 16 bits per pixel format is used, then the layer width must be configured in multiples of 2.

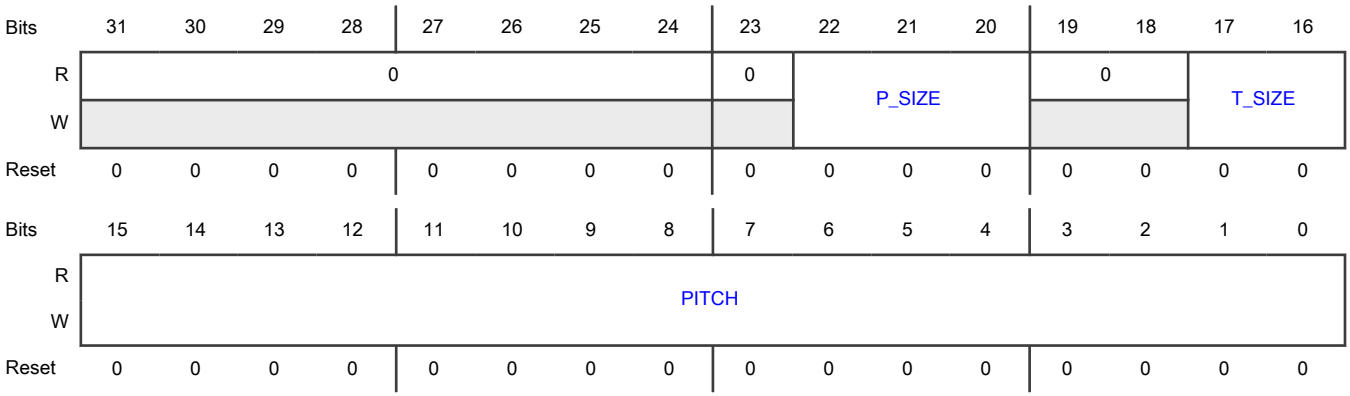
42.4.1.13 Control Descriptor Layer Register 3 (CTRLDESCL0_3)

This register sets the buffer line pitch of layer data.

Offset

Register	Offset
CTRLDESCL0_3	208h

Diagram



Fields

Field	Description
31-24 —	Reserved
23 —	Reserved
22-20 P_SIZE	Payload size.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Holds the payload size. The P_SIZE should never be programmed to be less than T_SIZE. The recommended configuration value is 010b. • 000b - 64 bytes • 001b - 128 bytes • 010b - 256 bytes • 011b - 512 bytes • 100b - Reserved • 101b - Reserved • 110b - Reserved • 111b - Reserved
19-18 —	Reserved
17-16 T_SIZE	Transaction Size Holds the transaction size. This T_SIZE should always be programmed in conjunction with P_SIZE where P_SIZE >= T_SIZE. The recommended configuration value is 10b. • 00b - 64 bytes • 01b - 128 bytes • 10b - 256 bytes • 11b - Reserved
15-0 PITCH	Number of bytes between 2 vertically adjacent pixels in system memory. Byte granularity is supported, but SW should align to 64B boundary.

42.4.1.14 Control Descriptor Layer Register 4 (CTRLDESCL_LOW0_4)

This register sets the low 32bits of the beginning address of layer data.

Offset

Register	Offset
CTRLDESCL_LOW0_4	20Ch

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3-0 ADDR_HIGH	Address of layer data in the memory.

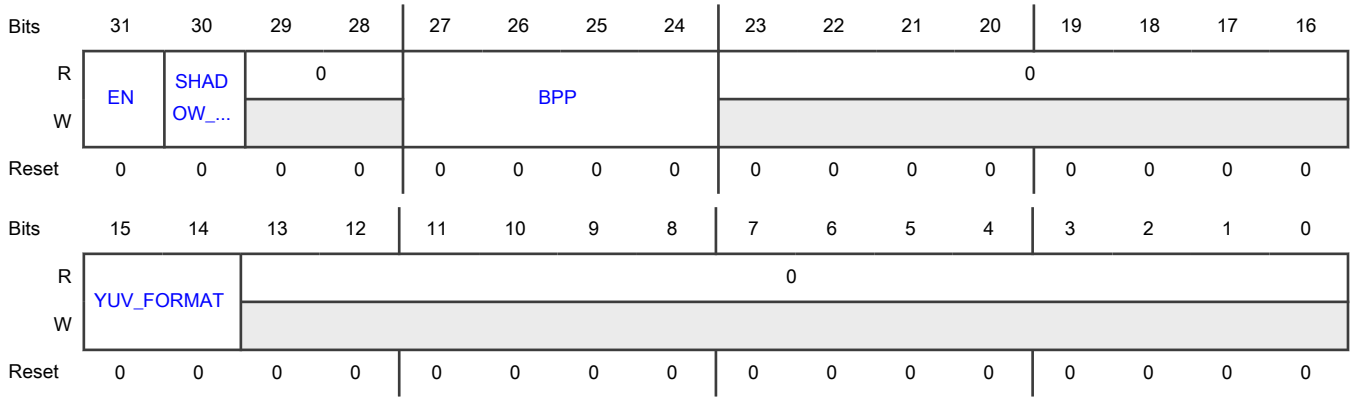
42.4.1.16 Control Descriptor Layer Register 5 (CTRLDESCL0_5)

This register controls various graphics options and whether the layer is enabled.

Offset

Register	Offset
CTRLDESCL0_5	214h

Diagram



Fields

Field	Description
31 EN	Enable the layer for DMA. 0 - OFF 1 - ON
30 SHADOW_LOAD_EN	Shadow Load Enable The SHADOW_LOAD_EN bit is written to 1 by software after all DMA control registers are written. If set to 1, shadowed control registers are updated to the active control registers on VSYNC of next frame. If set to 0, shadowed control registers are not loaded into the active control registers. The previous active control register settings will be used to process the next frame. Hardware will automatically clear this bit, when the shadow registers are loaded to the active control regsisters.

Table continues on the next page...

Table continued from the previous page...

Field	Description
29-28 —	Reserved
27-24 BPP	Layer encoding format (bit per pixel) 0100 - 16 bpp (RGB565) 0101 - 16 bpp (ARGB1555) 0110 - 16 bpp (ARGB4444) 0111 - YCbCr422 1000 - 24 bpp (RGB888) 1001 - 32 bpp (ARGB8888) 1010 - 32 bpp (ABGR8888)
23-16 —	Reserved
15-14 YUV_FORMAT	The YUV422 input format selection. 00 - The YUV422 32bit memory is {Y2,V1,Y1,U1} 01 - The YUV422 32bit memory is {Y2,U1,Y1,V1} 10 - The YUV422 32bit memory is {V1,Y2,U1,Y1} 11 - The YUV422 32bit memory is {U1,Y2,V1,Y1}
13-0 —	Reserved

42.4.1.17 Color Space Conversion Ctrl Register (CSC0_CTRL)

The CSC control register will configure the CSC module to perform color space converison between the RGB/YUV/YCbCr color spaces

// Converting from YUV/YCbCr color spaces to the RGB color space uses the

// R = A1(Y-D1) + A2(U-D2) + A3(V-D3)

// G = B1(Y-D1) + B2(U-D2) + B3(V-D3)

// B = C1(Y-D1) + C2(U-D2) + C3(V-D3)

//Converting from the RGB color space to YCbCr color spaces uses the

//following equation structure:

// Y = A1*R + A2*G + A3*B + D1

// U = B1*R + B2*G + B3*B + D2

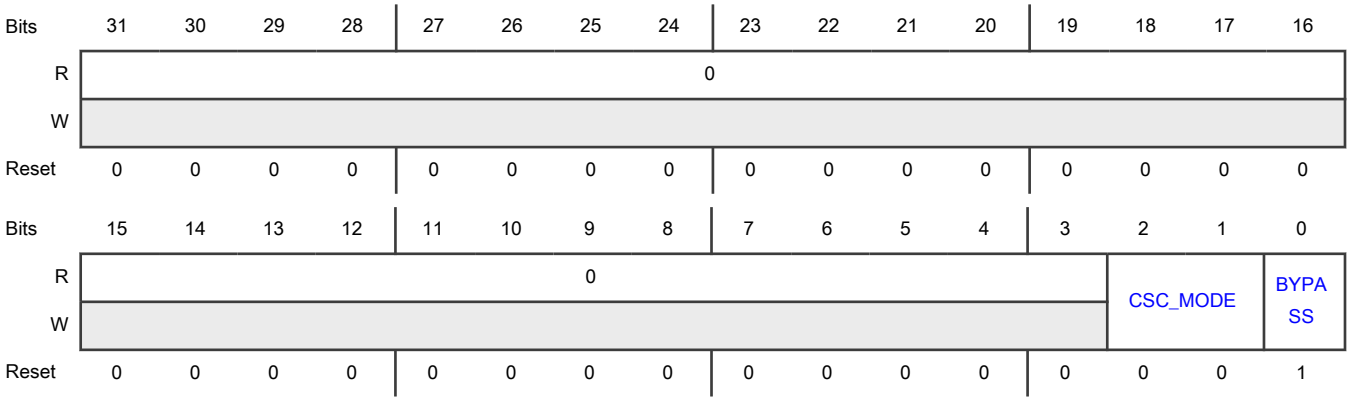
// V = C1*R + C2*G + C3*B + D3

//All math is signed, so all coefficients come in as two's comp numbers

Offset

Register	Offset
CSC0_CTRL	21Ch

Diagram



Fields

Field	Description
31-3 —	Reserved
2-1 CSC_MODE	This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 00 - Convert from YUV to RGB. 01 - Convert from YCbCr to RGB. 10 - Reserved 11 - Convert from RGB to YCbCr.
0 BYPASS	This bit controls whether the pixels entering the CSC2 unit get converted or not. When BYPASS is set, no operations occur on the pixels. When BYPASS is cleared, the selected CSC operation takes place.

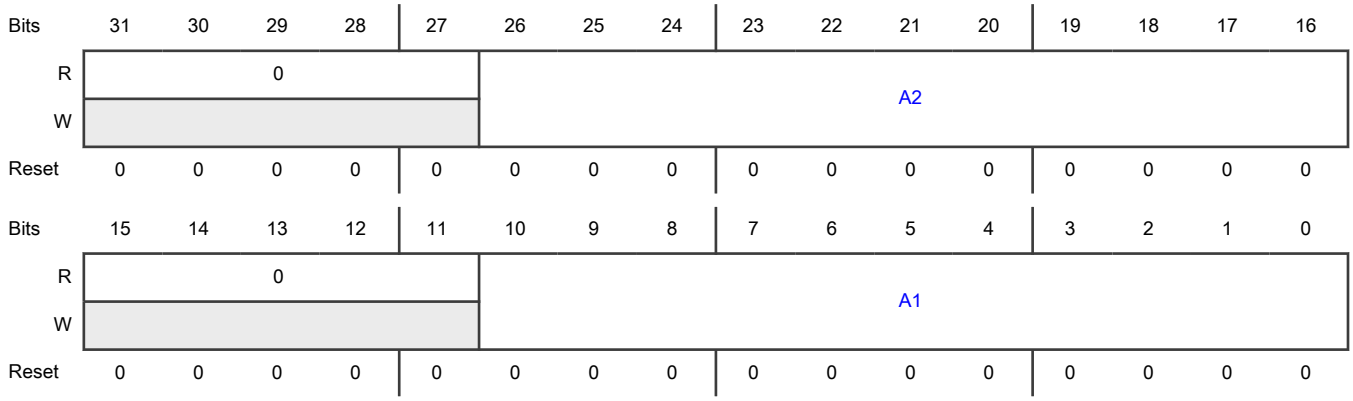
42.4.1.18 Color Space Conversion Coefficient Register 0 (CSC0_COEF0)

This register contains color space conversion coefficients in two's complement notation.

Offset

Register	Offset
CSC0_COEF0	220h

Diagram



Fields

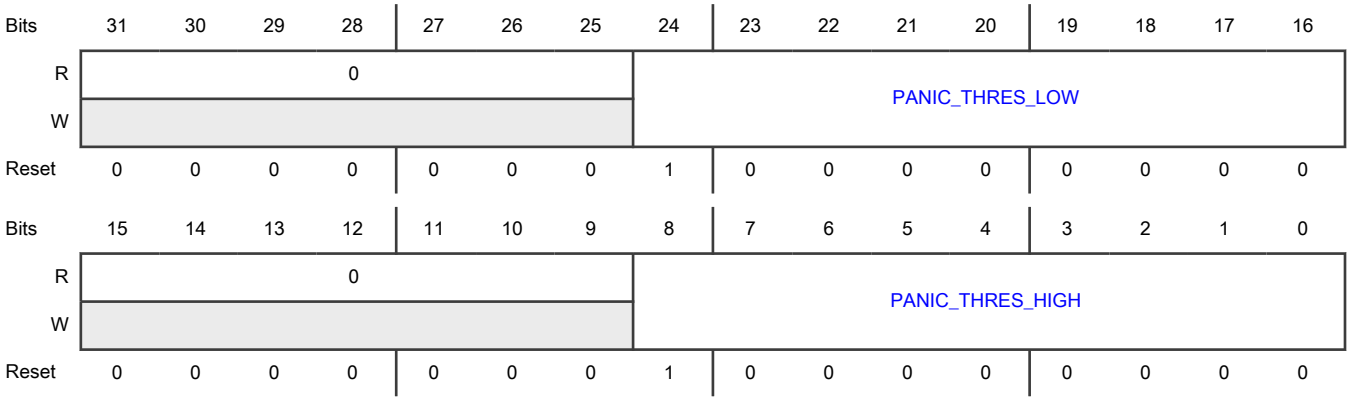
42.4.1.24 Memory request priority threshold register (PANIC0_THRES)

This register is used to activate panic signal when the number of pixels reaches the programmed threshold. It can be used to manipulate access priority to meet the required pixel throughput

Offset

Register	Offset
PANIC0_THRES	238h

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 PANIC_THRES_LOW	Panic Threshold Low Value This value should be set to a value of pixels, from (0+1)*128bits to (511+1)*128bits. When the number of pixels in the input pixel FIFO is less than this value, the panic control output will be raised.This signal can be used to raise the access LCDIF's access priority. • 0: threshold is 1*128bits • 1: threshold is 2*128bits • . • . • . • 511:threshold is 512*128bits
15-9 —	Reserved
8-0 PANIC_THRES_HIGH	Panic Threshold High Value This value should be set to a value of pixels, from (0+1)*128bits to (511+1)*128bits. When the number of pixels in the input pixel FIFO is more than this value, the panic control output will be removed.This signal can be used to raise the access LCDIF's access priority. • 0: threshold is 1*128bits • 1: threshold is 2*128bits • . • . • . • 511:threshold is 512*128bits

Chapter 43
Image Sensing Interface (ISI)

43.1 Chip-specific ISI information

Table 446. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

The ISI module on the chip implements one channel and one camera input. Virtual channels are not supported.

This one camera input can be connected to :

- Parallel camera input

43.2 Overview

ISI interfaces to a pixel link source to obtain the image data for processing in its pipeline. The pipeline processes the image line from a configured source and performs one or more functions that you can configure, such as:

- Downscaling
- Color space conversion
- Deinterlacing
- Alpha insertion
- Cropping
- Flipping (horizontal and vertical)

The processed image is stored in programmable memory locations.

This module implements a limited flow control mechanism to control the output from its internal buffer flushing or sourcing an image from memory. Depending on the format type, the module can process and store one line of pixels from the incoming frame.

43.2.1 Block diagram

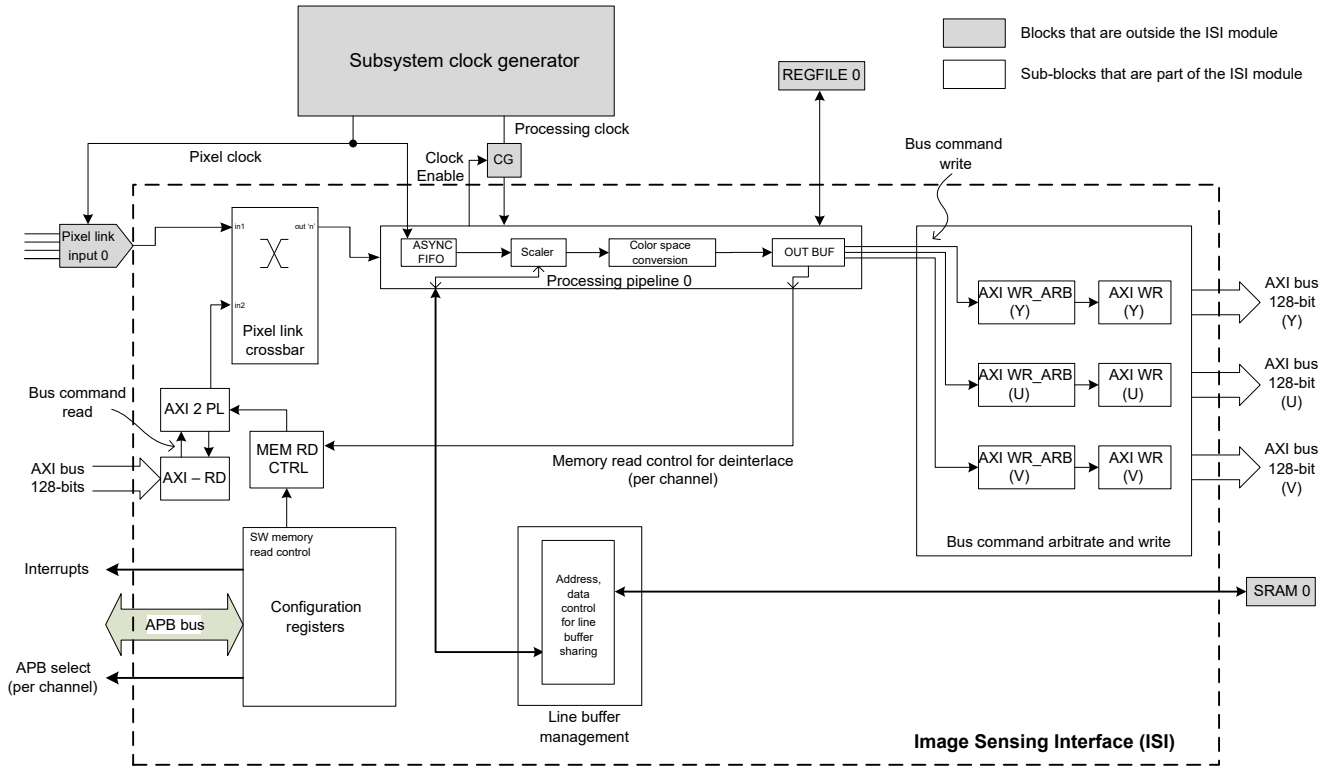


Figure 232. ISI block diagram

43.2.2 Features

- Up to 2K resolution at 30 or 60 fps (24 bpp)
- Input sources:
  - Supports 1 pixel link interface that can interface with 1 camera sensor
  - Supports system memory (AXI manager, internally converted to pixel link interface)
- Ability to assign each processing pipeline or channel to the same or different pixel input source
- Stream multiplexing:
  - Supports simple deinterlacing methods for interlaced input sources:
    - Weaving
- Stream manipulation features
  - Supported pixel formats when storing the image in memory:
    - RAW8, RAW10, RAW12, RAW14, RAW16, and RAW32
    - RGB888, BGR888, RGB565, RGB 10-bit, and BGR 10-bit
    - YUV444, YUV422, YUV420 (8-bit, 10-bit, 12-bit) in planar or semi-planar formats

    See CHNL_IMG_CTRL[FORMAT] for more formats.
  - Downscaling of input image via decimation and bilinear filtering:
    - Supports decimation by 2, 4, or 8
    - Bilinear filter further downscales by 1.0 to 2.0 (fractional downscaling)

- Color space conversion (CSC):
  - RGB, YUV, and YCbCr
  - User defined color space matrix-based conversion
- Alpha channel insertion for RGB formats:
  - Global alpha value
  - Separate rectangular region of interest (ROI) alpha value that has a higher priority than the global alpha value
  - Supports up to four ROI nonoverlapping rectangles
- Mirroring (image flip): horizontal and vertical flips supported
- Frame awareness and frame skipping:
  - Clean frame start and shutdown based on HSYNC and VSYNC
  - Buffer overrun protection
  - Buffer under run deterministic behavior

- Stream output options
  - Output to memory:
    - Input source is converted to and processed by the processing pipeline as YUV444 or RGB
    - Processed images are taken as an output from the pipeline and stored in a memory location that you specify
    - Full-line storage available at processing channel output before sending data to AXI (this storage can be automatically split or combined depending on the output format being used)
    - Dual buffered addresses used in a ping-pong fashion with an active buffer status indication
    - Line and frame stored interrupt status to software to track the progress of the frame
- Flow control:
  - Provides a panic indication to the chip to increase the priority of its write transactions to avoid potential overflow in output buffers (you can configure thresholds for panic indication)
  - When pixels are sourced from memory or input line buffers are flushed, you can program the rate at which pixels are sent out (by default, one pixel per clock is sent out)
  - Supports backpressure mechanism to stall the channel pipeline during line buffer flushing and sourcing of images from memory, when the AXI bus is unable to accept data, and the output buffers are low on storage
- Metadata processing (the embedded data from the sensor can be processed and written out)

43.3 Functional description

43.3.1 Design overview

This section describes ISI's design architecture and data flow with details of each block.

43.3.1.1 Pixel link crossbar

ISI comprises 1 processing pipeline that you can assign to any of the input image sources via the pixel link crossbar, which is a 2-input (including four pixel link inputs and one input read from memory) and 1-output multiplexer that you can use to configure each output port to connect to any of the 2 inputs. These 2 inputs are numbered from Pixel link input 1 to 1, and input 2 that is always a memory location.

The image input to the module is through the pixel line subordinate port that provides the following:

- Clock

- Data and control buses
- HSYNC and VSYNC signals

The crossbar connects these subordinate port signals to the processing channel that pull the pixel data out from the asynchronous FIFO in the pixel line subordinate port, the only exception being when the image is read from memory. In this case, ISI converts the lines read from memory into pixel link subordinate interface signals so that the signals seen at the crossbar and processing channels are the same as other sources.

43.3.1.2 Processing pipeline

A processing channel comprises:

- A downscaling engine
- A color space conversion (CSC) block
- An output buffer control block

The scaler performs decimation and bilinear filtering of the input image, and the output buffer control performs various functions such as alpha insertion, cropping, and horizontal or vertical flipping. It generates the AXI write transactions for storing the processed image in memory and supports storing the image as 1/2/3 planar at different memory locations.

43.3.1.3 Output buffer control and AXI output

The output buffer control block of each processing channel performs:

- Image cropping
- Flipping (horizontal and vertical)
- Alpha value insertion

This block collects the processed image pixels in a ping-pong buffer and sends out bursts of 128 bytes or 256 bytes (configurable) of data over the AXI interface to memory. This block also performs the function of deinterlacing the frames while storing them in memory. You can format the final processed image pixels to store them in any of the multiple image formats as mentioned in CHNL_IMG_CTRL[FORMAT].

This block also manages the concatenation of ping-pong buffers per component based on the output image format. The combined storage of the three ping-pong buffers is up to a full line of the image frame depending on the output image format. By using flow control and panic mechanisms, you can ensure that the data is sent out at a rate acceptable to the system and that output buffers do not overflow.

43.3.1.4 AXI memory read

ISI can read an image from memory in different formats as discussed in Channel Memory Read Control (CHNL_MEM_RD_CTRL). ISI reads the image via AXI read and internally drives the image through a pixel to the processing channel. This operation is also flow-controlled. You can configure the rate at which pixels are processed in the channel and are sent out. By default, one pixel per clock is processed when the read FIFO is not empty.

43.3.1.5 Configuration registers

Each channel has the same set of configuration registers that are aligned to a 64 KB boundary and are programmable via the APB interface. You must ensure that the correct values are being programmed. ISI does not check for the correctness of the values.

43.3.2 Pixel link data formats

A number of pixel link formats are standardized, which consist of different kinds of data, identifying information, and user control bits (commonly the DATA ENABLE bit is included). When HSYNC and VSYNC are asserted (that is, HSYNC and VSYNC are active or equal to zero), the core does not care the entire data field. The control field is more complex where clearly HSYNC and VSYNC are valid. This is intended to cover all of the data types transferred across pixel link.

Control field

Each pixel has an associated control field identifying its data. See chip specific ISI information for more details on control field bits.

NOTE

On the interface to the manager and subordinate modules, HSYNC and VSYNC are separated, so the relevant pixel input bit is different from the control field number (for the actual link).

43.3.3 Scaling operation

The scaling engine works in two parts: it performs pre-decimation of the image followed by bilinear filtering to achieve the desired downscaling factor.

The decimation filter provides a maximum downscaling factor of 8, and the subsequent bilinear filter provides a maximum downscaling factor of 2. Combined, the maximum scaling factor can be up to 16. You can program the decimation and bilinear scaling engines independently. You also program an initial offset to allow more source data to be considered in the bilinear scaling engine. The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel.

43.3.4 CSC

CSC is a full-duplex color space converter that can convert an image to either RGB or YUV (or YC_bC_r) color spaces depending on the desired output pixel format. You can program all coefficients as two's-complement numbers. If you do not require CSC in the application, then you can bypass the CSC unit individually on a channel. The CSC output is sent to the output buffer control block for further processing and storage in memory.

The following equations indicate the ALU architecture of the CSC module:

(a) RGB to YUV (or YC_bC_r) conversion

- Y = (A1 × R) + (A2 × G) + (A3 × B) + D1
- U = (B1 × R) + (B2 × G) + (B3 × B) + D2
- V = (C1 × R) + (C2 × G) + (C3 × B) + D3

(b) YUV (or YC_bC_r) to RGB conversion

- R = (A1 × (Y + D1)) + (A2 × (U + D2)) + (A3 × (V + D3))
- G = (B1 × (Y + D1)) + (B2 × (U + D2)) + (B3 × (V + D3))
- B = (C1 × (Y + D1)) + (C2 × (U + D2)) + (C3 × (V + D3))

where:

- A1–A3, B1–B3, C1–C3, and D1–D3 are programmable coefficients.
- YUV and RGB refer to pixel values.

You check the saturation of each color channel and correct it for excursions outside the nominal color space. Overflow for the three channels is saturated at 255h and underflow is saturated at 00h.

43.3.5 Image deinterlacing methods

ISI supports image deinterlacing for images that are interlaced across frames. You can use one of the following deinterlace methods to form the deinterlaced image.

43.3.5.1 Weaving

Weaving is performed by combining consecutive fields to form a new frame. It results in artifacts known as combing. The pixels in one frame do not line up with the pixels in the other and form a jagged edge. To perform weaving in an ISI channel, one field's lines are stored in memory with a double line pitch. It leaves one-line space in memory for the second field's lines to be stored.

The two interlaced frames are woven while being stored in memory. You can select which frame to have on the top (odd or even), (see Figure 233).

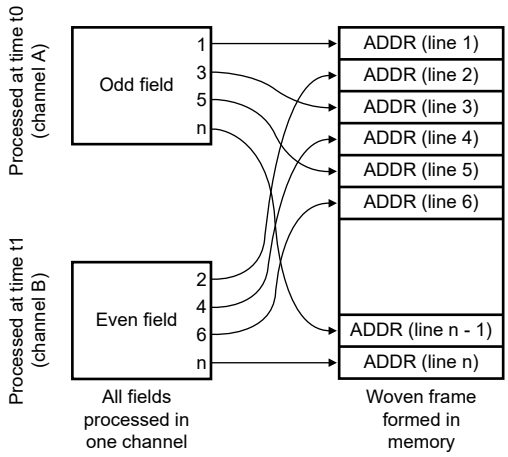

Figure 233. Weave deinterlacing

43.3.6 Output buffer management

The ISI output buffer management provides the following image processing options, and the operations related to them are carried out in this order:

1. Alpha insertion in RGB formats
2. Image cropping
3. Image flipping

You must perform these image manipulation operations before the image is stored in output buffers. The image input to the output buffer block (from scaler or CSC) is in either RGB or YUV444 format. The output buffer logic then formats each pixel from these two formats to the desired output format as specified in CHNL_IMG_CTRL[FORMAT]. The output buffers consolidate the formatted image pixel bytes and send out 128-byte or 256-byte AXI write bursts to store the image in memory.

ISI has an in-built pre-overflow warning mechanism through which it can warn the subsystem and request higher AXI write channel priority to avoid any overflows in its buffers. In any case, if an overflow occurs, ISI stops storing pixels for that line and starts storing pixels from the next line. This causes the frames to be corrupted. You must take appropriate action for such frames. For images sourced from memory, ISI can stall its internal pipeline or control the rate at which pixels are processed in the pipeline. See Flow control mechanisms for more details.

There are two destination addresses that you must program:

- CHNL_OUT_BUF1_ADDR_*n*
  - Channel RGB or Luma (Y) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_Y)
  - Channel Chroma (U/Cb/UV/CbCr) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_U)
  - Channel Chroma (V/Cr) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_V)
- CHNL_OUT_BUF2_ADDR_*n*
  - Channel RGB or Luma (Y) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_Y)
  - Channel Chroma (U/Cb/UV/CbCr) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_U)
  - Channel Chroma (V/Cr) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_V)

The BUF1 address is used when you enable the channel for the first time. This address increments internally by a line_pitch (Channel Output Buffer Pitch (CHNL_OUT_BUF_PITCH)) at the end of each line, except the last line, to compute the address

for each line storage. ISI generates a line_stored interrupt (CHNL_STS[LINE_STRD]) when a full line is completely stored and a frame_stored interrupt (CHNL_STS[FRM_STRD]) after the last line is completely stored in memory. The next frame is stored at the BUF2 address in the same way. You can update CHNL_OUT_BUF1_ADDR_*n* at this point if desired. On every frame_stored interrupt, ISI toggles between the two buffer addresses. Status fields indicate the buffer that is currently active. You can update the buffer address registers at any time, but they take effect only when the corresponding load address fields are toggled. The new address gets loaded when the current frame is complete.

ISI automatically manages the output buffer size depending on the output image format. For 2- and 3-planar formats, the output buffer is divided accordingly among each component based on the number of bytes that the component uses. For 1-planar, RGB, and RAW, the output buffer functions as a unified buffer. This allows efficient utilization of output buffers even when they are concatenated.

43.3.6.1 Alpha insertion in RGB formats

ISI supports global alpha value insertion to RGB images in which one alpha value is inserted into all pixels in the image. ISI supports up to four nonoverlapping regions of interest (ROI) in which you can insert different alpha values. If both ROI alpha and global alpha values are enabled, ROI alpha values take priority over the global alpha value. Pixels that do not lie in any of the ROI can have a global alpha value (if enabled) or do not have any alpha value inserted (if global alpha insertion is disabled). You can configure the upper-left coordinate (ULC) and the lower-right coordinate (LRC) individually for each ROI. ULC and LRC must lie within the dimensions that Channel Scaled Image Configuration (CHNL_SCL_IMG_CFG) specifies.

43.3.6.2 Image cropping

ISI supports cropping in both X and Y dimensions based on the programmed ULC and LRC, which must lie within the dimensions that Channel Scaled Image Configuration (CHNL_SCL_IMG_CFG) specifies.

43.3.6.3 Image flipping

ISI supports horizontal and vertical image flipping. You can enable either one or both of these.

43.3.7 Sourcing image from memory

This section discusses the configuration required for software-controlled memory reads. Perform the following steps in any order to configure the channel for software-controlled memory reads (you must initialize the channel before configuring the memory image read on a channel):

- Configure the memory address from where the image is to be sourced in .
- Configure the line and frame pitch in Channel Input Buffer Pitch (CHNL_IN_BUF_PITCH).
- Configure the read image format in CHNL_MEM_RD_CTRL[IMG_TYPE].
- Complete the initialization of other blocks and interrupts for channel 0 and write 1 to CHNL_CTRL[CHNL_EN].
- Write 1 to CHNL_MEM_RD_CTRL[READ_MEM] to enable reading of the frame from memory.
- Wait for CHNL_STS[MEM_RD_DONE] to become 1 before initiating a new image read. When this interrupt occurs, write 0 to CHNL_MEM_RD_CTRL[READ_MEM] followed by writing 1 to it to start the next read.

43.3.8 Flow control mechanisms

ISI implements the following flow control mechanisms to compensate for low bandwidth on the chip's AXI bus:

43.3.8.1 Panic and overflow

ISI provides a "panic" signal to the subsystem to request for a higher priority on the AXI write channel to empty the ping-pong buffers before they overflow. You can configure the assertion of a panic signal when the output ping-pong buffers are filled to a certain configurable threshold.

Depending on the reaction time from the subsystem, you can configure the appropriate threshold in CHNL_OUT_BUF_CTRL[PANIC_SET_THD_n], where *n* = Y, U, V. The panic signal deasserts when the amount of data

inside the ping-pong buffers goes below the configurable threshold. CHNL_STS[PANIC_n_BUF] indicates the panic status, where *n* = Y, U, V. The status fields do not clear if the amount of data inside the ping-pong buffers goes below the configurable threshold.

In case an overflow occurs, ISI stops storing pixels from the current line. ISI then resyncs to the next line and starts storing pixels thereon. CHNL_STS[OFLW_n_BUF] indicates the status of overflow in buffers, where *n* = Y, U, V. You can enable overflow and panic interrupts for the channel in Channel Interrupt Enable (CHNL_IER).

43.3.8.2 Back pressure to stall internal pipeline

ISI implements an automatic back pressure to stall the channel's pipeline in case the AXI bus is not ready to accept data and the ping-pong buffers have 128 bytes of space left. The back pressure to the channel pipeline is asserted when the scaler line buffers are flushed between frames, or the image is sourced from memory.

However, data can still be lost during scaler line buffer flushing if the back pressure stalls the pipeline for too long. This could happen when a new frame starts, and the flush is not completed because of back pressure. In this case, ISI moves to process the next frame and indicates an overflow error.

43.3.8.3 Adjustable flow rate

ISI provides registers to configure the rate at which pixels are processed in the pipeline when the image is sourced from memory, the scaler line buffers are flushed, or both. By default, the rate is one pixel per clock, assuming read buffers are full with data. Normally, the camera rate is less than 1 pixel per clock and when flushing, the high rate can peak the bandwidth demand on the AXI bus.

You can program the processing rate to match the camera rate as desired, by using Channel Flow Control (CHNL_FLOW_CTRL). Program the processing rate as a ratio in CHNL_FLOW_CTRL[FC_NUMER] and CHNL_FLOW_CTRL[FC_DENOM]. ISI sends pixels for the FC_NUMER number of clocks out of FC_DENOM clocks.

Return to Initialization and channel configuration steps to complete the initialization of other blocks and enable the channel.

43.3.9 Error resiliency

ISI implements resiliency against possible error frames and recovery from them. An error frame can have one of the following conditions:

- HSYNC at the wrong time; thereby causing fewer or more pixels in the frame. ISI recovers silently and there is no indication of this error event.
- VSYNC at the wrong time; thereby causing fewer or more lines in the frame. ISI writes 1 to CHNL_STS[EARLY_VSYNC_ERR] or CHNL_STS[LATE_VSYNC_ERR] to indicate you of this condition. Next, ISI resyncs to the next frame. You must enable these interrupts by writing 1 to the corresponding interrupt enable field in Channel Interrupt Enable (CHNL_IER).
- Unequal lines between interlaced fields; ISI expects both frames to have an equal number of lines. ISI asserts CHNL_STS[EARLY_VSYNC_ERR] for the interlaced frame that has fewer lines than the other frame.
- A missing or an extra interlaced field (odd or even); ISI masks out the unexpected field and does not flag any error in this event.
- Frame with no pixels; ISI recovers silently and there is no indication of this error event.
- Frame line with no pixels; ISI recovers silently and there is no indication of this error event.

All error resiliency mechanisms ensure that the frame is not stored outside its given memory range in case ISI receives an error frame.

43.3.10 Clocking

The processing clock must be greater than or equal to the incoming pixel link clock for ISI. The reason for this is that ISI can process one pixel per processing clock while the incoming pixel link can input one pixel per pixel link clock. If the incoming pixel link is faster than the processing clock, ISI can lose data because the speed of incoming data is faster than the speed at which ISI can process it.

Table 447. Clock domains

Clock domain	Description
Pixel clock	Incoming pixel link clock from the camera via pixel link interface
APB clock	Clock used for register accesses
AXI clock	Clock on the AXI bus at the output

43.3.11 Reset

ISI has software reset control for each processing channel. For more information, see CHNL_CTRL[SW_RST].

43.3.12 Interrupts

Each processing channel has an interrupt output. The interrupt is enabled by Channel Interrupt Enable (CHNL_IER). Interrupt source comes from Channel Status (CHNL_STS).

43.4 External signals

See chip-specific ISI information for the external signals used in Pixel link data formats.

43.5 Initialization and channel configuration

This section describes the suggested steps to configure individual channels in ISI and handle interrupts for proper and efficient image processing. For the correct operation of the module, you must follow these initialization steps for every channel that needs to be configured.

First, perform the general channel configuration as follows:

1. Write 1 to CNHL_CTRL[CLK_EN] to enable the clock to the channel. This is required to access other registers in the channel and also for image processing by the channel.
2. Write 1 to CHNL_CTRL[CHNL_BYPASS] to enable channel bypass, else write 0 to it. Enable channel bypass if no scaling and no color conversion are required. If the channel is bypassed, the image coming into the channel is directly stored in the memory without any kind of processing. However, you can perform image flipping (horizontal, vertical, or both), image cropping, alpha insertion (RGB format only), and format conversion (YUV444 to YUV422 or YUV420) while channel bypass is enabled. Disabling the CSC and scaler has no impact on these operations.
3. Select the source of input image. The input is Pixel 0.. You can select an additional pixel link (pixel link 1) as a source. Pixel link 1 always reads an image from a programmed location in memory. Configure the source in CHNL_CTRL[SRC].

   NOTE

   - See the chip-specific ISI information for actual source type connected to pixel link 0.

4. Select the type of source for the channel between:
   - Nonmemory pixel links (image sourced from camera sensor, CHNL_CTRL[SRC_TYPE] = 0)
   - Memory pixel link (image sourced from memory, CHNL_CTRL[SRC_TYPE] = 1).

   The memory pixel link refers to pixel link 1 that sources the image from a programmed memory location only. This is useful for deinterlacing and processing the image directly from memory. For the channels that do not support sourcing image from memory, the source type is always a nonmemory pixel link. You must configure the source type for the channel in CHNL_CTRL[SRC_TYPE].

   NOTE

   You can find the actual source type connected to pixel links 0 and 1 in the chip configuration.

5. Configure the image width and height by using CHNL_IMG_CFG[WIDTH] and CHNL_IMG_CFG[HEIGHT]. For example, a 1920x1080 image has width = 0x780 and height = 0x438.
6. Configure the memory address where the processed or bypassed data from the channel has to be stored. The image can be stored as:
   - 1-planar (all color components stored together).
   - 2-planar (Y component stored in one memory address and UV stored in a different memory address).
   - 3-planar (each component stored in a different memory address).

   Configure the 32-bit address as follows:
   - For 1-planar addressing, use Channel RGB or Luma (Y) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_Y) and Channel RGB or Luma (Y) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_Y).
   - For 2-planar and 3-planar addressing, use Channel Chroma (U/Cb/UV/CbCr) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_U) and Channel Chroma (U/Cb/UV/CbCr) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_U) additionally.
   - For 3-planar addressing, use Channel Chroma (V/Cr) Output Buffer 1 Address (CHNL_OUT_BUF1_ADDR_V) and Channel Chroma (V/Cr) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_V) additionally.

   See Output buffer management for more information on how the two buffer addresses are used.

   NOTE

   RGB and RAW images are always stored as 1-planar while other YUV formats can be stored as 1, 2, or 3-planar.
7. Configure the output buffer line pitch in CHNL_OUT_BUF_PITCH[LINE_PITCH]. The line pitch is defined as the number of bytes between the start location of two lines. It is mainly used to have line addresses start at an aligned boundary.

   NOTE

   - The line pitch is the same for all image components irrespective of whether they are being stored in 1-planar, 2-planar, or 3-planar. In 2- and 3-planar outputs, the U and V components have the same line pitch as the Y component.
   - You must program the line pitch to be no less than the number of bytes in one line.
8. Toggle the address load fields, that is, CHNL_OUT_BUF_CTRL[LOAD_BUF1_ADDR] and CHNL_OUT_BUF_CTRL[LOAD_BUF2_ADDR] to allow new configured addresses to be picked and used in the channel, when the output buffer is enabled later.

See the following sections for configuration information on various functionalities:

- Scaling operation for information about the scaler and configuring the scaler for use.
- CSC for information about CSC and configuring the block for use.
- Image deinterlacing methods section for information about different deinterlacing methods and configuration for enabling each deinterlacing method for the channels.
- Sourcing image from memory for information on how to configure channel 0 to read and process an image that is sourced from memory.
- Output buffer management for information on how to configure controls for image cropping, flipping, alpha insertion, handle buffer overflows, and request higher AXI channel priority for emptying the buffers.
- Flow control mechanisms for information on how to configure the rate of pixel output from this module onto the AXI bus.

After completing the configuration provided in the aforementioned sections, you can now enable and monitor the channel using the following steps:

1. Write 1 to appropriate interrupt enable fields in Channel Interrupt Enable (CHNL_IER) to enable the necessary interrupts.

2. Write 1 to CHNL_CTRL[CHNL_EN] to enable the channel. This enables the channel to start accepting images from the selected source.
3. Monitor the status of the channel through Channel Status (CHNL_STS). Each field provides you with a status or error indication to take appropriate action. Interrupt status fields become 0 by writing 1 to the respective fields.
4. Write 1 to CHNL_CTRL[SW_RST], when required, to reset the complete channel to its default reset state. You must retain the value of this field as 1 for at least 5 to 6 NOP cycles to allow the reset to propagate. Then, write 0 to it to complete the reset cycle. After the software reset, the channel returns to the same default state as it would have been after a hardware reset. No configuration register resets during the software reset. You can additionally write 0 to CHNL_CTRL[CHNL_EN] while the software reset is asserted to control the restarting of the channel after the software reset is complete.

When configuring multiple channels, you must perform the aforementioned steps for all channels.

43.6 Application information

43.6.1 Configuring the scaler

Channel initialization is a prerequisite to configuring the scaler. Perform the following steps in any order to configure the scaler:

1. Configure the scale offset values for the X and Y dimensions in Channel Scale Offset (CHNL_SCALE_OFFSET). This is the initial offset from the (0,0) coordinate, using which the first output scaled pixel is computed.
2. Configure the scale factor values for the X and Y dimensions in Channel Scale Factor (CHNL_SCALE_FACTOR). This is the step factor through which the image is sampled for downscaling.
3. Configure the decimation factor values for the X and Y dimensions in CHNL_IMG_CTRL[DEC_X] and CHNL_IMG_CTRL[DEC_Y]. The final scaling factor that the scaler uses is = decimation factor × scale factor.
4. Write 1 to CHNL_IMG_CTRL[YCBCR_MODE] if the incoming or converted image is in the YC_bC_r format.
5. Configure Channel Scaled Image Configuration (CHNL_SCL_IMG_CFG) according to the dimension of the image after scaling. You must configure this register whenever the scaler is enabled, even with 1:1 scaling.

Return to Initialization and channel configuration to complete the initialization of other blocks and enable the channel.

Example: If the image needs to be downscaled by a factor of 4.5 in the X and Y dimension, you can program the scaler by:

- Writing 10b to CHNL_IMG_CTRL[DEC_X] and CHNL_IMG_CTRL[DEC_Y] indicating "decimate by 4."
- Writing 1200h to CHNL_SCALE_FACTOR[X_SCALE] and CHNL_SCALE_FACTOR[Y_SCALE] indicating a scaling factor of 1.125.

The overall downscaling is 4 x 1.125 = 4.5.

43.6.2 Configuring CSC

Channel initialization is a prerequisite to configuring CSC. Perform the following steps in any order to configure CSC:

- Write 1 to CHNL_IMG_CTRL[CSC_BYP] to bypass the CSC block, if you do not require to run CSC and the channel is not bypassed.
- Configure the coefficients in Channel Color Space Conversion Coefficient 0 (CHNL_CSC_COEFF0) to Channel Color Space Conversion Coefficient 5 (CHNL_CSC_COEFF5), if CSC is required.
- Write 1 to CHNL_IMG_CTRL[YCBCR_MODE] if the incoming image or the image after color space conversion is in YC_bC_r mode.
- Configure CHNL_IMG_CTRL[CSC_MODE] according to the required conversion method.

Return to Initialization and channel configuration to complete the initialization of other blocks and enable the channel.

43.6.3 Configuring deinterlacing

Channel initialization is a prerequisite to configuring the deinterlace block. You can configure the deinterlace block using any one of the following deinterlace methods:

- **Weaving -** Write 10b or 11b to CHNL_IMG_CTRL[DEINT] to configure the weaving deinterlace method to enable weave deinterlacing with the odd frame first or even frame first, respectively.

Return to Initialization and channel configuration to complete the initialization of other blocks and enable the channel.

NOTE

- Channels for which you configure CHNL_IMG_CTRL[DEINT] with values other than 00xb, the scaler and CSC are automatically bypassed.

43.6.4 Configuring additional image processing options

You must initialize the channel before configuring additional image processing controls. To configure the image processing options, perform alpha insertion, image cropping, and image flipping in an order:

1. Configure CHNL_IMG_CTRL[GBL_ALPHA_VAL] to program the global alpha value. Write 1 to CHNL_IMG_CTRL[GBL_ALPHA_EN] if a global alpha value is to be inserted in the image. You must configure this field when both the global and regional alpha values are to be inserted.
2. Write 1 to CHNL_ROI_n_ALPHA[ALPHA] and CHNL_ROI_n_ALPHA[ALPHA_EN] (where *n* = 0, 1, 2, or 3) to have region-specific alpha values.
3. Configure the ROI coordinates in CHNL_ROI_n_ULC and CHNL_ROI_n_LRC (where *n* = 0, 1, 2, 3). The regions should neither overlap nor lie outside the scaled image dimensions.
4. Configure the cropped region of the image in Channel Crop Upper Left Corner Coordinate (CHNL_CROP_ULC) and Channel Crop Lower Right Corner Coordinate (CHNL_CROP_LRC). This is the region that is stored in memory.
5. Enable cropping by writing 1 to CHNL_IMG_CTRL[CROP_EN].
6. Write 1 to CHNL_IMG_CTRL[HFLIP_EN] to configure horizontal flipping of the output image.
7. Write 1 to CHNL_IMG_CTRL[VFLIP_EN] to configure vertical flipping of the output image.

NOTE

You must configure ULC and LRC (both for alpha insertion and cropping) based on the image resolution output from the scaler and not on the original image resolution. The output buffer block works on the output from CSC (when no bypass happens) or scaler (if CSC is bypassed). The original image resolution is used for determining ULC and LRC only during a channel bypass or 1:1 scaling.

43.6.5 Configuring output buffer controls

Perform the following steps in any order, involving output memory addressing, to configure the output buffer controls (you must perform channel initialization before configuring these controls):

- Configure the destination memory address in CHNL_OUT_BUF1_ADDR_*n* and CHNL_OUT_BUF2_ADDR_*n* (where *n* = Y, U, V).
- Configure the output image line pitch in CHNL_OUT_BUF_PITCH[LINE_PITCH]. The line pitch is the spacing between two lines in terms of the number of bytes.
- Toggle the load address fields, that is, CHNL_OUT_BUF_CTRL[LOAD_BUF1_ADDR] and CHNL_OUT_BUF_CTRL[LOAD_BUF2_ADDR] to allow new configured addresses to be picked and used in the channel.
- Update the appropriate buffer 1 or buffer 2 address on every CHNL_STS[FRM_STRD] interrupt assertion. If this is not done, the same address is used, and the frame is overwritten.
- Write 1 to the appropriate address load fields on every update to the CHNL_OUT_BUF1_ADDR_*n* or CHNL_OUT_BUF2_ADDR_*n* (where *n* = Y, U, V) register. Without configuring the load field, the new address is not picked.

The status fields CHNL_STS[BUF1_ACTIVE] and CHNL_STS[BUF2_ACTIVE] indicate the active buffer to which the current frame is stored.

NOTE

— When performing deinterlacing, the output memory addressing changes for that channel. See Image deinterlacing methods for configuring the destination memory addresses for that channel.

— You must program the line_pitch to be greater than the number of bytes in one line.

Return to Initialization and channel configuration to complete the initialization of other blocks and enable the channel.

43.7 ISI register descriptions

The memory map comprises 32-bit aligned registers that you can access via 32-bit accesses only. Write accesses to reserved locations generate a transfer error. Read accesses to reserved locations also generate a transfer error and the read data bus shows all 0s.

NOTE

- Ensure that the correct values are programmed for a smooth operation. The module does not check for correctness.
- The ISI registers are readable but cannot be configured or written successfully when CHNL_CTRL[CLK_EN] = 0.
- The following registers are dedicated and are spaced apart by 64 KB boundary. See chip-specific information for details on channel-specific base address values for the channel registers.

43.7.1 ISI memory map

ISI base address: 4AE4_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	Channel Control (CHNL_CTRL)	32	RW	0000_0000
4	Channel Image Control (CHNL_IMG_CTRL)	32	RW	0000_0000
8	Channel Output Buffer Control (CHNL_OUT_BUF_CTRL)	32	RW	0000_0000
C	Channel Image Configuration (CHNL_IMG_CFG)	32	RW	0438_0780
10	Channel Interrupt Enable (CHNL_IER)	32	RW	0000_0000
14	Channel Status (CHNL_STS)	32	RW	0000_0000
18	Channel Scale Factor (CHNL_SCALE_FACTOR)	32	RW	1000_1000
1C	Channel Scale Offset (CHNL_SCALE_OFFSET)	32	RW	0000_0000
20	Channel Crop Upper Left Corner Coordinate (CHNL_CROP_ULC)	32	RW	0000_0000
24	Channel Crop Lower Right Corner Coordinate (CHNL_CROP_LRC)	32	RW	0000_0000
28	Channel Color Space Conversion Coefficient 0 (CHNL_CSC_COEFF0)	32	RW	0000_0000
2C	Channel Color Space Conversion Coefficient 1 (CHNL_CSC_COEFF1)	32	RW	0000_0000

9C	Channel Flow Control (CHNL_FLOW_CTRL)	32	RW	0000_0000

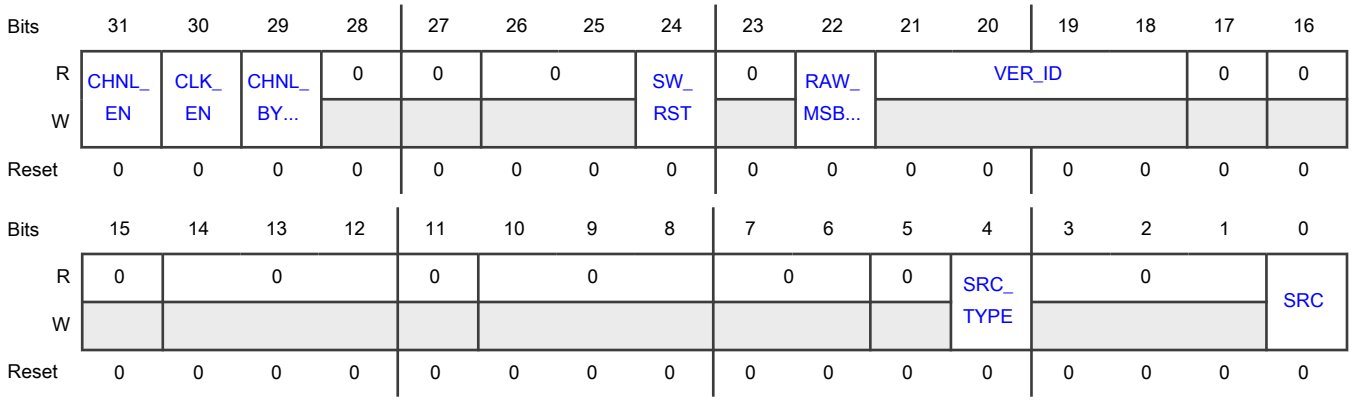
43.7.2 Channel Control (CHNL_CTRL)

Provides global settings for the channel pipeline, and controls how the internal blocks and line buffer perform the image processing.

Offset

Register	Offset
CHNL_CTRL	0h

Diagram



Fields

Field	Description
31 CHNL_EN	Enable Channel Processing Enables image processing in the channel. You must configure all other channels before writing 1 to this field. 0 - Disable 1 - Enable
30	Channel Clock Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
CLK_EN	Enables the channel processing clock. Writing 1 to this field specifies that the clock gating (outside the ISI block) is disabled and the clock to the channel is enabled. **NOTE** When this field is 0, the ISI registers are readable but cannot be configured or written successfully. 0 - Disable 1 - Enable
29 CHNL_BYPASS	Channel Bypass Enable Enables you to bypass a channel if scaling and CSC are not required. For certain applications, the ISI module might not be required to perform any scaling or CSC on the image. For such cases, you must write 1 to this field to bypass the channel pipeline and store the image in memory. Configure the output image format (CHNLn_IMG_CTRL[FORMAT]) in the same way as the input image format. You can still carry out image flipping, cropping, and alpha insertion. **NOTE** • For deinterlacing purposes, the channel is automatically bypassed for one frame. Do not write 1 to this field for deinterlacing. • If this field is 1, CSC is bypassed even if CHNLn_IMG_CTRL[CSC_BYP] = 0. • If channel is bypassed, line buffer is not used except for input format YUV420. YUV420 input data always uses line buffer even if channel is bypassed (if scaler is enabled for YUV420 input, it needs 2 line buffers, which requires to chain the line buffer of another channel). 0 - Disable 1 - Enable
28 —	Reserved
27 —	Reserved
26-25 —	Reserved
24 SW_RST	Software Reset Asserts a software reset to channel pipeline. Writing 1 to this field resets the processing pipeline similar to a hardware reset. This field does not become 0 itself; therefore, when writing 1, you must allow sufficient delay (four to six NOP cycles) for reset propagation before writing 0 to disable the software reset.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE Asserting the software reset does not clear the registers. It affects the processing pipeline and memory read control. Software reset allows any ongoing AXI transactions to complete and does not interrupt. 0 - No reset 1 - Software reset
23 —	Reserved
22 RAW_MSB_ALIGN	RAW to MSB Align Aligns the data selection from the pixel link to MSB. Data from Pixel link is aligned to MSB[15] when RAW size is smaller than 16 bits, otherwise it is aligned to MSB[31]. 0 - LSB aligned selection 1 - MSB aligned selection
21-18 VER_ID	Version ID Specifies a version ID for the module.
17 —	Reserved
16 —	Reserved
15 —	Reserved
14-12 —	Reserved
11 —	Reserved
10-8 —	Reserved
7-6 —	Reserved
5 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
4 SRC_TYPE	Type of Selected Input Image Source Defines the type of image input source. Write 1 to this field only when the source of the image is from memory. For all other sources, this field is 0. 0 - Pixel link 1 - Memory
3-1 —	Reserved
0 SRC	Input Image Source Port Selection Allows the source to select the desired input port of the pixel link crossbar from which the image is sourced. For example, if this field value is 000b, the image is sourced from input port 0 of the pixel link crossbar, and so on. Configure this field before enabling the channel processing. Do not change this field while the channel pipeline is working. **NOTE** The highest port number is for memory. 0 - Port 0 1 - Port 1

43.7.3 Channel Image Control (CHNL_IMG_CTRL)

Contains the fields that control how the input image is processed in the processing pipeline or channel.

All the output image formats that the FORMAT field defines are described in Table 448.

Table 448. Output image formats

Bit field value	Format	Description
000_0000b	RGBA8888	RGB format with alpha in LSB; 8 bits per component. 'A' indicates alpha value.
000_0001b	ABGR8888	BGR format with alpha in MSB; 8 bits per component. 'A' indicates alpha value.
000_0010b	ARGB8888	RGB format with alpha in MSB; 8 bits per component. 'A' indicates alpha value.
000_0011b	RGBX888	RGB format with 8 bits per color component (unpacked and MSB aligned in 32-bit DWORD). 'X' indicates the waste bits.
000_0100b	XBGR888	BGR format with 8 bits per color component (unpacked and LSB aligned in 32-bit DWORD). 'X' indicates the waste bits.

Table continues on the next page...

Table 448. Output image formats (continued)

Bit field value	Format	Description
000_0101b	XRGB888	RGB format with 8 bits per color component (unpacked and LSB aligned in 32-bit DWORD). 'X' indicates the waste bits.
000_0110b	RGB888P	RGB format with 8 bits per color component (packed into 24 bits). No waste bits.
000_0111b	BGR888P	BGR format with 8 bits per color component (packed into 24 bits). No waste bits.
000_1000b	A2BGR10	BGR format with 2 bits alpha in MSB; 10 bits per color component. 'A' indicates alpha value.
000_1001b	A2RGB10	RGB format with 2-bit alpha in MSB; 10 bits per color component. 'A' indicates alpha value.
000_1010b	RGB565	RGB format with 5 bits of R, B; 6 bits of G (packed into 16-bit WORD). No waste bits.
000_1011b	RAW8	8-bit RAW data packed into 32-bit DWORD
000_1100b	RAW10	10-bit RAW data packed into 16-bit WORD
000_1101b	RAW10P	10-bit RAW data packed into 32-bit DWORD
000_1110b	RAW12	12-bit RAW data packed into 16-bit DWORD
000_1111b	RAW16	16-bit RAW data packed into 32-bit DWORD
001_0000b	YUV444_1P8P	8 bits per color component; 1-plane, YUV interleaved packed bytes
001_0001b	YUV444_2P8P	8 bits per color component; 2-plane, UV interleaved packed bytes
001_0010b	YUV444_3P8P	8 bits per color component; 3-plane, non-interleaved packed bytes
001_0011b	YUV444_1P8	8 bits per color component; 1-plane YUV interleaved unpacked bytes (8 MSB waste bits in 32-bit DWORD)
001_0100b	YUV444_1P10	10 bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
001_0101b	YUV444_2P10	10 bits per color component; 2-plane, UV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
001_0110b	YUV444_3P10	10 bits per color component; 3-plane, non-interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
001_0111b		Reserved
001_1000b	YUV444_1P10P	10 bits per color component; 1-plane, YUV interleaved packed bytes (2 MSB waste bits in 32-bit DWORD)

Table continues on the next page...

Table 448. Output image formats (continued)

Bit field value	Format	Description
001_1001b	YUV444_2P10P	10 bits per color component; 2-plane, UV interleaved packed bytes (2 MSB waste bits in 32-bit DWORD)
001_1010b	YUV444_3P10P	10 bits per color component; 3-plane, non-interleaved packed bytes (2 MSB waste bits in 32-bit DWORD)
001_1011b		Reserved
001_1100b	YUV444_1P12	12 bits per color component; 1-plane, YUV interleaved unpacked bytes (4 LSB waste bits in 16-bit WORD)
001_1101b	YUV444_2P12	12 bits per color component; 2-plane, UV interleaved unpacked bytes (4 LSB waste bits in 16-bit WORD)
001_1110b	YUV444_3P12	12 bits per color component; 3-plane, non-interleaved unpacked bytes (4 LSB waste bits in 16-bit WORD)
001_1111b		Reserved
010_0000b	YUV422_1P8P	8 bits per color component; 1-plane, YUV interleaved packed bytes
010_0001b	YUV422_2P8P	8 bits per color component; 2-plane, UV interleaved packed bytes
010_0010b	YUV422_3P8P	8 bits per color component; 3-plane, non-interleaved packed bytes
010_0011b		Reserved
010_0100b	YUV422_1P10	10-bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
010_0101b	YUV422_2P10	10-bits per color component; 2-plane, UV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
010_0110b	YUV422_3P10	10 bits per color component; 3-plane, non-interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
010_0111b		Reserved
010_1000b	YUV422_1P10P	10 bits per color component; 1-plane, YUV interleaved packed bytes (2 MSB waste bits in 32-bit DWORD)

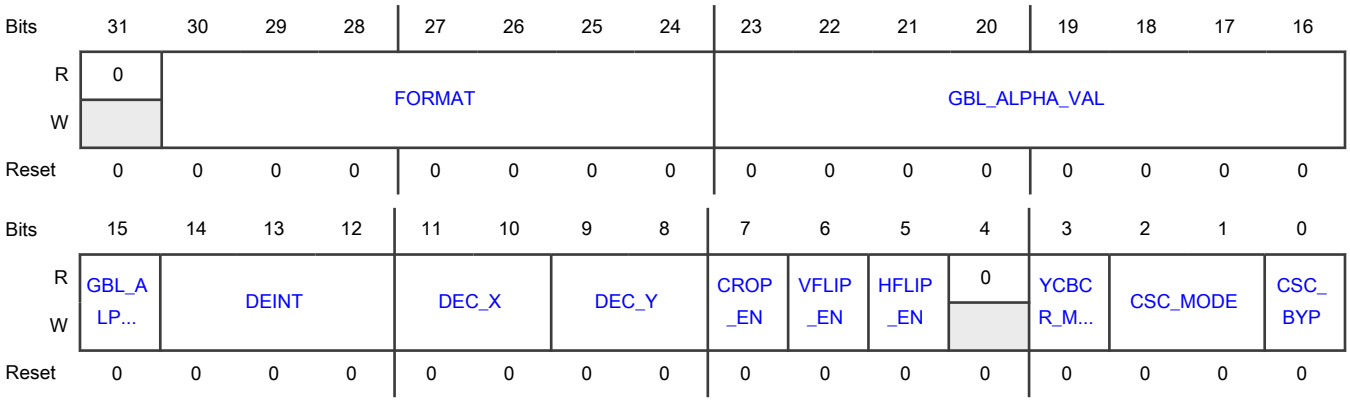
Diagram



Fields

Field	Description
31 —	Reserved
30-24 FORMAT	Output Image Format Specifies the image format to be used when storing the image output from channel pipeline to memory. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, you must select the YUV420_2P* formats when the output is YCbCr 2-plane 420 output format. See all output image formats in Table 448. **NOTE** For RAW pixel formats, if the output pixel format has few bits per pixel than the input pixel format, ISP truncates the MSB of each pixel. 000_0000-100_0001 - See Table 448.
23-16	Global Alpha Value

Table continues on the next page...

Table continued from the previous page...

Field	Description
GBL_ALPHA_VAL	Specifies the alpha value that is inserted with all RGB pixels in the image when being stored into the memory. For RGB 10-bit formats, only 2 MSBs are used as alpha value for insertion. When different alpha values are required to be inserted in up to four regions of interest, use the ROI_x_ALPHA, ROI_x_ULC, and ROI_x_LRC (where x = 0, 1, 2, 3) registers. 0000_0000-1111_1111 - Alpha value to be inserted with all RGB pixels
15 GBL_ALPHA_EN	Global Alpha Value Insertion Enable Enables you to insert the global alpha value in the RGB image. If you need to insert different alpha values in up to four regions of interest, use the ROI_x_ALPHA, ROI_x_ULC, and ROI_x_LRC (where x = 0, 1, 2, 3) registers. 0 - Disable 1 - Enable
14-12 DEINT	Deinterlace Control Defines the basic deinterlacing method that you use to combine the interlaced frames. Deinterlacing is required to send the interlaced frames over the pixel link. See Image deinterlacing methods for details on deinterlacing techniques and how to configure the channels to perform deinterlacing. 000,001 - No deinterlacing 010 - Weave deinterlacing (odd, even) 011 - Weave deinterlacing (even, odd)
11-10 DEC_X	Horizontal Pre-Decimation Control Controls the pre-decimation filter for down scaling of the input image in the horizontal direction. For field value 00b, pre-decimation filter is disabled but the bilinear scaling filter is still operational. 00 - Disabled 01 - Decimate by 2 10 - Decimate by 4 11 - Decimate by 8
9-8 DEC_Y	Vertical Pre-Decimation Control Controls the pre-decimation filter for down scaling of the input image in the vertical direction. For field value 00b, pre-decimation filter is disabled but the bilinear scaling filter is still operational. 00 - Disabled 01 - Decimate by 2 10 - Decimate by 4 11 - Decimate by 8
7 CROP_EN	Output Image Cropping Enable Enables cropping of the image when you write 1 to this field. Cropping of the image is carried out after down scaling. Therefore, you must program the cropping coordinates according to the scaled

Table continues on the next page...

Table continued from the previous page...

Field	Description
	image. You can configure the cropping coordinates in Channel Crop Upper Left Corner Coordinate (CHNL_CROP_ULC) and Channel Crop Lower Right Corner Coordinate (CHNL_CROP_LRC). 0 - Disable 1 - Enable
6 VFLIP_EN	Vertical Flip Control Enables vertical image flipping when you write 1 to this field. 0 - Disable 1 - Enable
5 HFLIP_EN	Horizontal Flip Control Enables horizontal image flipping when you write 1 to this field. 0 - Disable 1 - Enable
4 —	Reserved
3 YCBCR_MODE	YCbCr Mode Enables YCbCr mode. Write 1 to this field when performing YCbCr to RCB conversion and write 0 to this field when performing RGB to YUV conversion. This field changes the behavior of the scaler when performing U/V scaling. 0 - Disable 1 - Enable
2-1 CSC_MODE	Color Space Conversion Operating Mode Controls how the CSC unit operates on pixels when CSC is not bypassed. 00 - Convert from YUV to RGB 01 - Convert from YCbCr to RGB 10 - Convert from RGB to YUV 11 - Convert from RGB to YCbCr
0 CSC_BYP	Color Space Conversion Bypass Control Bypasses the CSC block that means no operation occurs on the pixels when you write 1 to this field. When you write 0 to this field, color conversion selected by CSC_MODE takes place. 0 - CSC operational 1 - CSC bypassed

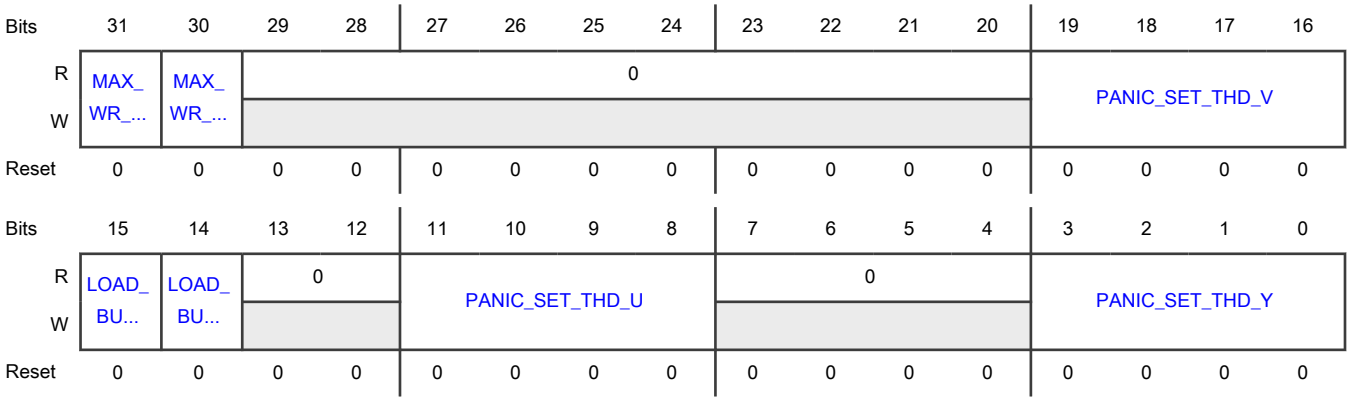
43.7.4 Channel Output Buffer Control (CHNL_OUT_BUF_CTRL)

Controls how the output buffer loads the destination memory address and configures the overflow panic controls.

Offset

Register	Offset
CHNL_OUT_BUF_CTRL	8h

Diagram



Fields

Field	Description
31 MAX_WR_BEATS_Y	Maximum AXI Write Beats for Y-Buffer Specifies the maximum write beats per write request for the Y-buffer. When Y-buffer is concatenated with other buffers (Y+U+V or Y+V), you can increase throughput by increasing the maximum write beats to 16 (that is, 256 bytes) per write request. When buffer is not combined, this field has no effect, and a maximum of 8 beats per write request are supported. 0 - 8 beats per write (128 bytes) 1 - 16 beats per write (256 bytes)
30 MAX_WR_BEATS_UV	Maximum AXI Write Beats for U- and V-Buffers Specifies the maximum write beats per write request for the U- and V-buffers. When U-buffer and V-buffer are concatenated, you can increase throughput by increasing the maximum write beats to 16 (that is, 256 bytes) per write request. When buffers are not combined, this field has no effect, and a maximum of 8 beats per write request are supported. 0 - 8 beats per write (128 bytes) 1 - 16 beats per write (256 bytes)
29-20 —	Reserved
19-16 PANIC_SET_THD_V	Overflow Panic Set Threshold Value for V Output Buffer Contains the threshold value after which the potential overflow panic alert interrupt (CHNL_STS[PANIC_V_BUF]) and the panic signal to the subsystem are asserted to request a higher

Table continues on the next page...

Table continued from the previous page...

Field	Description
	priority on AXI to drain the output buffers of the channel. Panic is asserted when the buffer is *n*×6.25%full (where *n* = 1 to 15). Panic signal deasserts when the number of filled rows in the ping-pong buffer fall below the programmed threshold. CHNL_STS[PANIC_V_BUF] becomes 0 when you write 1 to it. 0000 - No panic alert 0001-1111 - Panic asserts
15 LOAD_BUF2_ADDR	Load Buffer 2 Address Specifies the load buffer 2 address from the CHNL_OUT_BUF2_ADDR_*n* (where *n* = Y, U, V) registers. When you require to use a new value, you must toggle this field to indicate that a new buffer address has been programmed for use. On every toggle of this field, the new address values are shadowed in design.
14 LOAD_BUF1_ADDR	Load Buffer 1 Address Specifies the load buffer 1 address from the CHNL_OUT_BUF1_ADDR_*n* (where *n* = Y, U, V) registers. When you require to use a new value, you must toggle this field to indicate that a new buffer address has been programmed for use. On every toggle of this field, the new address values are shadowed in design.
13-12 —	Reserved
11-8 PANIC_SET_THD_U	Overflow Panic Set Threshold Value for U Output Buffer Contains the threshold value after which the potential overflow panic alert interrupt (CHNL_STS[PANIC_U_BUF]) and the panic signal to the subsystem are asserted to request a higher priority on AXI to drain the output buffers of the channel. Panic is asserted when the buffer is *n*×6.25%full (where *n* = 1 to 15). Panic signal deasserts when the number of filled rows in the ping-pong buffer fall below the programmed threshold. CHNL_STS[PANIC_U_BUF] becomes 0 when you write 1 to it. 0000 - No panic alert 0001-1111 - Panic asserts
7-4 —	Reserved
3-0 PANIC_SET_THD_Y	Overflow Panic Set Threshold Value for Y or RGB Output Buffer Contains the threshold value after which the potential overflow panic alert interrupt (CHNL_STS[PANIC_Y_BUF]) and the panic signal to the subsystem are asserted to request a higher priority on AXI to drain the output buffers of the channel. Panic is asserted when the buffer is *n*×6.25%full (where *n* = 1 to 15). Panic signal deasserts when the number of filled rows in the ping-pong buffer fall below the programmed threshold. CHNL_STS[PANIC_Y_BUF] becomes 0 when you write 1 to it. 0000 - No panic alert 0001-1111 - Panic asserts

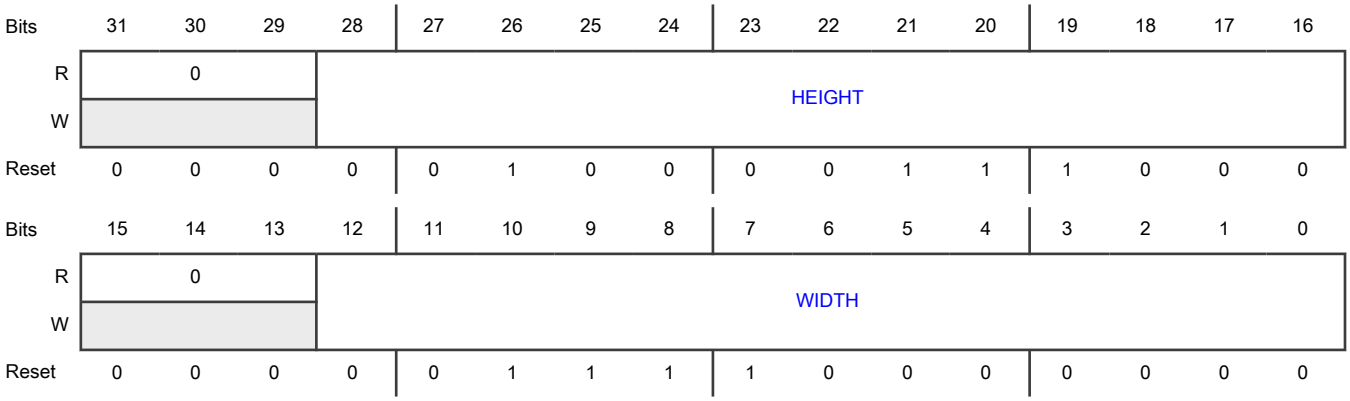
43.7.5 Channel Image Configuration (CHNL_IMG_CFG)

Specifies details related to the image width (in pixels) and height (in lines). This register specifies the image resolution for any type of source for the processing channel.

Offset

Register	Offset
CHNL_IMG_CFG	Ch

Diagram



Fields

Field	Description
31-29 —	Reserved
28-16 HEIGHT	Input Image Height Contains the height of the input image in terms of the number of lines for both cases when the image is input from the pixel link or from memory. The default height is 1080 lines.
15-13 —	Reserved
12-0 WIDTH	Input Image Width Contains the width of the input image in terms of the number of pixels for both cases when the image is input from the pixel link or from memory. The default width is 1920 pixels.

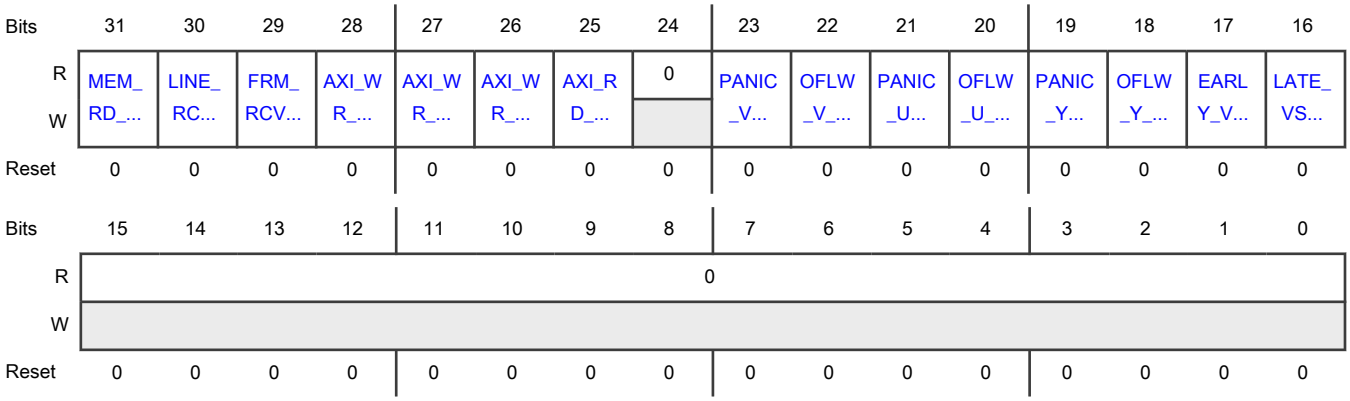
43.7.6 Channel Interrupt Enable (CHNL_IER)

Enables the generation of an interrupt to the processor.

Offset

Register	Offset
CHNL_IER	10h

Diagram



Fields

Field	Description
31 MEM_RD_DONE_EN	Memory Read Complete Interrupt Enable Enables the assertion of an interrupt from the channel when the corresponding status field is 1. 0 - Disable 1 - Enable

Fields

Field	Description
31 MEM_RD_DONE	Memory Read Complete Interrupt Flag Indicates that the channel has read the full image from the input memory location (). Configure the system to read the next image from the memory. 0 - Not complete or not started 1 - Completed
30 LINE_STRD	Line Received and Stored Interrupt Flag Indicates that a line is received and stored in the memory. This interrupt flag sets for every line received and stored in memory. 0 - Not received 1 - Received and stored
29 FRM_STRD	Frame Stored Successfully Interrupt Flag Indicates that a full frame is received and stored in the memory. This interrupt flag sets for every frame received and stored in memory. 0 - Not received or in progress 1 - Received and stored
28 AXI_WR_ERR_V	AXI Bus Write Error Interrupt Flag for V Data Buffer Indicates that an error has occurred on the AXI bus when storing V data into memory. 0 - No error 1 - Error occurred
27 AXI_WR_ERR_U	AXI Bus Write Error Interrupt Flag for U Data Buffer Indicates that an error has occurred on the AXI bus when storing U data into memory. 0 - No error

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Error occurred
26 AXI_WR_ERR_Y	AXI Bus Write Error Interrupt Flag for Y/RGB Data Buffer Indicates that an error has occurred on the AXI bus when storing Y/RGB data into memory. 0 - No error 1 - Error occurred
25 AXI_RD_ERR	AXI Bus Read Error Interrupt Flag Indicates that an error has occurred on the AXI bus when reading the image data from memory. 0 - No error 1 - Error occurred
24 —	Reserved
23 PANIC_V_BUF	V Output Buffer Potential Overflow Panic Alert Interrupt Flag Indicates whether the buffer has crossed the panic threshold limit. The channel requires you to increase the AXI bus priority for the V channel so that it can empty its output buffers; otherwise, the buffer might overflow and loose valid pixel data. You must perform an action on this interrupt in a way to empty out the buffers before any overflow occurs. You can configure the threshold for this panic interrupt in Channel Output Buffer Control (CHNL_OUT_BUF_CTRL) 0 - Threshold limit not crossed 1 - Threshold limit crossed
22 OFLW_V_BUF	Overflow in V Output Buffer Interrupt Flag Indicates that an overflow has occurred in the channel because of internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in Channel Status (CHNL_STS). 0 - No overflow 1 - Overflow
21 PANIC_U_BUF	U Output Buffer Potential Overflow Panic Alert Interrupt Flag Indicates whether the buffer has crossed the panic threshold limit. The channel requires you to increase the AXI bus priority for the U channel so that it can empty its output buffers; otherwise, the buffer might overflow and loose valid pixel data. You must perform an action on this interrupt in a way that buffers are emptied out before any overflow occurs. You can configure the threshold for this panic interrupt in Channel Output Buffer Control (CHNL_OUT_BUF_CTRL). 0 - Threshold limit not crossed 1 - Threshold limit crossed

Table continues on the next page...

Table continued from the previous page...

Field	Description
20 OFLW_U_BUF	Overflow in U Output Buffer Interrupt Flag Indicates that an overflow has occurred in the channel because of internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in Channel Status (CHNL_STS). 0 - No overflow 1 - Overflow
19 PANIC_Y_BUF	Y or RGB Output Buffer Potential Overflow Panic Alert Interrupt Flag Indicates whether the buffer has crossed the panic threshold limit. The channel requires you to increase the AXI bus priority for the Y or RGB channel so that it can empty its output buffers; otherwise, the buffer might overflow and loose valid pixel data. You must perform an action on this interrupt in a way that buffers are emptied out before any overflow occurs. You can configure the threshold for this panic interrupt in Channel Output Buffer Control (CHNL_OUT_BUF_CTRL). 0 - Threshold limit not crossed 1 - Threshold limit crossed
18 OFLW_Y_BUF	Overflow in Y or RGB Output Buffer Interrupt Flag Indicates that an overflow has occurred in the channel because of internal buffers not being read via AXI and are now full and not accepting new valid pixels in the output buffer control stage. The number of bytes lost during the overflow event is also reported in Channel Status (CHNL_STS). 0 - No overflow 1 - Overflow
17 EARLY_VSYNC_ERR	VSYNC Timing (Early) Error Interrupt flag Indicates that the VSYNC for the frame was detected earlier than expected. The resultant frame has corrupted data. 0 - No error 1 - VSYNC detected earlier
16 LATE_VSYNC_ERR	VSYNC Timing (Late) Error Interrupt flag Indicates that the VSYNC for the frame was detected later than expected. The resultant frame has corrected data. The extra lines in frame are ignored. 0 - No error 1 - VSYNC detected later
15-11 —	Reserved
10	Memory Read FIFO Overflow Error Status

Table continues on the next page...

Table continued from the previous page...

Field	Description
MEM_RD_OFLOW	Indicates that the read from memory has caused an internal FIFO to overflow. Data loss has occurred during memory read. Status is valid only when a memory read has been initiated. 0 - No overflow 1 - FIFO overflow
9 BUF2_ACTIVE	Current Frame Stored in Buffer 2 Address Indicates that the buffer 2 address is being used to store current frame. 0 - Buffer 2 address inactive 1 - Buffer 2 address in use
8 BUF1_ACTIVE	Current Frame Stored in Buffer 1 Address Indicates that the buffer 1 address is being used to store current frame. 0 - Buffer 1 address inactive 1 - Buffer 1 address in use
7-0 —	Reserved

43.7.8 Channel Scale Factor (CHNL_SCALE_FACTOR)

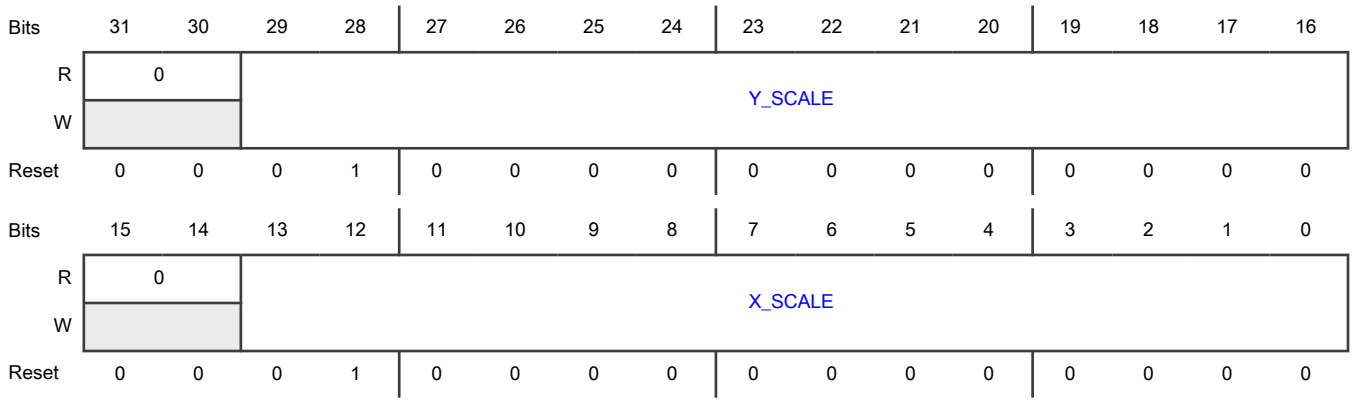
Provides the scale factor for the bilinear filter in the scaling engine. The maximum downscaling factor is 1/2 in a way that the output image in either axis is 1/2 the size of the source. The scale-down factor can range from 1.0 to 2.0. Use decimation and the bilinear filter together to achieve scaling by more than a factor of 2.

Write a value of 10.0000_0000_0000 to this register to reduce the image by a factor of two in the output frame buffer.

Offset

Register	Offset
CHNL_SCALE_FACTOR	18h

Diagram



Fields

Field	Description
31-30 —	Reserved
29-16 Y_SCALE	Vertical Scaling Factor Represents the Y-dimension scaling factor for the bilinear filter as a two-bit integer and 12-bit fractional number (##.####_####_####). The maximum value you can write to this field is 2 because scaling down by a factor greater than 2 is not supported with the bilinear filter. **NOTE** ISI actual output line value will be rounded up to an integer. For example, if the input line value = 800 and the output line value = 720, you must set [Y_SCALE] to a value such that the theoretical output line value (800/[Y_SCALE]) is equal to or less than 720, which means: • If [Y_SCALE] is set to 1C8h, the theoretical output line value = 719.859375 which will be rounded up to 720 → The actual output line is correct. • If [Y_SCALE] is set to 1C7h, the theoretical output line value = 720.017578 which will be rounded up to 721 → There will be one excessive line in the actual output.
15-14 —	Reserved
13-0 X_SCALE	Horizontal Scaling Factor Represents the X-dimension scaling factor for the bilinear filter as a two-bit integer and 12-bit fractional number (##.####_####_####). The maximum value you can write to this field is 2 because scaling down by a factor greater than 2 is not supported with the bilinear filter. **NOTE** ISI actual output width will be rounded up to an integer. For example, if the input width = 800 and the output width = 720, you must set [X_SCALE] to a value such that the theoretical output width (800/[X_SCALE]) is equal to or less than 720, which means: • If [X_SCALE] is set to 1C8h, the theoretical output width = 719.859375 which will be rounded up to 720 → The actual output width is correct. • If [X_SCALE] is set to 1C7h, the theoretical output width = 720.017578 which will be rounded up to 721 → There will be one excessive pixel in the actual output.

43.7.9 Channel Scale Offset (CHNL_SCALE_OFFSET)

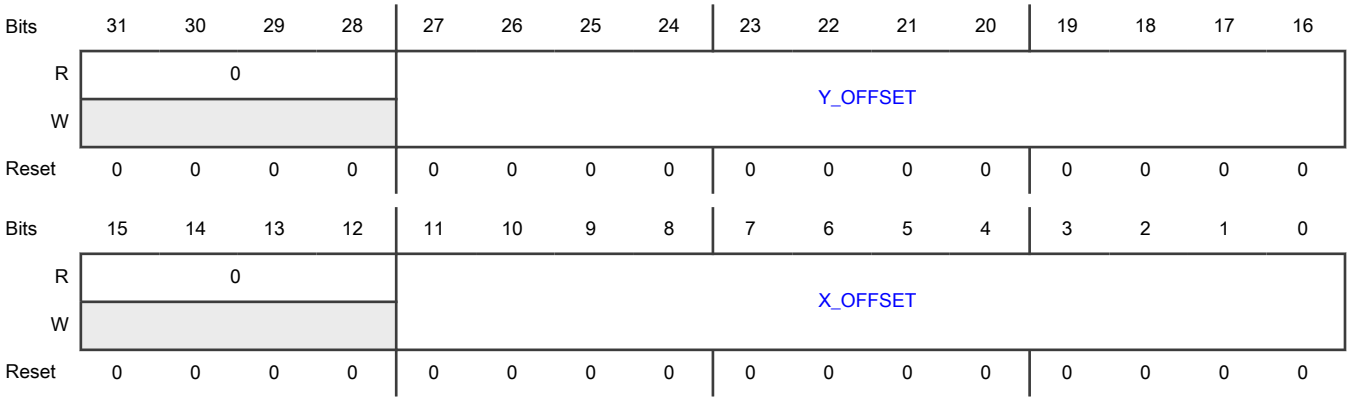
Provides the initial scale offset for the bilinear filter. The X and Y offset provide the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to affect the output image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter.

For example, when scaling an image down by a factor of 2, an initial offset of 0 results in subsampling every other pixel. In case of a fixed offset of 800h (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel is the sum of (1/2*P0) + (1/2*P1). This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

Offset

Register	Offset
CHNL_SCALE_OFFSET	1Ch

Diagram



Fields

Field	Description
31-28 —	Reserved
27-16 Y_OFFSET	Vertical Scaling Offset Represents the Y-dimension scaling offset as a 12-bit fractional number (0.####_####_####). This represents a fixed pixel offset that gets added to the scaled address to determine source data for the scaling engine.
15-12 —	Reserved
11-0 X_OFFSET	Horizontal Scaling Offset Represents the X-dimension scaling offset as a 12-bit fractional number (0.####_####_####). This represents a fixed pixel offset that gets added to the scaled address to determine source data for the scaling engine.

43.7.10 Channel Crop Upper Left Corner Coordinate (CHNL_CROP_ULC)

Provides the upper left coordinate of the source image that must be cropped. Configure ULC as per:

- The scaled image resolution (if scaler is enabled).
- The input image resolution (if scaler is bypassed).

The output image, after cropping, comprises pixels of the source image that are within the region that CHNL_ROI_n_ULC and CHNL_ROI_n_LRC (where *n* = 0, 1, 2, 3) specify. Write 1 to CHNL_IMG_CTRL[CROP_EN] to perform the cropping operation.

Offset

Register	Offset
CHNL_CROP_ULC	20h

43.7.18 Channel Alpha Value for ROI 0 (CHNL_ROI_0_ALPHA)

Provides the alpha value and control to enable alpha value insertion into ROI 0 of an image.

The region is defined by Channel Upper Left Coordinate for ROI 0 (CHNL_ROI_0_ULC) and Channel Lower Right Coordinate for ROI 0 (CHNL_ROI_0_LRC).

The alpha insertion happens after scaling is done, so ULC and LRC must correspond to the scaled image dimensions.

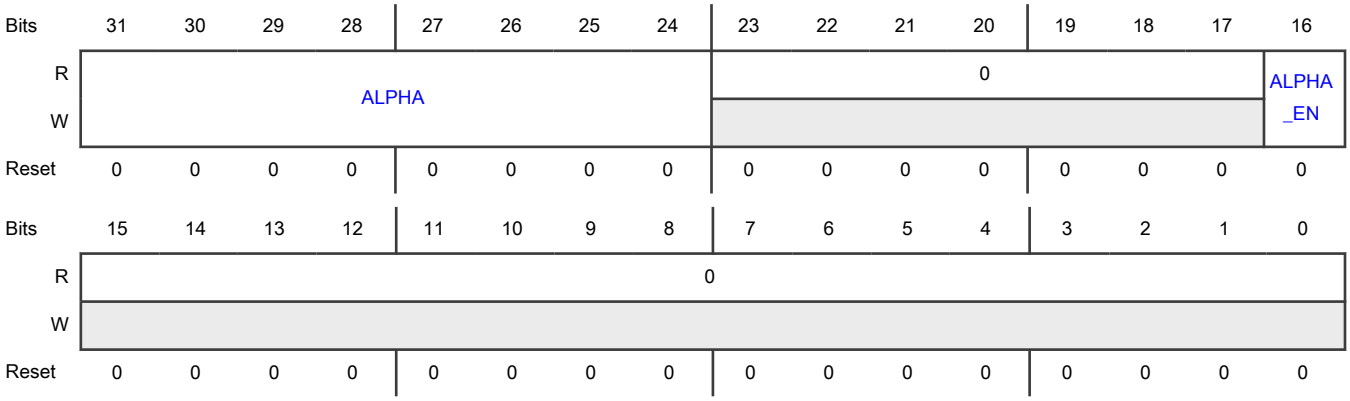
NOTE

If one value of alpha is to be inserted globally for the whole image, use Channel Image Control (CHNL_IMG_CTRL) to provide the global alpha value and enable control. The ROI_* registers are not used.

Offset

Register	Offset
CHNL_ROI_0_ALPHA	40h

Diagram



Fields

Field	Description
31-24 ALPHA	Alpha Value Specifies the alpha value to be inserted into a ROI of an image if you write 1 to ALPHA_EN. ROI is defined by Channel Upper Left Coordinate for ROI 0 (CHNL_ROI_0_ULC) and Channel Lower Right Coordinate for ROI 0 (CHNL_ROI_0_LRC).
23-17 —	Reserved
16 ALPHA_EN	Alpha Value Insertion Enable Controls whether the alpha value is inserted into a ROI of an image. ROI is defined by Channel Upper Left Coordinate for ROI 0 (CHNL_ROI_0_ULC) and Channel Lower Right Coordinate for ROI 0 (CHNL_ROI_0_LRC). 0 - Disable 1 - Enable
15-0 —	Reserved

43.7.19 Channel Upper Left Coordinate for ROI 0 (CHNL_ROI_0_ULC)

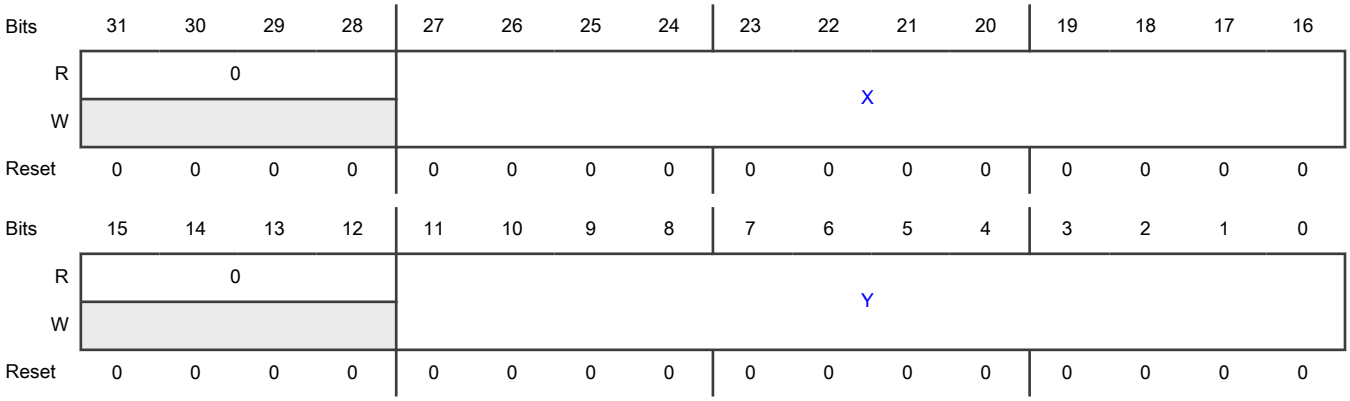
Defines the upper-left coordinate for ROI 0. Channel Upper Left Coordinate for ROI 0 (CHNL_ROI_0_ULC) and Channel Lower Right Coordinate for ROI 0 (CHNL_ROI_0_LRC) must correspond to the scaled image dimensions because the alpha insertion happens after scaling is performed.

Pixel locations that are greater than or equal to the upper-left coordinates and lesser than or equal to the lower-right coordinates define ROI.

Offset

Register	Offset
CHNL_ROI_0_ULC	44h

Diagram



Fields

Field	Description
31-28 —	Reserved
27-16 X	Upper Left X-Coordinate Indicates the upper-left X-coordinate (in pixels) of ROI 0.

27-16 X	Lower Right X-Coordinate Indicates the lower-right X-coordinate (in pixels) of ROI 1.
15-12 —	Reserved
11-0 Y	Lower Right Y-Coordinate Indicates the lower-right Y-coordinate (in pixels) of ROI 1.

43.7.24 Channel Alpha Value for ROI 2 (CHNL_ROI_2_ALPHA)

Provides the alpha value and control to enable alpha value insertion into ROI 2 of an image. The alpha insertion happens after you perform the scaling, so that ULC and LRC correspond to the scaled image dimensions.

The region is defined by Channel Upper Left Coordinate for ROI 2 (CHNL_ROI_2_ULC) and Channel Lower Right Coordinate for ROI 2 (CHNL_ROI_2_LRC).

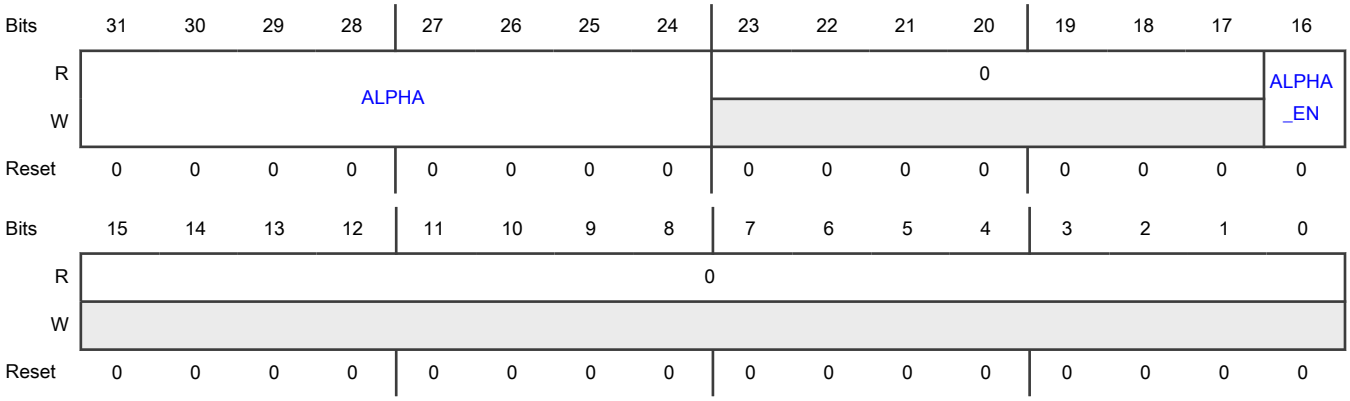
NOTE

If one particular value of alpha is to be inserted globally for the whole image, use Channel Image Control (CHNL_IMG_CTRL) to provide the global alpha value and enable control. The ROI_* registers are not used.

Offset

Register	Offset
CHNL_ROI_2_ALPHA	58h

Diagram



Fields

Field	Description
31-24 ALPHA	Alpha Value Specifies the alpha value to be inserted into the ROI of an image if ALPHA_EN = 1. ROI is defined by Channel Upper Left Coordinate for ROI 2 (CHNL_ROI_2_ULC) and Channel Lower Right Coordinate for ROI 2 (CHNL_ROI_2_LRC).
23-17 —	Reserved
16 ALPHA_EN	Alpha Value Insertion Enable Controls whether alpha value is inserted or not into the ROI of an image. ROI is defined by Channel Upper Left Coordinate for ROI 2 (CHNL_ROI_2_ULC) and Channel Lower Right Coordinate for ROI 2 (CHNL_ROI_2_LRC). 0 - Disable 1 - Enable
15-0 —	Reserved

43.7.25 Channel Upper Left Coordinate for ROI 2 (CHNL_ROI_2_ULC)

Defines the upper-left coordinate for ROI 2. Channel Upper Left Coordinate for ROI 2 (CHNL_ROI_2_ULC) and Channel Lower Right Coordinate for ROI 2 (CHNL_ROI_2_LRC) must correspond to the scaled image dimensions because the alpha insertion happens after scaling is performed.

Pixel locations that are greater than or equal to the upper-left coordinates and lesser than or equal to the lower-right coordinates define ROI.

Fields

Field	Description
31-16 —	Reserved
15-0 LINE_PITCH	Output Buffer Line Pitch Indicates the number of bytes in memory between two vertically adjacent pixels.

43.7.34 Channel Input Buffer Address (CHNL_IN_BUF_ADDR)

Provides the start address for reading the standalone or deinterlaced image frames from memory. Blending (or averaging) deinterlacing stores the odd frame image into the memory address that this register specifies. The channel reads back the image and sends it to the deinterlacing logic when SRC is set as memory (CHNL_CTRL[SRC_TYPE] = 1).

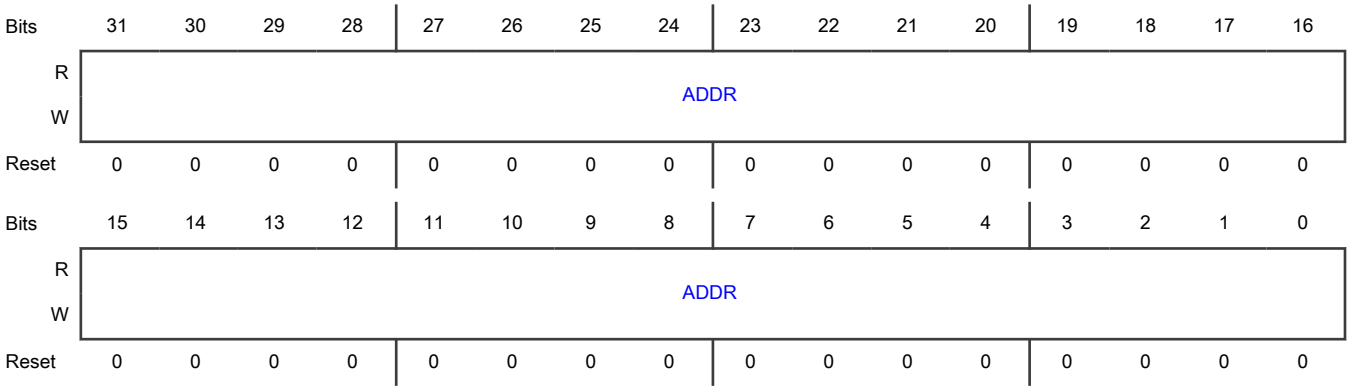
The storage location allows for two frames to be stored. When reading the image frames from memory, the module switches between the two locations automatically. The read operation starts automatically when you need to perform blend deinterlacing. When processing standalone images from memory, you must trigger the processing of images. The format of the image that can be stored in this location can be RGB, YUV444, or YUV422 only. The image format is set automatically when one channel is configured to perform blend deinterlacing.

For deinterlacing, configure the deinterlace method and source type in one channel and configure only the source type as memory in another channel. The module can pair the deinterlace and memory channels automatically to perform blend deinterlace. For other deinterlace methods, read back of frames from memory is not required. See Image deinterlacing methods for more information on deinterlacing.

Offset

Register	Offset
CHNL_IN_BUF_ADDR	80h

Diagram



Fields

Field	Description
31-0 ADDR	Starting Address Specifies the starting address from where the input image is read. You can update this field during direct memory reads. For deinterlacing of the intermediate frames, you must reserve address space of two frame size + pitch range. The hardware logic determines the addresses for the intermediate frames during deinterlacing because the software is not concerned about intermediate frames.

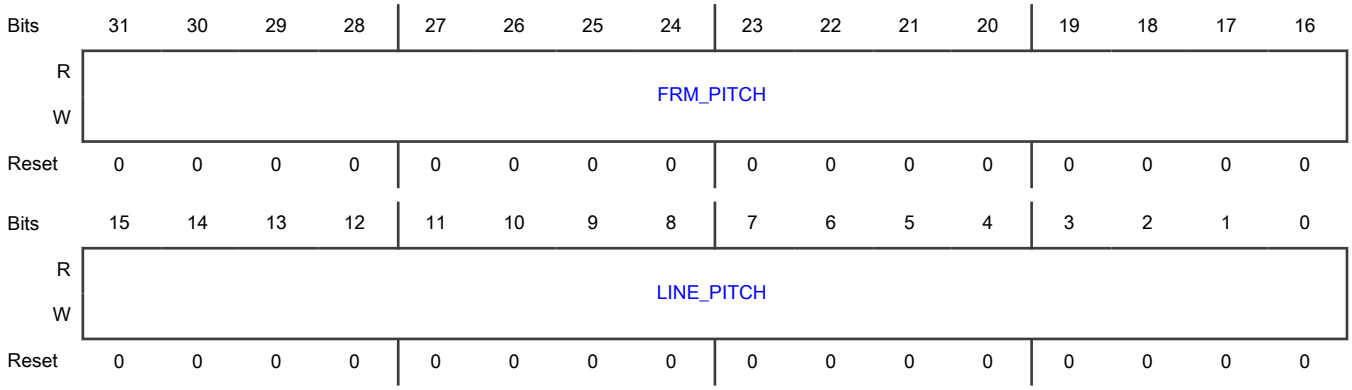
43.7.35 Channel Input Buffer Pitch (CHNL_IN_BUF_PITCH)

Provides the line and frame pitch for the image to be read out from the memory location that you configure in .

Offset

Register	Offset
CHNL_IN_BUF_PITCH	84h

Diagram



Fields

Field	Description
31-16 FRM_PITCH	Frame Pitch Indicates the number of bytes in memory between the two frames that are read from the memory. You can alternatively keep the frame pitch as zero and update during direct memory reads. For deinterlacing, the frame pitch is required to store the intermediate frames. You must reserve two frame size + pitch range of addresses for the intermediate frames because the software is not concerned about them.
15-0 LINE_PITCH	Line Pitch Indicates the number of bytes in memory between two vertically adjacent pixels.

43.7.36 Channel Memory Read Control (CHNL_MEM_RD_CTRL)

Provides the image format information and control to start reading image from memory. This register is used when the image source type is memory (CHNL_CTRL[SRC_TYPE] = 1) and standalone image is being read from memory (with no deinterlacing performed). This register is not used during deinterlacing where the deinterlace logic controls the image read back from memory.

Both deinterlace image read and standalone image read cannot happen together, even on different channels.

All input image formats that IMG_TYPE defines are described in Table 449.

Table 449. Input image formats

Bit field value	Format	Description
0000b	BGR8P	BGR format with 8 bits per color component (packed into 32-bit DWORD)
0001b	RGB8P	RGB format with 8 bits per color component (packed into 32-bit DWORD)
0010b	XRGB8	RGB format with 8 bits per color component (unpacked and LSB aligned in 32-bit DWORD)
0011b	RGBX8	RGB format with 8 bits per color component (unpacked and MSB aligned in 32-bit DWORD)
0100b	XBGR8	BGR format with 8 bits per color component (unpacked and LSB aligned in 32-bit DWORD)

Table continues on the next page...

Table 449. Input image formats (continued)

Bit field value	Format	Description
0101b	RGB565	RGB format with 5 bits of R, B; 6 bits of G (packed into 32-bit DWORD)
0110b	A2BGR10	BGR format with 2 bits alpha in MSB; 10 bits per color component
0111b	A2RGB10	RGB format with 2 bits alpha in MSB; 10 bits per color component
1000b	YUV444_1P8P	8 bits per color component; 1-plane, YUV interleaved packed bytes
1001b	YUV444_1P10	10 bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
1010b	YUV444_1P10P	10 bits per color component; 1-plane, YUV interleaved packed bytes (2 MSB waste bits in 32-bit WORD)
1011b	YUV444_1P12	12 bits per color component; 1-plane, YUV interleaved unpacked bytes (4 LSB waste bits in 16-bit WORD)
1100b	YUV444_1P8	8 bits per color component; 1-plane YUV interleaved unpacked bytes (8 MSB waste bits in 32-bit DWORD)
1101b	YUV422_1P8P	8 bits per color component; 1-plane YUV interleaved packed bytes
1110b	YUV422_1P10	10 bits per color component; 1-plane, YUV interleaved unpacked bytes (6 LSB waste bits in 16-bit WORD)
1111b	YUV422_1P12	12 bits per color component; 1-plane, YUV interleaved packed bytes (4 MSB waste bits in 16-bit WORD)

Fields

Field	Description
31-0 ADDR	Starting Address for U/Cb or 2-plane UV/CbCr Specifies the starting address for the (U or Cb) or two-plane (UV or CbCr) memory location.

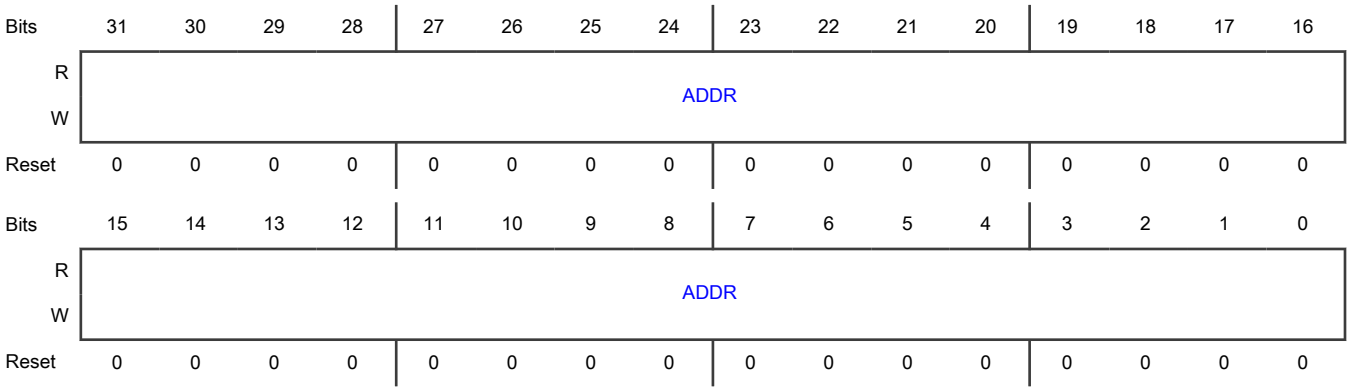
43.7.39 Channel Chroma (V/Cr) Output Buffer 2 Address (CHNL_OUT_BUF2_ADDR_V)

Specifies the starting memory address of buffer 2 where the V or Cr data of the processed image is stored. You do not use this register in one- or two-plane operations.

Offset

Register	Offset
CHNL_OUT_BUF2_ADDR_V	94h

Diagram



Fields

Field	Description
31-0 ADDR	Starting Address for V or Cr Specifies the starting address for the V or Cr memory location.

43.7.40 Channel Scaled Image Configuration (CHNL_SCL_IMG_CFG)

Provides details related to the image width (in pixels) and height (in lines) at the scaler output. Because the image after scaling can be flipped, cropped, or both; the dimension of the image after scaling becomes an important parameter for the output buffer control logic.

The scaled image dimension is computed as: dimension in Channel Image Configuration (CHNL_IMG_CFG) divided by the scale factor in Channel Scale Factor (CHNL_SCALE_FACTOR) and rounded to the closest integer.

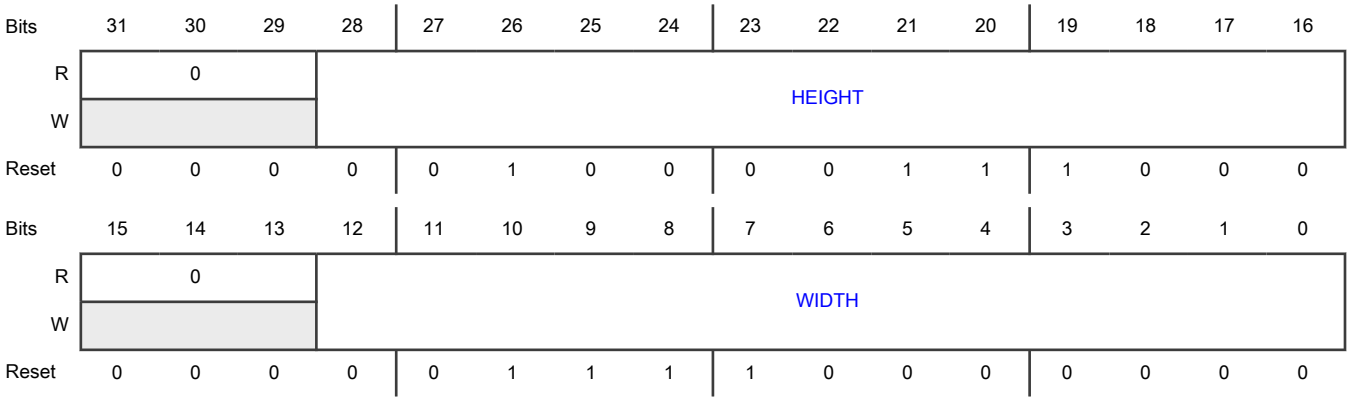
NOTE

You must program this register with the correct image dimensions even if the scaler is bypassed.

Offset

Register	Offset
CHNL_SCL_IMG_CFG	98h

Diagram



Fields

Field	Description
31-29 —	Reserved
28-16 HEIGHT	Scaled Image Height (Lines) Provides the height of the scaled image in terms of number of lines. Default height is 1080 lines for 1:1 scaling.
15-13 —	Reserved
12-0 WIDTH	Scaled Image Width (Pixels) Provides the width of the scaled image in terms of number of pixels. Default width is 1920 pixels for 1:1 scaling.

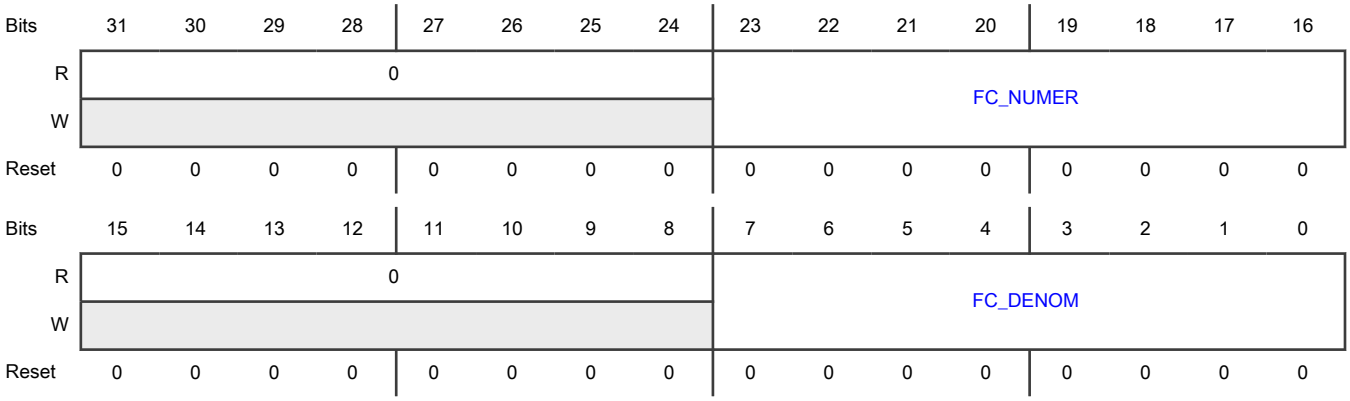
43.7.41 Channel Flow Control (CHNL_FLOW_CTRL)

Provides the amount of usable AXI bus bandwidth for writing out the pixel data from the channel's output buffers (Y, U, or V). The usable bandwidth is specified as a fraction (numerator/denominator) where denominator >= numerator. This flow control kicks in for the whole frame when the source of frame is memory or for only the last line when the source is a pixel link input and the line buffer inside the scaler is being used (that is, when scaler is enabled or YUV420 data is being input).

Offset

Register	Offset
CHNL_FLOW_CTRL	9Ch

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 FC_NUMER	Numerator Value of Fraction of Usable Bandwidth Determines the clock cycles out of the FC_DENOM number of clock cycles during which pixels can be written out. FC_NUMER cannot be greater than FC_DENOM. Flow control is disabled if you write 0 to this field. The AXI write request consumes the full available bandwidth if you configure FC_NUMER = FC_DENOM. 0000_0000 - Invalid value (flow control disabled)
15-8 —	Reserved
7-0 FC_DENOM	Denominator Value of Fraction of Usable Bandwidth Determines the total cycles within which the FC_NUMER clock cycles are used to write out the data on the AXI write bus. FC_DENOM cannot be less than FC_NUMER. Flow control is disabled if you write 0 to this field. The AXI write request consumes the full available bandwidth if you configure FC_NUMER = FC_DENOM. 0000_0000 - Invalid value (flow control disabled)

Chapter 44
Parallel Camera Interface

44.1 Overview

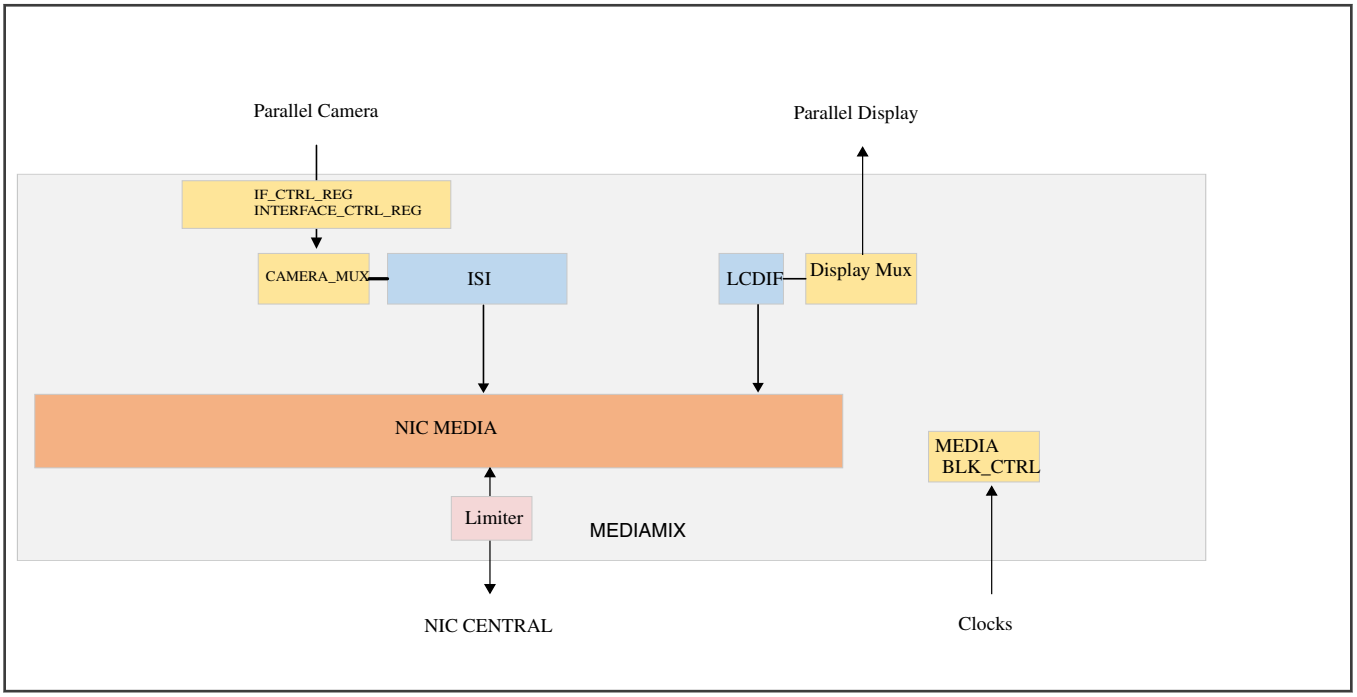
This chapter describes the Parallel Capture Interface. It interfaces the chip to the Parallel CSI sensor.

44.1.1 Features

The parallel camera interface provides the following features.

- Configurable interface logic to support most commonly used parallel CMOS sensors
- Supports up to 80MHz input clock from sensor
- Supports the following input data formats
  - 8-bit/10-bit Camera Sensor Interface (CSI)
  - 8-bit data port for RGB, YCbCr, and YUV data input
  - 8-bit/10-bit data ports for Bayer data input
- Parallel Camera Interface is hooked to the Imaging subsystem via the Pixel Link

44.1.2 Block Diagram



NOTE

For more information on Parallel Camera Interface Register (IF_CTRL_REG), Interface Control Register (INTERFACE_CTRL_REG), Camera Mux and Display Mux please refer Media Mix Domain Block Control.

NOTE

For more information about Parallel Display Outputs see LCDIF Parallel DISPLAY_MUX .

44.2 Functional Description

This section provides the functional description of the Parallel Camera Interface. The parallel camera interface is capable of forming a standard synchronous link between pixel sources (camera and/or image capture devices or the imaging subsystem) and a pixel consumer (ISI). The parallel camera interface provides a transport mechanism to deliver pixel data and bus connections to ISI.

Various types of data are supported by the interface and the format selection can be done by the INTERFACE_CTRL_REG and IF_CTRL_REG in the BLK_CTRL_MEDIAMIX. Please see the Media Mix Domain Block Control (BLK_CTRL_MEDIAMIX) for more feature information. The pixel transfer function is configured to support 36 data bits and up to 12 control bits standard pixel link interface. The control signals for this interface originate from the parallel port and are fed along with data at the same clock rate.

Data_type_in (BLK)	Clk gate (BLK)	Pixel_width (BLK)	DEINT (ISI)	YCBCR_MODE (ISI)	CSC_MODE (ISI)	CSC_BYP (ISI)	COEFF (ISI)
0x0 UYVY bt656 8-bit	1	Image width -1	Depend on camera	0x0	0x0 YUV->RGB	0x0	See Figure 234
0x5 YUV422 YVYU 8-bit	0	Image width -1	Depend on camera	0x1	0x1 YCbCr to RGB	0x0	See Figure 235

```
#ifdef __YUV422__
//YCrCb to RGB
#define COEFF0 0x12a | (0x0 << 16)// 1.164 / 0.
#define COEFF1 (0x198) | (0x12a << 16) // 1.596 / 1.164
#define COEFF2 (0x79c) | (0x730 << 16) // -0.392 / -0.813
#define COEFF3 0x12a | (0x204 << 16)// 1.164 / 2.017
#define COEFF4 (0x0) | (0x1f0 << 16)// 0 / -16
#define COEFF5 (0x180) | (0x180 << 16) // -128 / -128
#endif
```

Figure 234. YUV422

```
//YUV to RGB
#define COEFF0 (0x100   | (0 << 16)    ) // 1.0 / 0
#define COEFF1 ((0x124) | (0x100 << 16)) // 1.14 / 1
#define COEFF2 ((0x79b) | (0x76b << 16)) // -0.395 /- 0.581
#define COEFF3 (0x100   | (0x208 << 16)) // 1 / 2.032
#define COEFF4 ((0x0)   | (0x00 << 16) ) // 0.00 / 0
#define COEFF5 ((0x00)  | (0x00 << 16) ) // 0 / 0
```

Figure 235. YUV to RGB

1. When doing YUV to RGB, use COEFF of “YCrCb to RGB” and set the CSC_MODE to 1, which means YCrCb to RGB. The YUV mode of parallel camera module is recognized as YCbCr.

```
output_control &= ~(0b1 << 3);
output_control |= (0b0 << 3);  //0=yuv,1=ycbcr
```

2. When doing YCrCb to RGB, use COEFF of “YUV to RGB” and set the CSC_MODE to 0, which means YUV to RGB. The YCbCr mode of parallel camera module is recognized as YUV.

NOTE

```
output_control &= ~(0b1 << 3);
output_control |= (0b1 << 3);  //0=yuv,1=ycbcr
```

Chapter 45
Low Power Inter-Integrated Circuit (LPI2C)

45.1 Chip-specific LPI2C information

Table 451. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes eight instances of LPI2C Modules. LPI2C1 and LPI2C2 are in AONMIX. LPI2C3-8 in WAKEUPMIX. I2C1 and I2C2 are only supported in Master Mode, not Slave Mode.

The LPI2C feature of a bridge mode (separate SCL/SDA for I2C master and SCLS/SDAS for I2C slave on the one LPI2C instance) is not supported. The 4-pin unidirectional mode (separate SCL_IN, SCL_OUT, SDA_IN, SDA_OUT) is not supported.

HREQ host request feature to allow HW triggers to initiate the start of an I2C request is not supported.

NOTE

Peripheral triggers are not supported on this chip. References to LPI2C triggers in Peripheral triggers do not apply.

45.2 Overview

LPI2C supports an efficient interface to an I2C bus as a controller and target:

- Implements logic support for Standard, Fast, Fast+, HS-mode (target only) and Ultra-Fast modes of operation
- Uses little CPU overhead, with DMA offloading of FIFO register accesses
- Continues operating in Stop modes if an appropriate clock is available

LPI2C also complies with the System Management Bus (SMBus) Specification, version 3. The SMBus is a single-ended simple two-wire bus, which is typically used for low-bandwidth communications.

The Inter-Integrated Circuit (I^2C) serial bus is multi-controller, multi-target, packet-switched, and single-ended, and is often used to attach microcontroller ICs to lower-speed peripheral ICs.

NOTE

Terminology in this chapter has been updated to align with I^2C-bus specification, Rev. 7.0, as shown in Table 452.

Table 452. Updated terms

Updated term	Deprecated term

Target	Slave

45.2.1 Block diagram

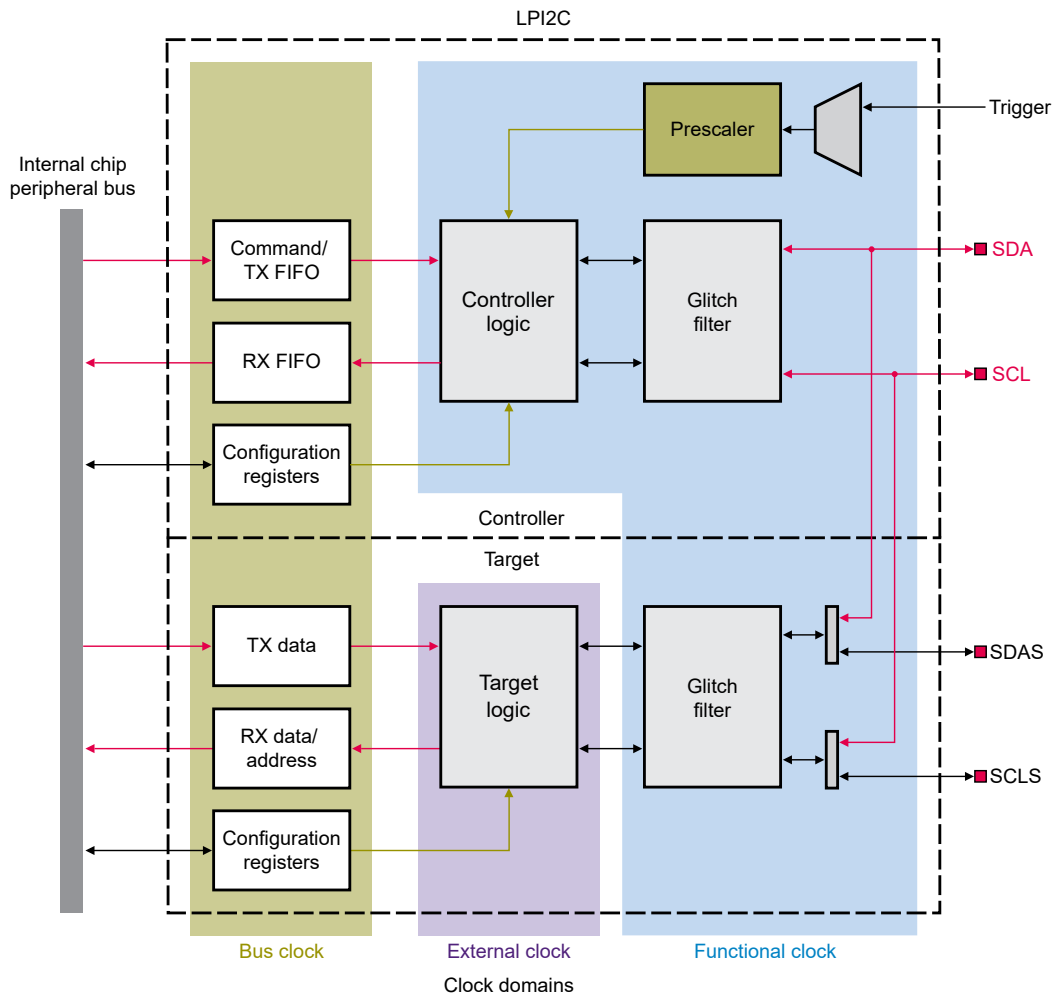

Figure 236. Block diagram

45.2.2 Features

LPI2C supports:

- Standard, Fast, Fast+ and Ultra Fast modes
- HS mode in target mode
- Multicontroller, including synchronization and arbitration, means that any number of controller nodes can be present. Also, controller and target roles can be changed between messages (after a Stop signal is sent).
- Clock stretching. Used on the SCL line, as an I2C flow control mechanism.
- Arbitration for when the system has more than one controller. When used on the SDA line, ensures that there is only one I2C transmitter at a time.
- General call, seven-bit addressing, and ten-bit addressing
- Software reset, Start byte, and device ID (also require software support)

The LPI2C controller supports:

- Command and transmit FIFO of 8 words (8-bit transmit data + 3-bit command)

- Receive FIFO of 8 words (8-bit receive data).
- Command FIFO waiting for an I2C idle bus before initiating a transfer
- Initiation of repeated Start and Stop conditions and one or more controller-receiver transfers by command FIFO
- Stop condition generation from command FIFO, or automatic generation of Stop condition when the transmit FIFO is empty
- Interrupt generation on data match and unwanted data rejection, via flexible receive data match
- Flags and optional interrupt signals at repeated Start condition, Stop condition, loss of arbitration, unexpected NACK, and command word errors
- Configurable bus idle timeout and pin-stuck-low timeout

The LPI2C target supports:

- Separate I2C target registers to minimize software overhead because of controller or target switching
- 7-bit or 10-bit addressing, address range, SMBus alert, and general call address.
- Transmit data register that supports interrupt or DMA requests
- Receive data register that supports interrupt or DMA requests
- Software-controllable ACK or NACK, with optional clock stretching on ACK or NACK field
- Configurable clock stretching, to avoid transmit-FIFO-underrun and receive-FIFO-overrun errors
- Flags and optional interrupt at end of packet, Stop condition, or bit error detection

45.3 Functional description

45.3.1 Controller mode

The LPI2C controller logic operates independently from the target logic to perform all controller-mode transfers on the I2C bus.

45.3.1.1 Transmit and Command FIFO commands

The transmit FIFO stores command data to initiate various I2C operations. The following operations can be initiated through commands in the transmit FIFO:

- Start or repeated Start condition with address byte, expecting ACK or NACK.
- Transmit data. This operation is the default for zero-extended-byte writes to the transmit FIFO.
- Receive 1-256 bytes of data. You can configure this operation to discard received data and not to store it in the receive FIFO.
- Stop condition. You can configure this operation to send a Stop condition when the transmit FIFO is empty.

Multiple transmit and receive commands can be inserted between the Start and Stop conditions. To comply with the I2C specification, transmit and receive commands must not be interleaved. The receive data command and the receive data and discard commands can be interleaved. This interleaving ensures that only the desired received data is stored in the receive FIFO (or compared with the data match logic).

The LPI2C controller automatically transmits a NACK on the last byte of a receive data command. It transmits the NACK unless the next command in the FIFO is also a receive data command. If the transmit FIFO is empty when a receive data command completes, a NACK is also automatically transmitted.

The LPI2C controller supports 10-bit addressing via a (repeated) Start condition, followed by a transmit data byte containing the second address byte, followed by any number of data bytes with the controller transmit data.

A Start or repeated Start condition expecting a NACK (for example, HS mode controller code) must be followed by a Stop or (repeated) Start condition.

45.3.1.2 Controller operations

When LPI2C is enabled, it monitors the I2C bus to detect when the I2C is idle (MSR[BBF]). If either SCL or SDA are low, the I2C bus is no longer considered idle. The bus becomes idle if a Stop condition is detected or if a bus idle timeout is detected (as configured by MCFGR2[BUSIDLE]). After the bus is idle, if the transmit FIFO is not empty and the host request is asserted or disabled, the LPI2C controller initiates a transfer on the bus. This transfer involves the following steps:

1. Wait the bus idle time equal to (MCCR0[CLKLO] + 1) multiplied by the prescaler (MCFGR1[PRESCALE]).
2. Transmit a Start condition and address byte using the timing configuration in Controller Clock Configuration 0 (MCCR0). If an HS mode transfer is configured, the timing configuration from Controller Clock Configuration 1 (MCCR1) is used instead.
3. Perform controller transmit or controller receive transfers, as configured by the transmit FIFO.
4. Transmit NACK on the last byte of a controller receive transfer. This action is performed unless the next command in the transmit FIFO is also a receive data command and the transmit FIFO is not empty.
5. Transmit a repeated Start or Stop condition as configured by the transmit FIFO or MCFGR1[AUTOSTOP]. A repeated Start can change which timing configuration register is used.

When MCFGR0[RELAX] is 1, the LPI2C controller does not wait for the I2C bus to be idle before starting a transfer. It also relaxes some restrictions on the order of FIFO commands. For example, it allows a Stop command when it is idle to generate a Start condition, followed by one SCL clock pulse, and then a Stop condition.

When the LPI2C controller is disabled, LPI2C continues emptying the transmit FIFO until a Stop condition is transmitted. (The controller could be disabled due to MCR[MEN] being 0, or automatically due to mode entry.) However, LPI2C no longer stalls the I2C bus by waiting for the transmit or receive FIFO. After the transmit FIFO is empty, LPI2C generates a Stop condition automatically.

The LPI2C controller can stall the I2C bus under certain conditions. This stalling results in SCL pulled low continuously on the first bit of a byte, until these conditions change:

- The LPI2C controller is enabled and busy, the transmit FIFO is empty, and MCFGR1[AUTOSTOP] is 0. The LPI2C controller continues to stall the bus until the transmit FIFO is loaded with more data.
- The LPI2C controller is enabled and receiving data, receive data is not being discarded (due to command or receive data match), and the receive FIFO is full. The LPI2C controller continues to stall the I2C bus until the receive FIFO is emptied.

The LPI2C controller aborts the existing transfer when MCFGR0[ABORT] becomes 1. This action causes the LPI2C controller to complete the existing word and then transmit a Stop condition. If the receive FIFO is full when the receive operation is aborted, the last received data is discarded. A new transfer does not start while MCFGR0[ABORT] is 1.

45.3.1.3 Receive FIFO and data matching

The receive FIFO stores receive data during controller-receiver transfers. You can configure the LPI2C controller to discard received data instead of storing it in the receive FIFO. This option is configured via the command word in the transmit FIFO.

Received data supports a receive data match function that can match received data against one of two bytes, or against a masked data byte. You can configure the data match function to compare only the first one or two data words received since the last (repeated) Start condition. Received data that is already discarded due to the command word cannot cause a data match. It delays the match on the first data word received until after the discarded data is received.

You can configure the receiver match function to discard all received data until a data match is detected, using MCFGR0[RDMO]. Following a data match, write 0 to MCFGR0[RDMO] before writing 0 to MSR[DMF] to allow all subsequent data to be received.

45.3.1.4 Timing parameters

The LPI2C controller can configure the following timing parameters. Parameters are configured separately for HS mode (Controller Clock Configuration 1 (MCCR1)) and other modes (Controller Clock Configuration 0 (MCCR0)). This separation allows the HS mode controller code to be sent using regular timing parameters. Then it allows a switch to HS mode timing (following a repeated Start) until the next STOP condition.

Configure the LPI2C controller timing parameters, measured in LPI2C functional clock cycles, as shown in Table 453. You must configure these parameters to meet the I2C timing specification for the required mode.

Table 453. Timing parameters

I2C specification timing parameter	I2C specification timing symbol	LPI2C timing parameter (in LPI2C functional clock cycles)
SCL clock period	tSCL	(CLKHI + CLKLO + 2 + SCL_LATENCY) × (2 ^ PRESCALE)
Hold time (repeated) Start condition	tHD:STA	(SETHOLD +1) × (2 ^ PRESCALE)
Low period of the SCL clock	tLOW	(CLKLO + 1) × (2 ^ PRESCALE)
High period of the SCL clock	tHIGH	(CLKHI + 1 + SCL_LATENCY) × (2 ^ PRESCALE)
Setup time for a repeated Start condition or Stop condition	tSU:STA, tSU:STO	(SETHOLD + 1 + SCL_LATENCY) × (2 ^ PRESCALE)
Data hold time	tHD:DAT	(DATAVD + 1) × (2 ^ PRESCALE)
Data setup time	tSU:DAT	(SDA_LATENCY + 1) × (2 ^ PRESCALE)
Bus free time between a Stop and Start condition	tBUF	(CLKLO + 1 + SDA_LATENCY) × (2 ^ PRESCALE)
Data valid time, data valid acknowledge time	tVD:DAT, tVD:ACK	(DATAVD + 1) × (2 ^ PRESCALE)

Table 454 defines the latency parameters. These parameters assume that the risetime is less than one LPI2C functional clock cycle. The risetime depends on a number of factors, including the I/O propagation delay, the I2C bus loading, and the external pullup resistor sizing. A larger risetime increases the number of cycles that the signal takes to propagate through the synchronizer (and glitch filter), which increases the latency.

Table 454. Synchronization latency

Timing parameter	Timing definition
SCL_LATENCY	ROUNDDOWN ((2 + FILTSCL + SCL_RISETIME) ÷ (2 ^ PRESCALE))
SDA_LATENCY	ROUNDDOWN ((2 + FILTSDA + SDA_RISETIME) ÷ (2 ^ PRESCALE))

The following timing restrictions must be enforced to avoid unexpected Start or Stop conditions on the I2C bus. These restrictions also avoid unexpected Start or Stop conditions detected by the LPI2C controller. The timing restrictions can be summarized as "SDA cannot change when SCL is high outside a transmitted (repeated) Start or Stop condition."

Table 455. LPI2C timing parameter restrictions

Timing parameter	Minimum	Maximum	Comment
CLKLO	03h	—	CLKLO x (2 ^ PRESCALE) > SCL_LATENCY
CLKHI	01h	—	Configure CLKHI to meet the duty cycle requirements in the I2C specification
SETHOLD	02h	—	SETHOLD × (2 ^ PRESCALE) > SDA_LATENCY

Table continues on the next page...

Table 455. LPI2C timing parameter restrictions (continued)

Timing parameter	Minimum	Maximum	Comment
DATAVD	01h	CLKLO – SDA_LATENCY – 1	Configure DATAVD to meet the data hold requirement in the I2C specification
FILTSCL	00h	[CLKLO × (2 ^ PRESCALE)] – 3	FILTSCL and FILTSDA are the only parameters not multiplied by (2 ^ PRESCALE)
FILTSDA	FILTSCL	[CLKLO × (2 ^ PRESCALE)] – 3	Configuring FILTSDA greater than FILTSCL can delay the SDA input to compensate for board level skew
BUSIDLE	(CLKLO + SETHOLD + 2) × 2	—	Must also be greater than (CLKHI + 1)

See the UM10204, *I2C-bus specification and user manual*.

See Application information for example LPI2C timing configurations.

45.3.1.5 Error conditions

The LPI2C controller monitors errors while it is active. The following conditions generate an error flag and block a new Start condition from being sent, until the flag is cleared by software:

- A Start or Stop condition is detected and is not generated by the LPI2C controller (MSR[ALF] becomes 1).
- Transmitting data on SDA and different values are received (MSR[ALF] becomes 1). LPI2C controller stops driving SDA immediately, but continues to drive SCL for the remainder of the byte.
- NACK is detected when transmitting data, and MCFGR1[IGNACK] is 0 (MSR[NDF] becomes 1).
- NACK is detected and is expecting ACK for the address byte, and MCFGR1[IGNACK] is 0 (MSR[NDF] becomes 1).
- ACK is detected and is expecting NACK for the address byte, and MCFGR1[IGNACK] is 0 (MSR[NDF] becomes 1).
- Transmit FIFO is requesting to transmit or receive data without a Start condition (MSR[FEF] becomes 1). This restriction is ignored when MCFGR0[RELAX] is 1.
- SCL (or SDA if MCFGR1[TIMECFG] is 1) is low for (MCFGR2[TIMELOW] × 256) prescaler cycles without a pin transition (MSR[PLTF] becomes 1).

You must respond to MSR[PLTF] to terminate the existing command. You can terminate the command cleanly by writing 0 to MCR[MEN], or you can terminate it abruptly by writing 1 to MCR[RST].

You can use MCFGR0[RELAX] to attempt to recover a target with SDA stuck low. If MCFGR0[RELAX] is 1, the LPI2C controller does not wait for the I2C bus to be idle before starting a transfer. Initiating a Start command with address FFh, then the Stop condition, should generate sufficient SCL clock edges to cause the target to release SDA.

You can use MCFGR2[BUSIDLE] to force the I2C bus to be considered idle when SCL and SDA remain high for (BUSIDLE + 1) prescaler cycles. The bus is considered idle when the LPI2C controller is first enabled. When BUSIDLE is configured greater than zero, then SCL or SDA must be high for (BUSIDLE + 1) prescaler cycles before the I2C bus is considered idle.

45.3.1.6 DMA support

For efficient DMA transfers to the transmit and command FIFO, two alias regions support incrementing 8-bit, 16-bit, or 32-bit write accesses to that FIFO.

- Controller Transmit Command Burst (MTCBR0 - MTCBR127) is a 512-byte region that supports pushing CMD and DATA into the transmit FIFO.

- Transmit Data Burst (MTDBR0 - MTDBR255) is a 1024-byte region that supports pushing zero extended DATA into the transmit FIFO.

The two regions are contiguous. A DMA transfer can start in the MTCBR region to initialize the transfer including START condition with address. The same transfer can complete in the MTDBR region with the data to transmit without changing the transfer size.

The transmit FIFO prevents writes that overflow the FIFO, but this prevention does not signal an error. Do not perform 32-bit writes to the MTDBR unless there are four empty slots in the transmit FIFO. Do not perform 16-bit writes to the MTDBR unless there are two empty slots in the transmit FIFO.

45.3.1.7 Pin configuration

Configuration	Description
Open-drain support	The LPI2C controller defaults to open-drain configuration of the SDA and SCL pins. Support for true open drain depends on the specific device, and requires the pins where LPI2C pins are muxed to support true open drain.
HS mode support	Support for HS mode depends on the specific device. This mode requires the SCL pin to support the current source pullup required in the I2C specification.
Ultra-Fast mode support	The LPI2C controller supports the output-only push-pull function required for I2C Ultra-Fast mode using the SDA and SCL pins. Support for Ultra-Fast mode also requires MCFGR1[IGNACK] to be 1.
Push-pull two-wire support	A push-pull two-wire configuration is available to the LPI2C controller. If LPI2C is the only controller and all I2C pins on the bus are at the same voltage, this configuration may support a partial HS mode. A partial HS mode, not a full HS mode, because this configuration actively drives high rather than enabling a current service pull-up. This configuration sets the SCL pin as push-pull for every clock except the first clock pulse, to allow HS-mode-compatible targets to perform clock stretching. In this mode, the SDA pin is tristated for controller-receive data bits and controller-transmit ACK/NACK bits, and is configured as push-pull at other times. To avoid the risk of contention when SDA is push-pull, configure the pin for open-drain operation, as part of the device-specific configuration.
Push-pull four-wire support	The push-pull four-wire configuration separates the SCL input data and output data into separate pins. It also separates the SDA input data and output data into separate pins. The SCL/SDA pins are used for input data; the SCLS/SDAS pins are used for output data, with configurable polarity. This configuration simplifies external connections when connecting the LPI2C to the I2C bus through external level shifters or discrete components. When using this four-wire configuration, the LPI2C controller logic and LPI2C target logic cannot connect to separate I2C buses.

45.3.2 Target mode

To perform all target mode transfers on the I2C bus, the LPI2C target logic operates independently from the LPI2C controller logic.

45.3.2.1 Address matching

You can configure the LPI2C target:

- To match one of two addresses, using either 7-bit or 10-bit addressing modes for each address.
- To match a range of addresses in either 7-bit or 10-bit addressing modes.
- To match the general call address and generate appropriate flags.
- To match the SMBus alert address and generate appropriate flags.
- To detect the HS mode controller code address, and to disable the digital filters and output valid delay time until the next Stop condition is detected.

After a valid address is matched, the LPI2C target automatically performs target-transmit or target-receive transfers until:

- A NACK is detected (unless SCFGR1[IGNACK] becomes 1).
- A bit error is detected (the LPI2C target is driving SDA, but a different value is sampled).
- A (repeated) Start or Stop condition is detected.

When SCFGR1[RXALL] is 1, the LPI2C target receives all addresses and data on the I2C bus. Unless the address is matched, it never drives the SDA pin. Configure the LPI2C target to match only on 7-bit address mode when this feature is enabled. Software can support 10-bit address mode. This option is intended for debugging the contents of an I2C transfer between another controller and target. Likewise, SCFGR1[SDCFG] and SCFGR1[RSCFG] configure the Stop or repeated Start flags to assert on all Stop or repeated Start conditions, even when there is no address match.

45.3.2.2 Transmit and receive data

Target Transmit Data (STDR) and Target Receive Data (SRDR) are double-buffered and only update during a target-transmit and target-receive transfer, respectively.

You can configure the target address that was received to be read from SRDR (for example, when using DMA to transfer data) or from Target Address Status (SASR).

You can configure STDR to request data only after a target-transmit transfer is detected. You can also configure it to request new data whenever STDR is empty.

Write to STDR only when SSR[TDF] is set.

Read SRDR only when SSR[RDF] is set, or when SSR[AVF] is set and SCFGR1[RXCFG] = 1.

Read SASR only when SSR[AVF] is set.

45.3.2.3 Read request

The LPI2C target generates a read request when the I2C bus is idle and you write 1 to SCFGR0[RDREQ]. This occurrence causes the LPI2C target to pull the SDA pin low until either the first SCL falling edge or SCFGR0[RDREQ] becomes 0. Following the next Stop condition or a software timeout, you can proceed as follows:

- If the LPI2C target is accessed at the correct address, the read request is acknowledged, and you must write 0 to SCFGR0[RDREQ].
- If SCFGR0[RDACK] is 1, the read request is acknowledged by a Start followed by one SCL pulse followed by a STOP condition. You must write 0 to SCFGR0[RDREQ].
- If neither of the first two cases occurred, the read request is not acknowledged. You must write 0 and then 1 to SCFGR0[RDREQ] after an appropriate delay, provided the I2C bus is idle.
- If a software timeout occurs, the read request is not acknowledged, and you should write 0 to SCFGR0[RDREQ]. Another request can be generated after an appropriate delay.

Writing to SCFGR0[RDREQ] when the I2C bus is busy results in a logic 0 being written. Write 1 to SCFGR0[RDREQ], then confirm that the register is written to correctly. If the register does not update correctly, the I2C bus is no longer idle and the read request must be attempted later.

45.3.2.4 Clock stretching

The LPI2C target supports many configurable options for clock stretching. You can configure these conditions to perform clock stretching:

- SSR[AVF] is set during the ninth clock pulse of the address byte.
- SSR[TDF] is set during the ninth clock pulse of a target-transmit transfer.
- SSR[RDF] is set during the ninth clock pulse of a target-receive transfer.
- SSR[TAF] is set during the eighth clock pulse of an address byte or a target-receive transfer. In HS mode, this option is disabled.

- Clock stretching can be extended for a number of cycles equal to the value of SCFGR2[CLKHOLD] cycles. This stretching allows additional setup time to sample the SDA pin externally. In HS mode, this option is disabled.

When clock stretching is enabled, clock stretching extends for one peripheral bus clock cycle after SDA updates, unless extended by the SCFGR2[CLKHOLD] configuration.

45.3.2.5 Timing parameters

The LPI2C target can configure the following timing parameters:

- SDA data valid time from SCL negation to SDA update
- SCL hold time when clock stretching is enabled to increase setup time when sampling SDA externally
- SCL glitch filter time
- SDA glitch filter time

These parameters are disabled when SCR[FILTEN] is 0, when SCR[FILTDZ] is 1 in Doze mode, and when LPI2C target detects HS mode. When disabled, the LPI2C target is clocked directly from the I2C bus. In this case, the target may not satisfy all timing requirements of the I2C specification (such as SDA minimum hold time in Standard/Fast mode).

The LPI2C target places the following restrictions on the timing parameters:

- You must configure SCFGR2[FILTSDA] to be greater than or equal to SCFGR2[FILTSCL] (unless compensating for board level skew between SDA and SCL).
- You must configure SCFGR2[DATAVD] to be less than the minimum SCL low period.

45.3.2.6 Error conditions

The LPI2C target can flag the following error conditions:

- SSR[BEF] is set when the LPI2C target is driving SDA but it samples a different value than what is expected.
- SSR[FEF] is set due to a transmit data underrun or a receive data overrun. To eliminate the possibility of underrun and overrun, enable clock stretching. When SCFGR1[RXNACK] is 1, the LPI2C target generates a NACK on a receive data overrun.
- SSR[FEF] is also set due to an address overrun, but only when SCFGR1[RXCFG] is 1. To eliminate the possibility of overrun, enable clock stretching. When SCFGR1[RXNACK] is 1, the LPI2C target generates a NACK on an address overrun regardless of the value of SCFGR1[RXCFG].

The LPI2C target does not implement a timeout due to SCL or SDA being stuck low. If this detection is required, use the LPI2C controller logic so you can reset the LPI2C target when this condition is detected.

45.3.3 Low-power modes

LPI2C remains functional during low-power modes, if MCR[DOZEN] = 0 and LPI2C uses an external or internal clock source that remains enabled. LPI2C can generate an interrupt or DMA request to cause a wake-up from low-power modes.

You can configure LPI2C to be disabled in low-power modes when MCR[DOZEN] = 1. In this case, LPI2C waits for the current transfer to complete any pending operation.

NOTE

See the chip-specific information for low-power modes available on your chip.

45.3.4 Debug mode

Table 456. Debug mode

Mode	LPI2C operation
Debug	If MCR[DBGEN] = 1, can continue operating in Debug mode.

45.3.5 Peripheral triggers

The connection of the LPI2C peripheral triggers to other peripherals depends upon the specific device being used.

Table 457. LPI2C triggers

Trigger	Description
Controller output trigger	Generates an output trigger that can be connected to other peripherals on the device. The controller output trigger asserts on either a repeated Start or a Stop condition. The trigger remains asserted for one cycle of the LPI2C functional clock divided by MCFGR1[PRESCALE].
Target output trigger	Generates an output trigger that can be connected to other peripherals on the device. The target output trigger asserts on either a repeated Start or a Stop condition that occurs after a target address match. The target output trigger remains asserted until the next target SCL pin negation.
Input trigger	Controls the start of a LPI2C bus transfer. The input trigger is synchronized. To be detected, the input trigger must assert for at least two cycles of the LPI2C functional clock divided by the value of MCFGR1[PRESCALE].

45.3.6 Clocking

Table 458. LPI2C clocks

Clock	Description
LPI2C functional clock	The LPI2C functional clock is asynchronous to the bus clock. It can remain enabled in low-power modes to support I2C bus transfers by the LPI2C controller. The functional clock is also used by the LPI2C target to support digital filter and data hold time configurations. The LPI2C controller divides the functional clock by a prescaler (MCFGR1[PRESCALE]) and the resulting frequency must be at least eight times faster than the I2C bus bandwidth.
External clock	The LPI2C target logic is clocked directly from the external pins. These pins are SCL and SDA, or SCLS and SDAS if the controller and target are implemented on separate pins). This clocking allows the LPI2C target to remain operational, even when the LPI2C functional clock is disabled. **NOTE** If the LPI2C functional clock is disabled, the LPI2C target digital filter must be disabled. This condition can affect compliance with some timing parameters of the I2C specification, such as data hold time.
Bus clock	The bus clock is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPI2C controller and target registers.

For chip-specific clocking information, see the Clocking chapter.

45.3.7 Reset

Table 459. LPI2C resets

Reset	Description
Chip reset	The logic and registers for the LPI2C controller and target are reset to their default states after a chip reset.
Software reset	The LPI2C controller implements a software reset field in its control register. MCR[RST] resets all controller logic and registers to their default states, except for Controller Control (MCR) itself. The LPI2C target implements a software reset field in its control register. SCR[RST] resets all target logic and registers to their default states, except for Target Control (SCR) itself.
FIFO reset	The LPI2C controller implements write-only control fields that reset the transmit FIFO (MCR[RTF]) and receive FIFO (MCR[RRF]). After a FIFO is reset, that FIFO is empty. The LPI2C target implements write-only control fields that reset the transmit data register (SCR[RTF]) and receive data register (SCR[RRF]). After a data register is reset, that data register is empty.

45.3.8 Interrupts and DMA requests

Depending on the configuration, interrupts and DMA requests can be combined:

- LPI2C controller and target interrupts
- LPI2C controller and target transmit DMA requests
- LPI2C controller and target receive DMA requests

45.3.8.1 Controller mode

Table 460 lists the Controller mode sources that can generate LPI2C controller interrupts and LPI2C controller transmit and receive DMA requests.

Table 460. Controller interrupts and DMA requests

Status flag	Description	Can generate		
		Interrupt?	DMA request?	Low-power wake-up?
Transmit Data Flag (MSR[TDF])	Data can be written to transmit FIFO, as configured by MFCR[TXWATER].	Y	TX	Y
Receive Data Flag (MSR[RDF])	Data can be read from the receive FIFO, as configured by MFCR[RXWATER].	Y	RX	Y
End Packet Flag (MSR[EPF])	Controller has transmitted a repeated Start or Stop condition.	Y	N	Y
Stop Detect Flag (MSR[SDF])	Controller has transmitted a Stop condition (and the LPI2C controller is idle, if MCFGR1[STOPCFG] = 1) .	Y	N	Y
NACK Detect Flag (MSR[NDF])	During an address byte, the controller expects an ACK but detects a NACK. During an address byte, the controller expects a NACK but detects an ACK.	Y	N	Y

Table continues on the next page...

Table 460. Controller interrupts and DMA requests (continued)

Status flag	Description	Can generate		
		Interrupt?	DMA request?	Low-power wake-up?
	During a controller-transmitter data byte, the controller detects a NACK.			
Arbitration Lost Flag (MSR[ALF])	The controller lost arbitration due to a Start or Stop condition detected at the wrong time, or the controller was transmitting data but received data different from the data that was transmitted.	Y	N	Y
FIFO Error Flag (MSR[FEF])	The controller expects a Start condition in the command FIFO, but the next entry in the command FIFO is not a Start condition.	Y	N	Y
Pin Low Timeout Flag (MSR[PLTF])	Pin low timeout is enabled and SCL (or SDA, if configured) is low for longer than the configured timeout.	Y	N	Y
Data Match Flag (MSR[DMF])	The received data matches the configured data match, but the received data is not discarded due to a command FIFO entry.	Y	N	Y
Start Detect Flag (MSR[STF])	A Start condition is detected on the I2C bus (and the LPI2C controller is idle, if MCFGR1[STARTCFG] = 1).	Y	N	Y
Controller Busy Flag (MSR[MBF])	LPI2C controller is busy transmitting or receiving data.	N	N	N
Bus Busy Flag (MSR[BBF])	LPI2C controller is enabled and activity is detected on the I2C bus, but no Stop condition is detected and no bus idle timeout (if enabled) occurred.	N	N	N

45.3.8.2 Target mode

Table 461 lists the target mode sources that can generate LPI2C target interrupts and LPI2C target transmit and receive DMA requests.

Table 461. Target interrupts and DMA requests

Status flag	Description	Can generate		
		Interrupt?	DMA request?	Low-power wake-up?
Transmit Data Flag (SSR[TDF])	Data can be written to Target Transmit Data (STDR).	Y	TX	Y
Receive Data Flag (SSR[RDF])	Data can be read from Target Receive Data (SRDR).	Y	RX	Y

Table continues on the next page...

Table 461. Target interrupts and DMA requests (continued)

Status flag	Description	Can generate		
		Interrupt?	DMA request?	Low-power wake-up?
Address Valid Flag (SSR[AVF])	Address can be read from Target Address Status (SASR).	Y	RX	Y
Transmit ACK Flag (SSR[TAF])	ACK or NACK can be written to Target Transmit ACK (STAR).	Y	N	Y
Repeated Start Flag (SSR[RSF])	Target has detected an address match followed by a repeated Start condition.	Y	RX	Y
Stop Detect Flag (SSR[SDF])	Target has detected an address match followed by a Stop condition.	Y	RX	Y
Bit Error Flag (SSR[BEF])	Target was transmitting data, but received data is different from what was transmitted.	Y	N	Y
FIFO Error Flag (SSR[FEF])	This flag is set by: • Transmit data underrun • Receive data overrun • Address status overrun when SCFGR1[RXCFG] = 1 This flag can only be set when clock stretching is disabled.	Y	N	Y
Address Match 0 Flag (SSR[AM0F])	Target detected an address match SAMR[ADDR0].	Y	N	N
Address Match 1 Flag (SSR[AM1F])	Target detected an address match with SAMR[ADDR1] or using an address range.	Y	N	N
General Call Flag (SSR[GCF])	Target detected an address match with the general call address.	Y	N	N
SMBus Alert Response Flag (SSR[SARF])	Target detected an address match with the SMBus alert address.	Y	N	N
Target Busy Flag (SSR[SBF])	LPI2C target is busy receiving an address byte or is transmitting or receiving data.	N	N	N
Bus Busy Flag (SSR[BBF])	LPI2C target is enabled and a Start condition is detected on I2C bus, but no Stop condition detected.	N	N	N

45.3.8.3 End-of-packet DMA transfer

End-of-packet functionality serves serial interfaces where the transfer size may not be known in advance and the data is pushed by an external device. Examples include UART receive, I2C Target mode, and SPI Target mode. End-of-packet processing is intended to ensure that data does not become stranded in either the receive FIFO or DMA receive buffer. Support for end-of-packet processing must be implemented in both the serial interfaces and DMA controller.

The condition that signals the end of packet differs for each serial interface but is processed by the serial peripheral and DMA in the same way. For example:

- UART end of packet is signaled by an idle line condition.

- I2C end of packet is signaled by Stop or repeated Start condition.
- SPI end of packet is signaled by PCS negation.

When the serial peripheral is configured to signal an end-of-packet condition to the DMA and the serial interface detects an end-of-packet condition, it asserts the DMA request for the receive FIFO regardless of the watermark configuration. For larger watermark configurations, this behavior ensures that the last few words of the transfer are first flushed from the receive FIFO.

The DMA then reads the contents of the receive FIFO, depending on the first word in the FIFO:

- If the receive FIFO is empty, the serial interface signals an end-of-packet condition to the DMA controller.
- If the receive FIFO is not empty, but the first word in the FIFO starts a new packet, data is not pulled from the receive FIFO. Also, the serial interface signals an end-of-packet condition to the DMA controller.
- If the receive FIFO is not empty, and the first word in the FIFO does not start a new packet, the DMA transfers data as normal.

Because the DMA may transfer multiple words per request, the end-of-packet condition persists until the DMA minor loop finishes and no additional data is pulled from the FIFO. The status flag that triggered the end-of-packet condition is cleared when the minor loop completes after the end of packet is signaled to the DMA controller.

When the DMA detects the end-of-packet condition, it writes all received words up to the end of packet into system memory. It also saves the destination address for the word after the last valid data. The DMA then terminates the channel as if the major loop completed, including final offsets and optional interrupts, channel linking, and scatter-gather. The final destination address can be saved to system memory or is available in the destination address register.

Because the DMA terminates the major loop, the receive FIFO is not serviced until the DMA is reconfigured. You can perform this reconfiguration through software or hardware (for example, channel linking or scatter-gather). Minimize this delay to avoid receiver FIFO overrun. Automatic DMA end-of-packet processing is not recommended when there are only a few words transferred between end-of-packet conditions. In this case, the DMA spends more time processing the end of packet than transferring the data. For example, to avoid an excessive number of idle conditions, increase the UART idle line length as needed.

45.4 External signals

Table 462. External signals

Signal	Name	Two-wire scheme	Four-wire scheme	Direction
SCL	LPI2C clock line	SCL	In Four-Wire mode, this pin is the SCL input pin.	Input or output
SDA	LPI2C data line	SDA	In Four-Wire mode, this pin is the SDA input pin.	Input or output
SCLS	Secondary I2C clock line	Not used	In Four-Wire mode, this pin is the SCLS output pin. If LPI2C controller/target are configured to use separate pins, then this pin is the LPI2C target SCL pin.	Input or output
SDAS	Secondary I2C data line	Not used	In Four-Wire mode, this pin is the SDAS output pin. If LPI2C controller/target are configured to use separate pins, then this pin is the LPI2C target SDA pin.	Input or output

Figure 237 shows the two-signal connection.

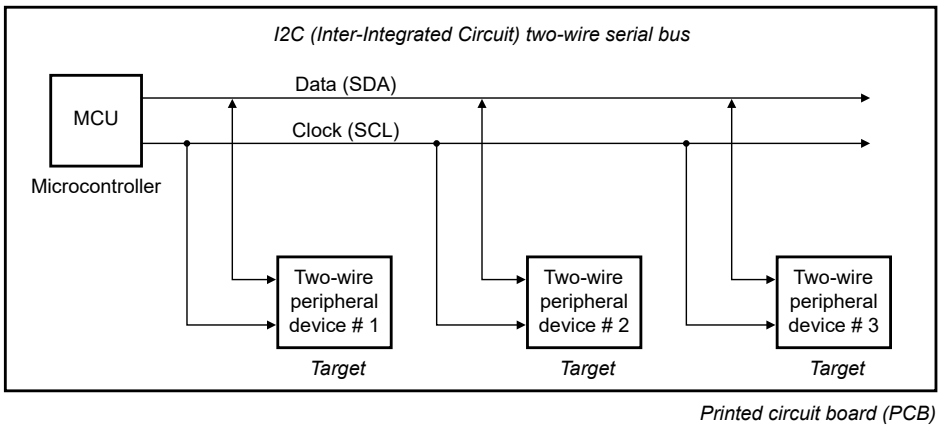

Figure 237. I²C two-wire serial bus

Figure 238 shows a possible four-signal connection.

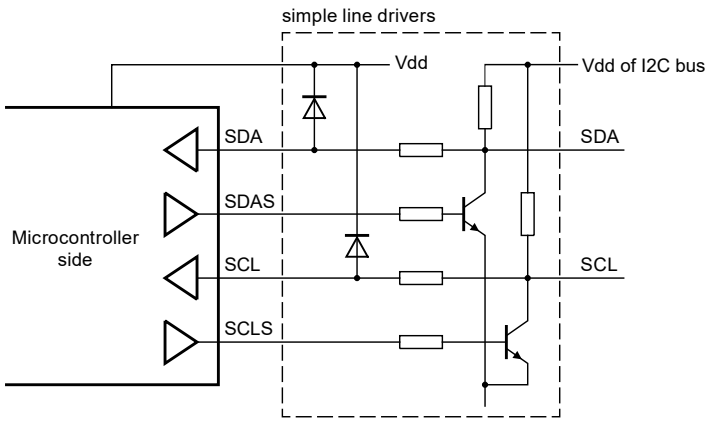

Figure 238. I²C four-wire serial bus

45.5 Initialization

To initialize the LPI2C controller:

1. Configure Controller Configuration 0 (MCFGR0)–Controller Configuration 3 (MCFGR3) as required by the application.
2. Configure Controller Clock Configuration 0 (MCCR0) and Controller Clock Configuration 1 (MCCR1) to satisfy the timing requirements of the I2C mode supported by the application.
3. Enable controller interrupts and DMA requests as required by the application.
4. Enable the LPI2C controller by writing 1 to MCR[MEN].

To initialize the LPI2C target:

1. Configure Target Address Match (SAMR) with the I2C address of the target location on the I2C bus.
2. Configure Target Configuration 0 (SCFGR0) and Target Configuration 1 (SCFGR1) as required by the application.
3. Configure Target Configuration 2 (SCFGR2) to satisfy the timing requirements of the I2C mode supported by the application.
4. Enable target interrupts and DMA requests as required by the application.
5. Enable the LPI2C target by writing 1 to SCR[SEN].

45.6 Application information

Configure the I2C timing parameters to meet the requirements of the I2C specification. This configuration depends on the supported mode and LPI2C functional clock frequency. When switching between two modes using different clock configuration registers (for example, Fast mode and HS mode), MCFGR1[PRESCALE] must remain constant between the modes.

Table 463. Example timing configurations

I2C mode	Clock frequency	Baud rate	PRESCALE	FILTSCL / FILTSDA	SETHOLD	CLKLO	CLKHI	DATAVD
Standard	8 MHz	100 kbit/s	0h	0h/0h	24h	28h	24h	02h

Fields

Field	Description
31-26 —	Reserved
25	Bus Busy Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
BBF	Specifies whether the I2C bus is busy. 0 - Idle 1 - Busy
24 MBF	Controller Busy Flag Specifies whether the I2C controller is busy. 0 - Idle 1 - Busy
23-16 —	Reserved
15 STF	Start Flag Specifies whether a Start condition is detected on the bus when the bus is idle. When MCFGR1[STARTCFG] is 0, this field becomes 1 only if the LPI2C controller is also idle. When MCFGR1[STARTCFG] is 1, STF becomes 1 for any Start condition when the I2C bus is idle. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Start condition not detected 1 - Start condition detected When writing 0 - No effect 1 - Clear the flag
14 DMF	Data Match Flag Indicates whether the received data matches MDMR[MATCH0] or MDMR[MATCH1] (as configured by MCFGR1[MATCFG]). Received data discarded due to MTDR[CMD] does not cause this flag to set. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Matching data not received 1 - Matching data received When writing 0 - No effect 1 - Clear the flag
13	Pin Low Timeout Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
PLTF	Indicates whether pin low timeout has occurred. Sets when the SCL or SDA input is low for more than the number of PINLOW cycles defined by MCFGR3[PINLOW], even when the LPI2C controller is idle. You must resolve the pin low condition via software. PLTF cannot be cleared as long as the pin low timeout continues. Before LPI2C can initiate a Start condition, you must clear this flag. See MCFGR1[TIMECFG] for the SCL and/or SDA timeout settings. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Pin low timeout did not occur 1 - Pin low timeout occurred When writing 0 - No effect 1 - Clear the flag
12 FEF	FIFO Error Flag Detects the LPI2C controller's attempt to send or receive data without first generating a (repeated) Start condition. This error can occur when the transmit FIFO underflows when MCFGR1[AUTOSTOP] = 1. When this flag is set, the LPI2C controller sends a Stop condition (if busy). The controller does not initiate a new Start condition until the flag is cleared. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No FIFO error 1 - FIFO error When writing 0 - No effect 1 - Clear the flag
11 ALF	Arbitration Lost Flag Indicates whether arbitration is lost. Either of these conditions sets this flag: • The LPI2C controller transmits a logic 1 and detects a logic 0 on the I2C bus. • The LPI2C controller detects a Start or Stop condition when the LPI2C controller is transmitting data. When ALF is set, the LPI2C controller releases the I2C bus (goes idle), and the LPI2C controller does not initiate a new Start condition until the ALF is cleared. **NOTE** This field behaves differently for register reads and writes.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When reading 0 - Controller did not lose arbitration 1 - Controller lost arbitration When writing 0 - No effect 1 - Clear the flag
10 NDF	NACK Detect Flag Indicates whether an unexpected NACK has been detected. This flag is set when the LPI2C controller detects a NACK it was not expecting when transmitting an address or data. When set, the controller does not initiate a new Start condition until this flag is cleared. If a NACK is expected for a given address (as configured by the command word), this flag is set if a NACK is not generated. When this flag is set, the LPI2C controller automatically transmits a Stop condition if MCFGR1[AUTOSTOP] = 1, or if the transmit FIFO is not empty. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No unexpected NACK detected 1 - Unexpected NACK detected When writing 0 - No effect 1 - Clear the flag
9 SDF	Stop Detect Flag Indicates whether the LPI2C controller has generated a Stop condition. When MCFGR1[STOPCFG] = 0, this flag is set for any Stop condition. When MCFGR1[STOPCFG] = 1, this flag is set only when the LPI2C controller is also idle (transmit FIFO is empty). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No Stop condition generated 1 - Stop condition generated When writing 0 - No effect 1 - Clear the flag
8	End Packet Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
EPF	Indicates whether the LPI2C controller has generated a repeated Start condition or a Stop condition. When the controller first generates a Start condition, this flag is not set. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No Stop or repeated Start generated 1 - Stop or repeated Start generated When writing 0 - No effect 1 - Clear the flag
7-2 —	Reserved
1 RDF	Receive Data Flag Indicates whether the receive data is ready. This flag is set when the number of words in the receive FIFO is greater than MFCR[RXWATER]. 0 - Receive data not ready 1 - Receive data ready
0 TDF	Transmit Data Flag Indicates whether transmit data is requested. This flag is set when the number of words in the transmit FIFO is equal or less than MFCR[TXWATER]. 0 - Transmit data not requested 1 - Transmit data requested

45.7.1.6 Controller Interrupt Enable (MIER)

Contains enables for:

- Transmit and receive data interrupts
- Start, Stop, and NACK detection interrupts
- DMA interrupts

Offset

Register	Offset
MIER	18h

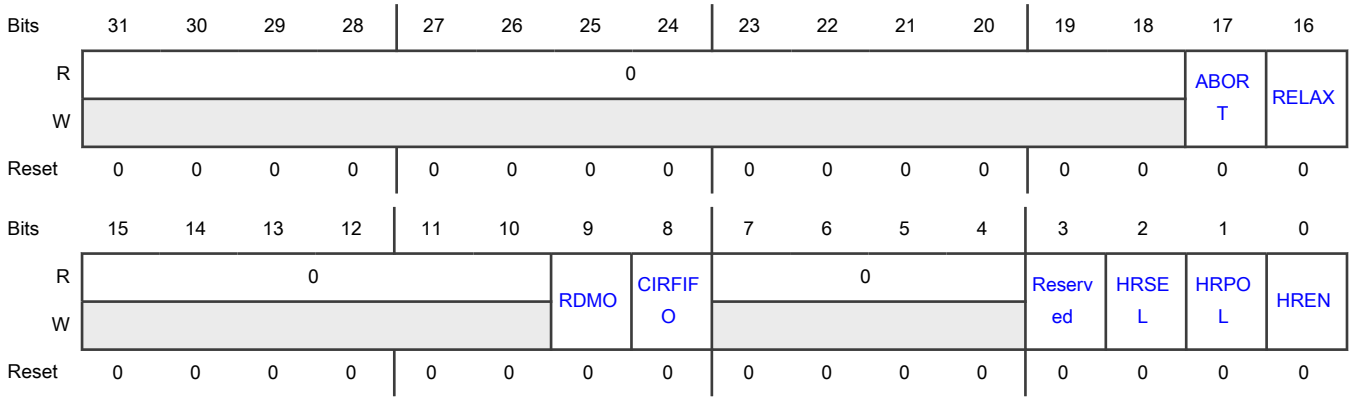
45.7.1.8 Controller Configuration 0 (MCFGR0)

Contains host settings and other receive and transfer settings.

Offset

Register	Offset
MCFGR0	20h

Diagram



Fields

Field	Description
31-18 —	Reserved
17 ABORT	Abort Transfer Determines whether the LPI2C controller completes the existing byte and then sends a Stop condition. A new transfer does not start while this field is 1. 0 - Normal transfer 1 - Abort existing transfer and do not start a new one
16 RELAX	Relaxed Mode Specifies the type of transfer. If this field is 1, the LPI2C controller relaxes several transfer restrictions. Transfers start when the bus is busy and FIFO commands are not checked for errors. You can use this mode to attempt recovery of a stuck I2C target by toggling the SCL pin. 0 - Normal transfer 1 - Relaxed transfer
15-10 —	Reserved
9 RDMO	Receive Data Match Only Determines whether all received data that does not set MSR[DMF] is discarded. After MSR[DMF] is set, the RDMO configuration is ignored. When disabling RDMO, write 0 to this field before writing 0 to MSR[DMF] to ensure that no receive data is lost. 0 - Received data is stored in the receive FIFO 1 - Received data is discarded unless MSR[DMF] is set
8 CIRFIFO	Circular FIFO Enable Enables the transmit FIFO read pointer to be saved to a temporary register. The transmit FIFO empties as normal. After the LPI2C controller is idle and the transmit FIFO is empty, the read pointer value is

Table continues on the next page...

Table continued from the previous page...

Field	Description
	restored from the temporary register. This setting causes the contents of the transmit FIFO to be cycled through repeatedly. If MCFGR1[AUTOSTOP] is 1, then a Stop condition is sent whenever the transmit FIFO is empty and the read pointer is restored. 0 - Disable 1 - Enable
7-4 —	Reserved
3 —	Reserved
2 HRSEL	Host Request Select Selects the source of the host request input. When host request is enabled, this field must not change. 0 - Reserved 1 - Host request input is input trigger
1 HRPOL	Host Request Polarity Configures the polarity of the host request input. When host request is enabled, this field must not change. HRPOL sets the polarity for both the HREQ pin and the input trigger. • When HRPOL=0, the polarity is configured for active low, so host request is asserted if the HREQ pin or input trigger are logic 0. • When HRPOL=1, the polarity is configured for active high, so host request is asserted if the HREQ pin or input trigger are logic 1. 0 - Active low 1 - Active high
0 HREN	Host Request Enable Enables host request. When enabled, the LPI2C controller only initiates a Start condition if the host request input is asserted and the bus is idle. A repeated Start condition is not affected by the host request. 0 - Disable 1 - Enable

45.7.1.9 Controller Configuration 1 (MCFGR1)

Contains controls for pin configuration, clock prescaler, and various other control settings.

Write to this register only when the I2C controller is disabled.

Offset

Register	Offset

Table continued from the previous page...

Field	Description
	111 - Four-pin push-pull mode (inverted outputs). SCL/SDA pins: Input only for controller and target. SCLS/SDAS pins: Inverted output-only push-pull for controller and target.
23-19 —	Reserved
18-16 MATCFG	Match Configuration Configures the condition that sets MSR[DMF]. See Controller Data Match (MDMR). 000 - Match is disabled 001 - Reserved 010 - Match is enabled: first data word equals MDMR[MATCH0] OR MDMR[MATCH1] 011 - Match is enabled: any data word equals MDMR[MATCH0] OR MDMR[MATCH1] 100 - Match is enabled: (first data word equals MDMR[MATCH0]) AND (second data word equals MDMR[MATCH1) 101 - Match is enabled: (any data word equals MDMR[MATCH0]) AND (next data word equals MDMR[MATCH1) 110 - Match is enabled: (first data word AND MDMR[MATCH1]) equals (MDMR[MATCH0] AND MDMR[MATCH1]) 111 - Match is enabled: (any data word AND MDMR[MATCH1]) equals (MDMR[MATCH0] AND MDMR[MATCH1])
15-13 —	Reserved
12 STARTCFG	Start Configuration Configures the conditions that set MSR[STF] when a Start condition occurs. When this field is 0, MSR[STF] is set on a Start condition when both the I2C bus and LPI2C are idle. In other words, any nonrepeated Start condition is initiated by any controller on the bus except the LPI2C controller. When this field is 1, MSR[STF] is set on a Start condition when the I2C bus is idle. In other words, any nonrepeated Start condition is initiated by any controller on the bus including the LPI2C controller. 0 - Sets when both I2C bus and LPI2C controller are idle 1 - Sets when I2C bus is idle
11 STOPCFG	Stop Configuration Configures the conditions that set MSR[SDF]. When this field is 0, any Stop condition generated by the LPI2C controller sets SDF. When this field is 1, the last Stop condition before the LPI2C controller is idle sets SDF. In this case, the transmit FIFO is empty at the time of the Stop condition. 0 - Any Stop condition

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Last Stop condition
10 TIMECFG	Timeout Configuration Configures which signals must be low for longer than the configured timeout to set MSR[PLTF]. When this field is 0, MSR[PLTF] is set when SCL is low for longer than the configured timeout. 0 - SCL 1 - SCL or SDA
9 IGNACK	Ignore NACK Determines whether the LPI2C controller ignores a received NACK and treats it as an ACK. In this case, MSR[NDF] is never set. This field must be 1 in Ultra-Fast mode. 0 - No effect 1 - Treat a received NACK as an ACK
8 AUTOSTOP	Automatic Stop Generation Determines whether a Stop condition is generated when the LPI2C controller is busy and the transmit FIFO is empty. A Stop condition can also be generated using a transmit FIFO command. When this field is 1, a Stop condition is automatically generated when the transmit FIFO is empty and the LPI2C controller is busy. 0 - No effect 1 - Stop automatically generated
7-3 —	Reserved
2-0 PRESCALE	Prescaler Configures the clock prescaler used for all LPI2C controller logic except the digital glitch filters. 000 - Divide by 1 001 - Divide by 2 010 - Divide by 4 011 - Divide by 8 100 - Divide by 16 101 - Divide by 32 110 - Divide by 64 111 - Divide by 128

45.7.1.10 Controller Configuration 2 (MCFGR2)

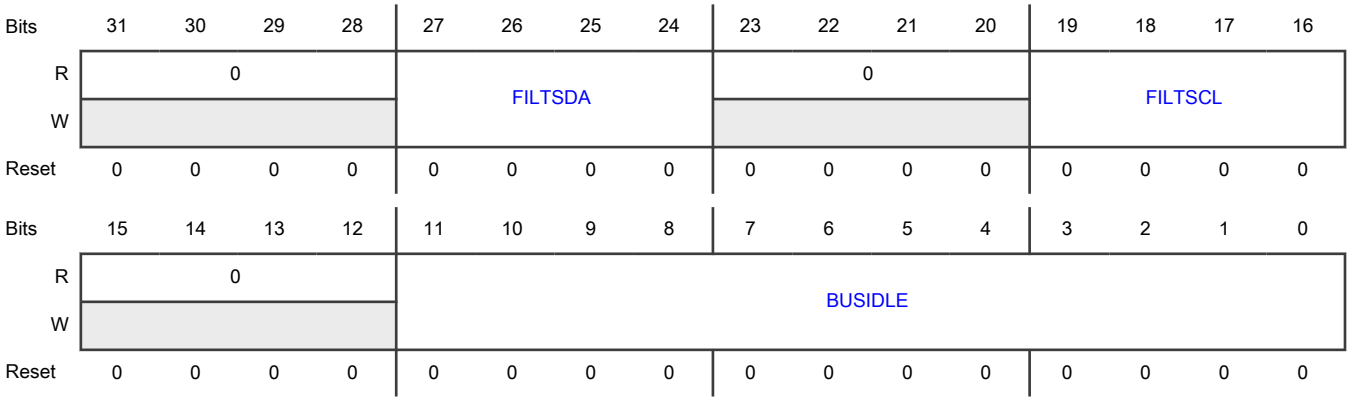
Contains the configuration for the bus idle timeout and glitch filters for SDA and SCL.

Write to this register only when the I2C controller is disabled.

Offset

Register	Offset
MCFGR2	28h

Diagram



Fields

Field	Description
31-28 —	Reserved
27-24 FILTSDA	Glitch Filter SDA Configures the I2C controller digital glitch filters for the SDA input. The latency through the glitch filter is equal to the number of cycles defined by this field. The value of this field must be less than the minimum SCL low or high period. Glitches equal to or less than the number of cycles defined by this field are filtered out and ignored. Writing 0 to this field disables the glitch filter. MCFGR1[PRESCALE] does not affect the glitch filter cycle count. It is automatically bypassed in HS mode.
23-20 —	Reserved
19-16 FILTSCL	Glitch Filter SCL Configures the I2C controller digital glitch filters for SCL input. The latency through the glitch filter is equal to the number of cycles defined by this field. The value of this field must be less than the minimum SCL low or high period. Glitches equal to or less than the number of cycles defined by this field are filtered out and ignored. These cycles are based on the functional clock. Writing 0 to this field disables the glitch filter. MCFGR1[PRESCALE] does not affect the glitch filter cycle count. It is automatically bypassed in HS mode.
15-12	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
11-0 BUSIDLE	Bus Idle Timeout Configures the bus idle timeout period, in clock cycles. If both SCL and SDA are high for longer than the number of cycles defined by this field, the I2C bus is assumed to be idle and the controller can generate a Start condition. Writing 0 to this field disables the bus idle timeout.

45.7.1.11 Controller Configuration 3 (MCFGR3)

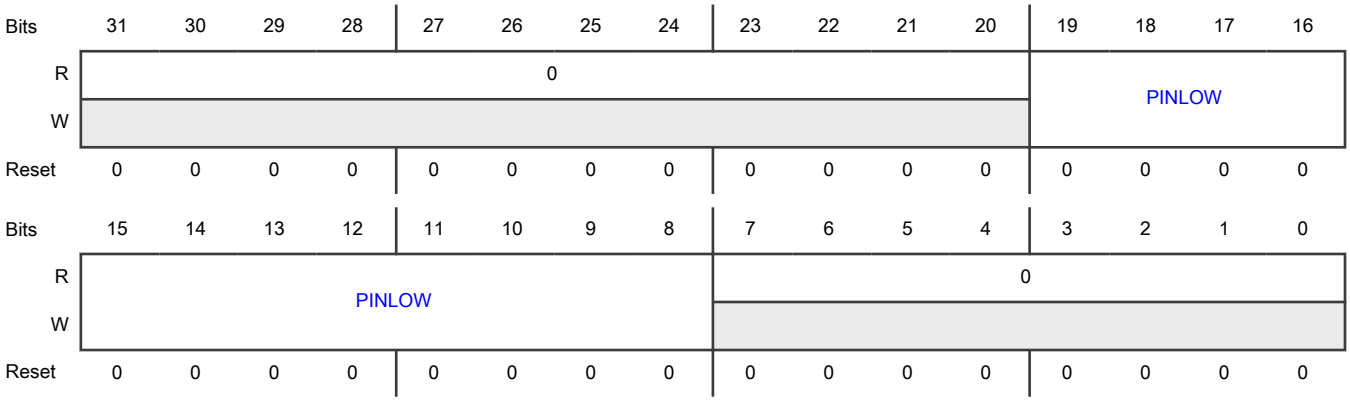
Configures the threshold value for the pin low timeout flag.

Write to this register only when the I2C controller is disabled.

Offset

Register	Offset
MCFGR3	2Ch

Diagram



Fields

Field	Description
31-20 —	Reserved
19-8 PINLOW	Pin Low Timeout Configures the threshold value, in clock cycles, that sets MSR[PLTF].

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If SCL or SDA (selected by MCFGR1[TIMECFG]) is low for longer than (PINLOW × 256) cycles, MSR[PLTF] is set. When this field is 0, the pin low timeout feature is disabled.
7-0 —	Reserved

45.7.1.12 Controller Data Match (MDMR)

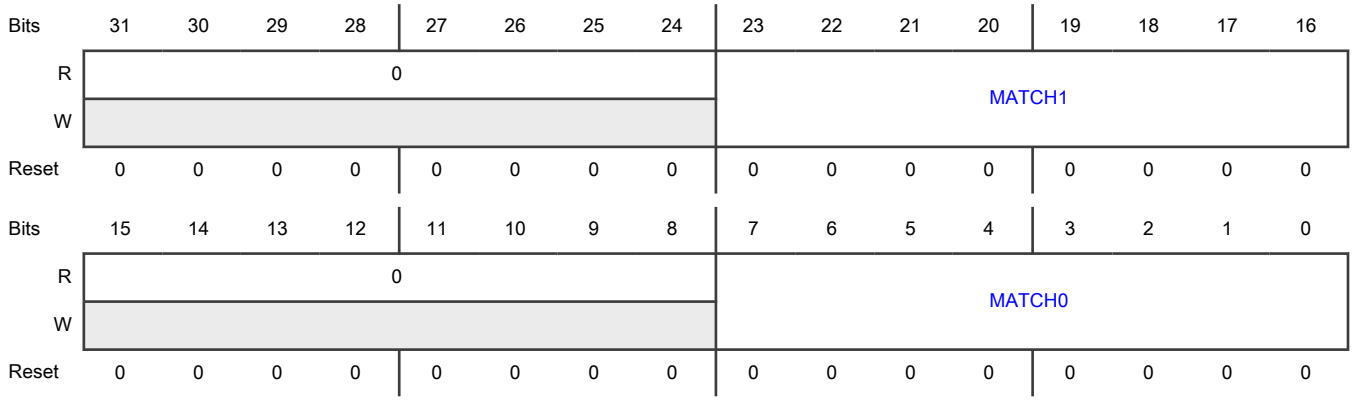
Contains data match values.

Write to this register only when the I2C controller is disabled or idle.

Offset

Register	Offset
MDMR	40h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 MATCH1	Match 1 Value Specifies match 1 value that is compared to the received data when receive data match is enabled.
15-8	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
7-0 MATCH0	Match 0 Value Specifies match 0 value that is compared to the received data when receive data match is enabled.

45.7.1.13 Controller Clock Configuration 0 (MCCR0)

Configures various clock controls.

You cannot make changes to this register when the I2C controller is enabled and is used for standard, fast, fast-mode plus, and ultra-fast transfers.

Offset

Register	Offset
MCCR0	48h

Diagram

Fields

Field	Description
31-30 —	Reserved
29-24 DATAVD	Data Valid Delay Specifies the minimum number of cycles (minus one) used as the data hold time for SDA. This value must be less than the minimum SCL low period.
23-22 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
21-16 SETHOLD	Setup Hold Delay Specifies the minimum number of cycles (minus one) used by the controller for these conditions: • Hold time for a Start • Setup and hold time for a repeated Start • Setup time for a Stop The setup time is extended by the time it takes to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.
15-14 —	Reserved
13-8 CLKHI	Clock High Period Specifies the minimum number of cycles (minus one) that the controller drives the SCL clock high. The SCL high time is extended by the time needed to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.
7-6 —	Reserved
5-0 CLKLO	Clock Low Period Specifies the minimum number of cycles (minus one) that the controller drives the SCL clock low. This value is also used for the minimum bus free time between a Stop and a Start condition. This period is extended by the time needed to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.

45.7.1.14 Controller Clock Configuration 1 (MCCR1)

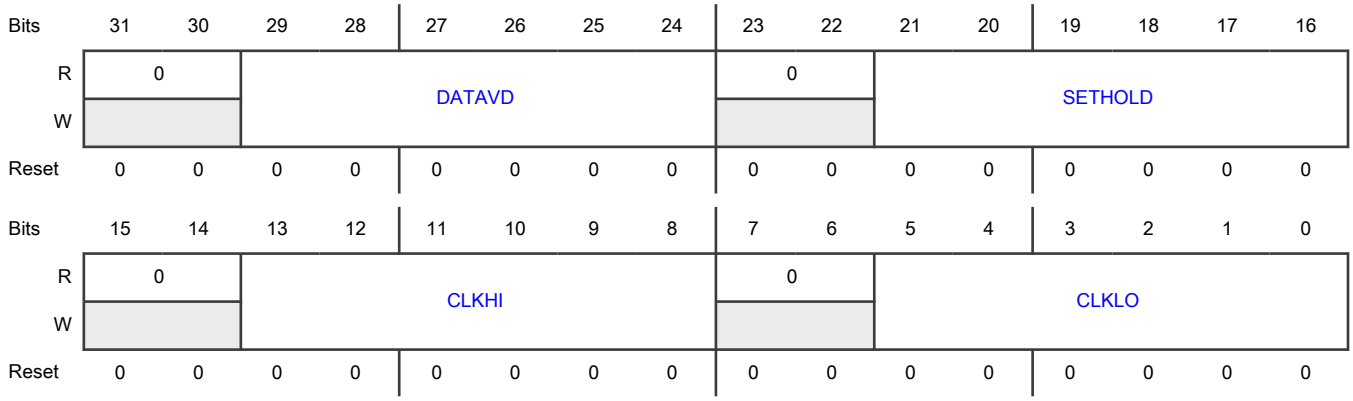
Configures various clock controls.

You cannot makes changes to this register when the I2C controller is enabled and is used for HS mode transfers. The separate clock configuration for HS mode allows arbitration to take place in Fast mode (with timing configured by Controller Clock Configuration 0 (MCCR0)), before switching to HS mode (with timing configured by MCCR1).

Offset

Register	Offset
MCCR1	50h

Diagram



Fields

Field	Description
31-30 —	Reserved
29-24 DATAVD	Data Valid Delay Specifies the minimum number of cycles (minus one) used as the data hold time for SDA. This value must be less than the minimum SCL low period.
23-22 —	Reserved
21-16 SETHOLD	Setup Hold Delay Specifies the minimum number of cycles (minus one) used by the controller for these conditions: • Hold time for a Start condition • Setup and hold time for a repeated Start condition • Setup time for a Stop condition The setup time is extended by the time needed to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.
15-14 —	Reserved
13-8 CLKHI	Clock High Period Specifies the minimum number of cycles (minus one) that the controller drives the SCL clock high. The SCL high time is extended by the time needed to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.
7-6 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
5-0 CLKLO	Clock Low Period Specifies the minimum number of cycles (minus one) that the controller drives the SCL clock low. This value is also used for the minimum bus free time between a Stop and a Start condition. This period is extended by the time needed to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to (2 + FILTSCL) ÷ 2^PRESCALE cycles.

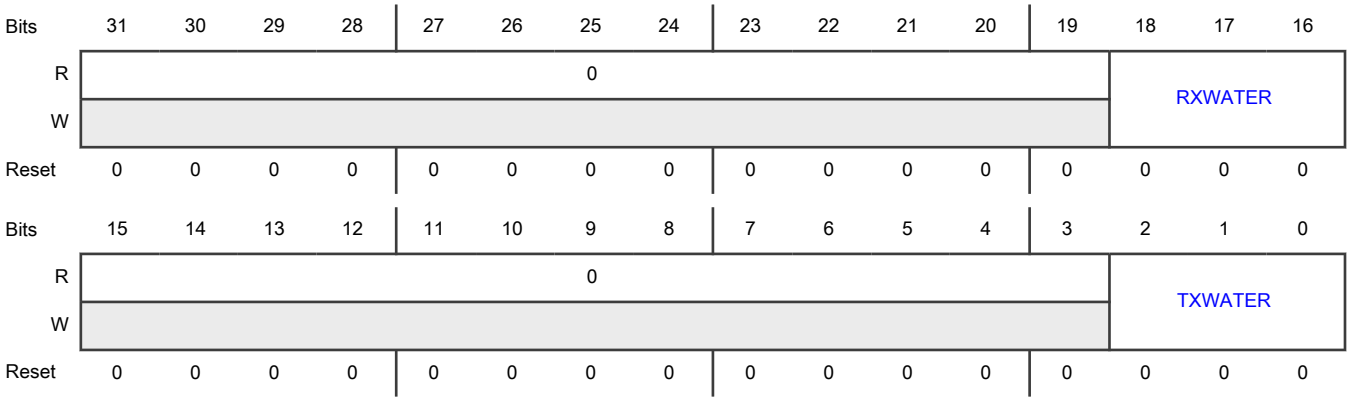
45.7.1.15 Controller FIFO Control (MFCR)

Controls the receive and transmit FIFO watermark values.

Offset

Register	Offset
MFCR	58h

Diagram



Fields

Field	Description
31-19 —	Reserved
18-16 RXWATER	Receive FIFO Watermark Determines the watermark for setting SSR[RDF]. That flag is set when the number of words in the receive FIFO is greater than the value of this field. Writing a value equal to or greater than the FIFO size truncates the value.
15-3 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
2-0 TXWATER	Transmit FIFO Watermark Determines the watermark for setting SSR[TDF]. That flag is set when the number of words in the transmit FIFO is equal or less than the value of this field. Writing a value equal to or greater than the FIFO size truncates the value.

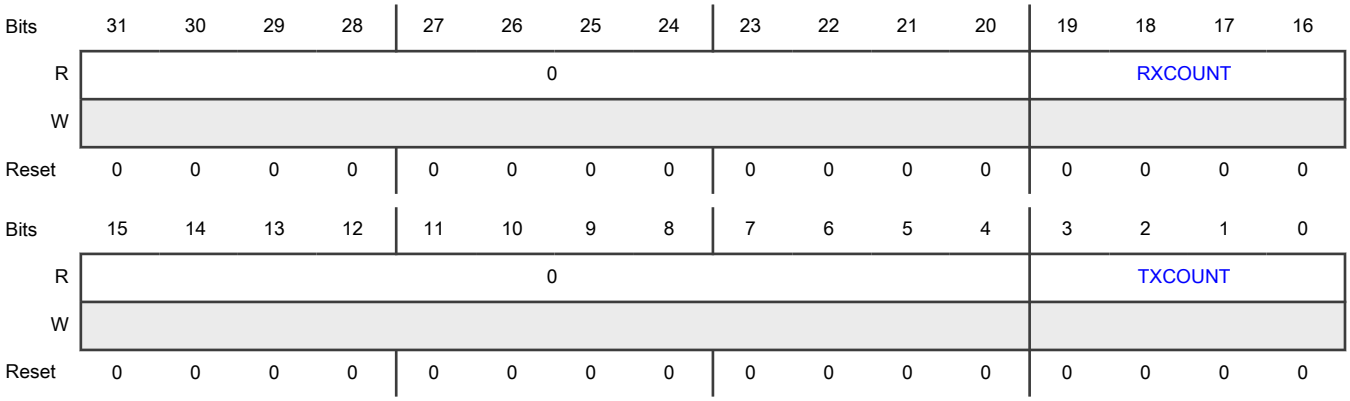
45.7.1.16 Controller FIFO Status (MFSR)

Specifies the number of words in the transmit and receive FIFOs.

Offset

Register	Offset
MFSR	5Ch

Diagram



Fields

Field	Description
31-20 —	Reserved
19-16 RXCOUNT	Receive FIFO Count Specifies the number of words in the receive FIFO.
15-4 —	Reserved
3-0 TXCOUNT	Transmit FIFO Count Specifies the number of words in the transmit FIFO.

45.7.1.17 Controller Transmit Data (MTDR)

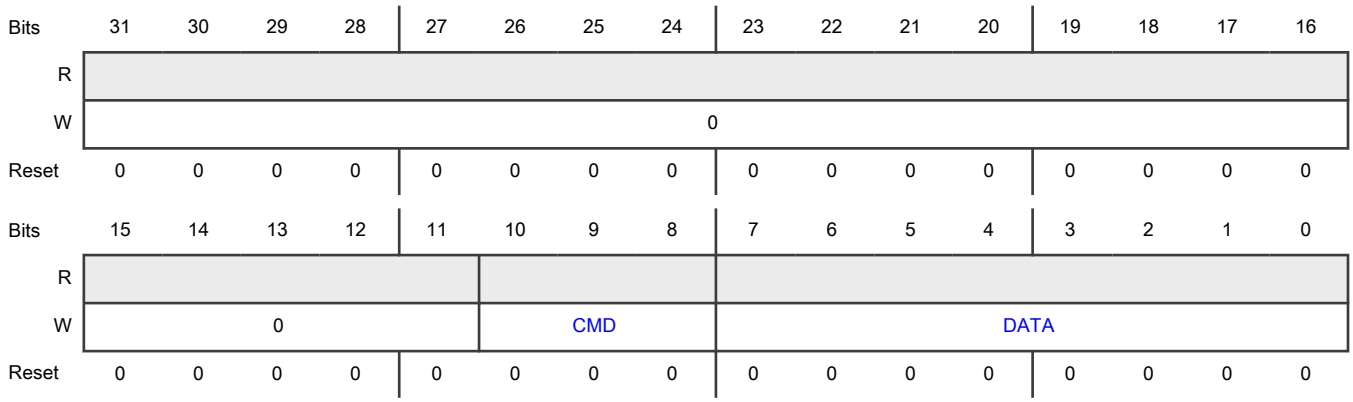
Configures transmit data:

- An 8-bit write to MTDR[CMD] is ignored and does not increment the FIFO write pointer.
- An 8-bit write to MTDR[DATA] zero-extends the value of MTDR[CMD] and increments the FIFO write pointer.
- A 16-bit or 32-bit write operation writes to both MTDR[CMD] and MTDR[DATA] and increments the FIFO write pointer.

Offset

Register	Offset
MTDR	60h

Diagram



Fields

Field	Description
31-11 —	Reserved
10-8 CMD	Command Data Selects command transmitted by controller. 000 - Transmit the value in DATA[7:0] 001 - Receive (DATA[7:0] + 1) bytes. DATA[7:0] is used as a byte counter. Receive that many bytes and check each for a data match (if configured) before storing the received data in the receive FIFO. 010 - Generate Stop condition on I2C bus 011 - Receive and discard (DATA[7:0] + 1) bytes. DATA[7:0] is used as a byte counter. Receive that many bytes but do not check for a data match or store those bytes in the receive FIFO. 100 - Generate (repeated) Start on the I2C bus and transmit the address in DATA[7:0] 101 - Generate (repeated) Start on the I2C bus and transmit the address in DATA[7:0] (this transfer expects a NACK to be returned) 110 - Generate (repeated) Start on the I2C bus and transmit the address in DATA[7:0] using HS mode

Table continues on the next page...

Table continued from the previous page...

Field	Description
	111 - Generate (repeated) Start on the I2C bus and transmit the address in DATA[7:0] using HS mode (this transfer expects a NACK to be returned)
7-0 DATA	Transmit Data Contains data used by the commands listed in MTDR[CMD]. Performing an 8-bit write to this field zero-extends the value of MTDR[CMD].

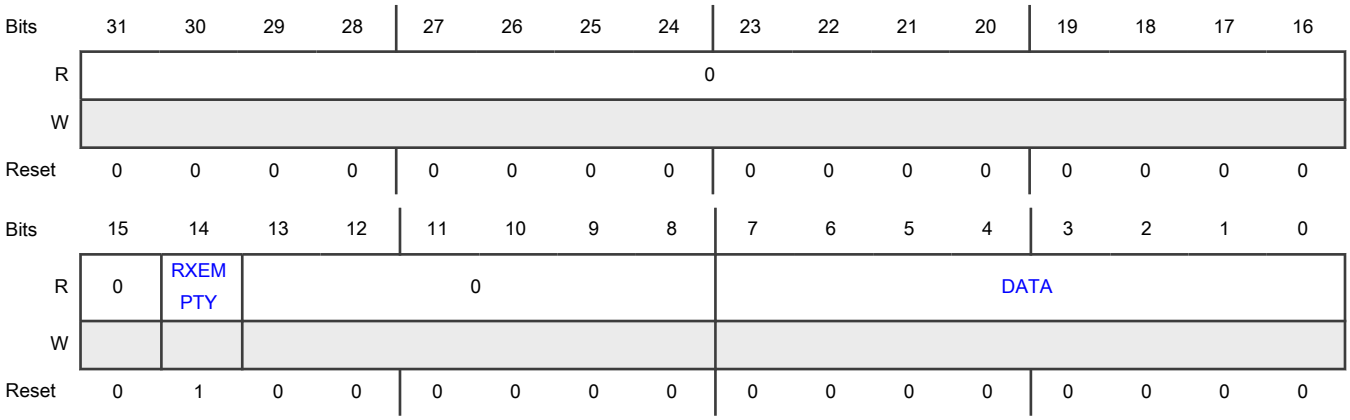
45.7.1.18 Controller Receive Data (MRDR)

Contains the status of the receive FIFO and the data received by the I2C controller that has not been discarded.

Offset

Register	Offset
MRDR	70h

Diagram



Fields

Field	Description
31-15 —	Reserved
14 RXEMPTY	Receive Empty Indicates whether the controller receive data FIFO is empty. 0 - Not empty 1 - Empty

Fields

Field	Description
31-26 —	Reserved
25 BBF	Bus Busy Flag Indicates whether an I2C bus is idle or busy. 0 - Idle 1 - Busy
24 SBF	Target Busy Flag Indicates whether an I2C target is idle or busy. 0 - Idle 1 - Busy
23-16 —	Reserved
15 SARF	SMBus Alert Response Flag Indicates whether an SMBus alert response has been detected. You can clear this flag by reading Target Address Status (SASR). This flag cannot generate an asynchronous wakeup. 0 - Disabled or not detected 1 - Enabled and detected
14 GCF	General Call Flag Indicates whether a target has detected the general call address. You can clear this flag by reading Target Address Status (SASR). This flag cannot generate an asynchronous wakeup.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - General call address disabled or not detected 1 - General call address detected
13 AM1F	Address Match 1 Flag Indicates whether the received address matches the value in ADDR1, or it falls within the ADDR0 to ADDR1 range as configured by SCFGR1[ADDRCFG]. This flag is cleared by reading Target Address Status (SASR). This flag cannot generate an asynchronous wakeup. 0 - Matching address not received 1 - Matching address received
12 AM0F	Address Match 0 Flag Indicates whether the received address matches the ADDR0 field, as configured by SCFGR1[ADDRCFG]. This flag is cleared by reading Target Address Status (SASR). This flag cannot generate an asynchronous wakeup. 0 - ADDR0 matching address not received 1 - ADDR0 matching address received
11 FEF	FIFO Error Flag Indicates whether there is a FIFO error. This flag can only be set when clock stretching is disabled. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No FIFO error 1 - FIFO error When writing 0 - No effect 1 - Clear the flag
10 BEF	Bit Error Flag Indicates whether the LPI2C target has transmitted a logic 1 and detects a logic 0 on the I2C bus. The target ignores the rest of the transfer until the next (repeated) Start condition. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No bit error occurred

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Bit error occurred When writing 0 - No effect 1 - Clear the flag
9 SDF	Stop Detect Flag Indicates whether the LPI2C target detects a Stop condition, and if the LPI2C target matched the last address byte. When SCFGR1[SDCFG] = 1, this flag is set on any Stop condition. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No Stop detected 1 - Stop detected When writing 0 - No effect 1 - Clear the flag
8 RSF	Repeated Start Flag Indicates whether the LPI2C target detects a repeated Start condition and if the LPI2C target matched the last address byte. When SCFGR1[RSCFG] = 1, this flag is set on any repeated Start condition. This flag is not set when the target first detects a Start condition. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No repeated Start detected 1 - Repeated Start detected When writing 0 - No effect 1 - Clear the flag
7-4 —	Reserved
3 TAF	Transmit ACK Flag Indicates whether a transmit ACK or NACK is required. You can clear this flag by writing to Target Transmit ACK (STAR). 0 - Not required

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Required
2 AVF	Address Valid Flag Indicates whether the contents of Target Address Status (SASR) are valid. You can clear this flag by reading SASR. When SCFGR1[RXCFG] = 1, this flag is also cleared by reading Target Receive Data (SRDR). 0 - Not valid 1 - Valid
1 RDF	Receive Data Flag Indicates whether receive data is ready. You can clear this flag by reading Target Receive Data (SRDR). When SCFGR1[RXCFG] = 1, this flag is not cleared when reading Target Receive Data (SRDR) if SSR[AVF] = 1. 0 - Not ready 1 - Ready
0 TDF	Transmit Data Flag Indicates whether transmit data has been requested. This flag is cleared by writing to Target Transmit Data (STDR). When SCFGR1[TXCFG] = 0, if a NACK, repeated Start, or Stop condition is detected, this flag is also cleared. 0 - Transmit data not requested 1 - Transmit data is requested

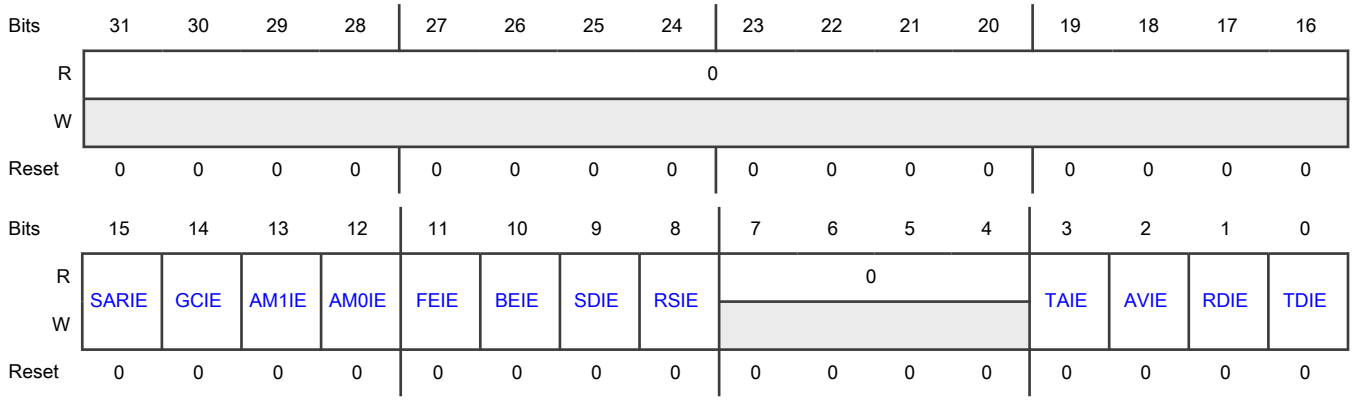
45.7.1.22 Target Interrupt Enable (SIER)

Contains transmit and receive data interrupt enables, start and stop detect interrupt enables, and other target interrupt enables.

Offset

Register	Offset
SIER	118h

Diagram



Fields

Field	Description
31-16 —	Reserved
15 SARIE	SMBus Alert Response Interrupt Enable Enables interrupt for SMBus alert response. 0 - Disable 1 - Enable
14 GCIE	General Call Interrupt Enable Enables interrupt for general call. 0 - Disabled 1 - Enabled
13 AM1IE	Address Match 1 Interrupt Enable Enables interrupt for address match 1. 0 - Disable 1 - Enable
12 AM0IE	Address Match 0 Interrupt Enable Enables interrupt for address match 0. 0 - Disable 1 - Enable
11 FEIE	FIFO Error Interrupt Enable Enables interrupt for FIFO error. 0 - Disable 1 - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
10 BEIE	Bit Error Interrupt Enable Enables interrupt for bit error. 0 - Disable 1 - Enable
9 SDIE	Stop Detect Interrupt Enable Enables interrupt for Stop detection. 0 - Disable 1 - Enable
8 RSIE	Repeated Start Interrupt Enable Enables interrupt for repeated start. 0 - Disable 1 - Enable
7-4 —	Reserved
3 TAIE	Transmit ACK Interrupt Enable Enables interrupt for transmit ACK. 0 - Disable 1 - Enable
2 AVIE	Address Valid Interrupt Enable Enables interrupt for valid address. 0 - Disable 1 - Enable
1 RDIE	Receive Data Interrupt Enable Enables interrupt for receive data. 0 - Disable 1 - Enable
0 TDIE	Transmit Data Interrupt Enable Enables interrupt for transmit data. 0 - Disable 1 - Enable

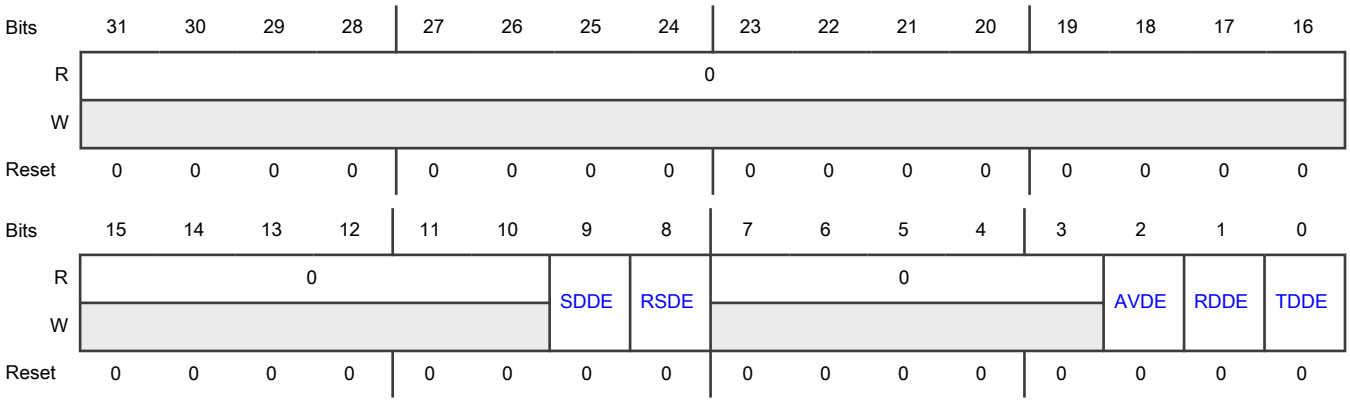
45.7.1.23 Target DMA Enable (SDER)

Contains the transmit, request, and receive enables for DMA.

Offset

Register	Offset
SDER	11Ch

Diagram



Fields

Field	Description
31-10 —	Reserved
9 SDDE	Stop Detect DMA Enable Enables DMA end-of-packet processing on stop detection. Reading Target Receive Data (SRDR) when it is empty: • Generates a DMA end-of-packet response. • Returns 0000_40FFh. • Writes 0 to SSR[SDF]. 0 - Disable 1 - Enable
8 RSDE	Repeated Start DMA Enable Enables DMA end-of-packet processing on repeated start. Reading Target Receive Data (SRDR) when it is empty: • Generates a DMA end-of-packet response. • Returns 0000_40FFh.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	• Writes 0 to SSR[RDF]. 0 - Disable 1 - Enable
7-3 —	Reserved
2 AVDE	Address Valid DMA Enable Enables address valid DMA request. The address valid DMA request is shared with the receive data DMA request. If both are enabled, write 1 to SCFGR1[RXCFG] to allow the DMA to read the address from Target Receive Data (SRDR). 0 - Disable 1 - Enable
1 RDDE	Receive Data DMA Enable Enables receive data for DMA. 0 - Disable DMA request 1 - Enable DMA request
0 TDDE	Transmit Data DMA Enable Enables transmit data for DMA. 0 - Disable 1 - Enable

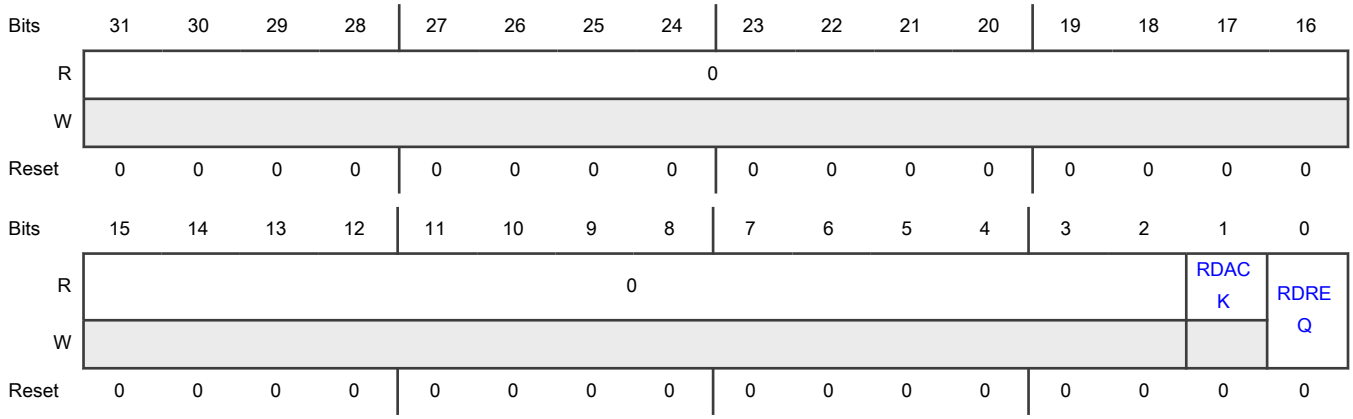
45.7.1.24 Target Configuration 0 (SCFGR0)

Configures the read request feature.

Offset

Register	Offset
SCFGR0	120h

Diagram



Fields

Field	Description
31-2 —	Reserved
1 RDACK	Read Acknowledge Flag Indicates whether a Start then Stop sequence with one SCL pulse between them acknowledged the read request while SCFGR0[RDREQ] = 1. You can clear this flag by writing 0 to SCFGR0[RDREQ]. 0 - Read Request not acknowledged 1 - Read Request acknowledged
0 RDREQ	Read Request Enables read request. When the I2C bus is idle, writing 1 to this field causes the LPI2C target to drive SDA low, triggering a Start condition. The LPI2C target releases SDA on the next falling edge of SCL or when you write 0 to this field. To initiate a second read request (for example, following I2C bus activity that did not acknowledge the request), write 0 then 1 to this field. When the I2C bus is busy, writing to this register always writes 0 to this field. 0 - Disable 1 - Enable

45.7.1.25 Target Configuration 1 (SCFGR1)

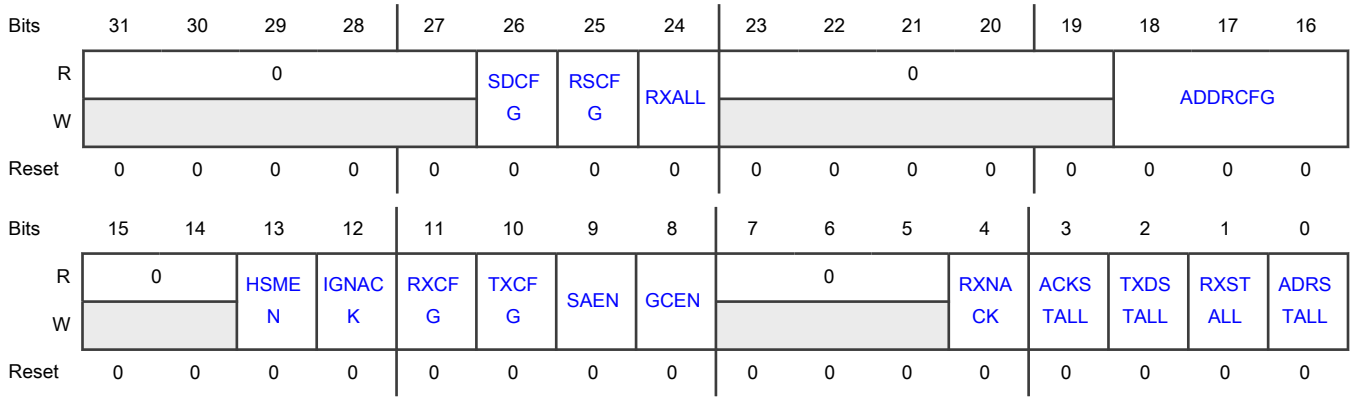
Configures various aspects of the target.

Write to this register only when the I2C target is disabled.

Offset

Register	Offset
SCFGR1	124h

Diagram



Fields

Field	Description
31-27 —	Reserved
26 SDCFG	Stop Detect Configuration Configures the conditions that set SSR[SDF]. 0 - Any Stop condition following an address match 1 - Any Stop condition
25 RSCFG	Repeated Start Configuration Configures the conditions that set SSR[RSF]. 0 - Any repeated Start condition following an address match 1 - Any repeated Start condition
24 RXALL	Receive All Enables receive-all functionality. When enabled, the LPI2C target stores all addresses on the I2C bus in Target Address Status (SASR) and all data on the I2C bus in Target Receive Data (SRDR). However, the LPI2C target does not drive SDA (for ACK or target-transmit transfer) unless there is an address match. The LPI2C target can drive SCL if clock stretching is enabled. When this field is 1, the LPI2C target only supports 7-bit addressing modes (you must configure SCFGR1[ADDRCFG] for 7-bit address match). Software can support 10-bit addresses, however. The first byte of a 10-bit address is saved to Target Address Match (SAMR). The second byte is saved as the first data byte in Target Receive Data (SRDR). Use this field to aid debugging of the I2C bus by saving all data on the bus without altering the state of the bus. When this field is 1, it is recommended to also write 1 to SCFGR1[RSCFG] and SCFGR1[SDCFG] so you can track the full state of the I2C bus. 0 - Disable 1 - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
23-19 —	Reserved
18-16 ADDRCFG	Address Configuration Configures the condition that causes an address to match. 000 - Address match 0 (7-bit) 001 - Address match 0 (10-bit) 010 - Address match 0 (7-bit) or address match 1 (7-bit) 011 - Address match 0 (10-bit) or address match 1 (10-bit) 100 - Address match 0 (7-bit) or address match 1 (10-bit) 101 - Address match 0 (10-bit) or address match 1 (7-bit) 110 - From address match 0 (7-bit) to address match 1 (7-bit) 111 - From address match 0 (10-bit) to address match 1 (10-bit)
15-14 —	Reserved
13 HSMEN	HS Mode Enable Enables detection of the HS mode controller code of target address 0000_1XX, but does not cause an address match on this code. When this field is 1 and any HS mode controller code is detected, SCR[FILTEN] and SCFGR1[ACKSTALL] are ignored until the next Stop condition is detected. 0 - Disable 1 - Enable
12 IGNACK	Ignore NACK Determines whether the target ends transfer when a NACK condition is detected. When this field is 1, the LPI2C target continues transfers after a NACK is detected. This field is required to be 1 in Ultra-Fast mode. 0 - End transfer on NACK 1 - Do not end transfer on NACK
11 RXCFG	Receive Data Configuration Configures which data is returned and which flags are cleared when reading Target Receive Data (SRDR). When this field is 0, reading SRDR returns received data and clears SSR[RDF]. When this field is 1, reading SRDR: • Returns the value of Target Address Status (SASR) and clears SSR[AVF] when SSR[AVF] is set. • Returns received data and clears SSR[RDF] when SSR[AVF] is not set. 0 - Return received data, clear SSR[RDF]

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Return SASR and clear SSR[AVF] when SSR[AVF] is set, return received data and clear SSR[RDF] when SSR[AFV] is not set
10 TXCFG	Transmit Flag Configuration Determines which conditions set SSR[TDF]. This field always becomes 1 before a NACK is detected at the end of a target-transmit transfer. This change can cause an extra word to be written to the transmit data FIFO. When this field is 0, Target Transmit Data (STDR) is automatically emptied when a target-transmit transfer is detected. SSR[TDF] is set when a target-transmit transfer is detected, and SSR[TDF] is cleared at the end of the target-transmit transfer. When this field is 1, SSR[TDF] is set when STDR is empty, and SSR[TDF] is cleared when STDR is full. This setting allows STDR to be filled before a target-transmit transfer is detected. However, it can cause STDR to be written before a NACK is detected on the last byte of a target-transmit transfer. 0 - SSR[TDF] is set only during a target-transmit transfer when STDR is empty 1 - SSR[TDF] is set whenever STDR is empty
9 SAEN	SMBus Alert Enable Enables a match on an SMBus alert. 0 - Disable 1 - Enable
8 GCEN	General Call Enable Enables a general call address. 0 - Disable 1 - Enable
7-5 —	Reserved
4 RXNACK	Receive NACK Determines whether to override the setting of STAR[TXNACK] when the LPI2C receives a matching address during an overrun. When this field is 1, the LPI2C target responds with a NACK under the following conditions: • SSR[AVF] would be set due to matching an address, but that flag is already 1 (address overrun). • SSR[RDF] would be set due to receiving data, but that flag is already 1 (receive data overrun). 0 - ACK or NACK always determined by STAR[TXNACK] 1 - NACK always generated on address overrun or receive data overrun, otherwise ACK or NACK is determined by STAR[TXNACK]
3	ACK SCL Stall

Table continues on the next page...

Table continued from the previous page...

Field	Description
ACKSTALL	Enables SCL clock stretching during target-transmit address bytes and target-receiver address and data bytes, so you can write to Target Transmit ACK (STAR) before the ACK or NACK is transmitted. Clock stretching occurs when transmitting the ninth bit, and is therefore not compatible with HS mode. If this field is 1: • You do not need to write 1 to SCFGR1[RXSTALL] or SCFGR1[ADRSTALL]. • When there is an address match on the first byte of a 10-bit address, SSR[AVF] is set, allowing you to read the received address before writing to Target Transmit ACK (STAR). 0 - Disable 1 - Enable
2 TXDSTALL	Transmit Data SCL Stall Enables SCL clock stretching when SSR[TDF] = 1 during a target-transmit transfer. Clock stretching occurs following the ninth bit, and is therefore compatible with HS mode. 0 - Disable 1 - Enable
1 RXSTALL	RX SCL Stall Enables SCL clock stretching when SSR[RDF] = 1 during a target-receive transfer. Clock stretching occurs following the ninth bit, and is therefore compatible with HS mode. 0 - Disable 1 - Enable
0 ADRSTALL	Address SCL Stall Enables SCL clock stretching when SSR[AVF] = 1. Clock stretching only occurs following the ninth bit, and is therefore compatible with HS mode. 0 - Disable 1 - Enable

45.7.1.26 Target Configuration 2 (SCFGR2)

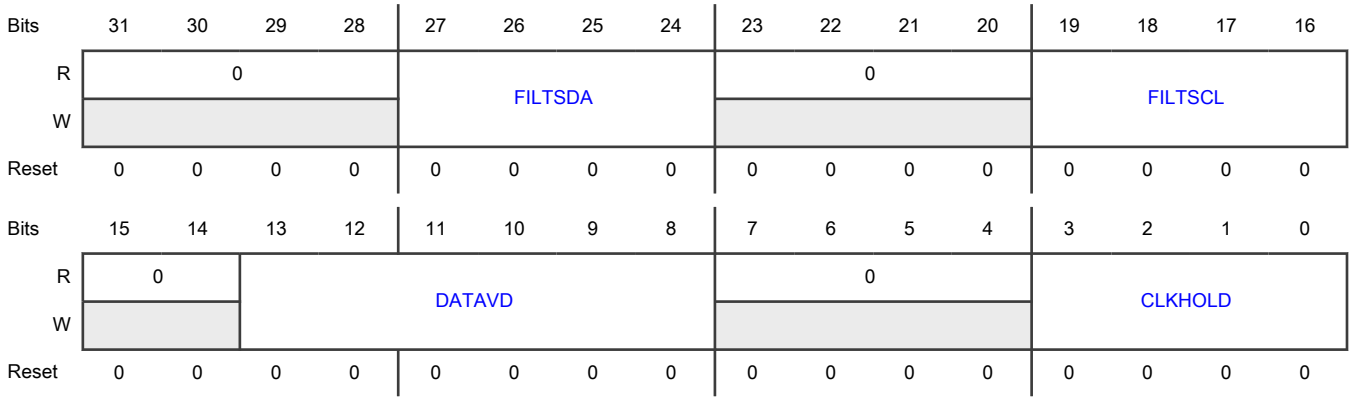
Configures data valid delay, clock hold time, and glitch filters for SDA and SCL.

Write to this register only when the I2C target is disabled.

Offset

Register	Offset
SCFGR2	128h

Diagram



Fields

Field	Description
31-28 —	Reserved
27-24 FILTSDA	Glitch Filter SDA Configures the I2C target digital glitch filters for SDA input. Writing 0 to this field disables the glitch filter. Glitches equal to or less than the number of cycles defined by this field are filtered out and ignored. The latency through the glitch filter is equal to the number of cycles defined by this field + 3. The latency must be configured to be less than the minimum SCL low or high period. MCFGR1[PRESCALE] does not affect the glitch filter cycle count, and the glitch filter cycle count is disabled in HS mode.
23-20 —	Reserved
19-16 FILTSCL	Glitch Filter SCL Configures the I2C target digital glitch filters for SCL input. Writing 0 to this field disables the glitch filter. Glitches equal to or less than the number of cycles defined by this field are filtered out and ignored. The latency through the glitch filter is equal to the number of cycles defined by this field + 3. The latency must be configured to be less than the minimum SCL low or high period. MCFGR1[PRESCALE] does not affect the glitch filter cycle count, and the glitch filter cycle count is disabled in HS mode.
15-14 —	Reserved
13-8	Data Valid Delay

Table continues on the next page...

Table continued from the previous page...

Field	Description
DATAVD	Configures the SDA data valid delay time for the I2C target, which is equal to FILTSCL + DATAVD + 3 cycles. The data valid delay must be configured to be less than the minimum SCL low period. MCFGR1[PRESCALE] does not affect the I2C target data valid delay time, and the I2C target data valid delay time is disabled in HS mode.
7-4 —	Reserved
3-0 CLKHOLD	Clock Hold Time Configures the minimum clock hold time for the I2C target, when clock stretching is enabled. The minimum hold time is equal to the number of cycles defined by this field + 3. MCFGR1[PRESCALE] does not affect the I2C target clock hold time, and the I2C target clock hold time is disabled in HS mode.

45.7.1.27 Target Address Match (SAMR)

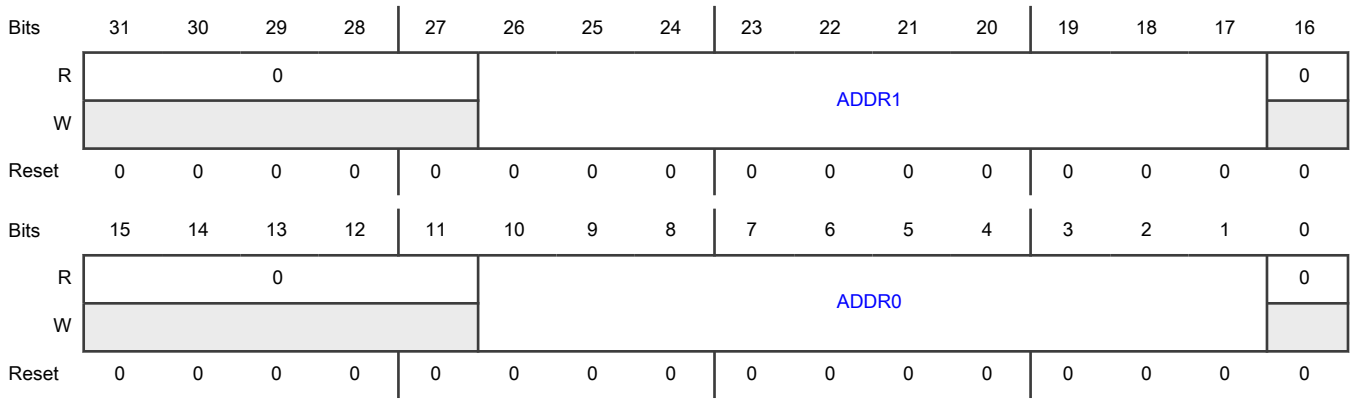
Contains address values for received target match comparison.

Write to this register only when the I2C target is disabled.

Offset

Register	Offset
SAMR	140h

Diagram



Fields

Field	Description
31-27 —	Reserved
26-17 ADDR1	Address 1 Value Contains the value of address 1, which is compared to the received address to detect the target address. In 10-bit mode, the first address byte is compared to {11110, ADDR1[26:25]} and the second address byte is compared to ADDR1[24:17]. In 7-bit mode, the address is compared to ADDR1[23:17].
16-11 —	Reserved
10-1 ADDR0	Address 0 Value Contains the value of address 0, which is compared to the received address to detect the target address. In 10-bit mode, the first address byte is compared to {11110, ADDR0[10:9]} and the second address byte is compared to ADDR0[8:1]. In 7-bit mode, the address is compared to ADDR0[7:1].
0 —	Reserved

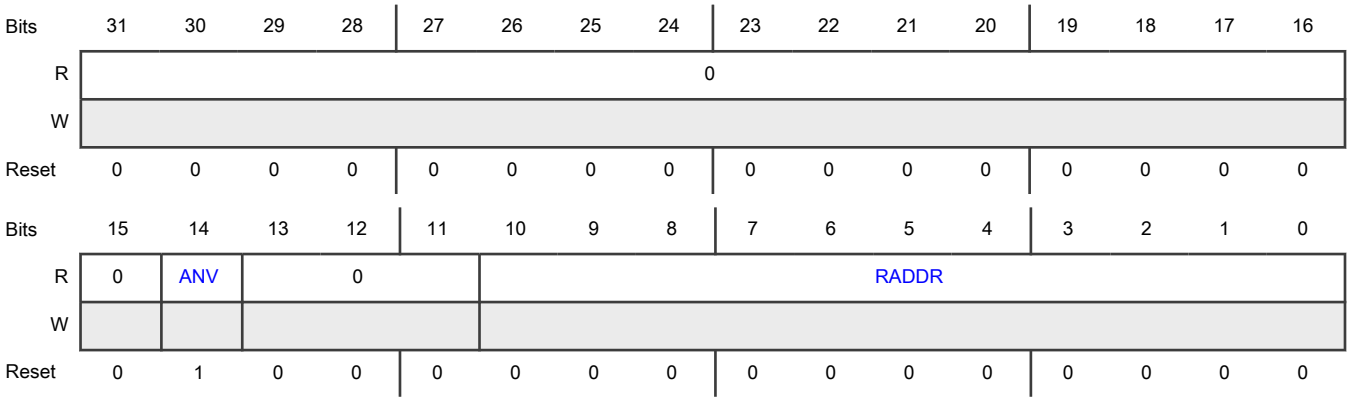
45.7.1.28 Target Address Status (SASR)

Contains the received address and its validity.

Offset

Register	Offset
SASR	150h

Diagram



Fields

Field	Description
31-15 —	Reserved
14 ANV	Address Not Valid Indicates whether SASR[RADDR] is valid. 0 - Valid 1 - Not valid
13-11 —	Reserved
10-0 RADDR	Received Address Contains the received address. Updates whenever SSR[AM0F] or SSR[AM1F] is set. Reading Target Address Status (SASR) clears SSR[AM0F] and SSR[AM1F]. In 7-bit mode, the address byte is stored in RADDR[7:0]. In 10-bit mode, the first address byte is {11110, RADDR[10:9], RADDR[0]} and the second address byte is RADDR[8:1]. The Read-or-Write bit is therefore always stored in RADDR[0]. When SCFGR1[ACKSTALL] = 1, if the first address byte matches in 10-bit mode, the first address byte is stored in RADDR[7:0] so you can read this field before writing the Transmit ACK. If the second address byte matches, this field is then updated with the full 10-bit address.

45.7.1.29 Target Transmit ACK (STAR)

Configures choice of ACK or NACK on each received word.

You can write to this register only when SCFGR1[ACKSTALL] = 1.

SCFGR1[ACKSTALL] enables clock stretching during the ACK-or-NACK bit slot. During this time, you can write to this register.

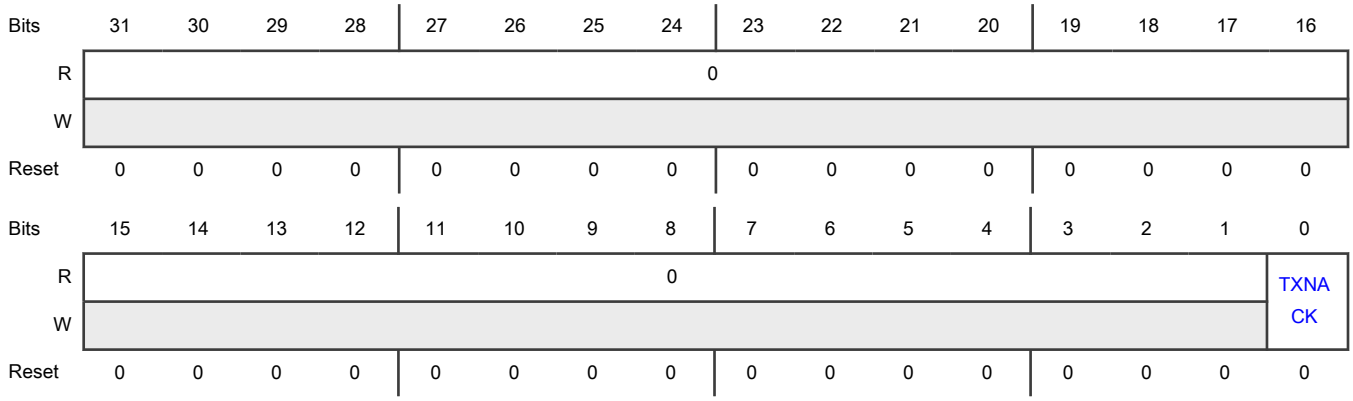
The logic ensures that the clock stretching continues for at least one bus clock cycle after this register is updated.

This clock stretching time can be extended via SCFGR2[CLKHOLD].

Offset

Register	Offset
STAR	154h

Diagram



Fields

Field	Description
31-1 —	Reserved
0 TXNACK	Transmit NACK Selects whether transmit ACK (logic 0) or NACK (logic 1) is returned on the bus by the I2C target after receiving each word. • When SCFGR1[ACKSTALL] = 1, a transmit NACK signal must be written once for each matching address byte and each received word. SCFGR1[ACKSTALL] must be 1, because that setting stalls the data transfer until software reads the received word (and determines whether to respond with an ACK or NACK). • To configure the default (ACK or NACK), you can write to this field when LPI2C target is disabled or idle. 0 - Transmit ACK 1 - Transmit NACK

45.7.1.30 Target Transmit Data (STDR)

Contains the I2C target data to transmit.

Clock stretching (enabled or disabled) affects when the transmit data is transferred. SCFGR1[TXDSTALL] enables clock stretching during the first data bit of a target-transmit transfer.

If clock stretching is enabled (SCFGR1[TXDSTALL] = 1), the transmit data transfer is stalled until this register is updated. Clock stretching is extended by at least 1 bus clock cycle after this register is updated. Clock stretching can be delayed further by using SCFGR2[CLKHOLD].

If clock stretching is disabled (SCFGR1[TXDSTALL] = 0), the transmit data must be written before the start of the target-transmit transfer, otherwise SSR[FEF] is set.

Offset

Register	Offset
STDR	160h

Table continued from the previous page...

Field	Description
DATA	Contains data received by the LPI2C target. When both SCFGR1[RXCFG] and SSR[AVF] are 1, bits [7:0] of SASR[RADDR] are returned.

45.7.1.33 Controller Transmit Command Burst (MTCBR0 - MTCBR127)

Contains transmit Command and Data fields to support burst transfers.

Is an alias of the Controller Transmit Data Register designed to support incrementing burst transfers to the transmit FIFO by a DMA controller using aligned 8-bit, 16-bit, or 32-bit writes. The size of the Controller Transmit Data Burst Register is 512-bytes.

- An aligned 32-bit write in this region pushes one entry into the transmit FIFO.
- An aligned 16-bit write in this region to MTCBRn[15:0] pushes one entry into the transmit FIFO.
- An 8-bit write in this region to MTCBRn[7:0] updates DATA[7:0], but does not push the data into the transmit FIFO.
- An 8-bit write in this region to MTCBRn[15:8] pushes the data written to CMD[2:0] plus the previously written DATA[7:0] into the transmit FIFO.
- An 8-bit or 16-bit write in this region to MTXBRn[31:16] is ignored.

Offset

7-0 DATA	Data Data is written to the Controller Transmit Data Register.

45.7.1.34 Transmit Data Burst (MTDBR0 - MTDBR255)

Contains transmit Data fields to support burst transfers.

Is an alias of the Transmit Data Register designed to support incrementing burst transfers to the transmit FIFO by a DMA controller using 8-bit, 16-bit, or 32-bit writes. The CMD field is always zero-extended for transmit data. The size of the Transmit Data Burst Register is 1024 bytes.

- An aligned 32-bit write in this region pushes four zero-extended DATA entries into the transmit FIFO (DATA0 byte first). Note that the register access is extended by 3 wait states.
- An aligned 16-bit write in this region to either half of a 32-bit word pushes two zero-extended DATA entries into the transmit FIFO (DATA0 or DATA2 first). Note that the register access is extended by 1 wait state.
- An 8-bit write in this region pushes one zero-extended DATA entry into the transmit FIFO.

Low Power Serial Peripheral Interface (LPSPI)

46.1 Chip-specific LPSPI information

Table 464. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes eight instances of LPSPI Modules. LPSPI1 and LPSPI2 are in AONMIX. LPSPI3-8 in WAKEUPMIX. SPI1 and SPI2 are only supported in Master Mode, not Slave Mode.

HREQ host request feature to allow HW triggers to initiate the start of an I2C request is not supported.

The table below summarizes the number of peripheral chip selects supported by each instance of LPSPI.

Table 465. Number of Peripheral Chip selects for each LPSI instance

MIX	Instance	PCS_NUM
AONMIX	LPSPI1	2
	LPSPI2	2
WAKEUPMIX	LPSPI3	2
	LPSPI4	3
	LPSPI5	2
	LPSPI6	2
	LPSPI7	2
	LPSPI8	2

46.2 Overview

LPSPI provides an efficient interface (either as a controller or peripheral) to an SPI bus, which is a synchronous serial communication interface used in embedded systems. It is typically used to perform short distance communications between microcontrollers and peripheral devices, on printed circuit boards. Typical applications include interfacing with secure digital cards and LCD displays.

NOTE

The terminology in this chapter has been updated to align with NXP's inclusive language standards, as shown in the table below.

Table 466. Updated terms

Updated term	Deprecated term
Controller	Master
Peripheral	Slave

46.2.1 Block diagram

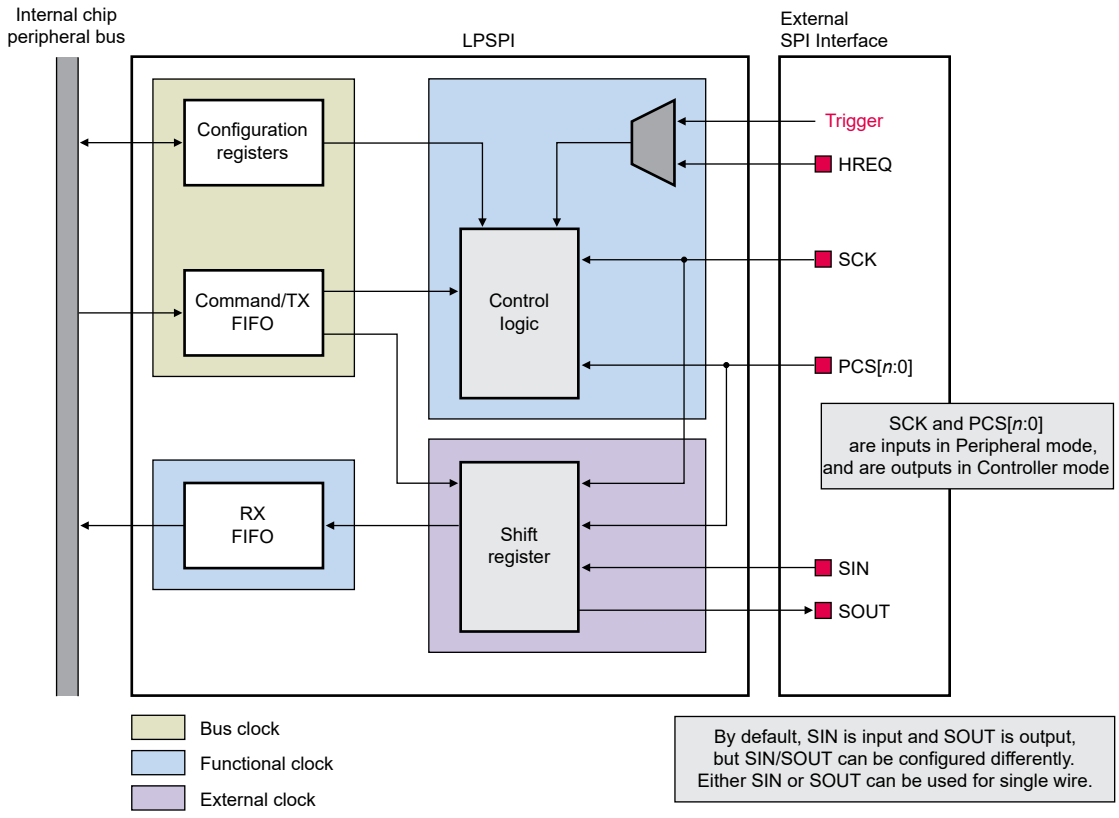

Figure 239. Block diagram

46.2.2 Features

- Minimal CPU overhead, with DMA transmit and receive requests supporting FIFO register accesses
- Operation continues in Stop mode, if configured to do so and an appropriate clock is available
- Support available for 32-bit word size
- Configurable clock polarity and phase
- Support available for 2 peripheral chip selects in Controller mode
- Support available for Peripheral mode
- 8-word transmit and command FIFO
- 8-word receive FIFO

- Flexible timing parameters in Controller mode, including SCK frequency and duty cycle, and delays between PCS and SCK edges
- Continuous transfer option to keep PCS asserted across multiple frames
- Full-duplex transfers that support 1-bit transmit and receive on each clock edge
- Half-duplex transfers that support:
  - 1-bit transmit or receive on each clock edge
- Receive data match logic that discards nonmatching data and interrupt on data match

46.3 Functional description

46.3.1 Controller mode

46.3.1.1 Transmit and command FIFO commands

The transmit and command FIFO is a combined FIFO that includes both transmit data words and command words. You store:

- Transmit data words in the transmit and command FIFO, by writing to Transmit Data (TDR).
- Command words in the transmit and command FIFO, by writing to Transmit Command (TCR).

When a command word is at the top of the transmit and command FIFO, the actions that can occur depend on whether LPSPI is busy or between frames (see TCR[CONT] and TCR[CONTC]). See Table 467 for conditions and possible corresponding actions when a command word is at the top of the transmit and command FIFO.

Table 467. Possible actions when a command word is at the top of the transmit and command FIFO

Condition	Action
LPSPI is enabled and idle.	The command word is pulled from the FIFO, and this command word controls all subsequent transfers.
LPSPI is busy and TCR[CONTC] is 0.	The SPI frame completes at the end of the existing word, ignoring TCR[FRAMESZ]. The command word is then pulled from the FIFO and that command word controls all subsequent transfers (or until the next update to the command word). Note that a command word with TCR[CONTC] = 0 always terminates the existing transfer regardless of the previous TCR[CONT] value.
LPSPI is busy; the existing TCR[CONT] value is 1 and the new TCR[CONTC] value is 1.	The command word must be updated at the frame boundary. The command word is pulled from the FIFO during the last SCK pulse of the existing frame (based on the value of FRAMESZ), and the frame continues using the new command value for the rest of the frame (or until the next update to the command word). When TCR[CONTC] = 1, only the lower 24 bits of the command word are updated. If the command word is updated at a word boundary, then the transfer halts (stops) after that word. TCR[CONTC] is ignored when not at a frame boundary, so the frame ends prematurely.

TCR[CONT] = 1 keeps PCS asserted at end of frame, allowing the transfer to continue.

TCR[CONTC] = 1 specifies that this command word must not terminate the existing frame, and the transfer can continue using the new command word.

TCR[CONTC] = 1 is restricted in the sense that the new command must load on a frame boundary, and the only way for a transfer to continue from a frame boundary is when the previous command has TCR[CONT] = 1.

You can read the current state of the existing command word from Transmit Command (TCR). It requires at least three LPSPI functional clock cycles for Transmit Command (TCR) to update after you write to it (assuming an empty FIFO), and LPSPI must be enabled (CR[MEN] = 1).

Writing to Transmit Command (TCR) does not initiate an SPI bus transfer, unless TCR[TXMSK] = 1. When TCR[TXMSK] = 1, a new command word is not loaded until the end of the existing frame (based on the value of TCR[FRAMESZ]); at the end of the transfer, TCR[TXMSK] transitions to 0.

In Controller mode, the LPSPI command word in Transmit Command (TCR) controls SPI attributes based on the selections in register fields. See Table 468 for TCR fields and associated functionality related to data transfer.

Table 468. Command word in Controller mode

Transmit Command (TCR)		Description	Can this field be modified during a data transfer?
Field	Name		
CPOL	Clock polarity	Specifies the polarity of the SCK pin. Any change of CPOL value causes a transition on the SCK pin.	N
CPHA	Clock phase	Specifies the clock phase of the transfer.	N
PRESCALE	Prescaler value	Specifies a prescaler used to divide the LPSPI functional clock, to generate the timing parameters of the SPI bus transfer. Changing PRESCALE in conjunction with PCS enables LPSPI to connect to different peripheral devices at different frequencies.	N
PCS	Peripheral chip select	Specifies which PCS pin asserts for the transfer; the polarity of PCS is static and specified by CFGR1[PCSPOL].	N
LSBF	LSB first	Specifies whether LSB (bit 0) or MSB (bit 31 for a 32-bit word) is transmitted or received first.	Y
BYSW	Byte swap	Enables byte swap on each 32-bit word when transmitting and receiving data. Byte swapping can be useful when interfacing with devices that organize data as big-endian.	Y
CONT	Continuous transfer	Configures LPSPI for a continuous transfer that keeps PCS asserted between frames (as specified by FRAMESZ). You must write a new command word to cause PCS to negate. Also, this field supports changing the command word at frame size boundaries.	Y
CONTC	Continuing command	Indicates that this is a new command word for the existing continuous transfer. When CONTC = 1, the command word must only be written to the transmit and command FIFO on a frame boundary.	Y
RXMSK	Receive data mask	Masks the receive data and does not store the masked receive data in the receive FIFO or perform receive data matching. This option is useful for half-duplex transfers or to specify which fields are compared during receive data matching.	Y
TXMSK	Transmit data mask	Masks the transmit data; masked transmit data is not pulled from the transmit FIFO, and the output data pin is 3-stated (unless otherwise configured by CFGR1[OUTCFG]). This option is useful for half-duplex transfers.	Y
FRAMESZ	Frame size	Configures the frame size in number of bits equal to (FRAMESZ + 1): • The minimum frame size is 8 bits. • If the frame size is larger than 32 bits, then the frame is divided into multiple words of 32 bits; each word is loaded from the transmit FIFO and stored in the receive FIFO separately.	Y

Table continues on the next page...

Table 468. Command word in Controller mode (continued)

Transmit Command (TCR)		Description	Can this field be modified during a data transfer?
Field	Name		
		• If the size of the frame is not divisible by 32, then the last load of the transmit FIFO and store of the receive FIFO contains the remaining bits. For example, a 72-bit transfer consists of three words: the first and second words are 32 bits, and the third word is 8 bits.	

46.3.1.1.1 SPI bus transfers

LPSPI initiates an SPI bus transfer when all these conditions are true:

- Data is written to the transmit FIFO.
- LPSPI is enabled.

To perform the SPI bus transfer, LPSPI uses the attributes configured in Transmit Command (TCR) and the timing parameters defined in Clock Configuration (CCR).

The SPI bus transfer ends after the number of bits indicated by the value of FRAMESZ have been transferred (provided CONT = 0), or at the end of a word when a new transmit command word is at the top of the transmit and command FIFO. When LPSPI is disabled, the SPI bus transfers end after the transmit FIFO is empty and LPSPI is idle.

46.3.1.1.2 Circular FIFO

The transmit and command FIFO supports a circular FIFO feature. This feature enables the LPSPI controller to (periodically) repeat a short data transfer that fits within the transmit and command FIFO, without requiring additional FIFO accesses. When the circular FIFO is enabled (CFGR0[CIRFIFO] = 1), the current state of the FIFO read pointer is saved and the status flags are not updated. After the FIFO is empty and LPSPI is idle, the FIFO read pointer is restored with the saved version, so the contents of the transmit and command FIFO are not permanently pulled from the FIFO when Circular FIFO mode is enabled.

46.3.1.2 Receive FIFO and data match

The receive FIFO stores received data during SPI bus transfers. When TCR[RXMSK] = 1, the received data is discarded instead of being stored in the receive FIFO:

- Received data is written to the receive FIFO when the last bit of the word is sampled.
- If the transmit FIFO is empty during a multiple-word or continuous transfer, then the receive data is written to the receive FIFO before the transfer stalls (assuming CFGR1[NOSTALL] = 0) while waiting for new transmit data or for a command word to be written.

LPSPI provides a receive data match function that can match received data against one of the two words in DMR0 and DMR1, or against a masked data word. You can also configure the received data match function to compare only the first one or two received data words since the start of the frame:

- Received data that is already discarded because of TCR[RXMSK] cannot cause the data match flag to set, and delays the receive data match on the first received data word, until all discarded data is received.
- You can configure the receive data match function to discard all received data until a data match is detected, using CFGR0[RDMO].
- After a receive data match, to allow all subsequent data to be received, write 0 to CFGR0[RDMO], and then write 0 to SR[DMF].

46.3.1.3 Timing parameters

The timing parameters that are used for all SPI bus transfers are relative to the LPSPI functional clock divided by the selection specified in TCR[PRESCALE]. Although you cannot change Clock Configuration (CCR) when LPSPI is busy, to support interfacing with different peripheral devices at different frequencies, you can change the TCR[PRESCALE] selection between SPI bus transfers by using Transmit Command (TCR).

NOTE

The minimum value shown in Table 469 is the minimum counter value, but the values of Clock Configuration (CCR) must also satisfy the data sheet specs based on the LPSPI functional clock frequency and prescaler value.

Table 469. Timing parameters

Clock Configuration (CCR) Clock Configuration 1 (CCR1)		Description	Minimum value	Maximum value
Field	Name			
SCKSET	SCK setup phase	Configures the SCK setup phase to (SCKSET + 1) cycles. The setup phase is the SCK high period when either CPHA = 0 and CPOL = 1, or CPHA = 1 and CPOL = 0. Otherwise, it is the SCK low period. The SCK period is defined as (SCKSET + SCKHLD + 2) and the duty cycle is the difference between SCKSET and SCKHLD.	0 (1 cycle)	255 (256 cycles)
SCKHLD	SCK hold phase	Configures the SCK hold phase to (SCKHLD + 1) cycles. The hold phase is the SCK low period when either CPHA = 0 and CPOL = 1, or CPHA = 1 and CPOL = 0. Otherwise, it is the SCK high period. The SCK period is defined as (SCKSET + SCKHLD + 2) and the duty cycle is the difference between SCKSET and SCKHLD.	0 (1 cycle)	255 (256 cycles)
PCSPCS	PCS-to-PCS delay	Configures the minimum delay between PCS negation and the next PCS assertion to (PCSPCS + PCSPCS + 2) cycles. When the command word is updated between transfers, there is a minimum of (PCSPCS + 1) cycles between the command word update and any change on PCS pins.	0 (2 cycles)	255 (512 cycles)
SCKSCK	SCK-to-SCK delay	Configures the delay during a continuous transfer between the last SCK edge of a frame and the first SCK edge of the continuing frame to (SCKSCK + 1) cycles. This is useful when the external peripheral requires a large delay between different words of an SPI bus transfer.	0 (1 cycle)	255 (256 cycles)
PCSSCK	PCS-to-SCK delay	Configures the minimum delay between PCS assertion and the first SCK edge to (PCSSCK + 1) cycles.	0 (1 cycle)	255 (256 cycles)
SCKPCS	SCK-to-PCS delay	Configures the minimum delay between the last SCK edge and the PCS negation to (SCKPCS + 1) cycles.	0 (1 cycle)	255 (256 cycles)

Figure 240 shows the timing settings controlled by:

- TCR[CPHA]
- TCR[CPOL]
- CCR[SCKPCS]
- CCR[PCSSCK]
- CCR1[SCKSET]
- CCR1[SCKHLD]

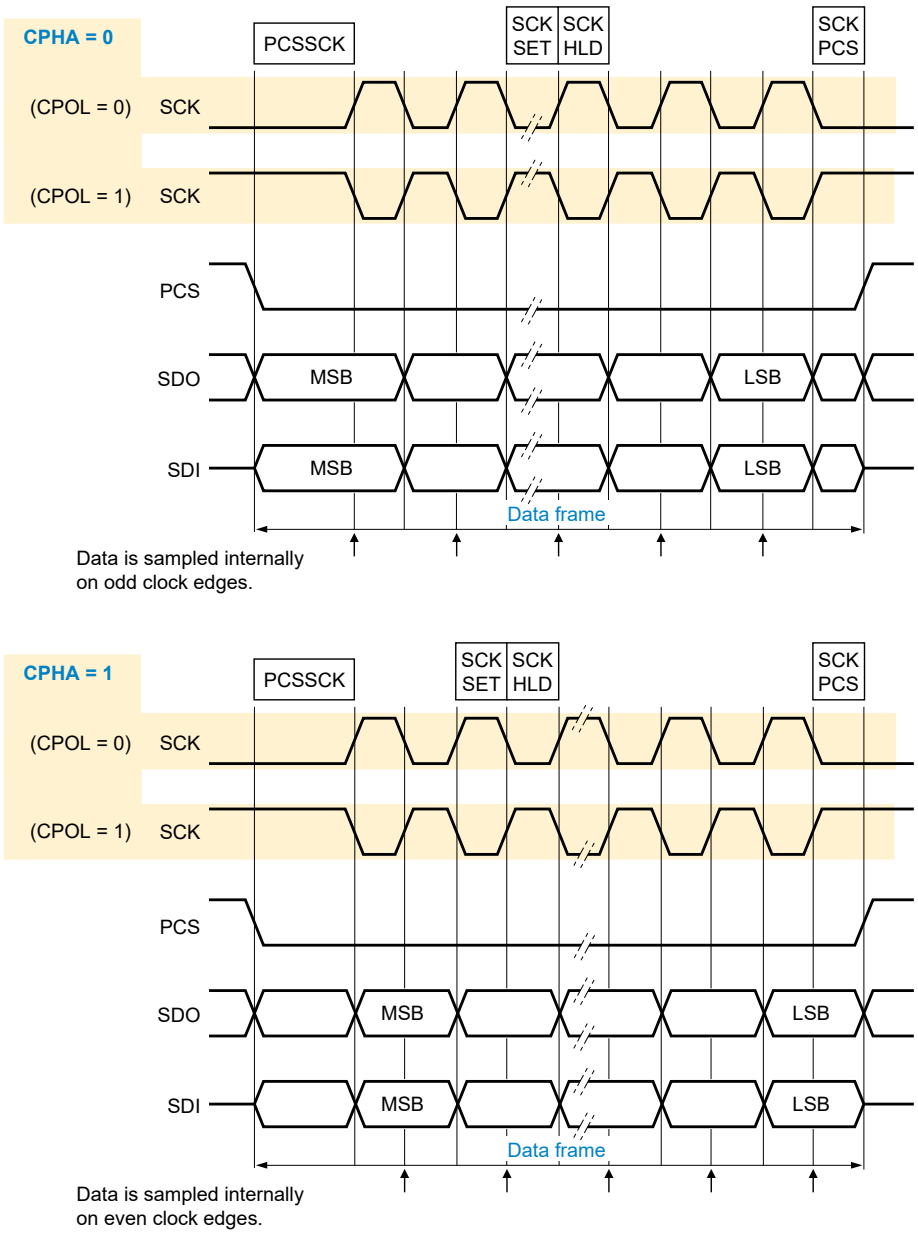

Figure 240. Clock phase (TCR[CPHA]) timing diagram example

To configure for a baud rate of 10 MHz with 50/50 duty cycle and with a functional clock frequency of 100 MHz, use the following settings:

- CCR1[SCKSET] = 0x4 (5 cycles)

- CCR1[SCKHLD] = 0x4 (5 cycles)
- CCR1[PCSPCS] = 0x8 (10 cycles)
- CCR1[SCKSCK] = 0x4 (5 cycles)
- CRR[PCSSCK] = 0x4 (5 cycles)
- CRR[SCKPCS] = 0x4 (5 cycles)
- TCR[PRESCALE] = 0x0 (divide by 1)

46.3.1.4 Pin configuration

Following are the pin configuration settings for half-duplex transfers:

- To swap directions or to support half-duplex transfers on the same pin, you can configure the SIN and SOUT pins using CFGR1[PINCFG].
- When configuring half-duplex transfers, you must configure the output data pins to 3-state when PCS is negated (CFGR1[OUTCFG] = 1).

46.3.1.5 Clock loopback

Configure the LPSPI controller to use one of the following clocks to sample the input data:

- The SCK output clock
- A delayed version of the SCK output clock

The delayed version of the SCK is chosen by the SCK pin output delay, plus the SCK pin input delay, and is selected by writing 1 to CFGR1[SAMPLE]. Enabling the loopback version of the SCK pin can improve the setup time of the input data from the peripheral.

See the chip data sheet for the specific input setup time in Controller Loopback mode.

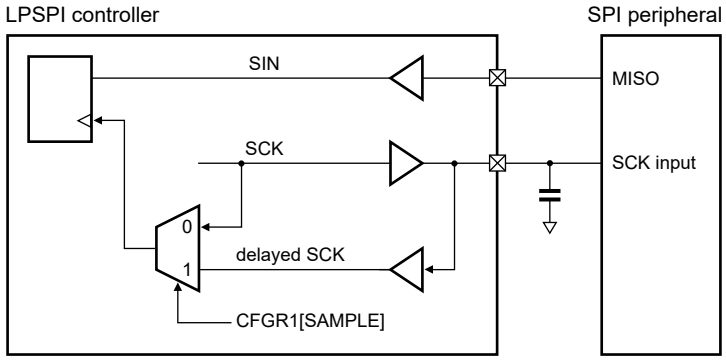

Figure 241. Clock loopback

46.3.2 Peripheral mode

LPSPI Peripheral mode:

- Uses the same shift register and logic that Controller mode uses.
- Does not use Clock Configuration (CCR).
- Requires Transmit Command (TCR) to remain static (unchanged) during SPI bus transfers.

46.3.2.1 Transmit and command FIFO commands

You must initialize Transmit Command (TCR) before enabling LPSPI in Peripheral mode, although this register is not updated until after LPSPI is enabled. After LPSPI is enabled, you must make changes to this register only when LPSPI is idle. In Peripheral mode, the LPSPI command word in this register controls SPI attributes. Before the PCS input asserts, the transmit FIFO must be filled with transmit data, or the transmit error flag sets.

Table 470. Command word in Peripheral mode

Transmit Command (TCR)		Description
Field	Name	
CPOL	Clock polarity	Specifies the polarity of the external SCK input.
CPHA	Clock phase	Specifies the clock phase of transfer.
PRESCALE	Prescaler value	Specifies the LPSPI functional clock prescaler.
PCS	Peripheral chip select	Specifies which PCS is used. The polarity of PCS is static and configured by CFGR1[PCSPOL].
LSBF	LSB first	Specifies whether LSB (bit 0) or MSB (bit 31 for a 32-bit word) is transmitted or received first.
BYSW	Byte swap	Enables byte swap on each 32-bit word when transmitting and receiving data. Byte swapping can be useful when interfacing with devices that organize data as big-endian.
CONT	Continuous transfer	When continuous transfer is selected in Peripheral mode, after the number of bits indicated by FRAMESZ are transferred, LPSPI passes through and transmits the received data until the next PCS negation. Whatever is shifted in on the receive data is shifted out as transmit data considering that there is a 32-bit shift register.
CONTC	Continuing command	When the continuing command is enabled in Peripheral mode, after the number of bits indicated by FRAMESZ are transferred, RXMSK is considered equal to 1 and TXMSK is considered equal to 0 until the next PCS negation. CONTC can be used to change the direction of a transfer after the number of bits indicated by FRAMESZ.
RXMSK	Receive data mask	Masks the receive data; LPSPI does not store masked receive data in the receive FIFO or perform receive data matching. This option is useful for half-duplex transfers or to specify which fields are compared during receive data matching.
TXMSK	Transmit data mask	Masks the transmit data so that the masked transmit data is not pulled from transmit FIFO, and the output data pin is 3-stated (unless otherwise specified in CFGR1[OUTCFG]). This option is useful for half-duplex transfers.
FRAMESZ	Frame size	Specifies the frame size in number of bits equal to (FRAMESZ + 1): • The minimum frame size is 8 bits. • If the frame size is larger than 32 bits, then the frame is divided into multiple words of 32 bits; each word is loaded from the transmit FIFO and stored in the receive FIFO separately. • If the size of the frame is not divisible by 32, then the last load of the transmit FIFO and store of the receive FIFO contain the remainder bits. For example, a 72-bit transfer consists of three words: the first and second words are 32 bits, and the third word is 8 bits.

46.3.2.2 Receive FIFO and data match

The receive FIFO stores receive data during SPI bus transfers. When TCR[RXMSK] = 1, the received data is discarded instead of storing the received data in the receive FIFO.

Receive data supports a receive data match function that can match received data against one of the two words in DMR0 and DMR1 or against a masked data word. You can also configure the data match function to compare only the first one or two received data words since the start of the frame.

- Received data that is already discarded because TCR[RXMSK] = 1 cannot cause the data match to set, and delays the match on the first received data word, until all discarded data is received.
- By using CFGR0[RDMO], you can also configure the receiver match function to discard all received data until a data match is detected.
- After a receive data match, to allow all subsequent data to be received, first write 0 to CFGR0[RDMO], then clear SR[DMF].

46.3.2.3 Partial received word

When the PCS pin deasserts and the receive shift register shifts in a partial word, you can configure the receive shift register to either discard the partial word or to store it in the receive FIFO. You must specify this using CFGR1[PARTIAL].

A partial word is defined as less than TCR[FRAMESZ] bits (when TCR[FRAMESZ] is equal or less than 32 bits, or it is the last word in a multi-word frame) or less than 32 bits (when TCR[FRAMESZ] is greater than 32 bits and not the last word in a multi-word frame).

A single-bit frame is not supported. A partial received word of 1 bit is supported, but a partial received frame of 1 bit is not supported.

46.3.2.4 Clocked interface

LPSPI supports interfacing with external controllers that provide only clock and data pins (PCS is not required). This interface requires:

- Writing 1 to TCR[CPHA] (data is changed on the leading edge of SCK and captured on the following edge).
- Configuring the PCS input to be always asserted (CFGR1[PCSPOL*n*] = 1). For example, to configure PCS[0] to be always asserted, write 1 to PCSPOL[0], and do not configure PCS[0] in the pin muxing. The chip-level drives PCS to a certain value (ideally 1); you could use CFGR1[PCSPOL*n*] to invert that value.
- Writing 1 to CFGR1[AUTOPCS] to enable automatic PCS generation. When CFGR1[AUTOPCS] = 1, a minimum of four LPSPI functional clock cycles (divided by the selection specified in TCR[PRESCALE]) is required between the last SCK edge of one word and the first SCK edge of the next word.

46.3.3 Low-power modes

LPSPI remains functional during low-power modes, if CR[DOZEN] = 0 and LPSPI uses an external or internal clock source that remains enabled. LPSPI can generate an interrupt or DMA request to cause a wake-up from low-power modes.

46.3.4 Debug mode

Table 471. Debug mode

Chip mode	LPSPI operation
Debug (the core is in Debug or Halted mode)	Can continue operating in Debug mode, if CR[DBGEN] = 1

46.3.5 Clocking

Table 472. LPSPI clocks

Type of clock	Description
Functional	• Asynchronous to the bus clock. • If the LPSPI functional clock remains enabled in low-power modes, then LPSPI can perform SPI bus transfers and low-power wakeups in both Controller and Peripheral modes. • LPSPI divides the functional clock by a prescaler; the resulting frequency must be at least two times faster than the SPI external clock frequency (SCK).
External	• The LPSPI shift register is clocked directly by the SCK clock. • How the SCK clock is generated or supplied depends on the mode (Controller or Peripheral): — In Controller mode, the SCK clock is generated internally. — In Peripheral mode, the SCK clock is supplied externally.
Bus	The bus clock is only used for bus accesses to the LPSPI control and configuration registers. The bus clock frequency must be high enough to support the data bandwidth requirements of the LPSPI registers, including the FIFOs.

See the chip-specific LPSPI information for more.

46.3.6 Reset

Table 473. LPSPI resets

Type of reset	Description
Chip	Resets the LPSPI logic and registers to their default states.
Software	• Resets the LPSPI logic and registers to their default states, except for the Control register. • The LPSPI software reset is controlled using CR[RST].
FIFO	• Resets the transmit and command FIFO and the receive FIFO. • CR[RTF] and CR[RRF] are write-only. • After being reset, FIFO is empty.

46.3.7 Interrupts and DMA requests

The following table lists sources (status flags) that can generate LPSPI interrupts and LPSPI transmit and receive DMA requests.

Table 474. Interrupts and DMA requests

Status (SR)		Description	Can generate		
Status flag	Name		Interrupt?	DMA request?	Low-power wake-up?
TDF	Transmit data flag	Indicates that data can be written to transmit FIFO, as configured by the transmit FIFO watermark, FCR[TXWATER].	Y	TX	Y

Table continues on the next page...

Table 474. Interrupts and DMA requests (continued)

Status (SR)		Description	Can generate		
Status flag	Name		Interrupt?	DMA request?	Low-power wake-up?
RDF	Receive data flag	Indicates that data can be read from the receive FIFO, as configured by the receive FIFO watermark, FCR[RXWATER].	Y	RX	Y
WCF	Word complete flag	Indicates that the word is complete and the last bit of the word has been sampled.	Y	N	Y
FCF	Frame complete flag	Indicates that the frame is complete and PCS is deasserted.	Y	RX	Y
TCF	Transfer complete flag	Indicates that transfer is complete, PCS is deasserted, and the transmit and command FIFO is empty.	Y	N	Y
TEF	Transmit error flag	Indicates a transmit and command FIFO underrun. In Controller mode, when CFGR1[NOSTALL] = 0 (transfers stall when transmit FIFO is empty), TEF cannot be set.	Y	N	Y
REF	Receive error flag	Indicates a receive FIFO overflow. In Controller mode, when CFGR1[NOSTALL] = 0 (transfers stall when receive FIFO is full), REF cannot be set.	Y	N	Y
DMF	Data match flag	Indicates that the received data matches the configured data match value.	Y	N	Y
MBF	Module busy flag	Indicates that LPSPI is busy performing an SPI bus transfer.	N	N	N

46.3.7.1 End-of-packet DMA transfer

The end-of-packet functionality is designed for serial interfaces where you may not be aware of the size of the transfer in advance and the data is pushed by an external device. Examples include UART receive, I2C Peripheral mode, and SPI Peripheral mode. The end-of-packet processing is intended to ensure that data is not stranded in either the receive FIFO or the DMA receive buffer. Support for end-of-packet processing must be implemented in both the serial interfaces and the DMA controller.

The condition that signals the end of packet is different for each serial interface but the serial peripheral and DMA process it in the same way. For example, UART end of packet is signaled by an idle line condition, I2C end of packet by a stop and/or repeated start condition, and SPI end of packet by PCS negation.

If you configure the serial peripheral to signal the end-of-packet condition to the DMA and the serial interface detects an end-of-packet condition, it asserts the DMA request for the receive FIFO irrespective of the watermark configuration. For larger watermark configurations, this ensures that the last few words of the transfer are first flushed from the receive FIFO.

The DMA then reads the contents of the receive FIFO, depending on the first word in the FIFO:

- If the receive FIFO is empty, the serial interface signals an end-of-packet condition to the DMA controller.
- If the receive FIFO is not empty, but the first word in the FIFO is the start of a new packet, then data is not pulled from the receive FIFO and the serial interface signals an end-of-packet condition to the DMA controller.
- If the receive FIFO is not empty, and the first word in the FIFO is not the start of a new packet, the DMA transfers the receive data as normal.

Because the DMA may be transferring multiple words on each request, the end-of-packet condition persists until the DMA minor loop is complete and no additional data is pulled from the receive FIFO. The status flag that triggered the end-of-packet condition is cleared when the minor loop completes following end of packet being signaled to the DMA controller.

When the DMA detects the end-of-packet condition, it writes all received words up to the end of the packet into the system memory and saves the destination address for the word after the last valid data. The DMA then terminates the channel as if the major loop is complete, including final offsets and optional interrupts, channel linking and scatter/gather. The final destination address can optionally be saved in the system memory or is available in the destination address register.

After the DMA terminates the major loop, no servicing of the receive FIFO occurs until either software or hardware reconfigures the DMA (for example, channel linking or scatter/gather). This delay must be minimized to avoid receiver FIFO overrun. NXP does not recommend automatic DMA end-of-packet processing when there are only a few words transferred between end-of-packet conditions. That is because the DMA spends more time processing the end of packet than transferring the data. For example, the UART idle line length must be increased as needed to avoid an excessive number of idle conditions.

46.3.7.2 DMA support registers

To support efficient DMA transfers to the transmit and control FIFO, an alias register supports 32-bit write access to the Transmit Command (TCR) and an alias region supports incrementing 32-bit write accesses to the Transmit Data (TDR).

- Transmit Command Burst (TCBR) is a 32-bit alias register for writing to TCR.
- Transmit Data Burst (TDBR0 - TDBR127) is a 512-byte alias region that supports writing to the TDR.

The burst alias locations are contiguous. A DMA transfer can start by writing to the TCBR register to initialize the transfer and then increment into the TDBR region without changing the DMA transfer size. The alias registers can also be used by the DMA to perform burst transfers when accessing the transmit FIFO.

The transmit FIFO prevents writes that overflow the FIFO, but this prevention does not signal an error. Do not perform writes to the TDBR unless there is sufficient room in the transmit FIFO.

Receive Data Burst (RDBR0 - RDBR127) is a 512-byte alias region that supports reading the Receive Data. This can be used by the DMA to perform burst transfers when accessing the receive FIFO.

46.3.8 Peripheral triggers

The connection of the LPSPI peripheral triggers with other peripherals depends on the device that is used.

Table 475. Peripheral triggers

Type of trigger	Description	Additional information
Frame output	The frame output trigger: • Asserts at the end of each frame (when PCS deasserts). • Remains asserted for one cycle of the LPSPI functional clock divided by the configuration defined in TCR[PRESCALE].	LPSPI generates two output triggers that can be connected to other peripherals on the chip.
Word output	The word output trigger: • Asserts at the end of each received word. • Remains asserted for one cycle of the LPSPI functional clock divided by the configuration defined in TCR[PRESCALE].	

46.4 External signals

Table 476. External signals

Signal	Name	Description	I/O
SCK	Serial clock	• Input in Peripheral mode • Output in Controller mode	I/O
PCS[0]	Peripheral chip select	• Input in Peripheral mode • Output in Controller mode	I/O
PCS[1]	Peripheral chip select	: • Input in Peripheral mode • Output in Controller mode	I/O
SOUT	Serial data output	Can be configured as serial data input signal (used as data pin 0 in half-duplex parallel data transfers)	I/O
SIN	Serial data input	Can be configured as serial data output signal (used as data pin 1 in half-duplex parallel data transfers)	I/O

46.5 Initialization

This module does not require initialization.

46.6 Memory map and registers

NOTE

- Writing to a read-only register or reading a write-only register can cause bus errors.
- LPSPI does not check values programmed in registers for validity, so you must take care to write valid values only.

Fields

Field	Description
31-24 —	Reserved
23-16 PCSNUM	PCS Number Indicates the number of PCS pins supported.
15-8 RXFIFO	Receive FIFO Size Indicates the maximum number of words in the receive FIFO. The maximum number of words is 2^{RXFIFO}.
7-0 TXFIFO	Transmit FIFO Size Indicates the maximum number of words in the transmit FIFO. The maximum number of words is 2^{TXFIFO}.

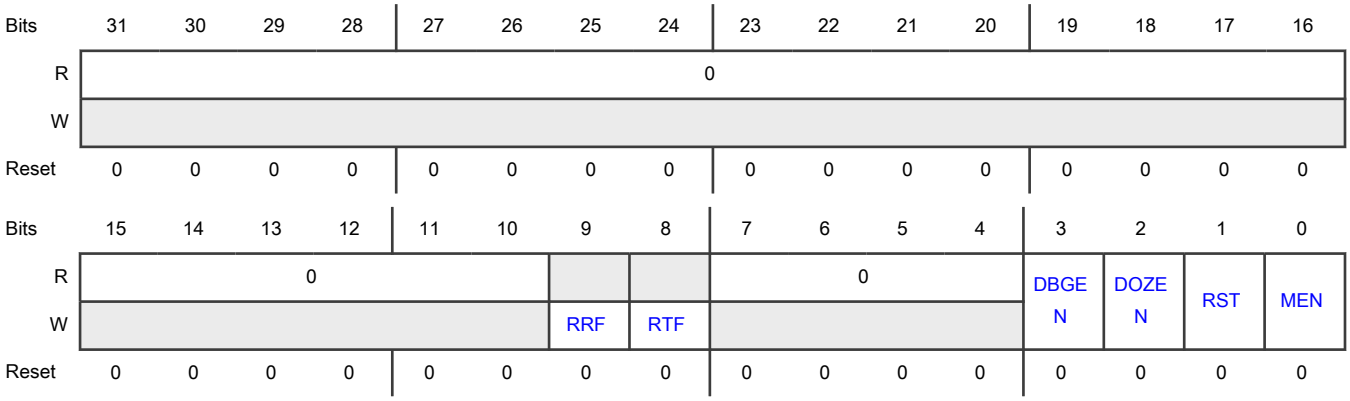
46.6.1.4 Control (CR)

Contains fields that control the module operation.

Offset

Register	Offset
CR	10h

Diagram



Fields

Field	Description
31-10 —	Reserved
9 RRF	Reset Receive FIFO Deletes all entries in the receive FIFO. This field always reads 0. 0 - No effect 1 - Reset
8 RTF	Reset Transmit FIFO Deletes all entries in the transmit FIFO. This field always reads 0. 0 - No effect 1 - Reset
7-4 —	Reserved
3 DBGEN	Debug Enable Enables LPSPI when the CPU is in Debug mode. If this field is 0, LPSPI is disabled when the CPU is halted; the PCS pin is deasserted after the transmit FIFO is empty regardless of the state of Transmit Command (TCR). You must update this field only when LPSPI is disabled (MEN = 0). 0 - Disable 1 - Enable
2 DOZEN	Doze Mode Enable Enables LPSPI when the chip is in Doze mode. You must update this field only when LPSPI is disabled (MEN = 0).

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Enable 1 - Disable
1 RST	Software Reset Resets all internal logic and registers, except Control (CR). The reset takes effect immediately and remains asserted until you write 0 to it. There is no minimum delay required before clearing the software reset by writing 0. 0 - Not reset 1 - Reset
0 MEN	Module Enable Enables the module. After writing 0, MEN remains set until LPSPI has completed the current transfer and is idle. 0 - Disable 1 - Enable

46.6.1.5 Status (SR)

Contains data flow status.

Fields

Field	Description
31-25 —	Reserved
24 MBF	Module Busy Flag Indicates, in Controller mode, whether there is data to transmit and LPSPI is able to transmit (for example, the HREQ pin is asserted). The HREQ pin deasserts after the PCS pin deasserts and the LPSPI controller has waited for half the time specified in CCR[DBT] with no new data to transmit. Peripheral mode sets this flag when LPSPI is enabled and PCS is asserted. 0 - LPSPI is idle 1 - LPSPI is busy
23-14 —	Reserved
13 DMF	Data Match Flag Indicates whether the received data matches DMR0[MATCH0] and/or DMR1[MATCH1] (as configured by CFGR1[MATCFG]). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No match 1 - Match When writing 0 - No effect 1 - Clear the flag
12 REF	Receive Error Flag Indicates a receive FIFO overflow error. When this flag is set: 1. End the transfer. 2. Empty the receive FIFO. 3. Clear this flag. 4. Restart the transfer from the beginning. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No overflow 1 - Overflow

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When writing 0 - No effect 1 - Clear the flag
11 TEF	Transmit Error Flag Indicates a transmit FIFO underrun error. When this flag is set: 1. End the transfer. 2. Clear this flag. 3. Restart the transfer from the beginning. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No underrun 1 - Underrun When writing 0 - No effect 1 - Clear the flag
10 TCF	Transfer Complete Flag Indicates, in Controller mode, whether all transfers are complete and LPSPI has returned to the Idle state and the transmit FIFO is empty. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not complete 1 - Complete When writing 0 - No effect 1 - Clear the flag
9 FCF	Frame Complete Flag Indicates whether a frame transfer is complete after PCS deasserts. **NOTE** This field behaves differently for register reads and writes. When reading

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Not complete 1 - Complete When writing 0 - No effect 1 - Clear the flag
8 WCF	Word Complete Flag Indicates whether the last bit of a received word is sampled. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not complete 1 - Complete When writing 0 - No effect 1 - Clear the flag
7-2 —	Reserved
1 RDF	Receive Data Flag Indicates whether the number of words in the receive FIFO is greater than the value in FCR[RXWATER]. 0 - Receive data not ready 1 - Receive data ready
0 TDF	Transmit Data Flag Indicates whether the number of words in the transmit FIFO is equal to or less than the value in FCR[TXWATER]. 0 - Transmit data not requested 1 - Transmit data requested

46.6.1.6 Interrupt Enable (IER)

Enables interrupts based on data flow and errors.

Offset

Register	Offset
IER	18h

0 TDIE	Transmit Data Interrupt Enable Enables the transmit data interrupt. 0 - Disable 1 - Enable

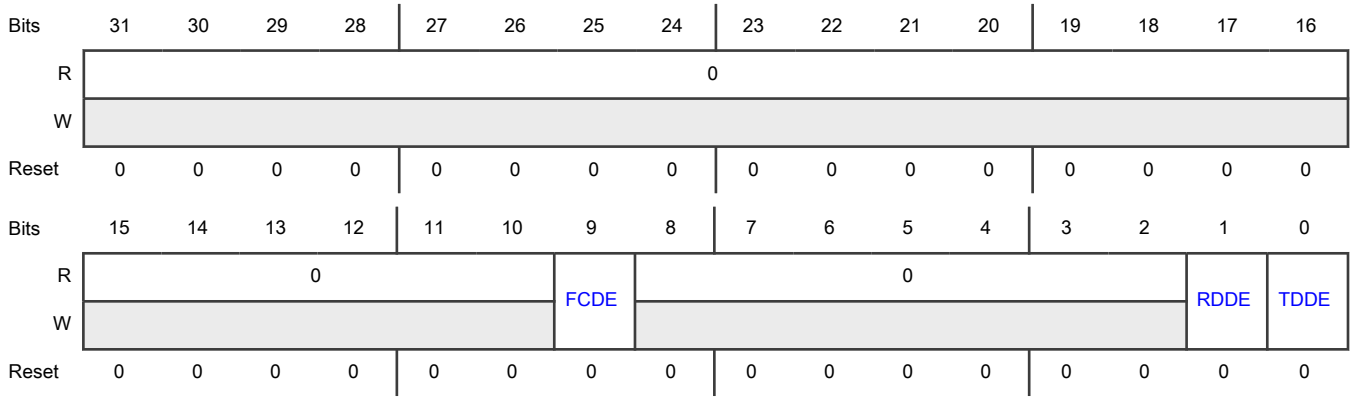
46.6.1.7 DMA Enable (DER)

Enables the DMA data flow.

Offset

Register	Offset
DER	1Ch

Diagram



Fields

Field	Description
31-10 —	Reserved
9 FCDE	Frame Complete DMA Enable Enables DMA end-of-packet processing. After the last word of a frame is read from the receive data FIFO, reading the receive data FIFO returns an end-of-packet signal with the receive data forced to FFFF_FFFFh. This continues until the DMA minor loop completes, and then SR[FCF] deasserts if the receive FIFO is empty or if LPSPI is busy (SR[MBF] = 1). 0 - Disable 1 - Enable
8-2 —	Reserved
1 RDDE	Receive Data DMA Enable Enables the receive data DMA. 0 - Disable 1 - Enable
0 TDDE	Transmit Data DMA Enable Enables the transmit data DMA. 0 - Disable 1 - Enable

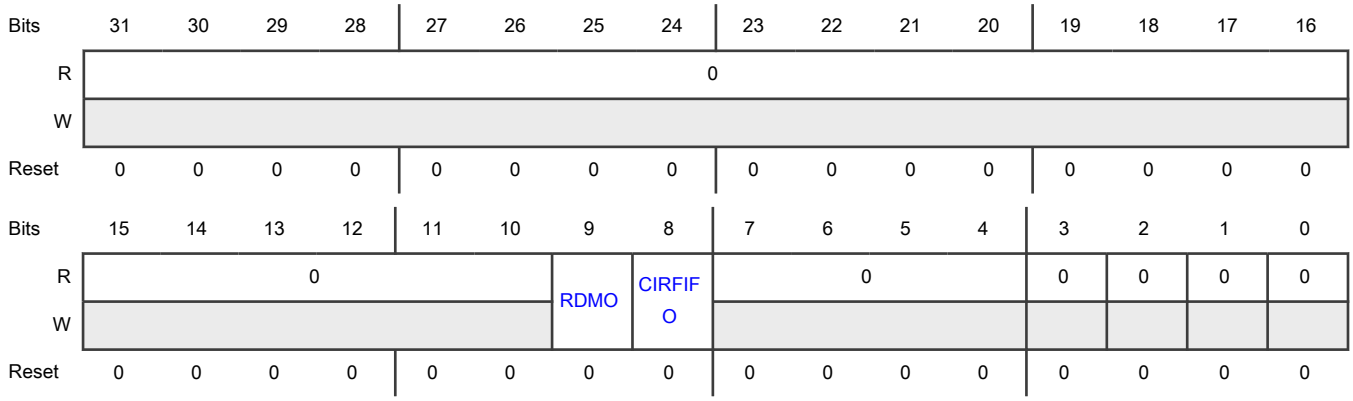
46.6.1.8 Configuration 0 (CFGR0)

Includes fields to configure LPSPI.

Offset

Register	Offset
CFGR0	20h

Diagram



Fields

Field	Description
31-10 —	Reserved
9 RDMO	Receive Data Match Only Enables receive data match. When enabled, all received data that does not cause SR[DMF] to assert is discarded: • Write 1 to this field when LPSPI is idle and SR[DMF] = 0. • After SR[DMF] = 1, this field is ignored. • To ensure that no receive data is lost when disabling RDMO, write 0 to this field before clearing SR[DMF]. See CFGR1[MATCFG] for the received data matching options. When disabled, all received data is stored in the receive FIFO. 0 - Disable 1 - Enable
8 CIRFIFO	Circular FIFO Enable Enables circular FIFO. When enabled, the transmit FIFO read pointer is saved to a temporary register. The transmit FIFO is emptied as in normal operation, but when LPSPI is idle and the transmit FIFO is empty, the read pointer value is restored from the temporary register. This restoring of the read pointer causes the contents of the transmit FIFO to be cycled through repeatedly. **NOTE** The read pointer is restored for as long as this field is 1. Writing additional words to the FIFO when this field is 1 adds them to the end of the FIFO, up to the size of the transmit FIFO. 0 - Disable 1 - Enable

46.6.1.9 Configuration 1 (CFGR1)

Includes fields to configure LPSPI. You must write to this register only when LPSPI is disabled.

In addition to pin and output configurations, this register contains match configuration details; the following table shows match conditions specified in MATCFG.

Table 477. Match conditions for CFGR1[MATCFG]

Condition	Description
Match first data word with compare word	Match if first data word equals MATCH0 logically ORed with MATCH1 first_data_word == (MATCH0 || MATCH1)
Match any data word with compare word	Match if any data word equals MATCH0 logically ORed with MATCH1 any_data_word == (MATCH0 || MATCH1)
Sequential match, first data word	Match if first data word equals MATCH0, and second data word equals MATCH1 (first_data_word == MATCH0) && (second_data_word == MATCH1)
Sequential match, any data word	Match if any data word equals MATCH0, and the next data word equals MATCH1 (any_data_word == MATCH0) && (next_data_word == MATCH1)
Match first data word (masked) with compare word (masked)	Match if first data word logically ANDed with MATCH1 equals MATCH0 logically ANDed with MATCH1 (first_data_word && MATCH1) == (MATCH0 && MATCH1)
Match any data word (masked) with compare word (masked)	Match if any data word logically ANDed with MATCH1 equals MATCH0 logically ANDed with MATCH1 (any_data_word && MATCH1) == (MATCH0 && MATCH1)

Fields

Field	Description
31-29 —	Reserved
28 —	Reserved
27 —	Reserved
26 OUTCFG	Output Configuration Specifies whether the output data is 3-stated between accesses (when PCS is deasserted). When performing half-duplex transfers, this field must be 1. 0 - Retain last value 1 - 3-stated
25-24 PINCFG	Pin Configuration Specifies the pins used for input and output data during serial transfers. 00 - SIN is used for input data; SOUT is used for output data 01 - SIN is used for both input and output data; only half-duplex serial transfers are supported 10 - SOUT is used for both input and output data; only half-duplex serial transfers are supported 11 - SOUT is used for input data; SIN is used for output data

<tr><td>3
NOSTALL</td><td>No Stall
Disables a normal operating feature that causes LPSPI, when in Controller mode, to stall transfers when the transmit FIFO is empty or when the receive FIFO is full. This feature prevents transmit FIFO underruns and receive FIFO overruns. Writing 1 to this field disables this functionality.
0 - Disable
1 - Enable</td></tr>
<tr><td>2</td><td>Automatic PCS</td></tr>
</table>

Table continues on the next page...

Table continued from the previous page...

Field	Description
AUTOPCS	Enables automatic PCS generation. For correct operation in Peripheral mode, LPSPI requires the PCS signal to deassert between frames. Writing 1 to this field generates an internal PCS signal at the end of each transfer word when TCR[CPHA] = 1. When this field is 1, SCK must remain idle for at least four LPSPI functional clock cycles, divided by the prescaler (see TCR[PRESCALE]) selected between each word to ensure correct operation. This field is ignored in Controller mode. 0 - Disable 1 - Enable
1 SAMPLE	Sample Point Specifies the SCK clock edge on which LPSPI, when in Controller mode, samples input data. Writing 1 to this field causes LPSPI to sample input data on a delayed loopback SCK clock edge, which improves the setup time when sampling data (see Clock loopback). In this configuration, the input data setup time in Controller mode is equal to the input data setup time in Peripheral mode. In Peripheral mode, this field is ignored. **NOTE** When SAMPLE = 1, both the input and output buffers must be enabled for the SCK pin. Buffers are configured at the chip level. 0 - SCK edge 1 - Delayed SCK edge
0 MASTER	Controller Mode Specifies the LPSPI operating mode, Controller or Peripheral. This field directly controls the direction of the SCK and PCS pins. 0 - Peripheral mode 1 - Controller mode

46.6.1.10 Data Match 0 (DMR0)

Specifies the match data to be used when data matching is enabled. See CFGR1[MATCFG] for the received data matching options.

NOTE

Do not change the value in this register when CFGR1[MATCFG] > 0.

Fields

Field	Description
31-0 MATCH1	Match 1 Value Specifies the MATCH1 value to be compared against received data.

46.6.1.12 Clock Configuration (CCR)

Contains clock configuration fields that are used only in Controller mode; you can only change them when LPSPI is disabled (CR[MEN] = 0).

Warning

Writing a 32-bit value to this register overwrites Clock Configuration 1 (CCR1); DBT and SCKDIV always read 0.

To avoid overwriting CCR1, do one of the following:

- Write to all four fields in Clock Configuration (CCR) simultaneously and only once in a 32-bit data.
- Modify the values of CCR[SCKPCS] and/or CCR[PCSSCK]; write only these two upper bytes in a 16-bit data or one of them in an 8-bit data.
- Modify CCR1[PCSPCS] and CCR1[SCKSCK] only or CCR1[SCKSET] and CCR1[SCKHLD] only, write respectively to CCR[DBT] or CCR[SCKDIV] in 8-bit data.

Fields

Field	Description
31-24 SCKPCS	SCK-to-PCS Delay

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Configures SCK-to-PCS delay. In Controller mode, this field helps you configure the delay from the last SCK edge to PCS negation: • The delay is equal to (SCKPCS + 1) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is one cycle. See Figure 240 for more information.
23-16 PCSSCK	PCS-to-SCK Delay Configures PCS-to-SCK delay. In Controller mode, this field helps you configure the delay from PCS assertion to the first SCK edge: • The delay is equal to (PCSSCK + 1) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is one cycle. See Figure 240 for more information.
15-8 DBT	Delay Between Transfers Configures the delay between transfers. Writing to this field updates the contents of CCR1[PCSPCS] and CCR1[SCKSCK].
7-0 SCKDIV	SCK Divider Updates the contents of CCR1[SCKSET] and CCR1[SCKHLD]. Baud rate = function clock ÷ (2^PRESCALE × (SCKSET + SCKHLD + 2))

46.6.1.13 Clock Configuration 1 (CCR1)

Contains clock configuration fields, which are used only in Controller mode. You can change them only when LPSPI is disabled (CR[MEN] = 0).

Offset

Register	Offset
CCR1	44h

R W	SCKHLD								SCKSET							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Description
31-24 SCKSCK	SCK Inter-Frame Delay Configures SCK inter-frame delay in Controller mode: • This field helps you configure the delay from the last SCK pulse of a frame and the first SCK pulse of the following frame, in a continuous transfer. • The delay is equal to (SCKSCK + 1) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is one cycle. **NOTE** For backward compatibility, writing to CCR[DBT] updates this field with the value written.
23-16 PCSPCS	PCS to PCS Delay Configures PCS to PCS delay in Controller mode: • This field helps you configure the delay from the PCS negation to the next PCS assertion. • The delay is equal to (PCSPCS + PCSPCS + 2) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is two cycles. • Half of the delay (PCSPCS + 1) occurs before PCS assertion and the other half of the delay (PCSPCS + 1) occurs after PCS negation. If the command word is updated between two transfers, then the command word is updated halfway between the PCS negation of the last transfer and PCS assertion of the next transfer. • The command word specifies which PCS signal is used, the polarity and phase of the SCK signal, and the selected prescaler. **NOTE** For backward compatibility, writing to CCR[DBT] updates this field with (DBT÷2) rounded up.
15-8	SCK Hold

Table continues on the next page...

Table continued from the previous page...

Field	Description
SCKHLD	Configures the hold phase of the SCK pin in Controller mode: • The hold phase is the delay between the SCK edge that samples the receive data and the SCK edge that drives the transmit data. • It is the SCK low period when CPHA = 0 and CPOL = 1, or CPHA = 1 and CPOL = 0. It is the SCK high period when CPHA = 0, CPOL = 0 and CPHA = 1, CPOL = 1. • The SCK hold phase delay is equal to (SCKHLD + 1) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is one cycle. • The SCK period is equal to (SCKSET + SCKHLD + 2) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The SCK duty cycle is based on the difference between SCKSET and SCKHLD. You must configure both these fields to the same value for a 50/50 duty cycle. See Figure 240 for more information. **NOTE** For backward compatibility, writing to CCR[SCKDIV] updates this field with (SCKDIV ÷ 2) rounded down.
7-0 SCKSET	SCK Setup Configures the setup phase of the SCK pin in Controller mode: • The setup phase is the delay between the SCK edge that drives the transmit data and the SCK edge that samples the receive data. • It is the SCK high period when CPHA = 0 and CPOL = 1, or CPHA = 1 and CPOL = 0. It is the SCK low period when CPHA = 0 and CPOL = 0, or CPHA = 1 and CPOL = 1. • The SCK setup phase delay is equal to (SCKSET + 1) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The minimum delay is one cycle. • The SCK period is equal to (SCKSET + SCKHLD + 2) cycles of the LPSPI functional clock divided by the selected prescaler (see TCR[PRESCALE]). • The SCK duty cycle is based on the difference between SCKSET and SCKHLD. You must configure both these fields to the same value for a 50/50 duty cycle. See Figure 240 for more information. **NOTE** For backward compatibility, writing to CCR[SCKDIV] updates this field with (SCKDIV ÷ 2) rounded up.

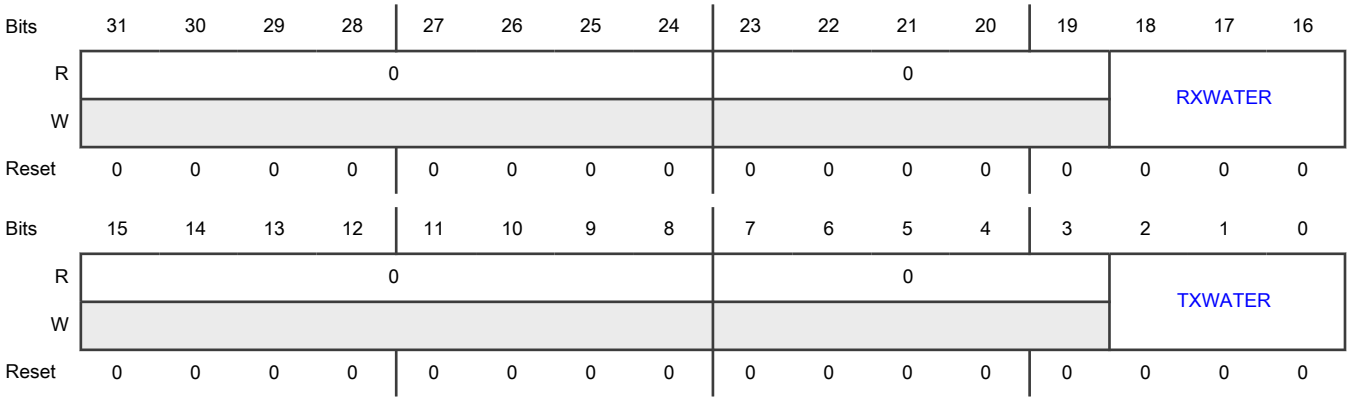
46.6.1.14 FIFO Control (FCR)

Contains the receive FIFO and transmit FIFO watermark values.

Offset

Register	Offset
FCR	58h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-19 —	Reserved
18-16 RXWATER	Receive FIFO Watermark Causes LPSPI to set SR[RDF] when the number of words in the receive FIFO is greater than RXWATER. Writing a value equal to or greater than the FIFO size truncates the written value.
15-8 —	Reserved
7-3 —	Reserved
2-0 TXWATER	Transmit FIFO Watermark Causes LPSPI to set SR[TDF] when the number of words in the transmit FIFO is equal to or less than TXWATER. Writing a value equal to or greater than the FIFO size truncates the written value.

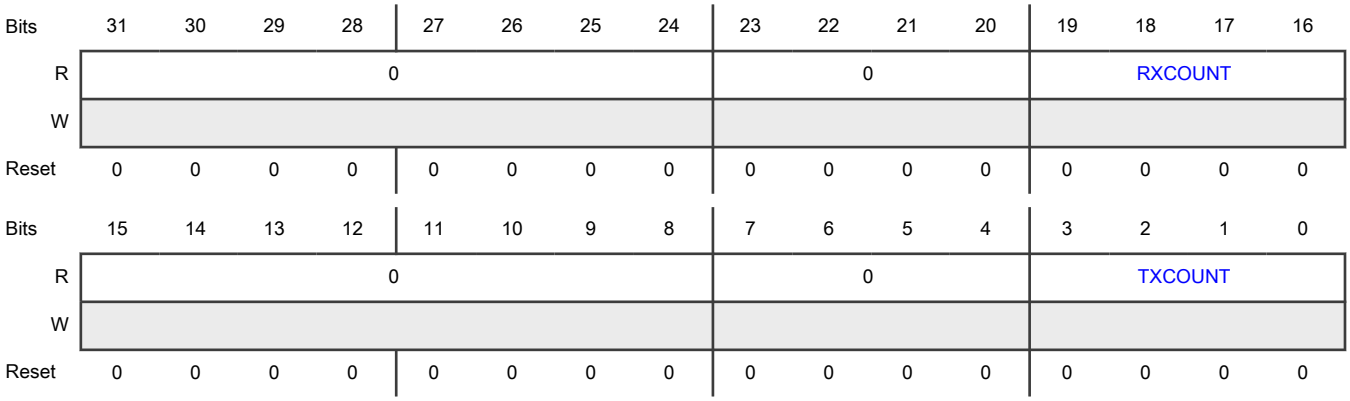
46.6.1.15 FIFO Status (FSR)

Contains fields that indicate the number of words currently stored in the receive and transmit FIFOs.

Offset

Register	Offset
FSR	5Ch

Diagram



Fields

Field	Description
31-24 —	Reserved
23-20 —	Reserved
19-16 RXCOUNT	Receive FIFO Count Indicates the number of words currently stored in the receive FIFO.
15-8 —	Reserved
7-4 —	Reserved
3-0 TXCOUNT	Transmit FIFO Count Indicates the number of words currently stored in the transmit FIFO.

46.6.1.16 Transmit Command (TCR)

Pushes the data into the transmit FIFO, in the same order as written.

When you write to either this register or to Transmit Data (TDR), each write pushes data into the transmit FIFO. You must write to this register only using 32-bit writes, which are tagged and cause the command register to update; after that the entry reaches the top of the FIFO and LPSPI is enabled. This allows changes to the command word and the transmit data itself to be interleaved.

That is, writes to the two registers can be interleaved (write command word, then data word, then command word, and so on). Changing the command word causes all subsequent SPI bus transfers to be performed using the new command word:

- In Controller mode, writing a new command word does not initiate a new transfer, unless TXMSK is 1. Transfers are initiated by transmit data in the transmit FIFO, or by a new command word (with TXMSK = 1). Hardware writes 0 to TXMSK when PCS deasserts.
- In Controller mode, if the command word is changed before an existing frame has completed, then the existing frame terminates and the command word updates. The command word can be changed during a continuous transfer, if CONTC of the new command word is 1 and the command word is written on a frame size boundary.
- In Peripheral mode, the command word must be changed only when LPSPI is idle and there is no SPI bus transfer.

Avoid resetting the transmit FIFO after writing to this register; wait for the command register to update from the FIFO first.

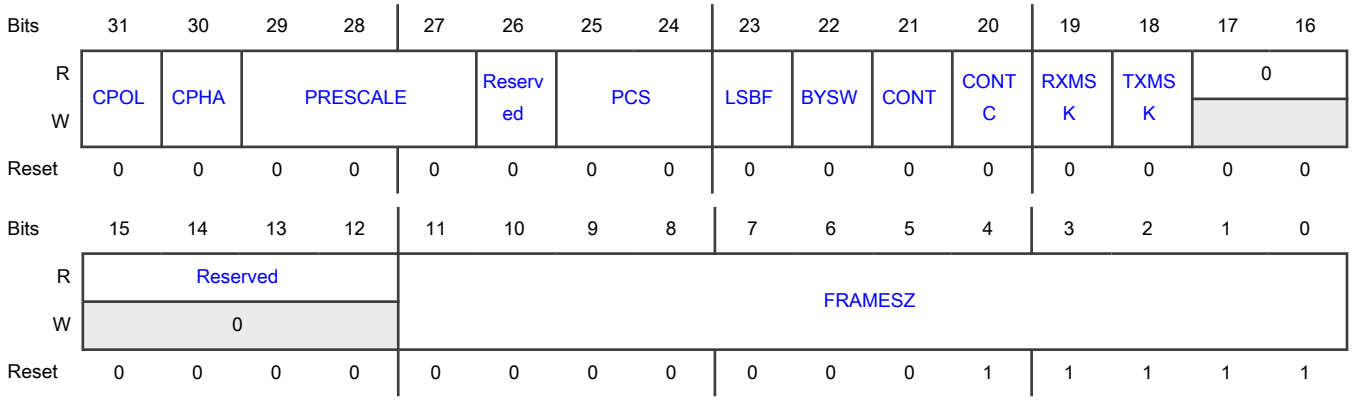
Avoid register reading problems: Reading this register returns the current state of the register. Reading this register at the same time that it is loaded from the transmit FIFO can return an incorrect register value. It is recommended to:

- Read this register when the transmit FIFO is empty.
- Read this register more than once and then compare the returned values.

Offset

Register	Offset
TCR	60h

Diagram



Fields

Field	Description
31 CPOL	Clock Polarity Specifies the value of SCK when it is idle. You can update this field only when PCS is deasserted. See Figure 240 for more information. 0 - Inactive low 1 - Inactive high
30	Clock Phase

Table continues on the next page...

Table continued from the previous page...

Field	Description
CPHA	Indicates whether data is captured or changed on the leading edge of SCK and captured or changed on the following edge of SCK. You can update this field only when PCS is deasserted. See Figure 240 for more information. 0 - Captured 1 - Changed
29-27 PRESCALE	Prescaler Value Specifies the division of the LPSPI functional clock. For all SPI bus transfers, this value is applied to Clock Configuration (CCR). You can update this field only when PCS is deasserted. 000 - Divide by 1 001 - Divide by 2 010 - Divide by 4 011 - Divide by 8 100 - Divide by 16 101 - Divide by 32 110 - Divide by 64 111 - Divide by 128
26 —	Reserved
25-24 PCS	Peripheral Chip Select Configures the peripheral chip select used for the transfer. This field is updated only when PCS is deasserted. **NOTE** This entire field is not fully supported in every LPSPI module instance. See the chip-specific LPSPI information. **NOTE** This field is not supported in every instance. The following table includes only supported registers.

Instance	Field supported in	Field not supported in
LPSPI1	TCR[24]	TCR[25]
LPSPI2	TCR[24]	TCR[25]
LPSPI3	TCR[24]	TCR[25]

Table continued from the previous page...

Field	Description
	<table><tr><th>Instance</th><th>Field supported in</th><th>Field not supported in</th></tr><tr><td>LPSPI4</td><td>TCR</td><td>—</td></tr><tr><td>LPSPI5</td><td>TCR[24]</td><td>TCR[25]</td></tr><tr><td>LPSPI6</td><td>TCR[24]</td><td>TCR[25]</td></tr><tr><td>LPSPI7</td><td>TCR[24]</td><td>TCR[25]</td></tr><tr><td>LPSPI8</td><td>TCR[24]</td><td>TCR[25]</td></tr></table> **NOTE** The descriptions of the field settings vary by module instance. <table><tr><th>Instance</th><th>Field value and description</th></tr><tr><td>LPSPI1 LPSPI2 LPSPI3 LPSPI5 LPSPI6 LPSPI7 LPSPI8</td><td>0 - Transfer using PCS[0] 1 - Transfer using PCS[1]</td></tr><tr><td>LPSPI4</td><td>00 - Transfer using PCS[0] 01 - Transfer using PCS[1] 10 - Transfer using PCS[2]</td></tr></table>
23 LSBF	LSB First Indicates whether data is transferred with MSB first or LSB first. 0 - MSB first 1 - LSB first
22 BYSW	Byte Swap Swaps the contents of [31:24] with [7:0] and [23:16] with [15:8] for each transmit data word read from the FIFO and for each received data word stored to the FIFO (or compared with match registers). 0 - Disable byte swap 1 - Enable byte swap
21	Continuous Transfer

Table continues on the next page...

Table continued from the previous page...

Field	Description
CONT	Enables continuous transfer: • In Controller mode, this field keeps PCS asserted at the end of the frame size until a command word is received that starts a new frame. • In Peripheral mode, when this field is enabled, LPSPI only transmits the first FRAMESZ bits, after which LPSPI transmits received data (assuming a 32-bit shift register) until the next PCS negation. 0 - Disable 1 - Enable
20 CONTC	Continuing Command Enables the command word to be changed within a continuous transfer in Controller mode: • The initial command word must enable continuous transfer (CONT = 1). • The continuing command must have CONTC = 1. • The continuing command word must be loaded on a frame size boundary. For example, if the continuous transfer has a frame size of 64 bits, then a continuing command word must be loaded on a 64-bit boundary. In Peripheral mode, this field modifies the internal RXMSK and TXMSK configuration after the first FRAMESZ bits and until PCS negation: • Receive data is discarded after the first FRAMESZ bits. If CONT is also 1, this does not block the transmission of received data. • Transmit data is not masked after the first FRAMESZ bits. This allows the first FRAMESZ bits to be received and a response transmitted. 0 - Command word for start of new transfer 1 - Command word for continuing transfer
19 RXMSK	Receive Data Mask Masks receive data (receive data is not stored in the receive FIFO). 0 - Normal transfer 1 - Mask receive data
18 TXMSK	Transmit Data Mask Masks transmit data (no data is loaded from the transmit FIFO and the output pin is 3-stated). In Controller mode, TXMSK initiates a new transfer that cannot be aborted by another command word. TXMSK automatically transitions to 0 at the end of the transfer. 0 - Normal transfer 1 - Mask transmit data
17-16 —	Reserved You must write only 0 to this field.

Table continues on the next page...

Table continued from the previous page...

Field	Description
15-12 —	Reserved
11-0 FRAMESZ	Frame Size Configures the frame size in number of bits equal to (FRAMESZ + 1): • The minimum frame size is 8 bits. • If the frame size is larger than 32 bits, then the frame is divided into multiple words of 32 bits; each word is loaded from the transmit FIFO and stored in the receive FIFO separately. • If the size of the frame is not divisible by 32, then the last load of the transmit FIFO and store of the receive FIFO contains the remainder bits. For example, a 72-bit transfer consists of three words: the first and second words are 32 bits, and the third word is 8 bits.

46.6.1.17 Transmit Data (TDR)

Pushes the data into the transmit FIFO, in the same order that the data is written. You can write to this register using 32-, 16-, or 8-bit writes.

When you write to this register or to Transmit Command (TCR), each write pushes data into the FIFO with zero pushed in unwritten bytes.

Offset

Register	Offset
TDR	64h

Chapter 47
Low Power Universal Asynchronous Receiver/ Transmitter (LPUART)

47.1 Chip-specific LPUART information

Table 478. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes eight instances of LPUART Modules. LPUART1 and LPUART2 are in AONMIX. LPUART3-8 in WAKEUPMIX.

All 8 LPUART instances support DOZE low power mode. CTRL(0x18) bit[6] is set to to 1'b1 to enable the usage of doze mode.

Entering doze mode or not, is decided by corresponding LPUART CCGRs in CCM, and the CCGRs are controlled by GPC CMCs. If the CMCs require SoC enter "WAIT" (cpu_power_mode[1:0]=2'b01) mode, then LPUART will be in "doze" mode.

LPUART loopback mode supports hardware flow control.

NOTE

LPUART DCB_B is the same as LPUART DCD_B.

NOTE

LPUART1, LPUART2, LPUART3, and LPUART4 support all signals mentioned in the External Signals section. LPUART5, LPUART6, LPUART7, and LPUART8 do not support DTR_B, DSR_B, DCD_B and RI_B.

47.2 Overview

LPUART provides asynchronous, serial communication capabilities with external devices. It supports the non-return-to-zero (NRZ) encoding format and infrared data association (IrDA)-compatible, low-speed serial infrared (SIR) protocol. LPUART can continue operating when the processor is in Low-Power mode, if an appropriate peripheral clock is available.

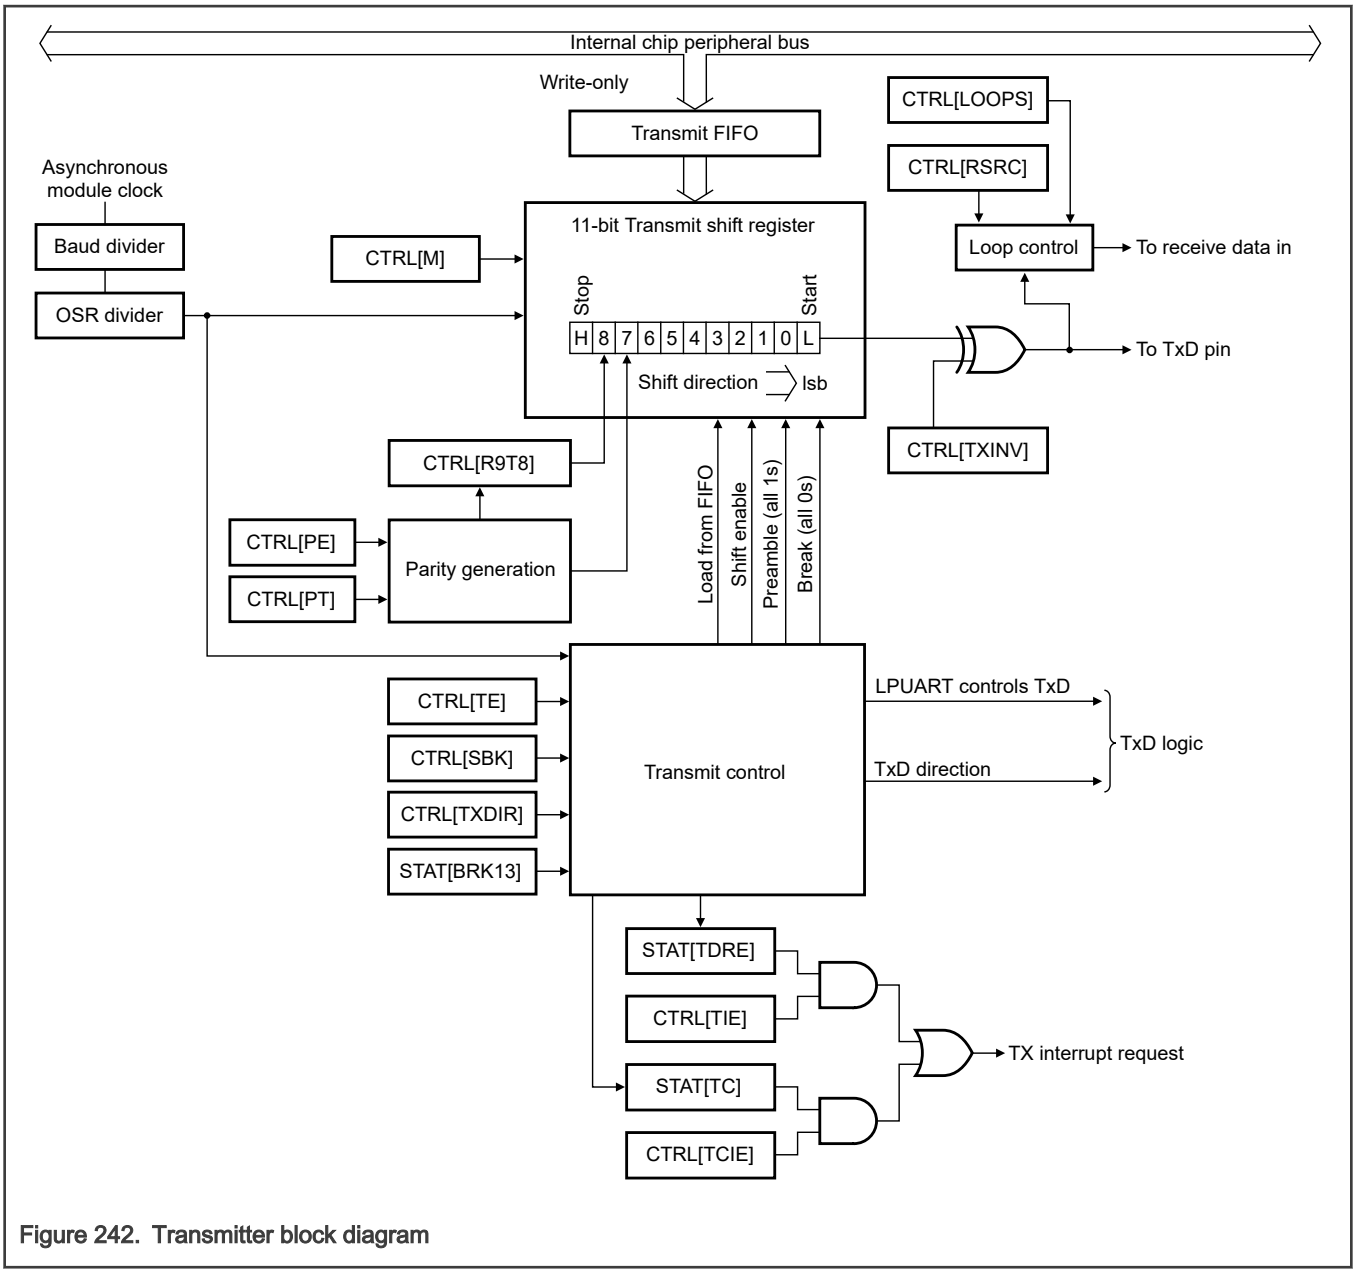

Figure 242. Transmitter block diagram

Figure 243 shows the receiver portion of LPUART.

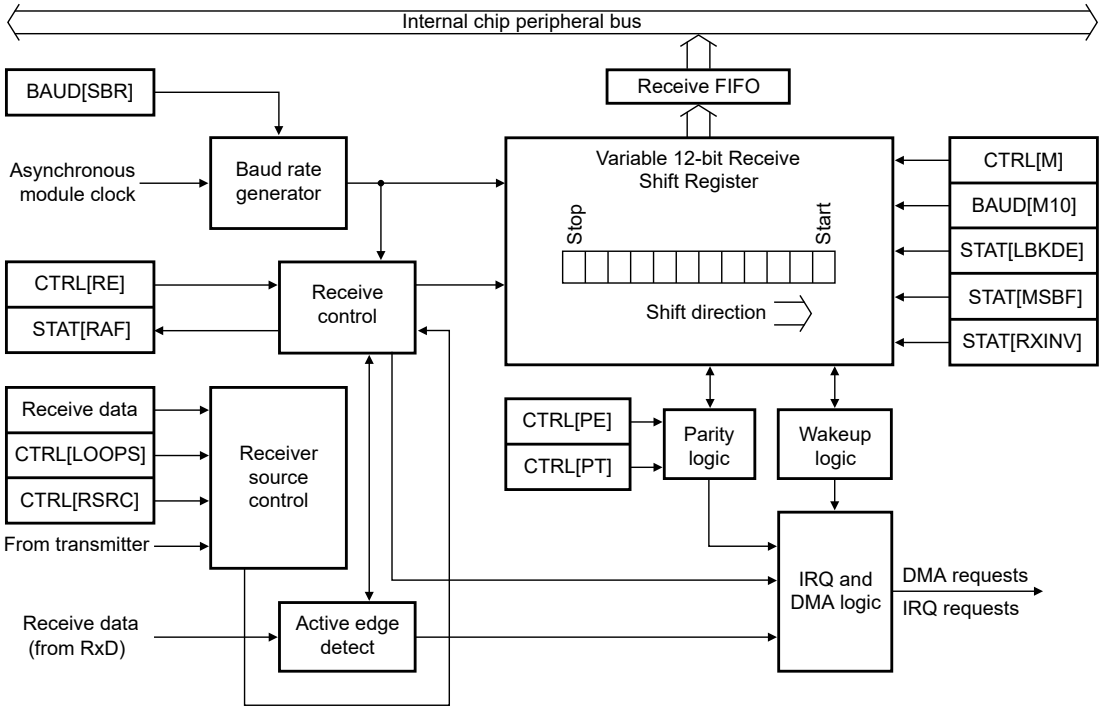

Figure 243. Receiver block diagram

47.2.2 Features

- Full-duplex, standard NRZ format
- Programmable baud rates (13-bit modulo divider) with a configurable oversampling ratio (OSR) from 4× to 32×
- Asynchronous operation of transmit and receive baud rates with respect to the bus clock:
  - Baud rate can be configured independently of the bus clock frequency.
  - Operation in Low-Power modes is supported.
- Interrupt, DMA, or polled operations:
  - Transmit data empty and transmission complete
  - Receive data full
  - Receive overrun, parity error, framing error, and noise error
  - Idle receiver detect
  - Active edge on receive pin
  - Break detect supporting LIN
  - Receive data match
- Hardware parity generation and checking
- Programmable 7-bit, 8-bit, 9-bit, or 10-bit character length
- Programmable 1-bit or 2-bit stop bits
- Support for three receiver wake-up methods:
  - Idle line wake-up

  - Address mark wake-up
  - Receive data match
- Automatic address matching to reduce ISR overhead:
  - Address mark matching
  - Idle line address matching
  - Address match start, address match end
- Optional 13-bit and 11-bit break character generation
- Configurable idle length detection supporting 1, 2, 4, 8, 16, 32, 64, or 128 idle characters
- Selectable transmitter output and receiver input polarity
- Hardware flow control support for request to send (RTS) and clear to send (CTS) signals
- Selectable IrDA 1.4 return-to-zero-inverted (RZI) format with a programmable pulse width
- Independent FIFO structure for transmit and receive functions:
  - Separate configurable watermarks for receive and transmit requests
  - Option for receiver to assert request after a configurable number of idle characters, if receive FIFO is not empty

47.3 Functional description

LPUART supports full-duplex, asynchronous, NRZ serial communication and comprises a baud rate generator, transmitter, and receiver block. The transmitter and receiver operate independently, although they use the same baud rate generator. The following sections describe all LPUART blocks.

47.3.1 Baud rate generation

A 13-bit modulus counter in the baud rate generator derives the baud rate for both the receiver and transmitter. The value, ranging from 1 to 8191, written to BAUD[SBR] determines the baud clock divisor for the asynchronous LPUART baud clock. The baud rate clock drives the receiver, while a bit clock, generated from the baud rate clock divided by the OSR, drives the transmitter. Depending on the OSR, the receiver has an acquisition rate of 4 to 32 samples per bit time. LPUART requires BAUD[SBR] and BAUD[OSR] to accurately match the baud rate requirement. There is a relationship between the required baud rate and the input clock frequency, SBR, and OSR. See the below figure for details.

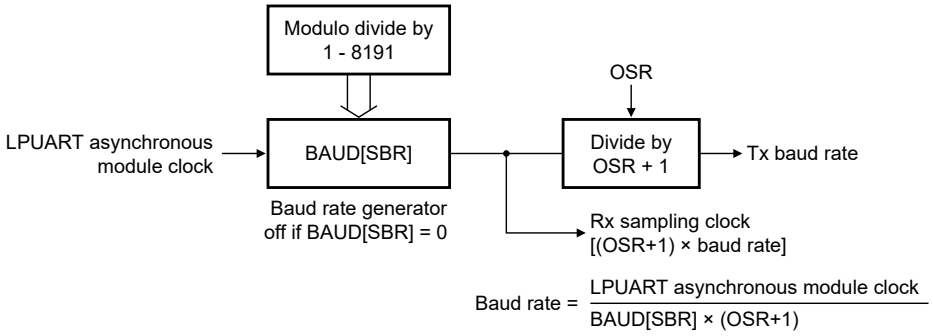

Figure 244. Baud rate generation

Baud rate generation is subject to these sources of error:

- Integer division of the asynchronous LPUART baud clock may not give the exact target frequency.
- Synchronization with the asynchronous LPUART baud clock can lead to a phase shift.

Baud rate generation is a free-running counter that continues whenever the transmitter or receiver is enabled. The transmitter bit clock continues whenever the transmitter is enabled; each transmitted character aligns to the next edge of the transmit bit clock.

In general, configuring OSR for a higher ratio and/or sampling on both edges of the clock slightly improves LPUART's tolerance to baud rate mismatch between the received data and LPUART configured baud rate. However, the three data samples in each bit (see Data sampling technique) are also closer together, which may impact noise sensitivity.

47.3.2 Baud rate tolerance

A transmitting device may operate at a baud rate below or above that of the receiver.

Accumulated bit time misalignment can cause one of the three stop bit data samples to fall outside the actual stop bit. A noise error will occur if the three samples are not all the same logical values. A framing error will occur if the receiver clock is misaligned in such a way that the majority of the three stop bit samples are a logic zero.

As the receiver samples an incoming frame, it may resynchronize the oversampling clock on any valid falling edge within the frame. Resynchronization within frames will correct a misalignment between transmitter bit times and receiver bit times.

In general, increasing the number of samples per bit will increase the baud rate tolerance and decreasing the number of samples per bit will reduce the baud rate tolerance. Note that since LPUART implements triple voting on consecutive receive data samples, increasing the number of samples per bit will move those samples closer together which would reduce the width of noise that can be filtered by the triple voting logic.

47.3.3 Calculating baud rate tolerance

Using the following definitions:

- SAM is the number of sample points per bit (valid range from 8 to 32; equal to (OSR + 1) × (BOTHEDGE + 1)).
- BIT is the number of bits in a character including start, data and stop bits (valid range from 9 to 13).

The ideal baud rate tolerance can be calculated as follows:

- Slow data rate tolerance = ((SAM ÷ 2) - 1) ÷ ((SAM × BIT) - (SAM ÷ 2) + 2)
- Fast data rate tolerance = ((SAM ÷ 2) - 2) ÷ (SAM × BIT)

As an example, if configured for 8-bit data, 1 stop bit (BIT = 10) and with OSR=0x7 and BOTHEDGE = 1 (SAM = 16):

- Slow data rate tolerance = (8 - 1) ÷ (160 - 8 + 2) = 7 ÷ 154 = 4.54%
- Fast data rate tolerance = (8 - 2) ÷ 160 = 6 ÷ 160 = 3.75%

If configured for 9-bit data with 1 stop bit (BIT = 11) with same oversampling configuration, then:

- Slow data rate tolerance = (8 - 1) ÷ (176 - 8 + 2) = 7 ÷ 170 = 4.12%
- Fast data rate tolerance = (8 - 2) ÷ 176 = 6 ÷ 176 = 3.41%

NOTE

Additional factors can contribute to a lower baud rate tolerance than the ideal. These include clock uncertainty or jitter on the LPUART functional clock source, differences in rise and fall times on the transmitter output and synchronization of the external receive pin to the local LPUART functional clock.

47.3.4 Transmitter functional description

This section describes the functioning of the LPUART transmitter, as shown in the transmitter portion of Block diagram, as well as specialized functions for sending break and idle characters.

The transmitter output (TXD) idle state defaults to logic high; the transmitter output is inverted when you write 1 to CTRL[TXINV], which becomes 0 following reset. You can enable the transmitter by writing 1 to CTRL[TE]. This queues a preamble character that is one full character frame of the Idle state. The transmitter then remains idle until data is available in the transmit FIFO and programs store data in the transmit FIFO by writing to Data (DATA).

The central element of the LPUART transmitter is the transmit shift register that is 9-bit to 13-bit long depending on the settings of CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS]. Going forward in this discussion, assume that CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] are 0, selecting the normal 8-bit Data mode, in which the shift register holds a start bit, eight data bits, and a stop bit. When the transmit shift register is available for a new character, the value waiting in transmit FIFO is transferred to the transmit shift register, synchronized with the baud rate clock, and STAT[TDRE] becomes 1 to indicate that another character may be written to the transmit FIFO at Data (DATA).

If no new character is waiting in the transmit FIFO after a stop bit is shifted out of the TXD pin, the transmitter sets the transmit complete flag and enters an idle mode, with TXD high, waiting for more characters to transmit.

Writing 0 to CTRL[TE] does not immediately disable the transmitter. The current transmit activity in progress must first be completed (that could include a data character, idle character, or break character), although the transmitter does not start transmitting another character.

47.3.4.1 Break character length

CTRL[SBK] sends break characters, originally used to gain the attention of old teletype receivers. Break characters are a full character time of logic 0, 9-bit to 12-bit times, including the start and stop bits. You can enable a longer break of 13-bit times by writing 1 to STAT[BRK13]. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, the program writes 1 and then writes 0 to CTRL[SBK]. This action queues a break character to be sent as soon as the shifter is available. If CTRL[SBK] remains 1 when the queued break moves into the shifter, synchronized with the baud rate clock, an additional break character is queued. When LPUART is the receiving module, it receives a break character as 0s in all data bits and a framing error (STAT[FE] = 1) is detected.

You can also transmit a break character by writing to Data (DATA) with DATA[FRETSC] = 1 and the data bits clear. This supports transmitting the break character as part of the normal data stream and also allows DMA to transmit a break character.

When idle line wake-up is used, a full character time of idle (logic 1) is needed between messages to wake up any sleeping receivers. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, write 0 and then write 1 to CTRL[TE]. This action queues an idle character to be sent as soon as the shifter is available. As long as the character in the shifter does not finish while CTRL[TE] becomes 0, the LPUART transmitter does not release control of the TXD pin.

You can also write to Data (DATA) to transmit an idle character, with DATA[FRETSC] and DATA[R9T9] = 1 and the values of all the other fields = 0. This supports transmitting the idle character as part of the normal data stream and also allows DMA to transmit an idle character.

As shown in the following table, STAT[BRK13], CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] affect the length of the break character.

Table 479. Break character length

STAT[BRK13]	CTRL[M]	BAUD[M10]	CTRL[M7]	BAUD[SBNS]	Break character length (in bit times)
0	0	0	0	0	10
0	0	0	0	1	11
0	0	0	1	0	9
0	0	0	1	1	10
0	1	0	—	0	11
0	1	0	—	1	12
0	—	1	—	0	12
0	—	1	—	1	13
1	0	0	0	0	13

Table continues on the next page...

Table 479. Break character length (continued)

STAT[BRK13]	CTRL[M]	BAUD[M10]	CTRL[M7]	BAUD[SBNS]	Break character length (in bit times)
1	0	0	0	1	13
1	0	0	1	0	12
1	0	0	1	1	12
1	1	0	—	0	14
1	1	0	—	1	14
1	—	1	—	0	15
1	—	1	—	1	15

47.3.4.2 Hardware flow control

The transmitter supports hardware flow control by gating the transmission with the value of CTS_B. If the CTS operation is enabled, the character is transmitted when CTS_B is asserted. If CTS_B is deasserted in the middle of a transmission with characters remaining in the transmitter FIFO, the character in the transmit shift register is complete. Any characters in the FIFO wait for CTS_B to assert again, and TXD remains in the mark state (idle state) until CTS_B is reasserted. The CTS_B pin must assert for longer than one bit period to guarantee that a new transmission is started when the transmitter is idle with CTS.

If the CTS operation is disabled, the transmitter ignores the state of CTS_B.

The transmitter's CTS_B signal can be enabled even if the same LPUART receiver's RTS_B signal is disabled.

47.3.4.3 Transceiver driver enable

The transmitter can use RTS_B as an enable signal for the driver of an external transceiver. See Transceiver driver enable using RTS_B for details. If the RTS operation is enabled, when a character is placed into an empty transmit shift register, RTS_B asserts 1-bit time before the start bit is transmitted. RTS_B remains asserted for the whole time that the transmit shift register has any characters. RTS_B deasserts 1-bit time after all characters in the transmit FIFO and shift register are completely sent, including the last stop bit. In other words, when RTS_B is used as a transceiver enable, RTS_B asserts 1-bit time before the transmitter starts transmitting and negates 1-bit time after the transmitter goes idle.

Transmitting a break character also asserts RTS_B, with the same assertion and deassertion timing as having a character in the transmit shift register.

The transmitter's RTS_B signal asserts only when the transmitter is enabled. However, the transmitter's RTS_B signal is unaffected by its CTS_B signal. RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled mid-way through a data transfer.

You can configure HDCR[RTSEXT] to the desired length by delaying the transmitter's RTS_B negation by up to 256-bit clock (baud rate) after the last stop bit.

47.3.4.4 Transceiver driver enable using RTS_B

RS-485 is a multiple drop communication protocol in which the LPUART transceiver's driver is three-stated unless LPUART is driving. The transmitter can use the RTS_B signal to enable the driver of a transceiver. The polarity of RTS_B can be matched to the polarity of the transceiver's driver enable signal.

The following figure shows the receiver enable signal asserted. This connection can also connect RTS_B to both DE and RE_B. The transceiver's receiver is disabled when driving. A pullup can pull RXD to a nonfloating value during this time. You can refine this option further by operating LPUART in Single-Wire mode, freeing the RXD pin for other uses.

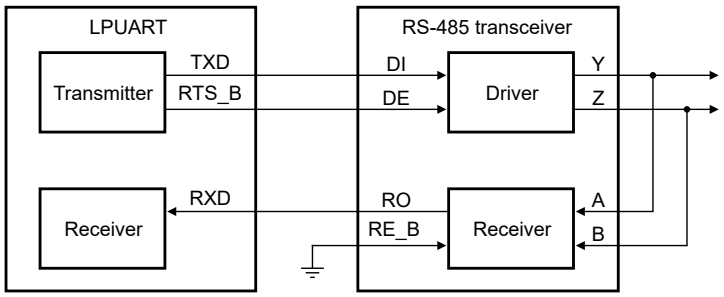

Figure 245. Transceiver driver enable using RTS_B

47.3.5 Receiver functional description

This section discusses the functioning of the LPUART receiver, as shown in the receiver portion of Block diagram. The section also discusses:

- The data sampling technique used to reconstruct receiver data.
- Different variations of the receiver wake-up function.

You can invert the receiver input by writing 1 to STAT[RXINV] and enable the receiver by writing 1 to CTRL[RE]. Character frames consist of a start bit of logic 0, along with N (7, 8, 9, 10) bits (MSB or LSB first), and one or two stop bits of logic 1. For information about 7-bit, 9-bit, or 10-bit Data mode, see Data modes. Going forward in this discussion, assume that LPUART is configured for a normal 8-bit Data mode.

After receiving the stop bit into the receive shifter, and provided the receive data register is not already full (STAT[RDRF] = 0), the data character is transferred to the receive FIFO, resulting in STAT[RDRF] becoming 1. However, if STAT[RDRF] is already 1, indicating that the receive data buffer is already full, STAT[OR] becomes 1 and the new data is lost.

Because the LPUART receiver is separate from the receive FIFO, the receive shift register can receive the next word when the receive FIFO is full, and it is only at the end of the character that the next data is written into the receive FIFO, potentially triggering the overrun flag if the FIFO is full.

When a program detects that the receive data register is full (STAT[RDRF] = 1), it gets the data from the FIFO by reading Data (DATA). See Interrupts for details about flag clearing.

47.3.5.1 Data sampling technique

The LPUART receiver supports a configurable oversampling rate of between 4× and 32× of the baud rate clock for sampling. The receiver starts by considering logic level samples at the oversampling rate times the baud rate to search for a falling edge on the RXD serial data input pin. A falling edge is defined as a logic 0 sample after three consecutive logic 1 samples. The oversampling baud rate clock divides the bit time into 4 to 32 segments from 1 to OSR (where OSR is the configured oversampling ratio). When a falling edge is located, three more samples are taken at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2 to ensure that this is a real start bit and not merely noise. If at least two of these three samples are 0, the receiver assumes they are synchronized to a received character. If another falling edge is detected before the receiver is considered synchronized, the receiver restarts sampling from the first segment.

The receiver then samples each bit time, including the start and stop bits, at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2, to determine the logic level for that bit. The logic level is interpreted to be that of the majority of the samples taken during the bit time. If any sample in any bit time, including the start and stop bits, in a character frame fails to agree with the logic level for that bit, noise flag (STAT[NF]) becomes 1 when the received character is transferred to the receive FIFO.

When the LPUART receiver is configured to sample on both edges of the baud rate clock (that is, when BAUD[BOTHEDGE] = 1), the number of segments in each received bit is effectively doubled (from 1 to OSR× 2). The start and data bits are then sampled at OSR, OSR + 1, and OSR + 2. You must enable sampling on both edges of the clock for oversampling rates of 4× to 7×. This sampling is optional for higher oversampling rates.

The synchronization feature of LPUART synchronizes the internal oversampling counter with a detected falling edge on the receive signal, and to adjust the data sampling window. The falling edge detection needs three consecutive 1s prior to the "1->0" (one to zero) transition. After the initial falling edge detection for the start bit, the circuit continuously monitors the next falling edge, and resets the counter after another falling edge is detected. This synchronization to the start bit is termed as resynchronization.

When BAUD[RESYNCDIS] is 0, you perform this falling edge detection and resynchronization not only for the start bit but also for the rest of the character reception after the start bit.

When BAUD[RESYNCDIS] is 1, you perform the falling edge detection and resynchronization only for the start bit. The use case for disabling the resynchronization is protocols that require this (for example, LIN 2.1 prohibits resynchronization within a byte).

The following table and figure explain LPUART resynchronization.

Table 480. LPUART resynchronization settings

Resynchronization	BAUD[RESYNCDIS] = 0	BAUD[RESYNCDIS] = 1
For the starting bit falling edge	Yes	Yes
For all falling edges after the start bit	Yes	No

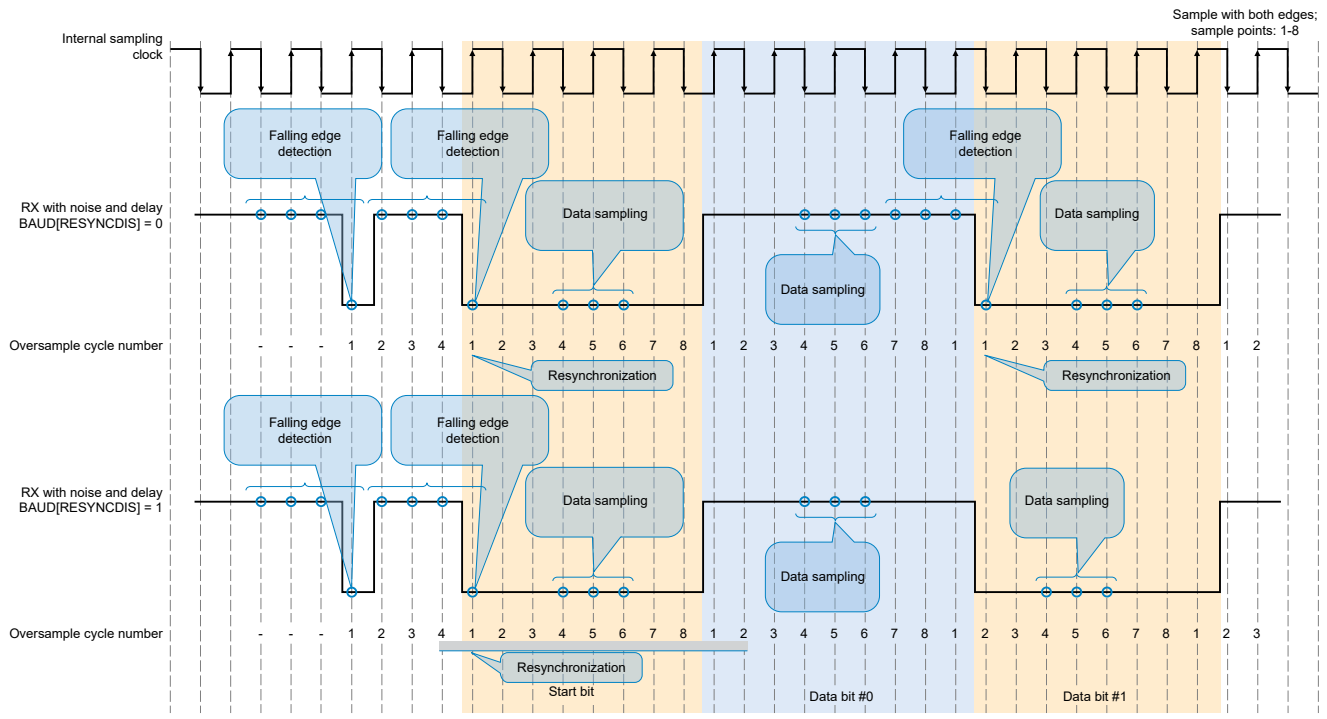

Figure 246. LPUART resynchronization diagram

47.3.5.2 Receiver wake-up operation

Receiver wake-up and receiver address matching are hardware mechanisms that allow an LPUART receiver to ignore the characters in a message intended for a different receiver.

During receiver wake-up, all receivers evaluate the first character(s) of each message, and as soon as they determine the message is intended for a different receiver, they write 1 to CTRL[RWU].

When CTRL[RWU] and STAT[RWUID] are 1, the status fields associated with the receiver, with the exception of STAT[IDLE], are inhibited from becoming 1, thus eliminating the software overhead for handling the unimportant message characters. At the end of a message, all receivers automatically force CTRL[RWU] to become 0. This results in all receivers waking up in time to look at the first character(s) of the next message.

During receiver address matching, the address matching is performed in hardware and the LPUART receiver ignores all characters that do not meet the address match requirements.

Table 481. Receiver wake-up options

CTRL[RWU]	BAUD[MAEN1] | BAUD[MAEN2]	BAUD[MATCFG]	CTRL[WAKE]: STAT[RWUID]	Receiver wake-up
0	0	X	X	Normal operation
1	0	00	00	Receiver wake-up on idle line; STAT[IDLE] = 0
1	0	00	01	Receiver wake-up on idle line; STAT[IDLE] = 1
1	0	00	10	Receiver wake-up on address mark
1	1	11	10	Receiver wake-up on data match
0	1	00	X0	Address mark address match; STAT[IDLE] = 0 for discarded characters
0	1	00	X1	Address mark address match; STAT[IDLE] = 1 for discarded characters
0	1	01	X0	Idle line address match
0	1	10	X0	Match on and match off; STAT[IDLE] = 0 for discarded characters
0	1	10	X1	Match on and match off; STAT[IDLE] = 1 for discarded characters

47.3.5.2.1 Idle line wake-up

When CTRL[WAKE] is 0, you can configure the receiver for an idle line wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a full character time of the idle-line level.

When CTRL[RWU] is set the receiver ignores everything until an idle condition is detected. After the idle condition is detected the CTRL[RWU] is cleared by hardware and the receiver starts receiving data.

The STAT[RWUID] indicates that whether the STAT[IDLE] flag is set or not as a result of the idle condition detection which clears CTRL[RWU].

The STAT[RWUID] says that if the STAT[IDLE] flag is to be set as a result of the idle condition which clears CTRL[RWU].

CTRL[M], CTRL[M7], and BAUD[M10] select 7-bit to 10-bit Data mode and BAUD[SBNS] selects a 1-bit or 2-bit stop bit number that determines how many bit times of idle are needed to constitute a full character time, 9 to 13 bit times because of the start and stop bits.

When CTRL[RWU] is 1 and STAT[RWUID] is 0, the idle condition that wakes up the receiver does not lead to STAT[IDLE] becoming 1. The receiver wakes up and waits for the first data character of the next message that leads to STAT[RDRF] becoming 1 and generates an interrupt if enabled. When STAT[RWUID] is 1, any idle condition leads to STAT[IDLE] becoming 1 and generates an interrupt if enabled, regardless of whether CTRL[RWU] is 0 or 1.

These are the ways to detect an idle line:

- When CTRL[ILT] is 0, the idle bit counter starts after the start bit so that the stop bit and any logic 1s at the end of a character count to calculate the full character time of idle.
- When CTRL[ILT] is 1, the idle bit counter does not start until after the stop bit time so that the data in the last character of the previous message does not impact the idle detection.

47.3.5.2.2 Address mark wake-up

When CTRL[WAKE] is 1, you can configure the receiver for an address mark wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a logic 1 in the most significant bit of the received character. When parity is enabled, the second most significant bit is used for address mark wake-up.

Address mark wake-up allows messages to contain idle characters, but requires one bit to be reserved for use in address frames. The logic 1 in the most significant bit (or second most significant bit when parity is enabled) of an address frame writes 0 to CTRL[RWU] and writes 1 to STAT[RDRF]. In this case, the character with the address mark bit is received even if the receiver is sleeping during most of this character time.

47.3.5.2.3 Data match wake-up

When CTRL[RWU] and CTRL[WAKE] are 1, and BAUD[MATCFG] equals 11, the receiver is configured for a data match wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a character that matches MATCH[MA1] when BAUD[MAEN1] is 1, or that matches MATCH[MA2] when BAUD[MAEN2] is 1.

47.3.5.2.4 Address match operation

You can enable the address match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 0. In this function, a character that the RXD pin receives with a logic 1 in the most significant bit (or the second most significant bit when parity is enabled) is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is only transferred to the receive buffer, and STAT[RDRF] becomes 1 if the comparison matches. All subsequent characters received with a logic 0 in the most significant bit (or the second most significant bit when parity is enabled) are considered to be data associated with the address and are transferred to the receive FIFO. If no marked address match occurs, no transfer is made to the receive FIFO, and all the characters that follow, with logic 0 in the most significant bit (or second most significant bit when parity is enabled), are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

The address match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, a marked address is compared only to the associated Match Address (MATCH) and data is transferred to the receive FIFO only on a match.
- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, a marked address is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

47.3.5.2.5 Idle match operation

You can enable the idle match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 1. In this function, the first character that the RXD pin receives after an idle line condition is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is transferred only to the receive buffer, and STAT[RDRF] becomes 1, if the comparison matches. All subsequent characters are considered to be data associated with the address and are transferred

to the receive FIFO until the next idle line condition is detected. If no address match occurs, no transfer is made to the receive FIFO, and all the frames that follow, until the next idle condition, are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

An idle match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, the first character after an idle line is compared only to the associated Data (DATA) and data is transferred to the receive FIFO only on a match.
- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, the first character after an idle line is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

47.3.5.2.6 Match on, match off operation

The match on, match off operation is enabled when both BAUD[MAEN1] and BAUD[MAEN2] are 1 and BAUD[MATCFG] = 10. In this function, a character that the RXD pin receives matches MATCH[MA1] and is transferred to the receive buffer, and STAT[RDRF] becomes 1. All subsequent characters are considered to be data and are also transferred to the receive FIFO, until a character that matches MATCH[MA2] is received. The character that matches MATCH[MA2], along with all subsequent characters, is discarded; and this continues until another character that matches MATCH[MA1] is received. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

NOTE

The match on, match off operation requires both BAUD[MAEN1] and BAUD[MAEN2] to be 1.

47.3.5.3 Hardware flow control

To support hardware flow control, you can program the receiver to automatically assert and deassert RTS_B:

- RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled midway through a data transfer. See Transceiver driver enable using RTS_B for more information.
- If the receiver RTS functionality is enabled, the receiver automatically deasserts RTS_B if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1.
- The receiver asserts RTS_B when STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. There is no impact if STAT[RDRF] is 1 already.
- Even if RTS_B is deasserted, the receiver continues to receive characters until the receive FIFO is overrun.
- If the receiver RTS functionality is disabled, the receiver's RTS_B remains deasserted.
- When RTS is driven by receiver, it will be negated when the receiver is disabled irrespective of the FIFO level.

47.3.6 Additional LPUART functions

47.3.6.1 Data modes

You can configure the LPUART transmitter and receiver to operate in 7-bit Data mode by writing 1 to CTRL[M7], 9-bit Data mode by writing 1 to CTRL[M], or 10-bit Data mode by writing 1 to BAUD[M10]. In 9-bit Data mode, there exists a ninth data bit and in 10-bit mode, there exists a tenth data bit.

When performing 8-bit writes to the transmit FIFO, the ninth and tenth bits are pushed into the FIFO from CTRL[T8] and CTRL[T9]. For coherent 8-bit writes, you must write to CTRL[T8] and CTRL[T9] before writing to Data (DATA)[7:0]. However, if the values in CTRL[T8] or CTRL[T9] do not need to change, it is not necessary to update CTRL[T8] and CTRL[T9] before every 8-bit write to Data (DATA).

When performing 16-bit or 32-bit writes to the transmit FIFO, all 10 bits are pushed into the transmit FIFO from the write data.

When performing 8-bit reads of the receive FIFO, the ninth and tenth bits are held in CTRL[R8] and CTRL[R9] but you must read them before reading Data (DATA). A 16-bit or 32-bit read of the receive FIFO returns all 10 bits in Data (DATA).

The 9-bit Data mode is typically used with parity to allow eight bits of data plus the parity in the ninth bit, or it is used with the address mark wake-up so that the ninth data bit can serve as the wake-up bit. The 10-bit Data mode is typically used with parity and address mark wake-up so that the ninth data bit can serve as the wake-up bit and the tenth bit can serve as the parity bit. In custom protocols, the ninth and/or tenth bits can also serve as software-controlled markers.

47.3.6.2 Idle length

An idle character is one where the start bit, all data bits, and stop bits are in the mark position (idle state, generally logic 1). You can configure CTRL[ILT] to start detecting an idle character from the previous start bit (any data bits and stop bits count for idle character detection) or from the previous stop bit.

You can also use CTRL[IDLECFG] to configure the number of idle characters that must be received before an idle line condition is detected. This field configures the number of idle characters that must be received before STAT[IDLE] becomes 1, STAT[RAF] becomes 0, and DATA[IDLINE] becomes 1 with the next received character.

CTRL[IDLECFG] also affects the idle line wake-up and idle match operations. When either the address match or match on/off operation is enabled, writing 1 to STAT[RWUID] causes any discarded characters to be treated as idle characters.

After the extended idle time is enabled for the receiver, you can configure an idle line condition by using REIR[IDTIME], which specifies the number of bits (baud rate) since the last stop bit that is required for an idle condition to be detected. This replaces the configuration of CTRL[ILT] and CTRL[IDLECFG].

The transmitter can also enable the extended idle time. In this case, any idle character queued through the transmit FIFO forces the transmitter to be idled for the configured number of bit clocks before the idle character is read from the FIFO and the transmitter continues.

After you enable the transmitter extended idle time, the transmitter does not automatically queue an idle character whenever it is enabled.

47.3.6.3 Loop mode

Enable Loop mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 0. You, sometimes, use Loop mode to check software, independent of connections in the external system, to help isolate system problems. In this mode, the transmitter output is internally connected to the receiver input and LPUART does not use the RXD pin.

Loop mode also internally connects the RTS_B output to the CTS_B input and the DTR_B output to the DSR_B input.

47.3.6.4 Single-Wire mode

Enable Single-Wire mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 1. Single-Wire mode implements a half-duplex serial connection. The receiver is internally connected to the transmitter output and TXD pin (the RXD pin is not used).

In Single-Wire mode, CTRL[TXDIR] controls the direction of serial data on the TXD pin. When CTRL[TXDIR] becomes 0, the TXD pin is an input to the receiver and the transmitter is temporarily disconnected from the TXD pin so that an external device can send serial data to the receiver. When CTRL[TXDIR] = 1, the TXD pin is an output that the transmitter drives. The internal loop back connection is disabled, and as a result, the receiver is unable to receive characters that the transmitter sends out.

Half Duplex Control (HDCR) replaces the implementation of CTRL[LOOPS] and CTRL[RSRC], and you can use this register to configure various options for both Single-Wire and Half-Duplex operations, using independent RXD and TXD pins:

- HDCR[TXSTALL] replaces the CTRL[TXDIR] functionality and prevents the transmitter from becoming busy or asserting the RTS_B transmitter if STAT[RAF] is 1.
- You can select the TXD pin, as the source for the receiver, to configure HDCR[RXSEL] for a single-wire operation. If HDCR[RXSEL] is 1, you must configure the TXD pin for an open-drain operation.
- HDCR[RXMSK] masks the receiver input when the RTS_B transmitter is asserted (this applies even if you have not configured RTS_B as an output).
- HDCR[RXWRMSK] blocks storage of the receive data in the receive FIFO when the RTS_B transmitter is asserted. This setting does not affect the receiver idle functionality.
- HDCR[RTSEXT] delays the negation of the RTS_B transmitter by the configured number of bit clocks (baud rate).

47.3.6.5 Timeout counter

LPUART implements four general-purpose timeout counters; counters 0 and 1 are used to monitor the receiver and counters 2 and 3 are used to monitor the transmitter. When enabled, you can configure each counter to monitor one of the following conditions:

- Idle time in number of bits, starting to increment when first enabled and an idle condition is detected. The counter restarts whenever a character is received or transmitted.
- Idle time in number of bits, starting to increment after the next character is received or transmitted. The counter restarts whenever a character is received or transmitted.
- Idle time is more than the timeout interval, in number of bits, but less than the extended idle timeout. The counter restarts whenever a character is received or transmitted. You can use this to detect a gap between characters that is greater than a threshold (timeout) but less than the configured extended idle time. This configuration requires the extended idle feature for the transmitter or receiver to be enabled for a proper operation.
- Number of characters received or transmitted is equal to the configured timeout. The counter asserts at the start of the character that equals the timeout value.

The timeout counters restart counting whenever the counter is disabled and then enabled. These timeout counters are disabled when the corresponding STAT[TSF] field is 1. If the timeout enable is still set after STAT[TSF] becomes 0, the timeout counter restarts as if the counter had been disabled and then enabled. You can measure the idle time in bit times from the end of the last stop bit and until a start bit is validated.

47.3.7 Peripheral triggers

The connection of the LPUART peripheral triggers with other peripherals is chip-specific.

47.3.7.1 Output triggers

LPUART generates the following output triggers that can be connected to other peripherals on the chip:

- The transmit word trigger asserts at the end of each transmitted word and negates after 1-bit period.
- The transmit data trigger is identical to the TXD pin output, but without support for input trigger modulation.
- The receive word trigger asserts at the end of each received word that is written to the receive FIFO, for one oversampling clock period.
- The receive idle trigger asserts when STAT[IDLE] becomes 1, and negates when the next valid start bit is detected.

47.3.7.2 Input trigger

LPUART supports a peripheral input trigger that you can configure in one of the following ways:

- By enabling the CTS function: You can connect the input trigger (active high) instead of the CTS_B (active low) pin input. The input trigger must assert for longer than 1-bit clock period when the transmitter is idle, with data to send, to guarantee a new transmission.
- By making the input trigger modulate the transmit data output (trigger is logically ANDed with the TXD output): The input trigger is expected to be a free-running clock (carrier signal) that generates from a timer or PWM source with a frequency that is greater than the bit-clock frequency. The carrier signal must not toggle faster than the maximum supported bit time.
- By connecting the input trigger instead of the RXD pin input: The input trigger is expected to be generated from a receive data source, such as an analog comparator or external pin.

47.3.8 Infrared (IR) interface

LPUART provides the capability of transmitting narrow pulses to an IR LED and receiving narrow pulses, transforming them to serial bits, which are then sent to LPUART. The IrDA physical layer specification defines a half-duplex IR communication link for exchanging data. The full standard includes data rates up to 16 Mbit/s. The LPUART IrDA support is limited to SIR mode that supports data rates only between 2.4 kbit/s and 115.2 kbit/s.

LPUART has an infrared transmit encoder and a receive decoder. The infrared decoder converts the received character from the IrDA format to the NRZ format, which the receiver uses. It also has an OSR oversampling baud rate clock counter that filters noise and indicates when a 1 is received. LPUART transmits serial bits of data, which the infrared submodule encodes, to transmit a narrow pulse for every zero bit. No pulse is transmitted for every single bit. When receiving data, an IR photo diode (external to LPUART) detects the IR pulses. The IR receive decoder transforms them to CMOS levels. The infrared receive decoder then stretches the narrow pulses to get back to a serial bit stream that LPUART receives. You can invert the polarity of transmitted pulses and expected receive pulses so that a direct connection can be made to external IrDA transceiver modules that use active-high pulses.

The IR submodule receives its clock sources from LPUART. The submodule selects one of these clocks to generate either 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulses during transmission.

47.3.8.1 Infrared transmit encoder

The infrared transmit encoder converts serial bits of data from the transmit shift register to the TXD signal. A narrow pulse is transmitted for a 0 bit and no pulse is transmitted for a 1 bit. The narrow pulse is sent at the start of the bit with a duration of 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR of a bit time. A narrow low pulse is transmitted for a 0 bit when CTRL[TXINV] is 0, while a narrow high pulse is transmitted for a 0 bit when CTRL[TXINV] is 1.

47.3.8.2 Infrared receive decoder

The infrared receive block converts data from the RXD signal to the receive shift register. A narrow pulse is expected for each 0 received and no pulse is expected for each 1 received. A narrow low pulse is expected for a 0 bit when STAT[RXINV] is 0, while a narrow high pulse is expected for a 0 bit when STAT[RXINV] is 1. This receive decoder meets the edge jitter requirement as defined by the IrDA serial infrared physical layer specification.

47.3.8.3 Start-bit detection

When STAT[RXINV] is 0, the first falling edge of the received character corresponds to the start bit. The infrared decoder resets its counter. At this time, the receiver also begins its start bit detection process. After the start bit is detected, the receiver synchronizes its bit times to this start bit time. For the rest of the character reception, the infrared decoder's counter and the receiver's bit time counter count independently of each other.

47.3.8.4 Noise filtering

The decoder ignores any rising edges detected during the first half of the infrared decoder counter, and can leave any pulses less than one oversampling baud clock as undetected. This is regardless of whether the pulse is seen in the first or second half of the count.

47.3.8.5 Low-bit detection

During the second half of the decoder count, a rising edge is decoded as 0, which is sent to the receiver. The decoder counter is also reset.

47.3.8.6 High-bit detection

At OSR oversampling baud rate clocks after the previous rising edge, if a rising edge is not seen, the decoder sends a 1 to the receiver.

If the next bit is 0, which arrives late, a low bit is detected according to Low-bit detection. The value sent to the receiver is changed from 1 to 0. Then, if a noise pulse occurs outside the receiver's bit time sampling period, the delay of a 0 is not recorded as noise.

47.3.9 MODBUS protocol

47.3.9.1 MODBUS frame structure

MODBUS is an application layer messaging protocol, positioned at level 7 of the OSI model. It provides client and server communication between devices connected on different types of buses or networks.

The MODBUS protocol defines a simple protocol data unit (PDU) independent of the underlying communication layers. The mapping of the MODBUS protocol on specific buses or network can introduce some additional fields on the application data unit (ADU).

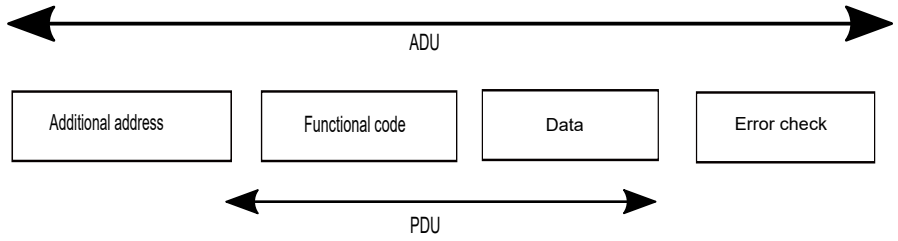

Figure 247. MODBUS frame structure

The function code field informs the server about which action to perform, as requested by the client (only the client can initiate the communication), where the data field contains additional information that the server uses to take the action defined by the function code. MODBUS PDU for serial line communication = 256 - server address (1 byte) - CRC (2 bytes) = 253 bytes.

You can set up a MODBUS controller to communicate on standard MODBUS networks using either of the two transmission modes: ASCII or RTU. RTU mode allows better character density and throughput for the same baud rate as the ASCII format allows 7 bits to represent a character where RTU keeps 8 bits for data representation in each packet.

47.3.9.2 MODBUS frame for LPUART

Though the protocol resides in the application layer, it can also be checked at the physical layer using LPUART by considering the frame structure shown in the following figure, following RTU mode of data transmission.

Start	Address	Function	Data	CRC	End
3.5 Char time	8 Bit	8 Bit	N * 8Bit	16 Bit	3.5 Char time

Figure 248. MODBUS frame for LPUART

An entire message frame of MODBUS must contain start character, address, function code, data, and end character. LPUART does not support CRC calculation for TX and RX, instead, each LPUART packet containing frame information is transmitted with its individual parity, and the same is checked in RX. Following the last transmitted character, a similar interval of at least 3.5 character times marks the end of the message and a new message can begin after this interval. The entire message frame must be transmitted as a continuous stream. If a silent interval of more than 1.5 character times occurs before the completion of the frame, the receiving device flushes the incomplete message, and assumes that the next byte is the address field of a new message. The correctness of timeout logic ensures the correctness of the MODBUS frame using LPUART.

Registers such as REIR, TEIR, TOCR, TOSR, TIMEOUT[0 - 3], TCBR, and TDBR are useful for realizing MODBUS using LPUART. The TX IDLE time is configured by using TEIR[IDTIME].

For higher baud rates, MODBUS recommends adopting fixed t1.5 and t3.5 times of 750us ms and 1.75 ms. The receiver idle line wake-up can be used by a MODBUS device to only wake-up on a matching address or broadcast address received after a valid idle time. The receiver end-of-packet DMA transfer can be used to offload the reception of a MODBUS packet onto the DMA controller.

47.3.9.3 MODBUS TX and RX programming sequence

The following programming sequences can be useful for sending and receiving MODBUS frames using LPUART.

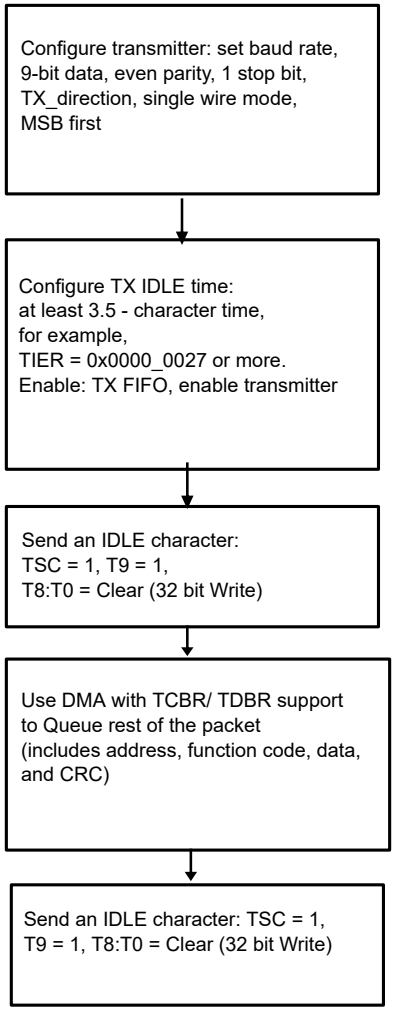

Figure 249. MODBUS TX programming

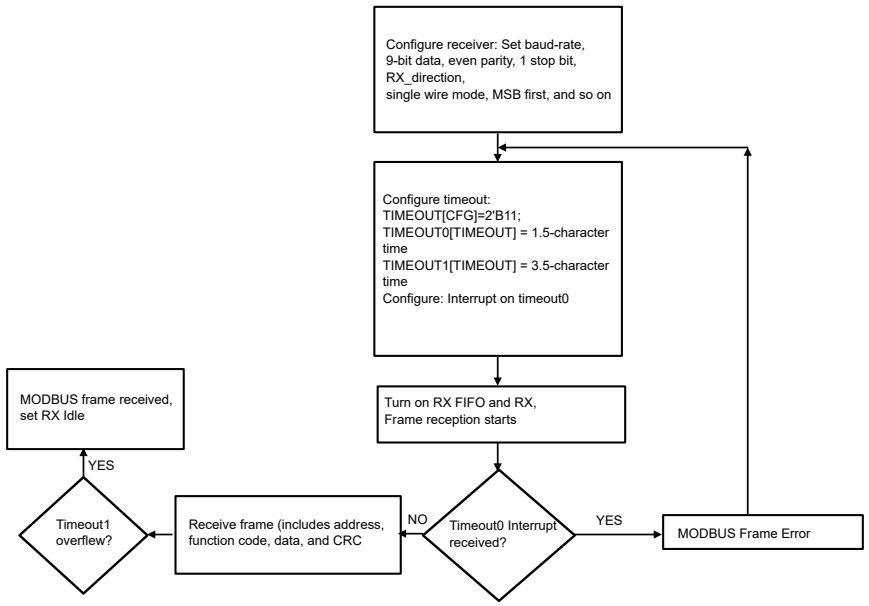

Figure 250. MODBUS RX programming

47.3.10 Modes of operation

47.3.10.1 Low-Power modes

LPUART remains functional during low-power modes, provided CTRL[DOZEEN] is 0 and the LPUART functional clock is enabled. LPUART can generate an interrupt or DMA request to cause a wake-up from low-power modes.

You can configure LPUART to be disabled in low-power modes, when CTRL[DOZEEN] is 1. In this case, the transmitter and receiver finish transmitting and receiving the current word.

If LPUART is disabled in low-power modes, it can generate a wake-up via STAT[RXEDGIF] if the receiver detects an active edge.

NOTE

See the chip-specific information for specific low-power modes available on your chip.

47.3.10.2 Debug mode

LPUART remains functional in Debug mode.

47.3.11 Clocking

Table 482. Types of clocks

Clock	Description
Functional	Is asynchronous to the bus clock and can remain enabled in Low-Power modes to support transmit and/or receive functions, including low-power wake-up.
Bus	Is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPUART transmit and receive registers, including the FIFOs.

47.3.12 Reset

Table 483. Types of resets

Reset	Description
Chip	Enables the logic and registers for the LPUART transmitter and receiver to reset to their default states.
Software	Resets the LPUART logic and registers to their default states, except for Global (GLOBAL). GLOBAL[RST] controls the LPUART software reset.
FIFO	Implements write-only control fields that reset the transmit FIFO (FIFO[TXFLUSH]) and receive FIFO (FIFO[RXFLUSH]). After a FIFO is reset, that FIFO becomes empty.

47.3.13 Interrupts

The LPUART transmitter has two status fields that can optionally generate hardware interrupt requests. If STAT[TDRE] is 1, it indicates that there is room in the transmit FIFO to write another transmit character to Data (DATA). If CTRL[TIE] is 1, a hardware interrupt is requested when STAT[TDRE] is 1.

STAT[TC] indicates that the transmitter is finished transmitting all data, preamble, and break characters and is idle with TXD at the inactive level. This field is often used in systems with modems to determine when it is safe to turn off the modem. If CTRL[TCIE] is 1, a hardware interrupt is requested when STAT[TC] is 1. Instead of hardware interrupts, software polling may be used to monitor STAT[TDRE] and STAT[TC] if the corresponding CTRL[TIE] or CTRL[TCIE] field is 0.

When a program detects that STAT[RDRF] is 1, it gets the data from this field by reading Data (DATA). The field becomes 0 by reading Data (DATA).

STAT[IDLE] includes logic that prevents it from becoming 1 repeatedly when the RXD line remains idle for an extended period of time. STAT[IDLE] becomes 0 when you write 1 to it, and cannot become 1 again until the receiver has received at least one new character and has 1 as the value of STAT[RDRF].

If the associated error is detected in the received character that caused STAT[RDRF] to become 1, STAT[NF], STAT[FE], and STAT[PF] become 1 at the same time STAT[RDRF] becomes 1. These flags do not become 1 in overrun cases.

If STAT[RDRF] is already 1 when a new character is ready to be transferred from the receive shifter to the receive FIFO, STAT[OR] becomes 1, instead of the data along with any associated STAT[NF], STAT[FE], or STAT[PF] condition getting lost.

If the received character matches the contents of MATCH[MA1] and/or MATCH[MA2], then STAT[MA1F] and/or STAT[MA2F] become 1 at the same time that STAT[RDRF] becomes 1.

At any time, an active edge on the RXD serial data input pin causes STAT[RXEDGIF] to become 1. STAT[RXEDGIF] becomes 0 when you write 1 to it. This function depends on the receiver being enabled (the value of CTRL[RE] being 1).

MODEM Status (MSR) can generate an interrupt from a configured status field, which STAT[MSF] indicates.

Timeout Status (TOSR) can generate an interrupt from a configured status field, which STAT[TSF] indicates.

47.3.14 DMA

47.3.14.1 DMA burst support

To support efficient DMA transfers to the transmit FIFO, two alias regions are implemented to support incrementing 8-bit, 16-bit, or 32-bit write accesses to the transmit FIFO:

- Transmit Command Burst (TCBR0 - TCBR127) is a 512-byte region that supports pushing 16-bit data into the transmit FIFO.
- Transmit Data Burst (TDBR0 - TDBR255) is a 1024-byte region that supports pushing zero extended 8-bit data into the transmit FIFO.

The aforementioned regions are contiguous, so a DMA transfer can start in Transmit Command Burst (TCBR0 - TCBR127) to initialize the transfer including address mark, idle word, or break character, and then complete the transfer in Transmit Data Burst (TDBR0 - TDBR255) with the data to transmit, without changing the transfer size.

The transmit FIFO block writes overflow the FIFO, but that does not signal an error. Do not perform 32-bit writes to Transmit Data Burst (TDBR0 - TDBR255) unless there are four empty slots in the transmit FIFO, and do not perform 16-bit writes to this register unless there are two empty slots in the transmit FIFO.

47.3.14.2 End-of-packet DMA transfers

The end-of-packet functionality is designed for serial interfaces where you may not know the size of the transfer in advance and the data is being pushed by an external device. The end-of-packet processing ensures that data does not become stranded in either the receive FIFO or the DMA receive buffer. Support for end-of-packet processing must be implemented in both the serial interfaces and DMA controller.

The condition that signals the end of packet is different for each serial interface, but the serial peripheral and DMA process it in the same way. For example, an idle line condition signals the UART end of packet, the Stop and/or Repeated Start condition signals the I2C end of packet, and PCS negation signals the SPI end of packet.

When the serial peripheral is configured to signal the end-of-packet condition to the DMA and the serial interface detects an end-of-packet condition, it asserts the DMA request for the receive FIFO irrespective of the watermark configuration. For larger watermark configurations, this ensures that the last few words of the transfer are first flushed from the receive FIFO.

The DMA then reads the contents of the receive FIFO, depending on the first word in the FIFO:

- If the receive FIFO is empty, the serial interface signals an end of packet condition to the DMA controller.
- If the receive FIFO is not empty, but the first word in the FIFO is the start of a new packet, data is not pulled from the receive FIFO and the serial interface signals an end-of-packet condition to the DMA controller.
- If the receive FIFO is not empty, and the first word in the FIFO is not the start of a new packet, the DMA transfers the receive data as normal.

Because the DMA may be transferring multiple words on each request, the end-of-packet condition persists until the DMA minor loop has completed and no additional data is pulled from the receive FIFO. The field that triggered the end-of-packet condition becomes 0 when the minor loop completes following the end of packet being signaled to the DMA controller.

When the DMA detects the end-of-packet condition, it writes all received words up to the end of packet into the system memory and saves the destination address for the word after the last valid data. The DMA then terminates the channel as if the major loop completed, including final offsets and optional interrupts, channel linking, and scatter-gather. You can, optionally, save the final destination address to the system memory. The final destination address is also available in the destination address register.

Because the DMA terminates the major loop, no servicing of the receive FIFO occurs until you or the hardware reconfigures the DMA (for example, channel linking or scatter-gather). You must minimize this delay to avoid receiver FIFO overrun. The automatic DMA end-of-packet processing is not recommended when there are only a few words transferred between end-of-packet conditions. This is because the DMA spends more time processing the end of packet than transferring the data. For example, the UART idle line length must be increased as needed to avoid an excessive number of idle conditions.

47.4 External signals

Table 484. External signals

Signal	Description	I/O
TXD	Transmit data: This pin is normally an output, but is an input (tristated) in Single-Wire mode whenever the transmitter is disabled or the transmit direction is configured for receive data.	I/O

Table continues on the next page...

Table 484. External signals (continued)

Signal	Description	I/O
RXD	Receive data	I
CTS_B	Clear-to-send	I
RTS_B	Request-to-send	O

DSR_B	Data set ready	I
DCD_B	Data carrier detect	I
RIN_B	Ring indicator	I

47.5 Initialization

This module does not require initialization.

47.6 LPUART register descriptions

LPUART includes registers to control baud rate, select options, report status, and store transmit and receive data. Access to an address outside the valid memory map generates a bus error.

NOTE

Writing to a read-only (RO) register or reading a write-only (WO) register can cause bus errors. LPUART does not verify whether programmed values in the registers are correct; you must write valid values to them.

Fields

Field	Description
31 MAEN1	Match Address Mode Enable 1 Enables automatic address matching or data matching mode for MATCH[MA1]. If this field is 0, normal operation takes place.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Disable 1 - Enable
30 MAEN2	Match Address Mode Enable 2 Enables automatic address matching or data matching mode for MATCH[MA2]. If this field is 0, normal operation takes place. 0 - Disable 1 - Enable
29 M10	10-Bit Mode Select Causes the tenth bit to be a part of the serial transmission. You must change the value of this field only when both the transmitter and receiver are disabled. 0 - Receiver and transmitter use 7-bit to 9-bit data characters 1 - Receiver and transmitter use 10-bit data characters
28-24 OSR	Oversampling Ratio Configures the OSR of the receiver. You must change the value of this field only when both the transmitter and receiver are disabled. **NOTE** BAUD[OSR] results in an OSR of BAUD[OSR] + 1, for example, BAUD[OSR] = 0_0101b results in a final division by 6. 0_0000 - Results in an OSR of 16 0_0001 - Reserved 0_0010 - Reserved 0_0011 - Results in an OSR of 4 (requires BAUD[BOTHEDGE] to be 1) 0_0100 - Results in an OSR of 5 (requires BAUD[BOTHEDGE] to be 1) 0_0101 - Results in an OSR of 6 (requires BAUD[BOTHEDGE] to be 1) 0_0110 - Results in an OSR of 7 (requires BAUD[BOTHEDGE] to be 1) 0_0111 - Results in an OSR of 8 0_1000 - Results in an OSR of 9 0_1001 - Results in an OSR of 10 0_1010 - Results in an OSR of 11 0_1011 - Results in an OSR of 12 0_1100 - Results in an OSR of 13 0_1101 - Results in an OSR of 14 0_1110 - Results in an OSR of 15

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0_1111 - Results in an OSR of 16 1_0000 - Results in an OSR of 17 1_0001 - Results in an OSR of 18 1_0010 - Results in an OSR of 19 1_0011 - Results in an OSR of 20 1_0100 - Results in an OSR of 21 1_0101 - Results in an OSR of 22 1_0110 - Results in an OSR of 23 1_0111 - Results in an OSR of 24 1_1000 - Results in an OSR of 25 1_1001 - Results in an OSR of 26 1_1010 - Results in an OSR of 27 1_1011 - Results in an OSR of 28 1_1100 - Results in an OSR of 29 1_1101 - Results in an OSR of 30 1_1110 - Results in an OSR of 31 1_1111 - Results in an OSR of 32
23 TDMAE	Transmitter DMA Enable Enables STAT[TDRE] to generate a DMA request. 0 - Disable 1 - Enable
22 —	Reserved
21 RDMAE	Receiver Full DMA Enable Enables STAT[RDRF] to generate a DMA request. 0 - Disable 1 - Enable
20 RIDMAE	Receiver Idle DMA Enable Enables STAT[IDLE] to generate a DMA request. If this field is 1, reading Data (DATA) when either DATA[RXEMPT] or DATA[IDLINE] is 1 generates an end-of-packet response until the completion of the DMA minor loop. During an end-of-packet response, reading Data (DATA) returns 0000_33FFh and does not pull data from the receive FIFO. STAT[IDLE] becomes 0 on completion of the minor loop, provided an end-of-packet response is generated and either the receive FIFO is empty or the receiver is active.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Disable 1 - Enable
19-18 MATCFG	Match Configuration Configures the match addressing mode used. You must change the value of this field only when both the transmitter and receiver are disabled. 00 - Address match wake-up 01 - Idle match wake-up 10 - Match on and match off 11 - Enables RWU on data match and match on or off for the transmitter CTS input
17 BOTHEDGE	Both Edge Sampling Enables sampling of the received data on both edges of the baud rate clock, effectively doubling the number of times the receiver samples the input data for a given OSR. This field must be 1 for OSRs between x4 and x7 and is optional for higher OSRs. You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver samples input data using the rising edge of the baud rate clock. If this field is 1, the receiver samples input data using the rising and falling edges of the baud rate clock. 0 - Rising edge 1 - Both rising and falling edges
16 RESYNCDIS	Resynchronization Disable Disables resynchronization of the received data word when a data one followed by data zero transition is detected. You must change the value of this field only when the receiver is disabled. 0 - Enable 1 - Disable
15 LBKDIE	LIN Break Detect Interrupt Enable Enables STAT[LBKDIF] to generate hardware interrupt requests. If this field is 0, hardware interrupts from STAT[LBKDIF] (uses polling) are disabled. If this field is 1, hardware interrupts are requested when STAT[LBKDIF] is 1. 0 - Disable 1 - Enable
14 RXEDGIE	RX Input Active Edge Interrupt Enable Enables STAT[RXEDGIF] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[RXEDGIF] are disabled. If this field is 1, hardware interrupts are requested when STAT[RXEDGIF] is 1.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Changing the value of CTRL[LOOPS] or CTRL[RSRC] when this field (RXEDGIE) is 1 can cause STAT[RXEDGIF] to become 1. 0 - Disable 1 - Enable
13 SBNS	Stop Bit Number Select Determines whether data characters include one or two stop bits. You must change the value of this field only when both the transmitter and receiver are disabled. 0 - One stop bit 1 - Two stop bits
12-0 SBR	Baud Rate Modulo Divisor Sets the modulo divide rate for the baud rate generator. • If SBR is 0, baud rate generator is disabled. • If SBR is 1–8191, baud rate = baud clock ÷ ((OSR + 1) × SBR). You must update the 13-bit baud rate setting [SBR12:SBR0] only when both the transmitter and receiver are disabled (both CTRL[RE] and CTRL[TE] are 0).

47.6.7 Status (STAT)

Provides the module status.

Offset

Register	Offset

Fields

Field	Description
31 LBKDIF	LIN Break Detect Interrupt Flag Indicates whether a LIN break character is detected. This field becomes 1 when the LIN break detect circuitry is enabled and a LIN break character is detected. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not detected 1 - Detected When writing 0 - No effect 1 - Clear the flag
30 RXEDGIF	RXD Pin Active Edge Interrupt Flag Indicates whether an active edge on the receive pin has occurred. This field becomes 1 whenever the receiver is enabled and an active edge (falling if STAT[RXINV] is 0; rising if STAT[RXINV] is 1) on the RXD pin occurs. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not occurred 1 - Occurred When writing 0 - No effect 1 - Clear the flag
29 MSBF	MSB First Specifies the first bit that is transmitted after the start bit. If this field is 0, LSB (bit 0) is the first bit transmitted after the start bit (which means, the first bit received after the start bit is identified as bit 0). If this field is 1, MSB (identified as bit 9, bit 8, bit 7, or bit 6) is the first bit that is transmitted, after the start bit, depending on the settings of CTRL[M], CTRL[PE], and BAUD[M10]. Writing 1 to this field reverses the order of the bits that are transmitted and received on the wire. This field does not affect the polarity of the bits, the location of the parity bit, or the location of the start or stop bits. You must change the value of this field only when both the transmitter and receiver are disabled. 0 - LSB 1 - MSB

Table continues on the next page...

Table continued from the previous page...

Field	Description
28 RXINV	Receive Data Inversion Specifies whether receive data is inverted. Writing 1 to this field reverses the polarity of the received data input. You must change the value of this field only when the receiver is disabled. **NOTE** Writing 1 to this field inverts the RXD input for all cases: data bits, start and stop bits, break, and idle. 0 - Inverted 1 - Not inverted
27 RWUID	Receive Wake Up Idle Detect Controls, for CTRL[RWU] on idle character detection, whether the idle character that wakes up the receiver writes 1 to STAT[IDLE]. For address match wake-up, this field controls whether STAT[IDLE] = 1 when the address does not match. You must change the value of this field only when the receiver is disabled. If this field is 0, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] does not become 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] does not become 1 when an address does not match. If this field is 1, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] becomes 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] becomes 1 when an address does not match. 0 - STAT[IDLE] does not become 1 1 - STAT[IDLE] becomes 1
26 BRK13	Break Character Generation Length Selects the longer transmitted break character length. The state of this field does not affect the detection of a framing error. You must change the value of this field only when the transmitter is disabled. You can send a break character by writing 1 to CTRL[SBK], or by writing the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0 - 9 to 13 bit times 1 - 12 to 15 bit times
25 LBKDE	LIN Break Detection Enable Enables LIN break detection. If this field is 0, LIN break detect is disabled, and only a normal break character can be detected. If this field is 1, LIN break detect is enabled and the LIN break character is detected at a length of 11 bit times (if CTRL[M] is 0), 12 bit times (if CTRL[M] is 1), or 13 bit times (if BAUD[M10] is 1). This field selects a longer break character detection length. When the field is 1, receive data is not stored in the receive FIFO.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE This field enables the LIN break detect circuit and disables writing receive data to FIFO. Therefore, it ignores all characters except a LIN break. 0 - Disable 1 - Enable
24 RAF	Receiver Active Flag Indicates whether the LPUART receiver is idle or active. This field becomes 1 when the receiver detects the beginning of a valid start bit, and the field becomes 0 automatically when the receiver detects an idle line. 0 - Idle, waiting for a start bit 1 - Receiver active (RXD pin input not idle)
23 TDRE	Transmit Data Register Empty Flag Indicates whether the transmit FIFO level is greater than, equal to, or less than the watermark. After the transmit FIFO is enabled, this field becomes 1 when the number of datawords in the transmit FIFO is equal to, or less than the number that WATER[TXWATER] indicates. To make the value of this field 0, write to it until the number of words in the transmit FIFO is greater than the number that WATER[TXWATER] indicates. After the transmit FIFO is disabled, this field becomes 1 to indicate that the FIFO level is less than the watermark. To make the value of this field 0 again, write to Data (DATA). This register is not affected by a character that is in the process of being transmitted; it is updated at the start of each transmitted character. 0 - Greater than watermark 1 - Equal to or less than watermark
22 TC	Transmission Complete Flag Indicates whether the transmitter is active. This field becomes 0 when a transmission is in progress or a preamble or break character is loaded; in other words, when the transmitter is active (sending data, a preamble, or a break). The field becomes 1 when the transmit buffer is empty and no data, preamble, or break character is being transmitted; in other words, when the transmission activity is complete. When this happens, the transmit data output signal becomes idle (logic 1). This field becomes 0 after you write to Data (DATA) to transmit new data, queuing a preamble by first writing 0 and then writing 1 to CTRL[TE], queuing a break character by writing 1 to CTRL[SBK]. 0 - Transmitter active 1 - Transmitter idle
21 RDRF	Receive Data Register Full Flag Indicates whether the receive FIFO level is less than, equal to, or greater than the watermark. This field becomes 1 when the number of datawords in the receive buffer is greater than the number that WATER[RXWATER] indicates and the receive FIFO is enabled. To write 0 to this field, read Data

Table continues on the next page...

Table continued from the previous page...

Field	Description
	(DATA) until the number of datawords in the receive FIFO is equal to, or less than the number that WATER[RXWATER] indicates. When the receive FIFO is disabled, this field (RDRF) becomes 1 if the receive buffer (Data (DATA)) is full. To make this field 0, read Data (DATA). A character that is in the process of being received does not cause a change in this field until the entire character is received. Even if this field is 1, the character continues to be received until an overrun condition occurs after the entire character is received. 0 - Equal to or less than watermark 1 - Greater than watermark
20 IDLE	Idle Line Flag Indicates whether an idle line is detected. This field becomes 1 when the LPUART receive line becomes idle for a full character time after a period of activity. When CTRL[ILT] is 0, the receiver starts counting idle bit times after the start bit. If the receive character is all 1s, these bit times and the stop bit time count towards the full character time of logic high, 10 to 13 bit times, needed for the receiver to detect an idle line. After CTRL[ILT] becomes 1, the receiver does not start counting idle bit times until after the stop bits. The stop bits and any logic high bit times at the end of the previous character do not count towards the full character time of logic high needed for the receiver to detect an idle line. For this field to become 0, write 1 to it. After the field becomes 0, you cannot write 1 to it again until after a new character is stored in the receive buffer or a LIN break character writes 1 to STAT[LBKDIF]. This field becomes 1 only once, even if the receive line remains idle for an extended period. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Idle line detected 1 - Idle line not detected When writing 0 - No effect 1 - Clear the flag
19 OR	Receiver Overrun Flag Indicates whether there is receive overrun. This field becomes 1 when you cannot prevent STAT[RDRF] from overflowing with data. The field becomes 1 immediately after the stop bit is completely received for the dataword that overflows the buffer and all the other error fields (STAT[FE], STAT[NF], and STAT[PF]) are prevented from becoming 1. The data in the shift register is lost, but the data already in the LPUART data registers is not affected. If STAT[LBKDE] is enabled and a LIN break is detected, this field becomes 1 if STAT[LBKDIF] is not 0 before the next data character is received. When this field is 1, no additional data is stored in the receive FIFO even if sufficient room exists.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE This field behaves differently for register reads and writes. When reading 0 - No overrun 1 - Receive overrun (new LPUART data is lost) When writing 0 - No effect 1 - Clear the flag
18 NF	Noise Flag Indicates whether noise is detected in the received character of Data (DATA). The advanced sampling technique used in the receiver takes three samples in each of the received bits. If some of these samples disagree with the rest of the samples within any bit time in the frame, then noise is detected for that character. This field becomes 1 whenever the next character to be read from Data (DATA) is received with noise detected within the character. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No noise detected 1 - Noise detected When writing 0 - No effect 1 - Clear the flag
17 FE	Framing Error Flag Indicates whether a framing error is detected. This field becomes 1 whenever the next character to be read from Data (DATA) is received with logic 0 detected where a stop bit was expected. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No framing error detected (this does not guarantee that the framing is correct) 1 - Framing error detected When writing 0 - No effect 1 - Clear the flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
16 PF	Parity Error Flag Indicates whether a parity error is detected. This field becomes 1 whenever the next character to be read from Data (DATA) is received when parity is enabled (CTRL[PE] is 1) and the parity bit in the received character does not agree with the expected parity value. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No parity error detected 1 - Parity error detected When writing 0 - No effect 1 - Clear the flag
15 MA1F	Match 1 Flag Indicates whether the received data is equal to MATCH[MA1]. This field becomes 1 whenever the next character to be read from Data (DATA) matches the value of MATCH[MA1]. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not equal to MA1 1 - Equal to MA1 When writing 0 - No effect 1 - Clear the flag
14 MA2F	Match 2 Flag Indicates whether the received data is equal to MATCH[MA2]. This field becomes 1 whenever the next character to be read from Data (DATA) matches the value of MATCH[MA2]. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not equal to MA2 1 - Equal to MA2

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When writing 0 - No effect 1 - Clear the flag
13-10 —	Reserved
9 TSF	Timeout Status Flag Indicates whether a field in Timeout Status (TOSR) is 1 and configured to generate an interrupt. 0 - Field is 0 1 - Field is 1
8 MSF	MODEM Status Flag Indicates whether a field in MODEM Status (MSR) is 1 and configured to generate an interrupt. 0 - Field is 0 1 - Field is 1
7-2 —	Reserved
1 AME	Address Mark Enable Configures the location of the address mark when configured for MSB first transfers. This field has no effect when configured for LSB first and you must change the value of this field only when both the transmitter and receiver are disabled. If this field is 0, address mark in character is MSB. If this field is 1, the address mark is stored in Data (DATA) at MSB (or MSB-1 when the parity bit is enabled). In other words, the address mark in character is the last bit before the stop bit (or parity bit when enabled). 0 - Disable 1 - Enable
0 LBKFE	LIN Break Flag Enable Enables the LIN break flag to assert whenever a LIN break character is detected. Unlike STAT[LBKDE], this does not impact data being stored in the receive data buffer, but does cause STAT[LBKDIF] to become 1 whenever a LIN break is detected. Because a LIN break is longer than a normal character, the LIN break triggers a write to STAT[RDRF] with the data fields as 0 and STAT[FE] as 1. The character following the LIN break has DATA[LINBRK] as 1 to indicate that the previous character was a LIN break. You must change the value of this field only when both the transmitter and receiver are disabled. If this field is 1, the LIN break character is detected at a length of 11-bit times (if CTRL[M] is 0), 12 (if CTRL[M] is 1), or 13 (if BAUD[M10] is 1). 0 - Disable

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Enable

47.6.8 Control (CTRL)

Controls various optional features of the LPUART system.

You must write to the fields of this register only when both the transmitter and receiver are disabled.

Offset

Fields

Field	Description
31 R8T9	Receive Bit 8 Transmit Bit 9 Contains R8 and T9 that correspond to different functions. R8 is the ninth data bit received after you configure LPUART for 9-bit or 10-bit data formats. When reading 9-bit or 10-bit data, read R8 before reading Data (DATA). T9 is the tenth data bit transmitted after you configure LPUART for 10-bit data formats. When writing 10-bit data, write T9 before writing to Data (DATA). If T9 does not need to change from its previous value, such as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R8 is a read-only bit and T9 is a write-only bit; the value read is different from the value written.

Table continues on the next page...

Table continued from the previous page...

Field	Description
30 R9T8	Receive Bit 9 Transmit Bit 8 Contains R9 and T8 that correspond to different functions. R9 is the tenth data bit received after you configure LPUART for 10-bit data formats. When reading 10-bit data, read R9 before reading Data (DATA). T8 is the ninth data bit transmitted after you configure LPUART for 9-bit or 10-bit data formats. When writing 9-bit or 10-bit data, write T8 before writing to Data (DATA). If T8 does not need to change from its previous value, such as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R9 is a read-only field and T8 is a write-only field; the value read is different from the value written.
29 TXDIR	TXD Pin Direction in Single-Wire Mode Determines the direction of data at the TXD pin, in Single-Wire mode, when LPUART is configured for a single-wire half-duplex operation (CTRL[LOOPS] and CTRL[RSRC] are 1). When writing 0 to this field, the transmitter finishes transmitting the current character (if any) before the receiver starts receiving data from the TXD pin. 0 - Input 1 - Output
28 TXINV	Transmit Data Inversion Specifies whether transmit data is inverted. Writing 1 to this field reverses the polarity of the transmitted data output. This action inverts the TXD output for all cases: data bits, start and stop bits, break, and idle. 0 - Not inverted 1 - Inverted
27 ORIE	Overrun Interrupt Enable Enables STAT[OR] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when OR interrupts are disabled. 0 - Disable 1 - Enable
26 NEIE	Noise Error Interrupt Enable Enables STAT[NF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when NF interrupts are disabled. 0 - Disable 1 - Enable
25	Framing Error Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
FEIE	Enables STAT[FE] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when FE interrupts are disabled. 0 - Disable 1 - Enable
24 PEIE	Parity Error Interrupt Enable Enables STAT[PF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when PF interrupts are disabled. 0 - Disable 1 - Enable
23 TIE	Transmit Interrupt Enable Enables STAT[TDRE] to generate interrupt requests if STAT[TDRE] is 1. 0 - Disable 1 - Enable
22 TCIE	Transmission Complete Interrupt Enable Enables STAT[TC] to generate interrupt requests if STAT[TC] is 1. 0 - Disable 1 - Enable
21 RIE	Receiver Interrupt Enable Enables STAT[RDRF] to generate hardware interrupt requests if STAT[RDRF] is 1. 0 - Disable 1 - Enable
20 ILIE	Idle Line Interrupt Enable Enables hardware interrupts. This field enables STAT[IDLE] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[IDLE] are disabled and polling is used, and if this field is 1, hardware interrupts are enabled when STAT[IDLE] is 1. 0 - Disable 1 - Enable
19 TE	Transmitter Enable Enables the LPUART transmitter. Using this field, you can also queue an idle preamble by first writing 0 and then writing 1 to this field. After this field becomes 0, the field reads 1 until the transmitter has completed the current character and the TXD pin is tristated.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	You can also queue a single idle character by writing to the transmit FIFO with DATA[FRETSC] and DATA[R9T9] = 1. 0 - Disable 1 - Enable
18 RE	Receiver Enable Enables the LPUART receiver. After you write 0 to this field, this field remains 1 until the receiver finishes receiving the current character (if any). 0 - Disable 1 - Enable
17 RWU	Receiver Wake-Up Control Specifies whether the LPUART receiver in standby is waiting for a wake-up condition. You can write 1 to this field to place the LPUART receiver in a Standby state. The field becomes 0 automatically when an RWU event occurs, that is, in case of an idle event when CTRL[WAKE] is 0 or an address match when CTRL[WAKE] is 1 and STAT[RWUID] is 0. **NOTE** You must write 1 to this field only when CTRL[WAKE] is 0 (wake-up on idle), if the channel is currently not idle. You can determine this by the value of STAT[RAF]. If the field is 1 to wake up an idle event and the channel is already idle, LPUART, possibly, discards the data. This is because the data must be received or a LIN break is detected after an Idle condition is detected before the IDLE flag is allowed to be reasserted. 0 - Normal receiver operation 1 - LPUART receiver in standby, waiting for a wake-up condition
16 SBK	Send Break Specifies whether queue break character(s) are to be sent. Writing 1 and then 0 to this field queues a break character in the transmit data stream. Additional break characters of 9 to 13 bits, or 12 to 15 bits if STAT[BRK13] is 1, and bit times of logic 0 are queued as long as this field is 1. Depending on the timing when this field is 1 and 0, relative to the character currently being transmitted, a second break character may be queued before you write 0 to this field. If the time taken to write 0 to this field is too long, for example, if the field does not become 0 by the end of the first break character, a second break character is sent. This is compared to queuing a break character through the transmit FIFO that guarantees only one break character is sent. You can also queue a single break character by writing to the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0 - Normal transmitter operation 1 - Queue break character(s) to be sent
15	Match 1 (MA1F) Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
MA1IE	Enables the MA1F interrupt. 0 - Disable 1 - Enable
14 MA2IE	Match 2 (MA2F) Interrupt Enable Enables the MA2F interrupt. 0 - Disable 1 - Enable
13 —	Reserved
12 —	Reserved
11 M7	7-Bit Mode Select Specifies the data characters that the receiver and transmitter use. You must change the value of this field only after both the transmitter and receiver are disabled. 0 - 8-bit to 10-bit 1 - 7-bit
10-8 IDLECFG	Idle Configuration Configures the number of idle characters that must be received before you write 1 to STAT[IDLE]. 000 - 1 001 - 2 010 - 4 011 - 8 100 - 16 101 - 32 110 - 64 111 - 128
7 LOOPS	Loop Mode Select Selects Loop mode. After this field becomes 1, the RXD pin is disconnected from LPUART and the transmitter output is internally connected to the receiver input. The transmitter and receiver must be enabled to use the loop function. In Loop mode or Single-Wire mode, the transmitter outputs are internally connected to the receiver input (see CTRL[RSRC]). 0 - Normal operation: RXD and TXD use separate pins

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Loop mode or Single-Wire mode
6 DOZEEN	Doze Mode Enables LPUART in Doze mode. If this field is 1, LPUART remains active when not in Doze mode. 0 - Enable 1 - Disable
5 RSRC	Receiver Source Select Determines the source of the receiver shift register input if CTRL[LOOPS] is 1. This field has no effect unless CTRL[LOOPS] is 1. If this field is 0, internal Loopback mode is selected. LPUART does not use the RXD pin. Additionally, the CTS_B pin is not used and internally driven by the RTS_B output. If this field is 1, single-wire LPUART mode is selected where the TXD pin is connected to the transmitter output and receiver input. 0 - Internal Loopback mode 1 - Single-wire mode
4 M	9-Bit Or 8-Bit Mode Select Specifies the data characters that the receiver and transmitter use. 0 - 8-bit 1 - 9-bit
3 WAKE	Receiver Wake-Up Method Select Determines which condition wakes up LPUART when CTRL[RWU] = 1 and BAUD[MATCFG] = 0 (this field must be 1 when BAUD[MATCFG] = 11): • Address mark in the bit preceding the stop bit (or bit preceding the parity bit when parity is enabled) of the received data character • An idle condition on the receive pin input signal If this field is 0, CTRL[RWU] is configured for idle line wake-up, and if this field is 1, CTRL[RWU] is configured with address mark wake-up. 0 - Idle 1 - Mark
2 ILT	Idle Line Type Select Determines when the receiver starts counting logic 1s as idle character bits. The count begins either after a valid start bit or the stop bit. If the count begins after the start bit, a string of logic 1s preceding the stop bit can cause false recognition of an idle character. Beginning the count after the stop bit avoids false idle character recognition, but requires properly synchronized transmissions.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE In case you write 1 to this field, a logic 0 is automatically shifted after a received stop bit, therefore resetting the idle count. 0 - After the start bit 1 - After the stop bit
1 PE	Parity Enable Enables hardware parity generation and checking. If parity is enabled, the bit immediately before the stop bit is treated as the parity bit. 0 - Disable 1 - Enable
0 PT	Parity Type Selects the type of parity, even or odd, if parity is enabled (CTRL[PE] = 1): • Odd parity means that the total number of logic 1 bits in the data character, including the parity bit, is odd. • Even parity means that the total number of 1s in the data character, including the parity bit, is even. 0 - Even parity 1 - Odd parity

47.6.9 Data (DATA)

Supports 8-bit, 16-bit, or 32-bit writes, each type of write performing a separate function. An 8-bit write to DATA[7:0] pushes {CTRL[R8T9], CTRL[R9T8], DATA[7:0]} the transmit FIFO with TSC clear. A 16-bit or 32-bit write pushes the data written into the FIFO and does not update the value of CTRL[R8T9] or CTRL[R9T8].

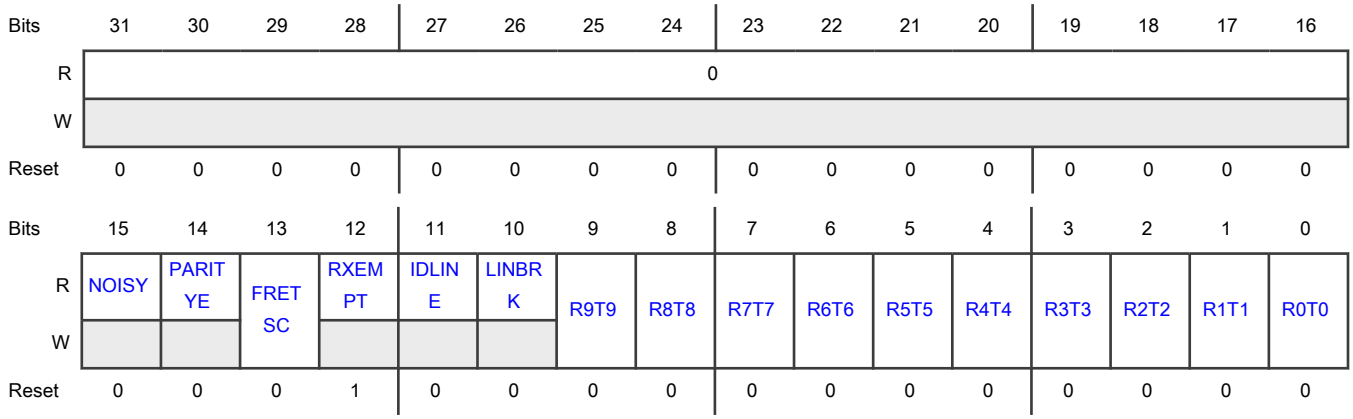
Reads and writes of this register are also involved in the automatic flag clearing mechanisms for some of the LPUART status fields.

NOTE
Reads return the contents of the read-only receive FIFO and writes go to the write-only transmit FIFO, making this register work as a set of two separate registers.

Offset

Register	Offset
DATA	1Ch

Diagram



Fields

Field	Description
31-16 —	Reserved
15 NOISY	Noisy Data Received Indicates whether the current received dataword contained in DATA[R9:R0] is received with noise. 0 - Received without noise 1 - Received with noise
14 PARITYE	Parity Error Indicates whether the current received dataword contained in DATA[R9:R0] is received with a parity error. 0 - Received without a parity error 1 - Received with a parity error
13 FRETSC	Frame Error Transmit Special Character Specifies the way the dataword is received. For reads, this field indicates that the current received dataword contained in DATA[R9:R0] is received with a frame error. For writes, the field indicates that a break or idle character is to be transmitted instead of the contents in DATA[T9:T0]. T9 indicates a break character when it is 0 and indicates an idle character when it is 1. The contents of DATA[T8:T0] must be 0. 0 - Received without a frame error on reads or transmits a normal character on writes 1 - Received with a frame error on reads or transmits an idle or break character on writes
12 RXEMPT	Receive Buffer Empty Indicates whether the receive buffer contains valid data. This field becomes 1 when there is no data in the receive buffer. The field does not consider data in the receive shift register.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Valid data 1 - Invalid data and empty
11 IDLINE	Idle Line Indicates whether the receiver line was idle before receiving the character in DATA[9:0]. It can be read as “1” on the first character when the receiver is first enabled. The difference between this field and STAT[IDLE] is that, STAT[IDLE] flag does not set on an idle line after the receiver is first enabled, it needs to receive a character before it can become set, whereas this field does not have this limitation and can be set on the first character received if an idle line is detected beforehand. 0 - Not idle 1 - Idle
10 LINBRK	LIN Break Indicates whether the receiver line detected a LIN break before receiving the character in DATA[9:0]. This field requires the value of STAT[LBKDIF] to be 1. If this field is 0, the LIN break detect circuitry is disabled. 0 - Not detected 1 - Detected
9 R9T9	Read receive FIFO bit 9 or write transmit FIFO bit 9
8 R8T8	Read receive FIFO bit 8 or write transmit FIFO bit 8
7 R7T7	Read receive FIFO bit 7 or write transmit FIFO bit 7
6 R6T6	Read receive FIFO bit 6 or write transmit FIFO bit 6
5 R5T5	Read receive FIFO bit 5 or write transmit FIFO bit 5
4 R4T4	Read receive FIFO bit 4 or write transmit FIFO bit 4
3 R3T3	Read receive FIFO bit 3 or write transmit FIFO bit 3
2 R2T2	Read receive FIFO bit 2 or write transmit FIFO bit 2

Table continues on the next page...

Table continued from the previous page...

Field	Description
1 R1T1	Read receive FIFO bit 1 or write transmit FIFO bit 1
0 R0T0	Read receive FIFO bit 0 or write transmit FIFO bit 0

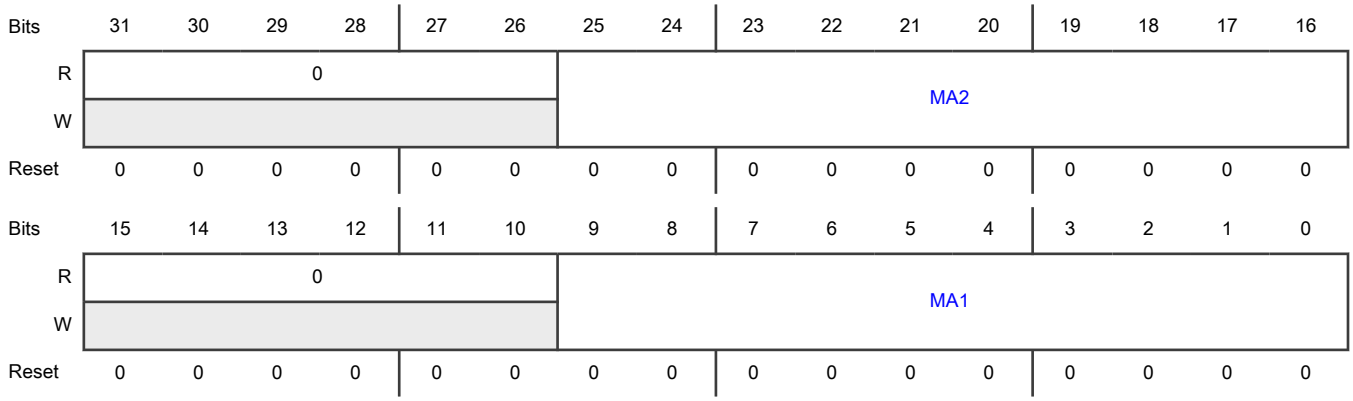
47.6.10 Match Address (MATCH)

Provides addresses for address matching during the receiver operation.

Offset

Register	Offset
MATCH	20h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-16 MA2	Match Address 2 Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] only when the associated Baud Rate (BAUD) field is 0.

Table continues on the next page...

Table continued from the previous page...

Field	Description
15-10 —	Reserved
9-0 MA1	Match Address 1 Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] fields only when the associated field in Baud Rate (BAUD) is 0.

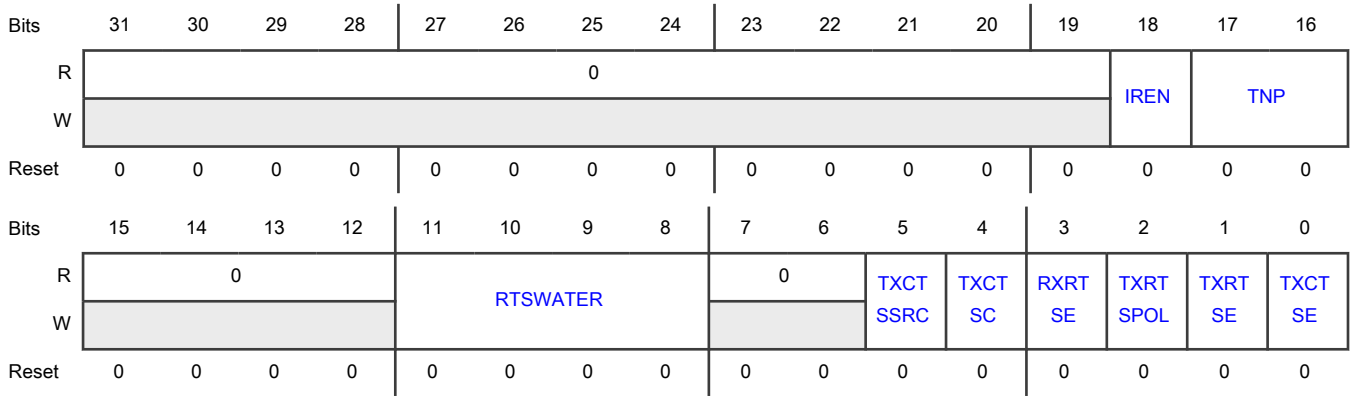
47.6.11 MODEM IrDA (MODIR)

Controls options for setting the MODEM configuration.

Offset

Register	Offset
MODIR	24h

Diagram



Fields

Field	Description
31-19 —	Reserved
18 IREN	IR Enable Enables IR modulation and demodulation.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	You must change the value of this field only when both the transmitter and receiver are disabled. 0 - Disable 1 - Enable
17-16 TNP	Transmitter Narrow Pulse Specifies whether LPUART transmits a 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulse when the IR pulse is enabled. You must change the value of this field only when both the transmitter and receiver are disabled. The IR pulse width must be configured to less than half of the OSR. Common pulse widths are 3 ÷ 16, 1 ÷ 16, 1 ÷ 32, or 1 ÷ 4 of the bit length. You can configure these by selecting the appropriate OSR and pulse width. 00 - 1 ÷ OSR 01 - 2 ÷ OSR 10 - 3 ÷ OSR 11 - 4 ÷ OSR
15-12 —	Reserved
11-8 RTSWATER	Receive RTS Configuration Configures the assertion and negation of the receiver's RTS_B output. The receiver's RTS_B output negates when the number of empty words in the receive FIFO is greater or equal to the value of this field. If this field is 0, the RTS_B pin negates when the receive FIFO is full. For the purpose of receive RTS_B generation, the number of words in the receive FIFO updates when a start bit is detected. This supports additional latency between RTS_B negation and the external transmitter ceasing transmission. If both receive RTS_B and address or data matching is enabled, RTS_B could assert at the end of a character if there exists no match. You must change the value of this field only when the receiver is disabled.
7-6 —	Reserved
5 TXCTSSRC	Transmit CTS Source Configures the source of the CTS input. 0 - The CTS_B pin 1 - An internal connection to the receiver address match result
4 TXCTSC	Transmit CTS Configuration Configures whether the CTS state or input is checked or sampled at the start of each character or only when the transmitter is idle. 0 - Sampled at the start of each character

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Sampled when the transmitter is idle
3 RXRTSE	Receiver RTS Enable Allows the RTS output to control the CTS input of the transmitting device to prevent receiver overrun. You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver has no effect on RTS. If this field is 1, RTS is deasserted if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1. RTS is asserted if STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. **NOTE** Do not write 1 to both MODIR[RXRTSE] and MODIR[TXRTSE]. 0 - Disable 1 - Enable
2 TXRTSPOL	Transmitter RTS Polarity Controls the polarity of the transmitter RTS. This field does not affect the polarity of the receiver RTS that remains negated in the active-low state unless MODIR[TXRTSE] is 1. You must change the value of this field only when the transmitter is disabled. 0 - Active low 1 - Active high
1 TXRTSE	Transmitter RTS Enable Controls the operation of RTS before and after a transmission. You must change the value of this field only when the transmitter is disabled. If this field is 0, the transmitter has no effect on RTS, and if this field is 1, a character is placed into an empty transmit shift register. RTS asserts 1-bit time before the start bit is transmitted and deasserts 1-bit time after all characters in the transmitter FIFO and shift register are completely sent, including the last stop bit. 0 - Disable 1 - Enable
0 TXCTSE	Transmitter CTS Enable Enables the operation of the transmitter. You can write 1 to this field irrespective of the states of MODIR[TXRTSE] and MODIR[RXRTSE]. If this field is 1, the transmitter checks the state of the CTS signal each time it is ready to send a character. If CTS is asserted, the character is sent. If CTS is deasserted, the TXD signal remains in the mark state and transmission is delayed until CTS is asserted. Changes in CTS, when a character is being sent, do not affect its transmission. 0 - Disable 1 - Enable

47.6.12 FIFO (FIFO)

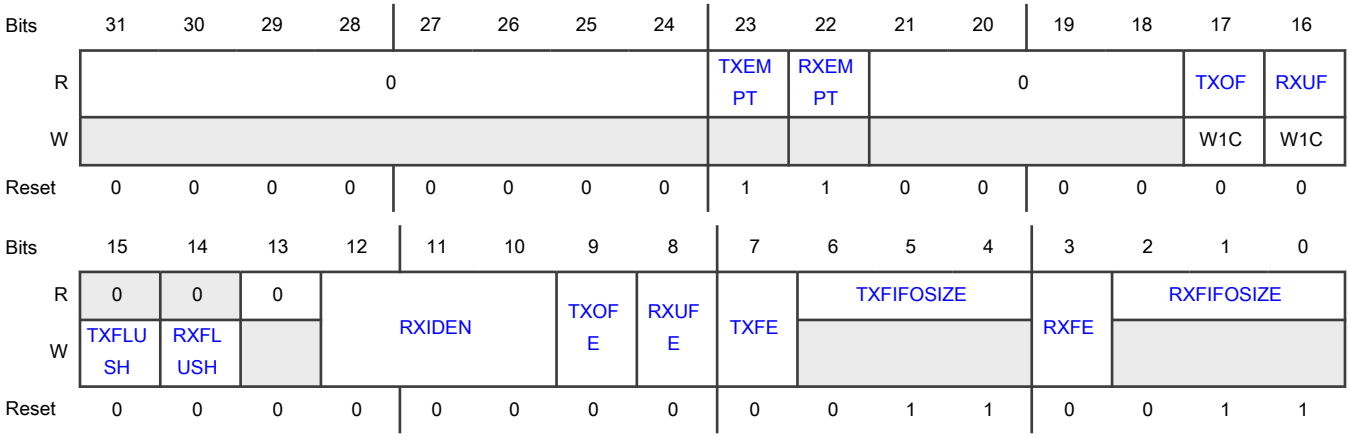
Provides you the ability to turn on and turn off the FIFO functionality.

This register also provides you the size of the FIFO that has been implemented. You can read this register at any time and must write to it only when CTRL[RE] and CTRL[TE] are 0 and the FIFO is empty.

Offset

Register	Offset
FIFO	28h

Diagram



Fields

Field	Description
31-24 —	Reserved
23 TXEMPT	Transmit FIFO Or Buffer Empty Indicates whether the transmit buffer is empty. This field becomes 1 when there is no data in the transmit FIFO or buffer. The field does not consider data in the transmit shift register. 0 - Not empty 1 - Empty
22 RXEMPT	Receive FIFO Or Buffer Empty Indicates whether the receive buffer is empty. This field becomes 1 when there is no data in the receive FIFO or buffer. The field does not consider data in the receive shift register. 0 - Not empty

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Empty
21-18 —	Reserved
17 TXOF	Transmitter FIFO Overflow Flag Indicates whether more data has been written to the transmit FIFO than it can hold. If this field is 0, no transmit FIFO overflow has occurred since the last time the field was cleared, and if this field is 1, at least one transmit FIFO overflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[TXOFE]. However, an interrupt is issued to the host only if FIFO[TXOFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No overflow 1 - Overflow When writing 0 - No effect 1 - Clear the flag
16 RXUF	Receiver FIFO Underflow Flag Indicates whether more data has been read from the receive FIFO than was present. If this field is 0, no receive FIFO underflow has occurred since the last time the field was cleared, and if this field is 1, at least one receive FIFO underflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[RXUFE]. However, an interrupt is issued to the host only if FIFO[RXUFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No underflow 1 - Underflow When writing 0 - No effect 1 - Clear the flag
15 TXFLUSH	Transmit FIFO Flush Causes all data that is stored in the transmit FIFO to be flushed.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the transmit FIFO or buffer clears out. This does not affect data in the transmit shift register. 0 - No effect 1 - All data flushed out
14 RXFLUSH	Receive FIFO Flush Causes all data that is stored in the receive FIFO to be flushed. If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the receive FIFO or buffer clears out. This does not affect data in the receive shift register. 0 - No effect 1 - All data flushed out
13 —	Reserved
12-10 RXIDEN	Receiver Idle Empty Enable Enables STAT[RDRF] to become 1 when the receiver is idle for a number of idle characters and the FIFO is not empty. This feature is not supported when the receiver extended idle time is enabled. 000 - Disable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle 001 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for one character 010 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for two characters 011 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for four characters 100 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for eight characters 101 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 16 characters 110 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 32 characters 111 - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 64 characters
9 TXOFE	Transmit FIFO Overflow Interrupt Enable Enables FIFO[TXOF] to generate an interrupt to the host. 0 - Disable

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Enable
8 RXUFE	Receive FIFO Underflow Interrupt Enable Enables FIFO[RXUF] to generate an interrupt to the host. 0 - Disable 1 - Enable
7 TXFE	Transmit FIFO Enable Enables the transmit FIFO. If this field is 0, the transmit buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[TXFIFOSIZE]. Both CTRL[TE] and CTRL[RE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the transmit buffer is enabled. FIFO[TXFIFOSIZE] indicates the size of the FIFO structure. 0 - Disable 1 - Enable
6-4 TXFIFOSIZE	Transmit FIFO Buffer Depth Indicates the maximum number of transmit datawords (transmit FIFO buffer depth) that can be stored in the transmit buffer. 000 - 1 001 - 4 010 - 8 011 - 16 100 - 32 101 - 64 110 - 128 111 - 256
3 RXFE	Receive FIFO Enable Enables the receive FIFO. If this field is 0, the receive buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[RXFIFOSIZE]. Both CTRL[RE] and CTRL[TE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the receive buffer is enabled. FIFO[RXFIFOSIZE] indicates the size of the FIFO structure. 0 - Disable 1 - Enable
2-0	Receive FIFO Buffer Depth

Table continues on the next page...

Table continued from the previous page...

Field	Description
RXFIFOSIZE	Indicates the maximum number of receive datawords (receive FIFO buffer depth) that can be stored in the receive buffer before an overrun occurs. 000 - 1 001 - 4 010 - 8 011 - 16 100 - 32 101 - 64 110 - 128 111 - 256

47.6.13 Watermark (WATER)

Provides the ability to set a programmable threshold for notification, or sets the programmable thresholds to indicate that transmit data can be written or receive data can be read.

You may read this register at any time but must write to it only when CTRL[TE] is 0.

Offset

Register	Offset
WATER	2Ch

31-29	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
28-24 RXCOUNT	Receive Counter Indicates the number of datawords in the receive FIFO or buffer. If a dataword is being received in the receive shift register, it is not included in the count. This value may be used in conjunction with FIFO[RXFIFOSIZE] to calculate the room left in the receive FIFO or buffer.
23-20 —	Reserved
19-16 RXWATER	Receive Watermark Generates an interrupt or a DMA request if the number of datawords in the receive FIFO or buffer is greater than the value of this field. For proper operation, the value of this field must be less than the size of the receive FIFO or buffer, as indicated by FIFO[RXFIFOSIZE] and FIFO[RXFE].
15-13 —	Reserved
12-8 TXCOUNT	Transmit Counter Indicates the number of datawords in the transmit FIFO or buffer. If a dataword is being transmitted to the transmit shift register, it is not included in the count. This value may be used in conjunction with the value of FIFO[TXFIFOSIZE] to calculate the room left in the transmit FIFO or buffer.
7-4 —	Reserved
3-0 TXWATER	Transmit Watermark Generates an interrupt or a DMA request when the number of datawords in the transmit FIFO or buffer is equal to or less than the value of this field. For proper operation, the value of this field must be less than the size of the transmit buffer or FIFO, as indicated by FIFO[TXFIFOSIZE] and FIFO[TXFE].

47.6.14 Data Read-Only (DATARO)

Indicates the first entry in the receive FIFO, but does not pull data from the FIFO.

Offset

Register	Offset
DATARO	30h

0 DCTS	Delta Clear To Send Indicates whether the CTS_B pin changed state since the last time this field was 0. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Did not change state 1 - Changed state When writing 0 - No effect 1 - Clear the flag

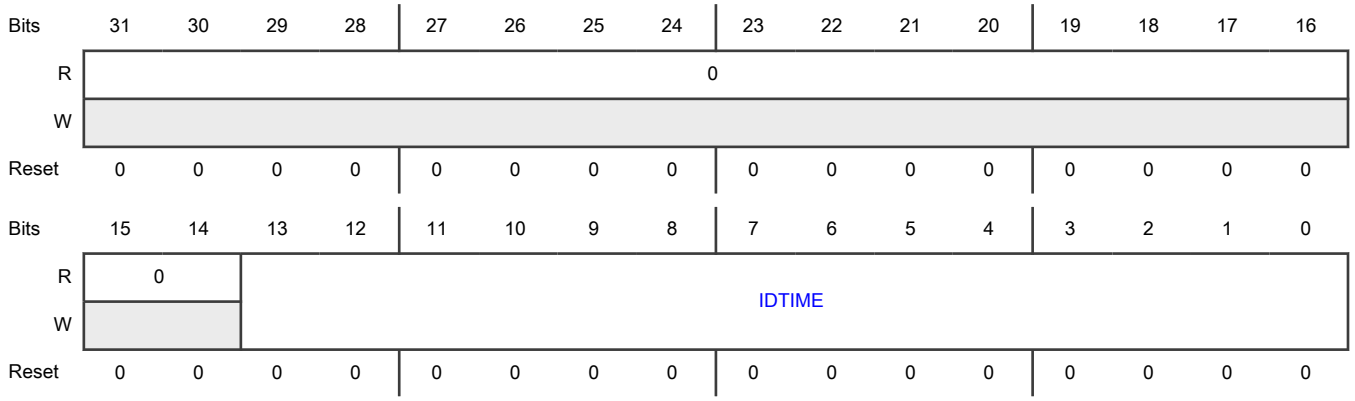
47.6.17 Receiver Extended Idle (REIR)

Configures the receiver extended idle functionality. You must not change this value when the receiver is enabled.

Offset

Register	Offset
REIR	48h

Diagram



Fields

Field	Description
31-14 —	Reserved
13-0 IDTIME	Idle Time Configures the idle length in number of bits (baud rate) since the end of the last stop bit. This affects the behavior of the idle wake-up, STAT[IDLE], DATA[IDLINE], and STAT[RAF]. The minimum supported extended idle time is equal to one idle character. The extended idle feature is disabled when this field is 0.

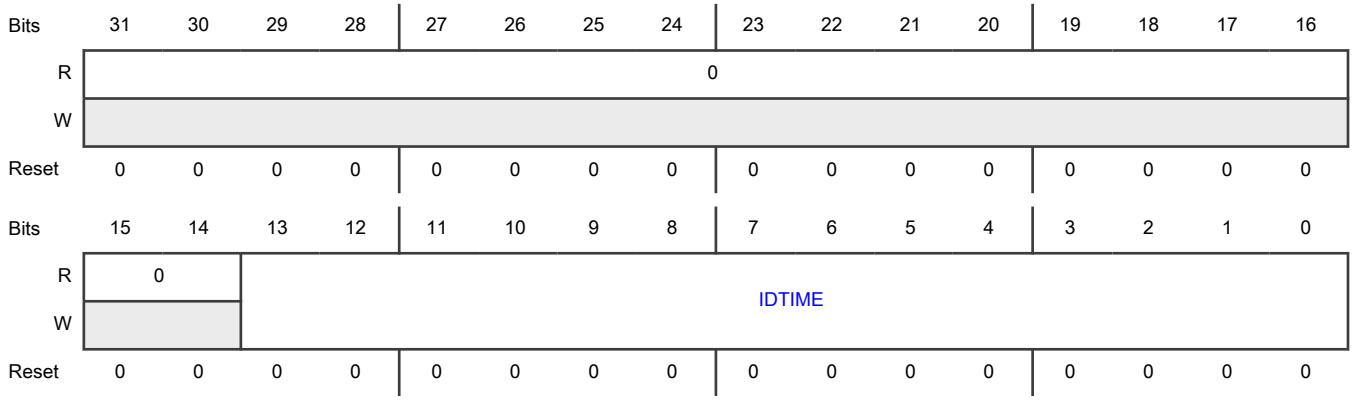
47.6.18 Transmitter Extended Idle (TEIR)

Configures the transmitter extended idle functionality. You must not change this value when the transmitter is enabled.

Offset

Register	Offset
TEIR	4Ch

Diagram



Fields

Field	Description
31-14 —	Reserved
13-0 IDTIME	Idle Time Configures the transmitter idle time in number of bits (baud rate) whenever an idle character is queued through the transmit FIFO. An idle character is not automatically queued whenever the transmitter is enabled. The minimum supported extended idle time equals one idle character.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	The extended idle feature is disabled when this field is 0.

47.6.19 Half Duplex Control (HDCR)

Provides control for half-duplex-related operations.

You can use this register instead of CTRL[LOOPS], CTRL[RSRC], and CTRL[TXDIR] functions, although you can use CTRL[LOOPS] to loop-back the transmitter outputs to the receiver.

Offset

Register	Offset
HDCR	50h

Fields

Field	Description
31-16 —	Reserved
15-8 RTSEXT	RTS Extended Specifies RTS extension. The transmit RTS_B remains asserted for (RTSEXT + 1) bit times after the end of the last stop bit. This applies even when the transmitter's RTS_B output is disabled and is only used internally to mask the receiver.
7-4 —	Reserved
3	Receive Mask

Table continues on the next page...

Table continued from the previous page...

Field	Description
RXMSK	Specifies whether the transmitter RTS_B masks the receive data pin. When enabled, the transmitter RTS_B masks the receive data pin. 0 - Do not mask 1 - Mask
2 RXWRMSK	Receive FIFO Write Mask Specifies whether the transmitter RTS_B masks writes to the receive FIFO. When enabled, the transmitter RTS_B masks receive FIFO writes, but the idle flag is not affected. 0 - Do not mask 1 - Mask
1 RXSEL	Receive Select Specifies the receive data pin. When enabled, the receive data is sourced from the TXD pin. 0 - RXD 1 - TXD
0 TXSTALL	Transmit Stall Specifies whether the transmitter becomes busy when the receiver is active. When enabled, the transmitter does not become busy or asserts transmitter RTS_B when the receiver is active (STAT[RAF] is 1). 0 - No effect 1 - Does not become busy

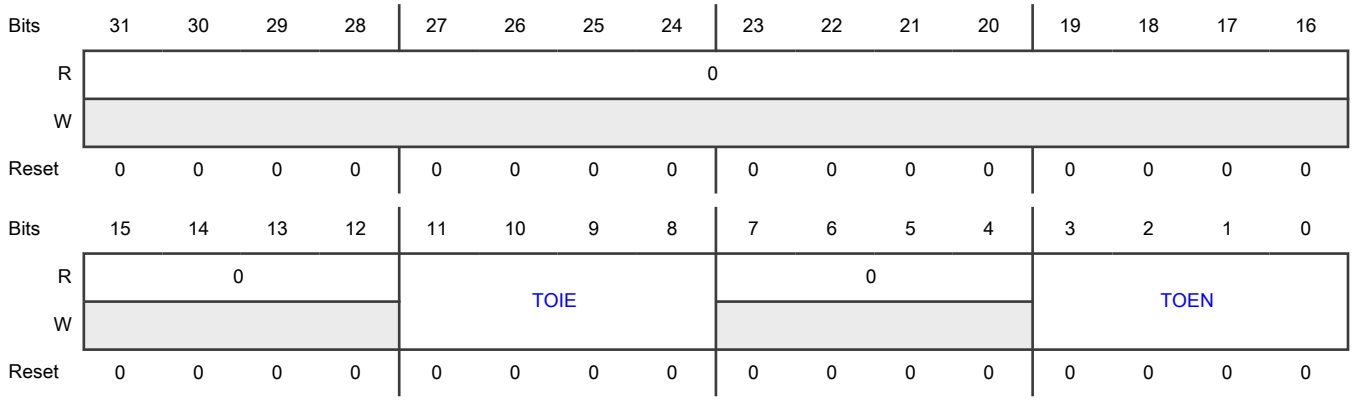
47.6.20 Timeout Control (TOCR)

Configures the behavior of the timeout logic. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter.

Offset

Register	Offset
TOCR	58h

Diagram



Fields

Field	Description
31-12 —	Reserved
11-8 TOIE	Timeout Interrupt Enable Enables the corresponding timeout flag to generate an interrupt.
7-4 —	Reserved
3-0 TOEN	Timeout Enable Enables the corresponding timeout counter.

47.6.21 Timeout Status (TOSR)

Indicates the status of the timeout logic. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter.

Offset

Fields

Field	Description
31-12 —	Reserved
11-8 TOF	Timeout Flag Indicates whether the corresponding timeout occurred. The timeout counter is disabled when this field is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0000 - Not occurred 0001 - Occurred When writing 0000 - No effect 0001 - Clear the flag
7-4 —	Reserved
3-0 TOZ	Timeout Zero Indicates whether the corresponding timeout counter equals 0.

47.6.22 Timeout N (TIMEOUT0 - TIMEOUT3)

Configures the corresponding timeout counter and status field. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter. You must write to this register only when the corresponding timeout is disabled or when the value of the corresponding timeout field is 1.

Offset

Register	Offset
TIMEOUT0	60h

Fields

Field	Description
31-30 CFG	Idle Configuration Configures the behavior of TIMEOUT[TIMEOUT]. 00 - Becomes 1 after timeout characters are received 01 - Becomes 1 when idle for timeout bit clocks 10 - Becomes 1 when idle for timeout bit clocks following the next character 11 - Becomes 1 when idle for at least timeout bit clocks, but a new character is detected before the extended idle timeout is reached
29-14 —	Reserved
13-0 TIMEOUT	Timeout Value Configures the timeout value.

47.6.23 Transmit Command Burst (TCBR0 - TCBR127)

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller, using aligned 8-bit, 16-bit, or 32-bit writes. The size of this register is 512 bytes:

- An aligned 32-bit write in this region pushes one entry into the transmit FIFO.
- An aligned 16-bit write in this region to TCBR*x*[15:0] pushes one entry into the transmit FIFO.

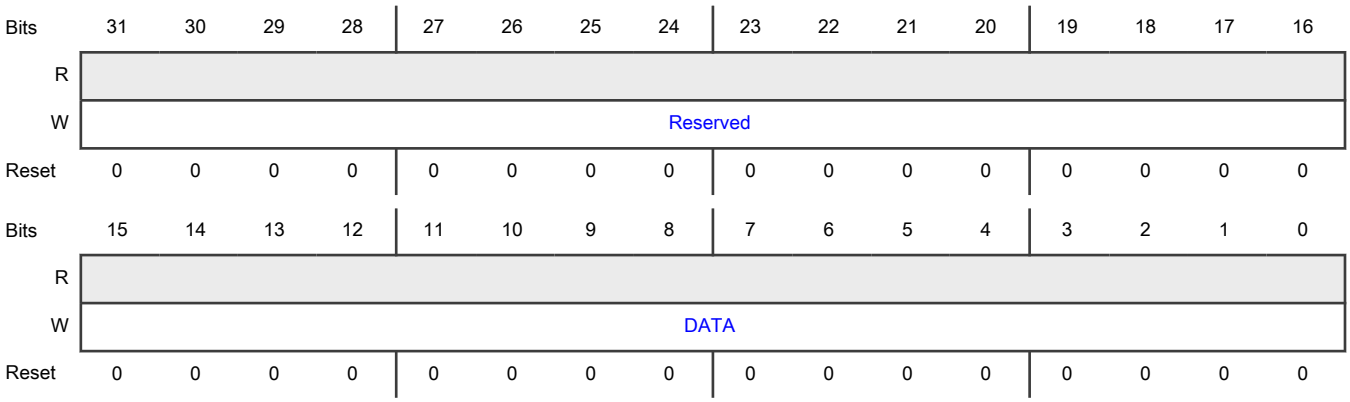
- An 8-bit write in this region to TCBR*x*[7:0] updates DATA[7:0], but does not push the data into the transmit FIFO.
- An 8-bit write in this region to TCBR*x*[15:8] pushes the data written to DATA[15:8] plus the previously written DATA[7:0] into the transmit FIFO.
- An 8-bit or 16-bit write in this region to TXBR*x*[31:16] is ignored.

Offset

For a = 0 to 127:

Register	Offset
TCBRa	200h + (a × 4h)

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 DATA	Data Enables writing data to Data (DATA).

47.6.24 Transmit Data Burst (TDBR0 - TDBR255)

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller using 8-bit, 16-bit, or 32-bit writes. The size of this register is 1024 bytes:

- An aligned 32-bit write in this region pushes four DATA byte entries into the transmit FIFO (DATA0 byte first). The register access is extended by three wait states.
- An aligned 16-bit write in this region to either half of a 32-bit word pushes two DATA byte entries into the transmit FIFO (DATA0 or DATA2 first). The register access is extended by one wait state.
- An 8-bit write in this region pushes one DATA byte entry into the transmit FIFO.

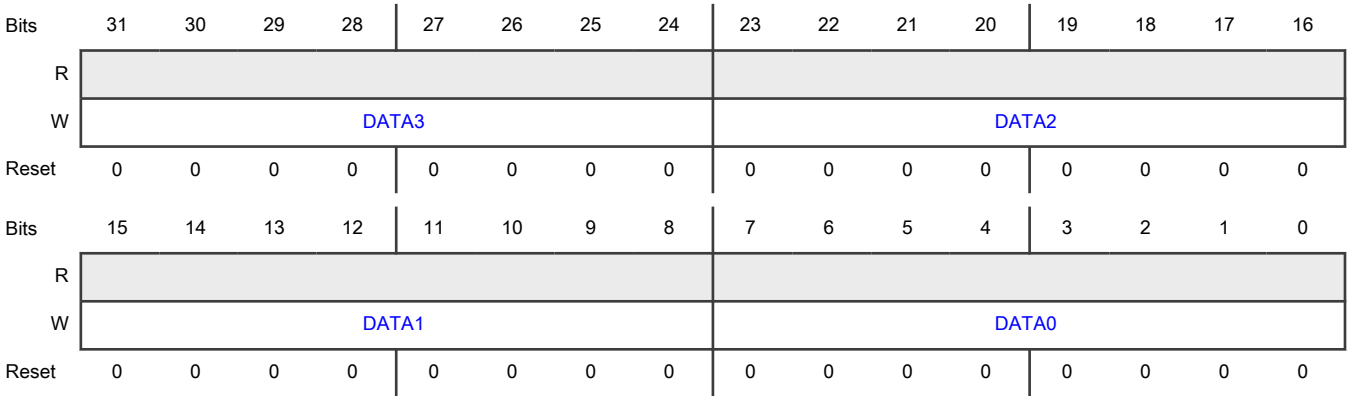
Byte writes to Data (DATA) use the contents of CTRL[R9T8] for the ninth data bit, CTRL[R8T9] for the tenth data bit, and zero extend DATA[FRETSC].

Offset

For a = 0 to 255:

Register	Offset
TDBRa	400h + (a × 4h)

Diagram



Fields

Field	Description
31-24 DATA3	Data3 Enables writing of data to Data (DATA).
23-16 DATA2	Data2 Enables writing of data to Data (DATA).
15-8 DATA1	Data1 Enables writing of data to Data (DATA).
7-0 DATA0	Data0 Enables writing of data to Data (DATA).

47.7 Glossary

Baud rate Number of bits per second that LPUART transmits or receives

Break character Break character is generated when the transmitter is holding the data line at the space level for at least one character time

Oversampling Number of times the receive circuitry samples the receive input per baud period (that is, per data bit)

Chapter 48
Improved Inter-Integrated Circuit (I3C)

48.1 Chip-specific I3C information

Table 485. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes two I3C Modules (I3C1 in AONMIX and I3C2 in WAKEUPMIX). The HCI-I3C (Host Controller Interface) is not supported.

48.2 Overview

I3C is a communications processor that improves upon the use and power of I2C, and provides an alternative to SPI for mid-speed applications.

The I3C bus protocol supports:

- In-band interrupts (IBI): these interrupts move from target to controller without extra wires, and the controller knows which target sent the interrupt
- Common command codes (CCC)
- Dynamic addressing
- Multi-controller and multi-drop
- Hot-Join (HJ)
- I2C compatibility

I3C supports all required and many optional features of the MIPI Alliance Specification for I3C, v1.0 and v1.1, except for ternary data rates (HDR-TSP and HDR-TSL). See Features, Target Capabilities (SCAPABILITIES), and Target Capabilities 2 (SCAPABILITIES2) for more information.

48.2.1 Block diagram

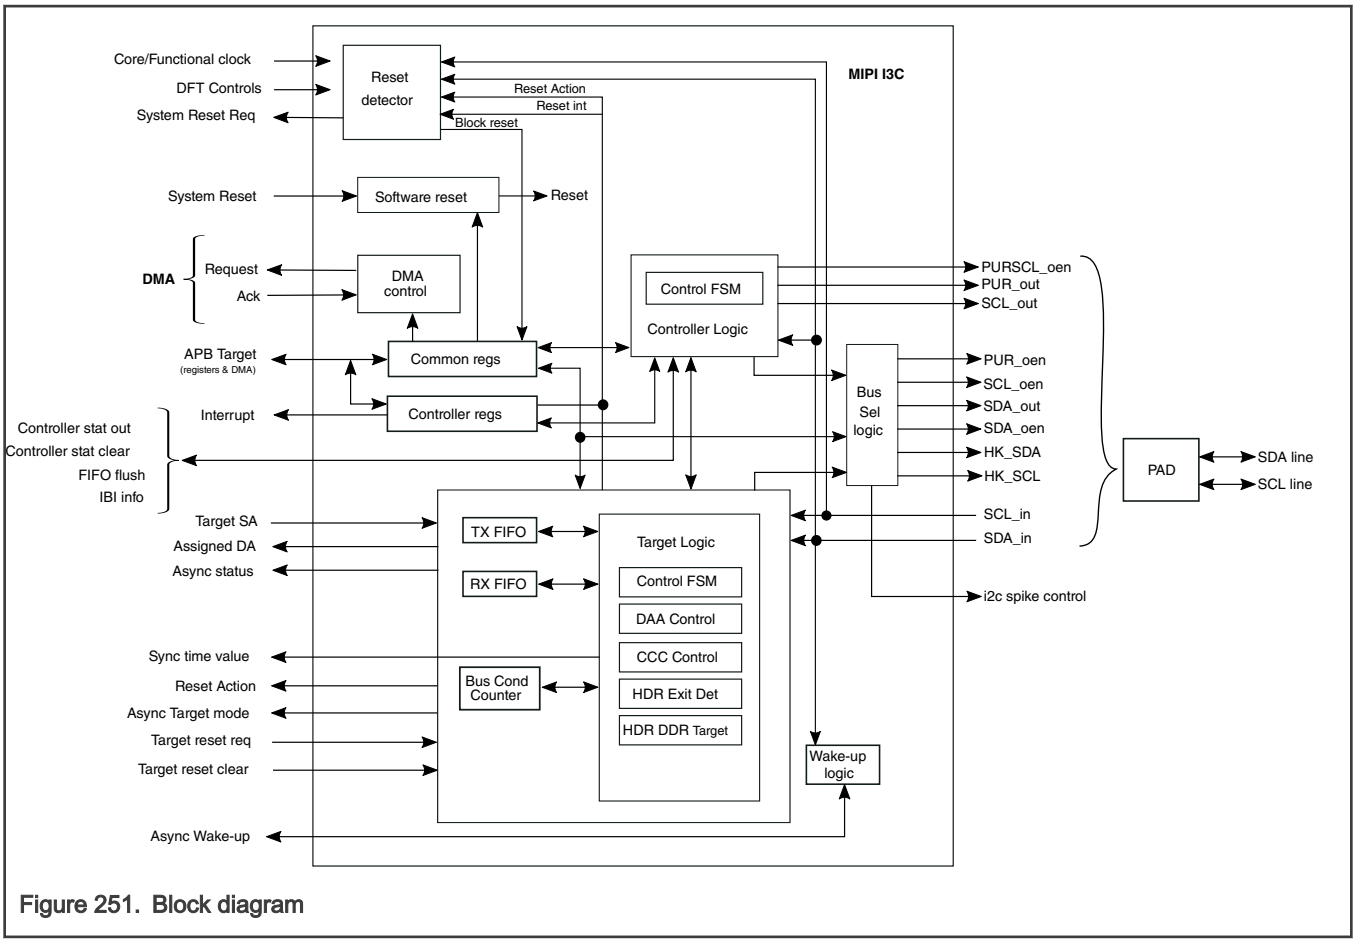


Figure 251. Block diagram

48.2.2 Features

- Two-wire multidrop bus that is capable of up to 12.5 MHz clock speeds with up to 11 devices:
  - Uses standard pads with 4 mA drive.
  - Dynamically assigns target addresses, and targets do not require static addresses (SAs). However, targets can have an I2C static address assigned at startup, so the target can operate on an I2C bus. By default, I3C supports 7-bit I2C-style addresses.
  - Supports extended I2C 10-bit addressing through Map Feature Control 1 (SMAPCTRL1).
  - Allows targets to use the inbound SCL clock as the peripheral clock (instead of the clock from the controller) so that devices can have slow or inaccurate clocks internally.
  - Allows simple targets, such as temperature sensors, to have no internal clock.
  - I3C controller supports handoff from Open-Drain to Push-Pull mode for ACK to data transfer.
  - Generally, the controller terminates the read, but for I3C, the target can also end the read.
- IBIs that allow targets to send notifications to a controller:
  - Can be equivalent to a separate GPIO, but can also be directly data-bearing.
  - Can be prioritized. When multiple targets send interrupts to a controller at the same time, the order is resolved. Dynamic addresses (DAs) establish the priority of the targets, so the controller controls the priority of the targets.

    Targets with lower-value DAs are higher-priority level IBIs.

  - Can start interrupts even when the controller is not active on the bus. A free-running clock is not required, but starting an interrupt requires a Bus Available condition.
  - Can resolve an initial event via a time-stamping option, not requiring an interrupt.
- Built-in commands for applications created in software or firmware by using the register interface maintained in a separate space. These commands do not collide with normal controller-to-target messages and:
  - Control bus behavior, modes and states, low-power state, inquiries, and more.
  - Have an extra room for new built-in commands for other groups.
- Organized forms of multicontroller modes that are secondary controllers using clean handoffs between different controllers.
- Hot-Join onto I3C bus allows devices to connect to the bus later than when the bus starts. This:
  - Enables a device or module to access the I3C bus after power up or when physically inserted onto the I3C bus.
  - Provides a clean method for notification when new devices or modules access the I3C bus.
- I3C can use both I2C and I3C buses:
  - I3C supports specific legacy I2C devices on the bus.
  - I3C target devices can operate on I2C buses.
  - In I2C controller mode, it supports only Push-Pull mode on the SCL line.
  - A reset output is available for I2C mode SW reset for application usage. Asserted when the module is an I2C target and gets a I2C software General command from a controller. See the chip-specific section, for usage if this is available.
- Higher data rate modes are available:
  - I3C has a high data rate: double data rate (HDR-DDR) mode, which is double the data rate of SDR .
  - Only the controller and the specific targets, which are capable and configured to work with HDR-DDR, support the higher data rate (the other targets can ignore it).

I3C supports most of the I3C features (see Target Capabilities (SCAPABILITIES) and Target Capabilities 2 (SCAPABILITIES2)), except for the ternary data rates (HDR-TSP and HDR-TSL), HDR-BT modes, and peer-to-peer messaging.

48.3 Functional description

48.3.1 Operating modes

This section describes all functional operation modes of the I3C module.

48.3.1.1 Target and controller roles for I3C

The I3C protocol defines these roles for devices on the I3C bus:

- Main controller: initially configures the I3C bus and serves as the first active controller
- Secondary controller: accepts the controller role from any active controller to become the new active controller (the secondary controller may then pass the controller role along: either back to the previous active controller, or on to any other controller-capable device)
- Target: responds to commands from any I3C controller
- I2C target: responds to compatible commands from any I3C controller

The I3C peripheral contains both controller and target components and can be configured to be either controller or target, or as target with secondary controller capability. However, if I3C is chosen to be a controller, then the I3C peripheral supports Target mode to facilitate handoffs to multiple controllers.

In general, any I3C controller can be a controller or a target because a controller becomes a target when giving over control to another controller. The only exceptions to this rule occur when using point-to-point communication or when using a controller that never shares controllership.

48.3.1.1.1 Controller requirements

Controller mode uses software that supports the requirements of the controller (including as a secondary controller):

- Managing the enter dynamic address assignment (ENTDAA) assigning dynamic addresses (DAs) to each target. The I3C peripheral supports this process but requires you to make choices.
- Driving the serial data (SDA) signal in both Open-Drain and Push-Pull modes. After START command, SDA is in Open-Drain mode and after Repeated START command, it is in Push-Pull mode:
  - SDA is subject to arbitration because both controller and target can drive the SDA line (arbitration is also useful for handoff from controller to target).
  - The ninth bit of SDA controller write data is an odd parity bit.
- Building a table of targets and their capabilities to control which actions and commands may be sent to the targets.
- Managing requests such as IBI and controller requests (handoff).
- Adjusting clock speed or write-to-read timing to match the limitations of the target. This adjustment can be done in hardware using dividers and uneven duty cycles, but you must decide how.
- Adjusting the maximum data length.
- Being a target after the controller role handoff to another controller-capable device.

The controller needs an accurate clock capable of running at a frequency that is the multiple of a frequency between 11 MHz and 12.5 MHz. Following are the possible clock frequencies:

- 24 MHz (multiple of 12 MHz)
- 25 MHz (multiple of 12.5 MHz)

If required to use a lower I3C SCL value, for example as small as 5 MHz (although the lower value does not support a mixed bus system):

- The controller clock can be a multiplier of that value.
- A lower SCL can also be achieved using a higher PPBAUD value.

48.3.1.1.2 I3C target acts like I2C target on I3C buses

If the target is assigned an I2C static address, the I3C target acts like an I2C device when it first powers on. If the I3C target is placed on an I2C bus with an I2C controller, then the I3C target stays in I2C mode and operates normally. The software is aware that the I3C target is in I2C mode because:

- There has not been an interrupt (see SSTATUS[DACHG]) indicating that a dynamic address was assigned.

For full I2C support of Fast mode (Fm) and Fast-mode Plus (Fm+), the pads must support a 50-ns spike filter. This filter must be turned off when the I3C 7Eh broadcast address is received (indicating an I3C controller). You can turn off the spike filters via hardware using the raw net indicating that the address was received, or via software. I3C does not need a 50-ns spike filter to operate on an I2C bus. Therefore, the spike filter is not a requirement for the I3C peripheral.

Depending on the configuration, the module supports most I2C features. Supported features include an extended 10-bit address, DeviceID, and software reset. See Target Capabilities (SCAPABILITIES) and Target Capabilities 2 (SCAPABILITIES2) for more information.

48.3.1.1.3 How a target rejoins the I3C bus

When a target tries to rejoin the I3C bus following a power-up or hard reset, the target needs a new dynamic address (DA). The target can rejoin the I3C bus in these ways:

- If the DA is lost, Hot-Join is used.
- If the DA is retained in the peripheral (for example, with state retention flip-flops), SCONFIG[OFFLINE] is used.

When SCONFIG[SLVENA] is 1, SCONFIG[OFFLINE] may become 1. This setting causes the peripheral to rejoin the bus safely. It does so by ensuring that the I3C bus is not in HDR mode, using the same approach as TE0 or TE1 exit. The peripheral waits for the HDR exit pattern from the controller, or for 60 µs of SCL and SDA lines not changing, whichever occurs first.

After using SCONFIG[OFFLINE], the I3C peripheral cannot safely use IBI until SSTATUS[STOP] becomes 1. This status ensures that the next START is safe to use for IBI.

If the application has to perform an IBI, it must wait for SSTATUS[STOP] to become 1, or for SCL and SDA lines to remain high for 200 µs. You can perform this process using the SSTATUS and SINTSET controls:

- If Target Status (SSTATUS) indicates that the bus is not busy and the peripheral interrupts on START or STOP, use a timer to measure 200 µs. If the timer finishes with no START or STOP, it is safe to use IBI.
- If a START causes an interrupt, then the timer must be turned off and the application must wait for a STOP.
- If a STOP causes an interrupt, it is safe to use IBI.

48.3.1.2 Using the I3C controller for I2C and I3C

The I3C controller operates with the following set of built-in capabilities with the application flow:

- Built-in enter dynamic address assignment (ENTDAA) mechanism to simplify the assignment of dynamic addresses to targets. This feature is used when set dynamic address from static address (SETDASA) is not available.

  NOTE

  When SETDASA CCC is available, use SETDASA CCC before using ENTDAA CCC; all targets without assigned dynamic addresses respond to ENTDAA CCC.

- Request for START + address with IBI support, including both I2C and I3C modes.
- SDR write flow via FIFO, with automatic parity in I3C and ACK or NACK detection in I2C.
- SDR read flow via the FIFO, with an automatic NACK generator for I2C, and optional use of a terminate generator for I3C.
- Request for Repeated START + address or STOP when finished with the previous request, including both I2C and I3C.
- Auto-IBI mode, which responds immediately to a target-initiated IBI and can be used when in Sleep or Deep Sleep mode.
- Special message mode for SDR and DDR to simplify DMA use.
- Automated SCL, SDA, pullup, and High-Keeper controls.
- I2C and I3C frequency and duty cycle configurations from functional clock.

  NOTE

  You must configure Controller Configuration (MCONFIG) and Controller In-band Interrupt Registry and Rules (MIBIRULES) before using the controller.

48.3.1.3 Protocol modes and states

The following modes are activated in I3C:

- I2C mode is the default mode on startup:
  - If no I2C static address is used, this mode has no effect other than to track frames looking for I3C transitional frames.
  - If an I2C static address is used, the device can interact with the I2C bus controller using the address.
- When in I2C mode, I3C Transitory Frame mode occurs whenever the I3C broadcast address is received (7Eh). In particular:

- This mode occurs when 7Eh is broadcast followed by SETDASA from the controller. If there is a static address match, the target is assigned a dynamic address and it enters I3C SDR mode.
- This mode occurs when 7Eh is broadcast followed by ENTDAA from the controller. If the target can send a 48-bit provisioned ID (48b ID), a dynamic address is assigned, and the target enters I3C SDR mode.
- If a Hot-Join arbitrated event occurs (sending 02h when the controller generates another address such as 7Eh), there is a conceptual Hot-Join mode. ENTDAA or SETDASA sets a dynamic address to resolve the event, and the target enters I3C SDR mode.

NOTE

An I3C target can operate as a normal I2C target only when it has a static address. Otherwise, it matches nothing in I2C and waits for the aforementioned events.

- I3C SDR mode is the standard mode after I3C activates, which is defined by a dynamic address being assigned. This mode is the resting mode of I3C, and all devices are normally in SDR mode:
  - RSTDAA CCC causes an exit from SDR mode and a return to I2C mode. This transition is not normally used.

    RSTDAA can be issued to ensure that all I3C targets participate in an upcoming dynamic address assignment process, before the I3C controller starts assigning the target address.
  - SETNEWDA does not affect the SDR mode; it only changes the dynamic address of an I3C device that already had a dynamic address assigned.
  - When in SDR mode, the device ignores messages to or from its original I2C static address.
- The I3C CCC command submode of type Direct or Broadcast. Following are the options to exit the CCC:
  - Exit the Broadcast CCC submode by a Repeated START or by a STOP.
  - Exit the Direct CCC submode by a 7Eh broadcast address after a Repeated START or by a STOP.
  - I3C dynamic address assignment (DAA) CCC command enters DAA mode. This mode is a special mode for dynamic addressing. Use STOP to exit. If a target has a dynamic address, the command is ignored.
- I3C SETDASA CCC command enters Static Address Match submode, which allows matching the static address of the device (if any). The command is ignored when a target has a dynamic address, or when the target in I2C mode has no static address.

NOTE

The special point-to-point address is also matched.

- I3C HDR modes are activated by ENTHDR*n* CCC commands, where *n* represents the type of HDR (0 to 7). This mode is valid until an HDR exit pattern is detected, irrespective of whether HDR mode for a target is supported.

  Exit-pattern detection must always be on to prevent errors. Alternatively, you could set it to be activated only on ENTHDR.
- A special HDR-DDR syntax is used for transmitting CCC in the HDR-DDR protocol.
- Internal states such as IBI or no-IBI and Low-Power mode are flagged internally (see SSTATUS[EVDET] for more information). These states are exported to the application and affect the engine to restrain it from performing a prohibited operation.

48.3.1.4 Address match

For an address match to occur, the target matches the I3C broadcast address and either the I2C-style static address or I3C dynamic address (see Table 486).

The address match is inactive (just listening) for all Repeated START commands and also for the START command, unless an IBI, CR, or Hot-Join has been activated. If inactive, it simply tries to match. If not matched, it waits for a Repeated START or STOP command. If an IBI, CR, or Hot-Join has been activated, the arbitration mechanism is used for START (but never for a Repeated START).

When matching the 7Eh broadcast address, it looks for a CCC until the next Repeated START or STOP command.

Table 486. Address match conditions

For	Match condition occurs when	Notes
I3C broadcast address	The address is 111 1110b (written as 7Eh).	
I2C-style static address	• The device has a static address. • The device is not in I3C mode.	When in I3C mode, the address matches only until the ENTDAA, SETDASA, or SETAASA command has a dynamic address assigned. SETDASA matches the static address or the special one-controller-to-one-target point-to-point address.
I3C dynamic address	ENTDAA or SETDASA assigns it, or SETNEWDA modifies it.	

48.3.1.5 I3C from low power mode and wake-up

A wake-up interrupt is available to bring the I3C module out of low power mode.

This interrupt works in both Controller and Target mode of operation as described below.

48.3.1.5.1 Controller mode

In Controller mode, I3C works with 2 clocks.

- Host interface clock for accessing registers and DMA
- Functional clock (FCLK) for controller logic operation and generating SCL

The Functional clock can be switched off to keep the I3C controller in low power mode if there is no data to be sent by the host and the i3C bus is in idle state (SDA = 1).

Before switching off the clock, take the below steps.

- Ensure that you enable the Controller mode MCONFIG[MSTENA] = 01b.
- Ensure that the bus is in the idle state.
- Switch off the Functional Clock.

If any agent on the bus pulls the SDA line low and at the SoC level the ENABLE bit of the I3C SDA interrupt is set to 1, then the interrupt goes high to inform the SoC logic to switch on the FCLK again.

48.3.1.5.2 Target mode

In Target mode, I3C works with only the Host interface clock (for accessing registers and DMA)

The main target control logic works on the external SCL clock.

The Host interface clock can be switched off to keep the I3C Target in low-power mode.

Before switching off the clock, take these steps.

- Ensure that you configure the Target mode, MCONFIG[MSTENA] = 00b along with all other normal target configuration as required.
- Clear the interrupts in Target Status (SSTATUS) after handling them.
- Enable DA matched interrupt in SINTSET[MATCHED].

- The host can now stop the Host interface clock to enter low power mode.

The interrupt asserts when any address match happens, either DA or SA or group address with this target.

The host then resumes the Host interface clock to serve and clear the interrupt.

48.3.2 Operations

This section describes the operations of the module.

48.3.2.1 Reading and writing I2C messages using the normal method

1. Set up interrupts using the following fields of Controller Interrupt Set (MINTSET):
   - MCTRLDONE: Indicates when the module completes an MCTRL request.
   - COMPLETE: Indicates when data is finished sending or being received.
   - RXPEND: Used for read operations. Works with Controller Data Control (MDATACTRL) to set the FIFO trigger. You can also use this field to allow DMA to read out data.
   - TXNOTFULL: Used for write operations. Works with Controller Data Control (MDATACTRL) to set the FIFO trigger. You can also use this field to allow DMA to supply data.
   - IBIWON: Indicates that an IBI, CR, or HJ has won the arbitration on a header address.
   - Additionally, Controller Errors and Warnings (MERRWARN) indicates the causes of errors and warnings.
2. Configure the following fields in Controller Control (MCTRL) simultaneously:
   a. Write 1 to REQUEST (EmitStartAddr).
   b. Write 1 to TYPE (I2C).
   c. Configure IBIRESP to respond to IBIs in your chosen manner.
   d. Write 1 to DIR for read, or write 0 for write.
   e. Write the static address of the I2C target to ADDR.
   f. Configure RDTERM to the maximum length for read operations, to auto-terminate, or set it to STOP as the data is read out. For example, write 1 (with MCTRL[REQUEST] = 0) to stop after the next character.
3. Write or read the data.
   - For write operations, write to Controller Write Data Byte (MWDATAB) for each byte before the last byte, and then write to Controller Write Data Byte End (MWDATABE) for the last byte:
     — You can perform or start this operation before setting up interrupts.
     — If there is more data than the FIFO can hold, use the TXNOTFULL interrupt based on the trigger level. This interrupt allows the application to provide more data or to use DMA.
   - For read operations, wait for RXPEND, and then read out data via Controller Read Data Byte (MRDATAB). DMA may also be used.
4. After message transfer is complete (MSTATUS[COMPLETE] = 1), the message may end with a STOP condition, or a new message may start with a Repeated START condition:
   a. Write 2 to MCTRL[REQUEST] (EmitStop to STOP). Then wait for the MCTRLDONE status to be asserted for its completion. (When sending STOP in I2C mode, MCONFIG[ODSTOP] and MCTRL[TYPE] must be 1.)
   b. Write 1 to MCTRL[REQUEST] (EmitStartAddr to restart). IBI is not possible in this case.

NOTE

I2C Fm and I2C Fm+ modes are supported for legacy I2C devices as per the I3C standard specifications. See I2C configuration to meet timing requirements for Fm and Fm+ modes for more information.

48.3.2.2 Reading and writing I3C messages using the normal methods (SDR and HDR-DDR)

The normal method for I3C is the same as the method for I2C with a few differences:

1. Set up interrupts using the following fields of Controller Interrupt Set (MINTSET):
   - MCTRLDONE: Indicates when the I3C module completes an MCTRL request.
   - COMPLETE: Indicates when data is finished sending or being received.
   - RXPEND: Used for read operations. Works with Controller Data Control (MDATACTRL) to set the FIFO trigger. You can also use it to allow DMA to read out bytes.
   - TXNOTFULL: Used for write operations. Works with Controller Data Control (MDATACTRL) to set the FIFO trigger. You can also use it to allow DMA to supply bytes.
   - IBIWON: Indicates that an IBI, CR, or HJ has won the arbitration on a header address.
   - Additionally, Controller Errors and Warnings (MERRWARN) indicates the causes of errors and warnings.
2. Set up Controller Control (MCTRL).
   - Option 1: Configure the following fields of Controller Control (MCTRL) simultaneously in this way:
     a. Write 1 to REQUEST (EmitStartAddr).
     b. Write 0 to TYPE for I3C Single Data Rate (SDR) mode or write 2 for Double Data Rate (DDR) mode.
     c. Configure IBIRESP to respond to IBIs in your chosen manner.
     d. Write 1 to DIR for read, or write 0 for write.
     e. Write the dynamic address of the I3C target to ADDR.
     f. For read operations, you can configure RDTERM to the maximum length to terminate automatically.
     g. For write operations, prewriting the data (MWDATAB or MWDATAH) is preferred to ensure that there are no time delays waiting for the data.

        For DMA with MCTRL, use either Controller Write Byte Data 1 (to Bus) (MWDATAB1) or Controller Write Halfword Data (to Bus) (MWDATAH1).

     NOTE

     HDR-DDR mode requires writing an 8-bit command value for read or write. This value must be written into the TX FIFO via Controller Write Data Byte (MWDATAB). The END field is not used for this byte.

   - Option 2: This option is preferred when stopped (bus free condition) in SDR mode, and not in HDR-DDR mode. It allows any target to issue an IBI and avoids collisions with an IBI address. Also, it is faster (when the MSB of the dynamic address is always 0).

     Configure the following fields of Controller Control (MCTRL) in this way:
     a. Write 1 to REQUEST (EmitStartAddr). No prewritten transmit data can be in the FIFO.
     b. Write 0 to TYPE (I3C).
     c. Configure IBIRESP to respond to IBIs in your chosen manner.
     d. Write 0 to DIR.
     e. Write 7Eh to ADDR.
     f. Wait for MCTRLDONE (via interrupt, for example), then proceed as in option 1. The option 2 method has advantages for IBIs when 7Eh is sent on START (but not on Repeated START conditions).
3. Write or read the data.
   - For write operations, write to MWDATAB for each byte before the last byte, and then write to Controller Write Data Byte End (MWDATABE) for the last byte. For HDR-DDR, the byte with END must be even (second, fourth, sixth, and so on) because DDR uses byte pairs:

— You can perform or start this operation before step 1 (REQUEST = 1) of the option 1 method, but not before the option 2 method.

— If there is more data than the FIFO can hold, use the TXNOTFULL interrupt based on the trigger level. This interrupt allows the application to provide more data or to use DMA.

- For read operations, wait for RXPEND, and then read out data via Controller Read Data Byte (MRDATAB) or Controller Read Data Halfword (MRDATAH). DMA may also be used. When using DMA, read using the same registers.

4. After message transfer is complete (MSTATUS[COMPLETE] = 1), the message may be ended with STOP (or EXIT in HDR mode). Alternatively, a new message may be started with a Repeated START (or HDR-Restart in HDR mode):
   - In SDR mode, write 2 to MCTRL[REQUEST] (EmitStop to STOP). Then wait for the MCTRLDONE status to be asserted for its completion.
   - For HDR mode, write 6 to MCTRL[REQUEST] (ForceExit) to end HDR mode. Then wait for the MCTRLDONE status to be asserted for its completion. When sending the HDR exit pattern, MCONFIG[ODSTOP] must be 0.
   - Write 1 to MCTRL[REQUEST] (EmitStartAddr to start another message). IBI is not possible in this case.

48.3.2.3 Determining bus types and modes

The settings of MCTRL[TYPE] and MCTRL[REQUEST] determine bus types and modes.

Table 487. Determining bus types and modes

Value of MCTRL[TYPE]	Meaning when MCTRL[REQUEST] = 1 (EmitStartAddr)	Meaning when MCTRL[REQUEST] = 2 (EmitStop)	Meaning when MCTRL[REQUEST] = 6 (ForceExit)
0	SDR mode of I3C	SDR mode of I3C	Exit pattern
1	Standard I2C protocol	Standard I2C protocol	Reserved
2	The bus enters DDR mode (7E and then ENTHDR0), if the module is not in DDR mode already. The first byte written to the transmit FIFO must be a command and already in the FIFO. To end DDR mode, use ForceExit.	Reserved	Target reset
3	If not already in HDR-BT, the bus automatically enters BT mode (7E and then ENTHDR3). You must also configure the MHDRBTCFG register for multilane and CMD rules.	Reserved	Reserved

Table 488. Deriving the dynamic address

Value of MCTRL[TYPE]	Meaning when MCTRL[REQUEST] = 4 (ProcessDAA)
0	The dynamic address is derived from MWDATAB[VALUE]; in case of a NACK, ProcessDAA continues to the next 7E/R request.
1	Reserved
2	The dynamic address is derived from MWDATAB[VALUE]; in case of a NACK, a STOP condition is sent after the assignment.
3	Reserved

48.3.2.4 Sending a CCC to I3C targets

The normal common command code (CCC) method uses an I3C write operation with an address of 7Eh (the CCC is the first byte):

- For broadcast type, any remaining bytes are sent with the CCC. This operation ends with a STOP or a Repeated START and 7Eh.
- For direct type, only the CCC byte is sent (or by a CCC and a defining byte, if required by the CCC).

  These bytes are followed by a Repeated START and the address of the I3C target (for SETDASA, this address is its I2C static address). This sequence may be repeated with more Repeated START conditions and addresses until done. It may end in STOP or a Repeated START and 7Eh. After the Repeated START and target address, the values are read or written depending on the CCC.
- I3C provides interrupts (by hardware) for unhandled and handled CCC when received by the target. Its state is reflected in Target Status (SSTATUS).

I3C controllers require to emit a single START, 7E/W sequence with both SCL high and SCL low half periods at full open-drain timing (for example, 200 ns). This sequence allows I3C targets acting as I2C legacy devices to turn off their I2C 50-ns spike filters, if they have them.

NOTE

START, 7E/W is a notation indicating a START command, followed by the 7Eh broadcast address and then by a write command.

After that sequence, addresses following START may be sent with Open-Drain Low (for example, 200 ns) but high of Push-Pull timing (for example, 40 ns). The I3C controller must emit this START, 7E/W sequence with MCONFIG[ODHPP] = 0. ODHPP is Open-Drain High period at Push-Pull speeds, and MCONFIG[ODHPP] is usually 1.

NOTE

- MCONFIG[ODHPP] is ignored when sending a message to an I2C legacy device on an I3C bus.
- Each Repeated START is a new EmitStart request. This request can be chained by an interrupt or pushed by a message model using DMA.

48.3.2.5 IBI handling

An IBI occurs when a target sends its address after a START, and that address is numerically the lowest. That is, it is lower than the address sent by the controller and addresses sent by any other targets. When the controller sends 7Eh, the controller always loses the arbitration.

The IBI can occur unexpectedly when any new START (not a Repeated START) is sent. The IBI can also occur in response to a target pulling SDA low. This condition can occur in one of these ways:

- The controller has set the request to AutoIBI mode, so the IBI occurs automatically. The controller sends 7Eh to allow the target to win the arbitration.
- The application receives the SLVSTART (target START request) interrupt, so it sends 7Eh.

The IBI response is configured by MCTRL[IBIRESP], which can be set to:

- NACK (always reject the IBI).
- ACK (always accept the IBI):
  - You must configure Controller In-band Interrupt Registry and Rules (MIBIRULES) so that the engine knows whether IBI bytes follow.
  - If IBI bytes follow (also known as IBI mandatory byte), then the COMPLETE field does not become 1 when IBIWON becomes 1. RXPEND becomes 1 for one or more bytes in the receive FIFO. When the last byte is received, then the COMPLETE field becomes 1. The controller automatically stops IBI data after 9 bytes (including the mandatory data byte). MCTRL[RDTERM] can be used with MCTRL[REQUEST] = 0 to end the process of receiving data sooner. I3C

supports address ACK to mandatory byte transition during IBI from Open_Drain (controller acknowledges the target address) to Push Pull (target sends SDR data).

— I3C target supports up to 7 bytes (maximum limit is defined by IBIEXT1[MAX]) of extended IBI data following a mandatory data byte. Extended data to send, if any, is present in Extended IBI Data 1 (IBIEXT1) and Extended IBI Data 2 (IBIEXT2).

- Manual (allow the decision to be made by the application on a case-by-case basis):
  — The application rewrites it when stopped, pending an IBI.
  — The application can ACK or NACK the IBI based on the IBI address defined in MSTATUS.
  — This mode selects whether there is an IBI byte when accepting the IBI request from targets.

Accurate timestamping of I3C target data is supported in I3C though Async mode 0. In I3C Asynchronous Timing Control mode, a target device timestamp event occurs within that target. The target notifies the controller about the event by generating an IBI.

48.3.2.6 Assigning dynamic addresses to I3C devices

If dynamic addresses (DAs) are all assigned below 40h (7-bit values from 3Fh down to 03h, except where not allowed), then MIBIRULES[MSB0] can be 1. This setting optimizes the START timing. When dynamic addresses are assigned, you must program Controller In-band Interrupt Registry and Rules (MIBIRULES) based on which I3C target uses IBI bytes (present in SIDEXT[BCR]).

Any SETDASA assignments can be performed via the normal CCC model. These assignments cannot be performed when using the static address for the directed part.

There is a built-in mechanism to process ENTDAA mode:

1. Set up interrupts using the following fields of Controller Interrupt Set (MINTSET):
   - MCTRLDONE: Indicates when a target has sent its ID and BCR or DCR, and a new DA is needed.
   - COMPLETE: Indicates when DAA is done (NACKed by all targets).
   - RXPEND: Indicates the reading of the IDs of the targets. You can also use this field to allow DMA to read out bytes.
   - IBIWON: Indicates when an IBI has occurred (normally there are no IBI conditions when assigning dynamic addresses to the I3C device).
   - Additionally, Controller Errors and Warnings (MERRWARN) indicates the causes of errors and warnings.
2. Configure Controller Control (MCTRL):
   a. Write 4 to MCTRL[REQUEST] (ProcessDAA).
   b. Set MCTRL[IBIRESP] to IBI response, if possible. If not possible, set to the first target assignment.
3. Wait for the MCTRLDONE interrupt when reading ID using the RXPEND interrupt. If MSTATUS[STATE] = 5 (DAA mode) and MSTATUS[BETWEEN] = 1, it is waiting to write a dynamic address:
   a. Write the dynamic address into Controller Write Data Byte (MWDATAB) using bits 6:0, such as 14h for DA = 7'h14.
   b. Write 4 to MSTATUS[STATE] (ProcessDAA again). This option writes the DA, then moves to the next DA.
   c. If MSTATUS[COMPLETE] = 1 and MSTATUS[STATE] = 0, then all targets are assigned.
   d. If MSTATUS indicates NACK after writing a new DA, the DA is not accepted by the target. The next step is to write 2 to MCTRL[REQUEST] (EmitStop) and start over. It is also acceptable to write 4 to MCTRL[REQUEST] (ProcessDAA again).

48.3.2.7 Using Controller Message mode

Controller Message mode is intended for use with DMA although Message mode can also be used by the processor. In Message mode, all writes are to the same location, including control and data. Reads occur from an associated location.

NOTE

The data writes for Message mode work in the same way as the halfword access registers, Controller Write Data Halfword (MWDATAH) and Controller Read Data Halfword (MRDATAH).

To send a message via Single Data Rate (SDR), follow these steps (from DMA or processor):

1. Write the control request to Controller Write Message Control in SDR mode (MWMSG_SDR_CONTROL). This request includes the following items:
   - The address.
   - I2C or I3C.
   - Read or write.
   - The count of bytes to process.
   - How to end (on STOP or ready for Repeated START).
2. Process the data:
   - For write operations, write the rest of the data to Controller Write Message Data in SDR mode (MWMSG_SDR_DATA). Use the DMA trigger (or interrupt) to keep the transmit FIFO full, and the controller stops using the data when it has already consumed the number of bytes configured in the LEN field.
   - For read operations, a DMA trigger (or interrupt) indicates when the RX FIFO is ready to be read out via Controller Read Message in SDR mode (MRMSG_SDR).
3. Select the in-band interrupt (IBI) behavior in MCTRL[IBIRESP].
4. Use END type STOP (MCTRL[REQUEST] = 2) with a zero-length message or by using Controller Control (MCTRL). To exit Message mode with the original message, use END type STOP (MCTRL[REQUEST] = 2) with a zero-length message or by using the MCTRL register.

To send a message via Double Data Rate (DDR), follow these steps (from DMA or processor):

1. Write the control request to Controller Write Message in DDR mode: First Control Word (MWMSG_DDR_CONTROL). This request includes:
   - The count of byte pairs.
   - How to end the message (through HDR exit or to wait for HDR restart).
2. Write the second control data to MWMSG_DDR_CONTROL. This second write includes:
   - The address.
   - Read or write.
   - The 7-bit command value.
3. Process the data:
   - For write operations, write the rest of the data to MWMSG_DDR_DATA. Use the DMA trigger (or interrupt) to keep the transmit FIFO full, and the controller stops using the data when the program count MWMSG_DDR_CONTROL register reaches 0.
   - For read operations, a DMA trigger (or interrupt) indicates when the receive FIFO is ready to be read out.
4. Select in-band interrupt (IBI) behavior in MCTRL[IBIRESP].
5. Use END type exit (MCTRL[REQUEST] = 6) with a zero-length message or by using the MCTRL register to exit DDR Message mode with the original message.

48.3.2.8 Handing off controllership to another target and getting it back

To hand off controllership, the controller can perform either of the following actions:

- Wait for a controller request (CR) (that is, MSTATUS[IBIWON] = 1 interrupt), indicating that the CR is using MSTATUS[IBITYPE].
- Push the request manually.

In either case, the controller sends a GETACCMST request, which is a directed GET informing the target that it is being assigned controllership. If the target accepts this request, it returns its dynamic address in bits 7:1 and the negative parity of its dynamic address in bit 0. A STOP must be issued, and MCONFIG[MSTENA] must be set to 2 (switching to Target mode).

To gain controllership, the target sends a CR using Target Control (SCTRL):

- If MCONFIG[MSTENA] is 2, the GETACCCR CCC is ACKed.
- If MCONFIG[MSTENA] is not 2, the GETACCCR CCC is NACKed.

After controllership is granted, MSTATUS[NOWMASTER] becomes 1. The application must enable MINTSET[NOWMASTER], so the application is interrupted when a controllership transfer occurs.

48.3.2.9 Controller engine flow diagram

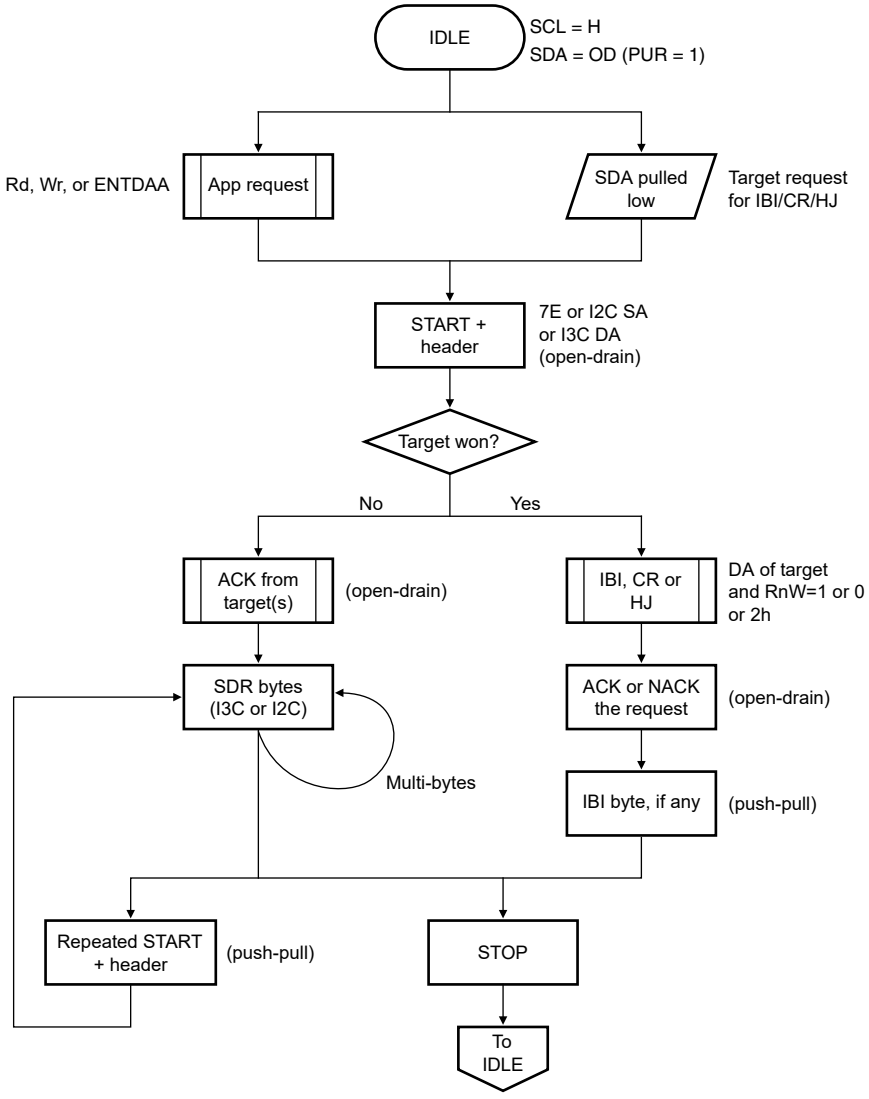

Figure 252. Controller engine flow diagram for SDR (HDR flow progresses from SDR bytes)

48.3.2.10 Target receives data from controller

When the address match is valid for the target dynamic address and the type is W (write from controller), the target ACKs the address. It does so unless some condition prevents it, such as a full buffer. On ACK, the Write state is entered. Once ACKed, it waits for each complete data byte. This process occurs in two steps:

1. Eight bits are clocked in and stored in the next buffer location when in the Write state.
2. On the ninth bit:
    - In I3C mode, the W9TH state (in I3C, the ninth data bit written by the controller is the parity of the preceding eight data bits) is used and the parity is checked. The buffer is marked as complete with or without a parity error.
    - In I2C mode, the W9TH state (in I2C, the ninth data bit written by the controller is an ACK by the target) is used and the data is ACKed and stored.

When the address match is valid for the 7Eh broadcast address, the target acknowledges it. After first data completion, it sets the in_ccc broadcast or direct flag (based on bit 7 of the command). If recognized, it parses the command, setting that bit as well. The recognized commands are for dynamic address work and modes. The CCC and DAA blocks handle the workload afterward. If not supported, then the commands are passed up to the system.

48.3.2.11 Target sends data to controller

When the address match is valid for the target dynamic address, and the type is R (read by controller), the target ACKs the address. The target does so unless there is no data waiting for the read. On ACK, the Read state is entered.

After being ACKed, it emits the data byte at a time, with the ninth bit using the R9TH state. In I2C, the ninth data bit from target to controller is an ACK by the controller. In I3C, this bit allows the target to end a read, and allows the controller to abort a read:

- In I3C mode, the T bit is emitted to allow the device to indicate whether this byte is the last. If it is not the last byte, the controller may terminate the read via the T bit.
- In I2C mode, the ninth bit allows the controller to terminate via NACK, or else it allows the read to continue via ACK. On completion of each byte read, the "done" signal is pulsed to get the next byte.

If the read is terminated by the controller unexpectedly (abort in I3C, NACK before END marked), the application is notified.

48.3.3 Clocking

The controller works on the following primary clocks:

- The system clock, which controls access to the memory-mapped registers.
- A functional clock (FCLK), which is used to generate the SCL clock rate on the I2C or I3C bus.

I3C supports adjusting clock frequency and accuracy via Target Time Control Clock (STCCLOCK).

FCLK is used to check conditions such as bus availability, bus free for IBI, or HJ:

- To determine the Bus Available condition for IBI, the target needs a clock to generate the ~1 µs timing. To support this requirement, a slow clock (CLK_SLOW) is provided to save on power.
- I3C supports a counter field, SCONFIG[BAMATCH], to calculate the Bus Available condition. BAMATCH provides the count of the slow clock . This field counts 1 µs or more to allow an IBI to drive SDA low when the controller is free. The I3C module controls the maximum width and maximum values.

I3C supports a timeout when stalled for too long in a frame. This timeout occurs when:

- The transmit FIFO or receive FIFO is not handled and the bus is stuck in the middle of a message.
- No STOP is issued and the bus is between messages.
- IBI manual is used and no decision is made.

48.3.4 Reset

- Global or system reset fed into the module: Everything is reset by this global or system reset. Release is assumed to be synchronized with the system clock. It is not synchronized with SCL or SDA. These signals must not be active when the reset is released; otherwise, I3C enters Hot-Join mode and remains inactive.
- Software reset (see Self Reset (SELFRESET) for details)

48.3.4.1 Target reset and RSTACT CCC

The target reset mechanism is designed to allow an always-on tiny block to monitor SDA and SCL for a specific pattern based on HDR exit, extended with Repeated START and STOP at the end. You can use this detector to wake or reset the device or just a peripheral, as well as do nothing for any specific reset. The normal use is that the controller emits a RSTACT CCC message requiring not to reset when this pattern is emitted just after; broken devices are reset (because they miss the CCC) and devices in deepest sleep state (for example, an unpowered core domain) wake state (because they also miss the CCC).

The first default action is only to reset the peripheral. If that does not work, the chip or system is reset the next time.

The controller may also request a specific action, which the target can dial in if it supports that (for example, reset the peripheral only).

The target reset is connected to the system as shown in Figure 253. It is outside the I3C peripheral and may be in an always-on domain. Table 489 shows the common connections (sleep and wake signals are not shown).

Table 489. Target resets

Reset detector	Connect to system	Notes
I3c_slave_active	If I3C can be unused	Connect to enable if can be unused — should probably not clear for safety reasons.
iRstAction[3:0]	—	Result of RSTACT CCC
oRstRstAction	—	Clear the RSACT state
oResetBlock	—	Triggers IRQ in the module
oRstAll	System reset	Should perform in the same way as pin RST*n*
oRstCustom	Custom reset if enabled	Must be setup via RSTACT_CONFIG[2]

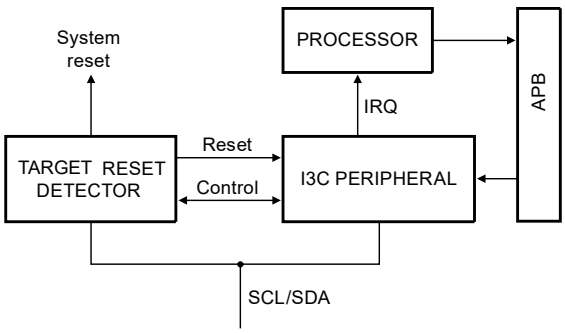

Figure 253. Target reset detector connected in the system (target reset may be in Always-On domain)

Figure 254 shows the connections of the target reset detector, including support for deepest sleep and wake. If those are not used, they are just not connected. If the I3C peripheral may be powered off when the reset detector is powered, the isolation cells are used to protect it, although the nets are logically gated off when iDeepestSleep is 1.

Note that the block wants the SCL and SDA signals to be fed as clocks. This is done outside the block, using any method needed. Three domains are needed to support the reset.

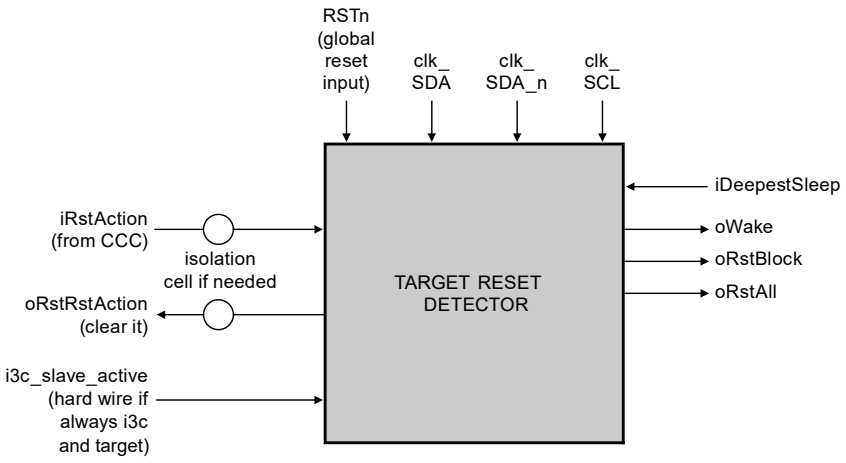

Figure 254. Showing reset detector connections — not all used in many systems

The i3c_slave_active signal must be used with caution, as it disables the reset detector when 0; it must be strapped 1 if always i3c and target, or must be safely controlled (otherwise, it may defeat the purpose of the target reset block). If the i3c peripheral is optional, then it must be selected by some system control feature (that must be what controls i3c_slave_active).

The block is connected to the I3C peripheral through the iRstAction and oRstRsttAction ports. These are clamped off if iDeepestSleep signal is 1; if that kind of sleep is not possible, the iDeepestSleep port must be strapped 0. The two nets can be treated as asynchronous even though from the same SCL. This is to avoid having to perform setup or hold timing between the modules when the reset detector is in a separate domain. That is, clk_SCL and clk_SDA_n are not intended to be treated as the same clocks as used in the peripheral. This allows freedom in placement of the detector.

Finally, the reset and wake signals are connected to the system; they are 0 when inactive, 1 when actively driven. There are clearing events used to clear: RstAll waits for the Reset input to assert (or i3c_active to go to 0); RstBlock waits for the I3C peripheral to clear its cause register or to see a RSTACT or GETSTATUS. Wake clears on release of iDeepestSleep.

48.3.5 Interrupts

This section describes all the interrupts (IRQs) that this module generates. All status interrupts are updated in Controller Status (MSTATUS) and Target Status (SSTATUS).

Supported interrupts occur:

- For pending IBI, CR, or Hot-Join that have been sent by a target.
- When a CCC is received and is handled by the module (SSTATUS[CHANDLED]).
- When an error or warning has occurred, such as data underrun, data overrun, parity error, HDR-DDR, or CRC error.
- When a CCC is received that is unhandled by I3C. CCC Mask for Unhandled CCCs (SCCCMASK) allows you to suppress any CCC which is intended to be unhandled.

A wake-up interrupt is also available to bring the I3C module out of low power mode. See I3C from low power mode and wake-up .

48.4 External signals

Table 490. External signals

Signal	Description	Direction
SCL	Serial clock	Input or output
SDA	Serial data	Input or output
PUR	Pull up resistance. There is an internal pullup resistance on SDA, which the I3C controls. If the internal pullup is not enough, PUR can control an external pullup resistance on SDA actively. See the chip-specific I3C information on whether this external pullup is available on your chip.	Output

48.5 Initialization

48.5.1 Controller configuration

Certain configuration is performed when initializing this module. Controller Configuration (MCONFIG) controls the frequencies, duty cycle, optimizations for performance, and other parameters.

Table 491. Configuration for module initialization

Configuration parameter		Description
MSTENA	Controller enable	Determines whether the peripheral starts in Controller mode (main controller in I3C terms) or starts in Target mode (and switches to Controller mode later).
HKEEP	High-Keeper	Determines how the high-keeper (weak pullup) is implemented, depending on the device capabilities.
PPBAUD	Push-Pull baud	Sets the push-pull frequency as a divider from the FCLK (alternative clock fed to the peripheral). This frequency sets the SCL half-clock period baseline (used at least for the high time of SCL). The formula for SCL in Push-Pull mode using PPBAUD and PPLOW is: SCL frequency (in MHz) = FCLK ÷ ((2 + 2 × PPBAUD) + PPLOW) If PPLOW is 0, then SCL high = SCL low (in ns) = (1 + PPBAUD) × 1000 ÷ FCLK (in MHz) Examples: • If FCLK = 24 MHz, then PPBAUD = 0 yields 12 MHz (42.67 ns per half period) • If FCLK = 50 MHz, then PPBAUD = 1 yields 12.5 MHz (20 + 20 = 40 ns per half period)
PPLOW	Push-Pull low	Changes the duty cycle for Push-Pull. It indicates how many more FCLK cycles to use for low. The formula for SCL in Push-Pull mode using PPBAUD and PPLOW is: SCL frequency (in MHz) = FCLK ÷ ((2 + 2 × PPBAUD) + PPLOW) If PPLOW is a nonzero value, then: • SCL high (in ns) = (1 + PPBAUD) × 1000 ÷ FCLK (in MHz) • SCL low (in ns) = (1 + PPBAUD + PPLOW) × 1000 ÷ FCLK (in MHz) For example, when FCLK is 50 MHz, PPBAUD is 1, and PPLOW is 1, then the periods are:

Table continues on the next page...

Table 491. Configuration for module initialization (continued)

Configuration parameter		Description
		• (1 + 1) × 1000 ÷ 50 = 20 + 20 = 40 ns high • (1 + 1 + 1) × 1000 ÷ 50 = 20 + 20 + 20 = 60 ns low This timing is equivalent to 10 MHz SCL, but this timing maintains the 40 ns high needed; therefore, I2C devices do not see the high periods. **NOTE** The PPLOW value does not have any impact on Open-Drain mode and I2C mode SCL rate calculations.
ODBAUD	Open-Drain baud	Determines the number of PPBAUD periods to make up one I3C Open-Drain half-clock baseline. If ODHPP is 0, the ODBAUD half-clock time period = (ODBAUD + 1) × PPBAUD high period. If ODHPP is 0, the formula for SCL in Open-Drain mode is: SCL (in MHz) = FCLK ÷ (2 + 2 × PPBAUD) × (ODBAUD + 1) Target to get open-drain half-clock period is 200 ns. For example: • If PPBAUD yields 12.5 MHz (40 ns per PPBAUD period), then ODBAUD = 4 can be used to get 200 ns. See ODHPP for details on short high and long low. • If PPBAUD = 1, FCLK = 50 MHz, and ODBAUD = 4, then open-drain SCL = 50 ÷ (2 + 2 × 1) × 5 = 2.5 MHz.
ODHPP	Open-Drain High Push-Pull	Optional field that allows the I3C open drain to be long low and short high. The high period of SCL is the PPBAUD period. This period leaves enough time for the pullup resistor to pull the SDA high when SCL is low. It is also quick when SCL is high and there are no changes happening. ODBAUD low half-clock time period = (ODBAUD + 1) × PPBAUD high period. ODBAUD high half-clock time period = PPBAUD high period If ODHPP is 1, the formula for SCL in Open-Drain mode is: SCL (in MHz) = FCLK ÷ (1 + PPBAUD) × (ODBAUD + 1) + (1 + PBAUD) For example: • If PPBAUD produces 12.5 MHz (40 ns per PPBAUD period), then ODBAUD = 4 and ODHPP = 1. These settings provide a high period of 40 ns and a low period of 200 ns. • If PPBAUD = 1, FCLK = 50 MHz, and ODBAUD = 4, then open-drain SCL = 50 ÷ (1 + 1) × 5 + (1 + 1) = 4.16 MHz.
I2CBAUD	I2C Baud	Indicates the number of ODBAUD periods that are required to communicate with I2C devices (MCTRL[TYPE] = 2 or MWMSG_SDR_CONTROL[I2C] = 1). For example, if ODBAUD gives 200 ns, and the goal is Fm+ (Fast Mode, 1 MHz), then the sum must be 1 µs. I2CBAUD acts differently for odd and even values. For example:

Table continues on the next page...

Table 491. Configuration for module initialization (continued)

Configuration parameter		Description
		• If I2CBAUD = 3, it gives three ODBAUD periods low and two ODBAUD periods high. • If I2CBAUD = 4, it gives three ODBAUD periods for low and three ODBAUD periods for high. • Also, if I2CBAUD = 3, this yields 200 × 3 = 600 ns and 200 × 2 = 400 ns, with the sum 600 + 400 = 1000 ns = 1 µs.
SKEW	Skew	The normal SDA skew from SCL is handled by using the time for the SCL to reach its pad and return. This time is normally 2 ns to 5 ns (or sometimes more). If the skew is too fast, then add more delay. The skew allows specifying the number of FCLK to insert.

Additional optimizations:

- Use MIBIRULES[MSB0] to obtain faster start header times. If the controller application assigns all I3C dynamic addresses to be less than 40h (it does not have MSB set), you can write 1 to MIBIRULES[MSB0]. When the controller emits 7Eh (broadcast) and a target does not drive the first bit low, the rest of the header can be at push-pull speeds. This speed is two times faster or more, depending on optimizations.
- Auto-emit 7Eh speeds up the frame when used with MIBIRULES[MSB0]. It allows the processor to sleep when the frame starts automatically (in response to a target).

48.5.2 Interrupt service flow

Set up interrupts for Controller Status (MSTATUS) in Controller Interrupt Set (MINTSET).

Set up interrupts for Target Status (SSTATUS) in Target Interrupt Set (SINTSET).

48.6 Application information

48.6.1 I2C configuration to meet timing requirements for Fm and Fm+ modes

I2C Fm and I2C Fm+ modes are supported according to the I3C standard specifications.

Table 492 shows the configuration for Fm mode, where frequency is close to 400 kHz but timing requirement is not met (T_{SU_STA} is not met) because the actual value is 600 ns. Rest of the requirements are met per the I2C specifications in the chip data sheet.

Table 493 shows the configuration for Fm mode, where all timing requirements are met.

Table 492. Configuration for Fm mode with not all timing requirements met

FCLK	PPBAUD	ODBAUD	I2CBAUD	SCL frequency	Timing requirement status
24 MHz	0	4	11	370 kHz	T_{SU_STA} - 353 ns
133/134 MHz	5	4	11/12	412 kHz / 382 kHz	T_{SU_STA} - 267 ns and T_{SU_STO} - 529 ns

Table 493. Configuration for Fm mode with all timing requirements met

FCLK	PPBAUD	ODBAUD	I2CBAUD	SCL frequency	Timing requirement status
24 MHz	1	2	9	363 kHz	All requirements met per the I2C specifications in the chip data sheet
133/134 MHz	11	2	9/8	338 kHz / 372 kHz	All requirements met per the I2C specifications in the chip data sheet

Table 494 shows the configuration for Fm+ mode, where the frequency is close to 1 MHz. In this case, the T_{SU_STA} timing requirement is not met because the actual value is 260 ns. Rest of the requirements are met per the I2C specifications in the chip data sheet.

Table 495 shows the configuration for Fm+ mode, where all timing requirements are met. To meet all the timing specifications, frequency may differ from 1 MHz. Use the configurations listed in Table 495.

Table 494. Configuration for Fm+ mode with not all timing requirements met

FCLK	PPBAUD	ODBAUD	I2CBAUD	SCL frequency	Timing requirement status
24 MHz	0	4	3	960 kHz	T_{SU_STA} - 228 ns
133/134 MHz	4	4	3	1.087 MHz	T_{SU_STA} - 156 ns

Table 495. Configuration for Fm+ mode with all timing requirements met

FCLK	PPBAUD	ODBAUD	I2CBAUD	SCL frequency	Timing requirement status
24 MHz	0	3	6	749 kHz	All requirements met per the I2C specifications in the chip data sheet
133/134 MHz	4	3	6	839 kHz	All requirements met per the I2C specifications in the chip data sheet

NOTE

The controller module provides an option to slow down the clock for standard speed mode to support legacy I2C standard targets as well (although this option may not necessarily meet the exact timing requirement of the standard mode according to the standard I2C timing specification).

For the timing requirements under consideration, see the "I3C timing requirements when communicating with I2C legacy devices" table in the MIPI I3C v1.1.1 specification available on www.mipi.org.

48.7 I3C register descriptions

Writing to a read-only (RO) register, except to Controller Interrupt Mask (MINTMASKED), causes bus errors. This module does not verify whether programmed values in the registers are correct. You must ensure that valid programmed values are written.

However, the peripheral ignores writes to RO registers and returns 0 for reads from WO or nonexistent registers. It requires all 32-bit registers to be read and written as 32-bit and aligned to 32 bits. The peripheral uses the advanced peripheral bus (APB: AMBA 3 APB Protocol Specification v1.0); therefore, the peripheral does not know whether partial read or write operations (less than 32 bits) are used.

Fields

Field	Description
31-28 I2CBAUD	I2C Baud Rate Specifies the I2C low and high times in ODBAUD counts. See I2CBAUD in Controller configuration.
27-25 SKEW	Skew Specifies the number of FCLK counts for an SDA change after SCL for I3C push-pull. This skew is in addition to the roundtrip of the SCL line from the pad back to the module (6 ns or more): • SKEW is normally not needed, so assign SKEW = 0. • SKEW is only used if SDA is not naturally skewing from an SCL change. • I2C automatically skews SDA (but not PUR) to match I2C rules. Use the following values: • In I2C Controller mode (MCONFIG[MSTENA] = 11b) — SKEW > 0 when clock stretching feature is not required. — SKEW = 0 when clock stretching feature is required. • In I3C Controller mode, use SKEW = 0.
24	Open-drain High Push-Pull

Table continues on the next page...

Table continued from the previous page...

Field	Description
ODHPP	Enables ODHPP. If you write 0 to this field, open-drain SCL high half-clock period is the same as the open-drain low SCL half period. If you write 1 to this field, open-drain high SCL half-lock period is one PPBAUD count for I3C messages. This setting is faster and works for I3C devices. Any legacy I2C devices on the bus do not see the SCL high level at all (less than the spike filter period). For open-drain timing, check upon the first 7Eh broadcast allowing I3C peripherals acting as I2C legacy devices to turn off their I2C 50-ns spike filters. See Sending a CCC to I3C targets for more information. 0 - Disable 1 - Enable
23-16 ODBAUD	Open-drain Baud Rate Specifies the open-drain baud rate. ODBAUD is configured in terms of number of PPBAUD counts - 1. This field must not be 0; this setting is not the same as push-pull. See Controller configuration for more information. The open-drain baud rate is usually 200 ns (see I2CBAUD for I2C counts). When used with MCONFIG[ODHPP], this setting produces 250 ns per clock in I3C. In this case, if MCONFIG[PPBAUD] provides 12 MHz, then one PPBAUD count is half of 12 MHz, or 41.67 ns. To obtain a rate around 200 ns, use a value of 5 - 1 = 4 for ODBAUD.
15-12 PPLOW	Push-Pull Low Acts as an adder for push-pull low to create a duty cycle with a longer low period, with up to 15 more FCLK cycles low than high. PPLOW = 0 produces a 50/50 duty cycle.
11-8 PPBAUD	Push-Pull Baud Rate Specifies the push-pull baud rate. The number of FCLK counts makes each push-pull low and normally high period. PPBAUD = 0 when run at 1/2 input FCLK speed. For example, a 24 MHz FCLK produces a 12 MHz SCL because each FCLK is SCL low or SCL high. MCONFIG[PPLOW] has an effect on the duty cycle. For example, 24 MHz with 50/50 duty cycle is 12 MHz. However, when PPLOW adds three more low beats, the push-pull baud rate becomes 4.8 MHz (from 24 MHz or 5 beats).
7 —	Reserved
6 ODSTOP	Open-drain Stop Enables open-drain stop. If you write 0 to this field, open-drain stop is disabled. ODSTOP must be disabled when sending an HDR exit pattern. If you write 1 to this field, open-drain stop is enabled. STOP condition is emitted at open-drain speeds even for I3C messages. In legacy devices, this feature can ensure that the legacy devices see the STOP condition. 0 - Disable 1 - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
5-4 HKEEP	High-Keeper Indicates how High-Keeper is supported. If this field is 00b, use pull-up resistor (PUR). No separate pin_HK_SDA or pin_HK_SCL is used. Only pin_PUR_oena is used for SDA. The pin_SCL_oena pin is held high in this mode, SCL clock is push-pull, and pin_SCL_out toggles, which is the actual clock. If this field is 01b, High-Keeper controls are in place; pin_HK_SDA or pin_HK_SCL (High-Keeper) controls are used. SCL may use an HK or that signal (pin_HK_SCL) may only OR into pin_SCL_oena. The pin_HK_SDA pin is used as well for SDA high keeper, along with pin_PUR_oena. Use HKEEP = 10b or 11b for I2C modes. Use HKEEP = 00b or 01b for I3C modes. **NOTE** Your chip may not support any or all High-Keeper methods. You must check the availability of High-Keeper methods. 00 - None 01 - WIRED_IN 10 - PASSIVE_SDA (I2C mode, no clock stretches mode). SDA is open drain, and will be Hi-Z (high-impedance) for Bus Free (IDLE) and hold. The pin pin_HK_SDA is not used in this option, only a combination of SDA_oena and pin_PUR_oena are used. SCL is push-pull. The pin pin_HK_SCL is not used in this option, only pin_SCL_oena is used. Since the controller does not support multi-controller mode, there is no need to have open-drain SCL for I2C. For a single controller application, the controller's SCL output can be a push-pull driver design if there are no devices on the bus which would stretch the clock. 11 - PASSIVE_ON_SDA_SCL. For I2C clock stretching mode, where both SCL and SDA are open-drain. Open-Drain on both SDA and SCL, can Hi-Z (high-impedance) both for Bus Free (IDLE), and can Hi-Z SDA for hold. Does not support multi-controller mode, SCL open-drain is only to support clock stretching.
3 DISTO	Disable Timeout Disables the timeout that produces application errors. If the controller is left in a state other than Stopped for more than 100 µs (because 10 kHz is the slowest allowed I3C speed), the timeout sends a MERRWARN interrupt. To prevent the MERRWARN interrupt during development or testing, write 1 to DISTO to disable the timeout. In systems that support timeouts, timeout is disabled automatically during debug. To obtain a clock configuration with 100 µs timeout, see SCONFIG[BAMATCH]. 0 - Enabled 1 - Disabled
2 —	Reserved
1-0 MSTENA	Controller Enable Indicates whether the controller is enabled and the states it can use.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If this field is 0b, the controller is disabled. The module can only use Target mode. If this field is 1b, the controller is enabled. When used upon start-up, this module is the main controller by default. I3C controls the bus unless the controller is handed off. When this happens, MSTENA must become 2 so that it has the capability to become the controller again. Performing the handoff means emitting the GETACCMST CCC command. If the command is accepted, I3C emits a STOP condition and sets this field to 2 (or 0). If this field is 10b, I3C is controller-capable, but is operating as a target now. When used from the start, I3C starts as a target, but is prepared to switch to Controller mode. To switch to this mode, the target emits a controller request (CR) or receives a GETACCMST CCC command and accepts it (to switch on the STOP condition). Legacy I2C—if this field is 11b, I2C Controller mode uses an open-drain clock (to allow clock stretching) and relies on passive pull-up resistors (PURs) on both SCL and SDA. This mode uses only I2CBAUD. START requests can only be made for I2C type, and I3C requests are not accepted. If there are only I2C targets on the bus and no clock stretching, use type 1 instead. Type 1 has a push-pull SCL clock, which is faster and uses less power. 00 - CONTROLLER_OFF 01 - CONTROLLER_ON 10 - CONTROLLER_CAPABLE 11 - I2C_CONTROLLER_MODE

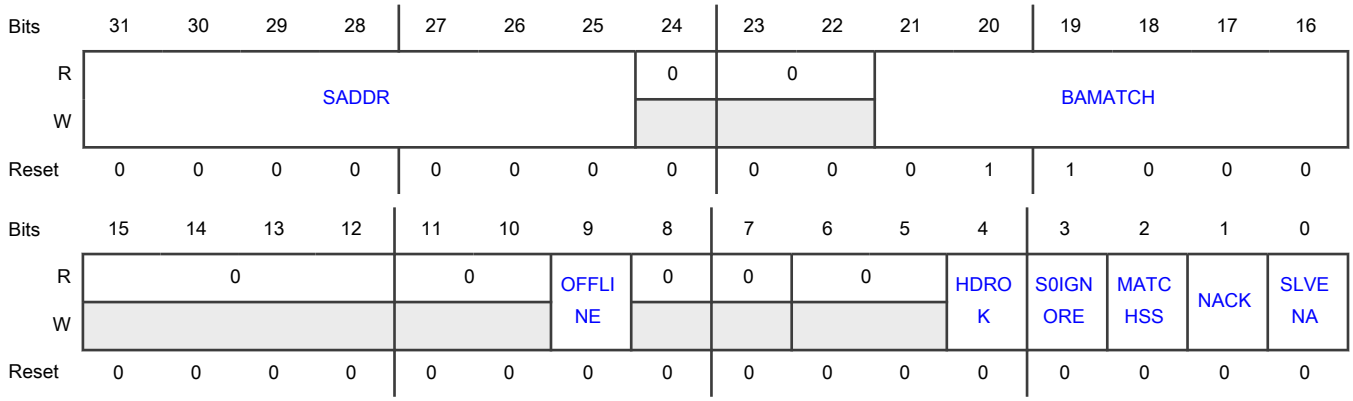
48.7.3 Target Configuration (SCONFIG)

Contains fields that must be configured before the module is activated.

Offset

Register	Offset
SCONFIG	4h

Diagram



Fields

Field	Description
31-25 SADDR	Static Address Sets the I2C 7-bit static address, which otherwise must be 0.
24 —	Reserved
23-22 —	Reserved
21-16 BAMATCH	Bus Available Match Specifies the bus available condition match value for the current slow clock. BAMATCH provides the count of the slow clock to count out 1 µs (or more). The BAMATCH should be set as (slowClk(MHz) - 1) to generate a 1 µs clock cycle. Use BAMATCH = 1 to generate 1 µs clock cycle if slow clock is 1 MHz. A value of 0 would not give a correct match indication. The default value applies to the default slow clock setting of the chip. If the I3C slow clock is updated to a new value, BAMATCH must be updated, too. When I3C operates in Controller mode, BAMATCH is used to generate a 1 µs clock cycle basic time to count 100 µs timeout. When I3C operates in Target mode, BAMATCH allows the IBI to drive SDA low when the controller is not doing so.
15-12 —	Reserved
11-10 —	Reserved
9 OFFLINE	Offline Enables wait to ensure that the bus is not in HDR mode. If this field is 1 when SCONFIG[SLVENA] is 1, then I3C waits for either 60 µs of bus quiet or an HDR exit pattern. This waiting ensures that the bus is not in HDR mode, and so can safely monitor the next activity in Single Data Rate (SDR) mode. 0 - Disable 1 - Enable
8 —	Reserved
7 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
6-5 —	Reserved
4 HDROK	HDR OK Enables HDR OK. If you write 1 to this field, it allows HDR-DDR and/or HDR-BT messaging, if available, by writing 1 to the corresponding SIDEXT[BCR] field to indicate HDR is available, and the corresponding GETCAPS field for DDR and/or BT bit permitting use. This is a deprecated field; use the SIDEXT[BCR] field instead. 0 - Disable HDR OK 1 - Enable HDR OK
3 S0IGNORE	Ignore TE0 or TE1 Errors Ignores TE0 or TE1 errors. If you write 1 to this field, the target does not detect TE0 or TE1 errors, so it does not lock up waiting on an exit pattern. You must not use this setting when the bus does not use HDR mode. 0 - Do not ignore TE0 or TE1 errors 1 - Ignore TE0 or TE1 errors
2 MATCHSS	Match Start or Stop Enables matched START, that is Repeated START, or STOP condition. If you write 1 to this field, SINTSET[START] and SINTSET[STOP] become 1 only when SSTATUS[MATCHED] is 1. This setting allows the START and STOP fields to be used to detect the end of a message to or from this target. **NOTE** SSTATUS[START] does not assert for START of transaction if SCONFIG[MATCHSS] = 1. SSTATUS[START] only asserts for Repeated Start within that transaction, because SSTATUS[START] only asserts after SSTATUS[MATCHED] occurs, which is after START of transaction. 0 - Disable 1 - Enable
1 NACK	Not Acknowledge Controls the ACK or NACK capability. If you write 1 to this field, the target rejects all requests, except for a CCC broadcast. NACK = 1 must be used with caution because the controller may decide that the target is missing, if NACK is overused. 0 - Always disable NACK mode 1 - Always enable NACK mode (works normally)
0 SLVENA	Target Enable Enables the target. If you write 0 to this field, the target ignores the I2C or I3C bus. If you write 1 to this field, the target can operate on the I2C or I3C bus.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	You must not write 1 to this field before registers such as Target Configuration (SCONFIG), Target ID Part Number (SIDPARTNO), Target ID Extension (SIDEXT), and others are configured because these registers affect the data to and from the controller. Target enable is configured just once before the bus comes up. If target enable is used at other times, SCAPABILITIES[IBI_MR_HJ] must be 1 before writing 1 to SLVENA so that the device does not see a START or STOP condition incorrectly. 0 - Disable 1 - Enable

48.7.4 Target Status (SSTATUS)

Indicates the sticky status for interrupts, states, and modes related to the I3C bus. Not all fields of the register are used if the module only acts as a target. The fields are divided into current activity, interrupt maskable actions, and then states and modes on the bus.

Offset

Register	Offset
SSTATUS	8h

Fields

Field	Description
31-30 TIMECTRL	Time Control Indicates whether time control is enabled, and in which mode. 00 - NO_TIME_CONTROL (no time control is enabled) 01 - SYNC_MODE (Synchronous mode is enabled)

Table continues on the next page...

Table continued from the previous page...

Field	Description
	10 - ASYNC_MODE (Asynchronous standard mode (0 or 1) is enabled) 11 - BOTHSYNCASYNC (both Synchronous and Asynchronous modes are enabled)
29-28 ACTSTATE	Activity State from Common Command Codes (CCC) Indicates the activity state from CCC. 00 - NO_LATENCY (normal bus operations) 01 - LATENCY_1MS (1 ms of latency) 10 - LATENCY_100MS (100 ms of latency) 11 - LATENCY_10S (10 seconds of latency)
27 HJDIS	Hot-Join Disabled Indicates whether hot-join is disabled. When hot-join is disabled, CTRL requests are not responded to. 0 - Enabled 1 - Disabled
26 —	Reserved
25 MRDIS	Controller Requests Disable Indicates whether controller requests are disabled. When controller requests are disabled, CTRL requests are not responded to. 0 - Enabled 1 - Disabled
24 IBIDIS	In-Band Interrupts Disable Indicates whether in-band interrupts are disabled. When in-band interrupts are disabled, CTRL requests are not responded to. 0 - Enabled 1 - Disabled
23-22 —	Reserved
21-20 EVDET	Event Details Indicates current details of the last (EVENT = 1) or pending event. 00 - NONE (no event or no pending event) 01 - NO_REQUEST (request is not sent yet; either there is no START condition yet, or is waiting for Bus-Available or Bus-Idle (HJ)) 10 - NACKed (not acknowledged, request sent and rejected); I3C tries again

Table continues on the next page...

Table continued from the previous page...

Field	Description
	11 - ACKed (acknowledged; request sent and accepted), so done (unless the time control data is still being sent)
19 SLVRST	Target Reset Flag Helps you perform follow-up tasks such as reinitialization (target reset to peripheral (not whole chip)).
18 EVENT	Event Flag Indicates, for a target, whether a pending in-band interrupt (IBI), controller request (CR), or hot-join (HJ) has been sent as requested. See the upper status register fields for details. This field becomes 1 only when acknowledged by a controller. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No event occurred 1 - IBI, CR, or HJ occurred When writing 0 - No effect 1 - Clear the flag
17 CHANDLED	Common Command Code Handled Flag Indicates whether an HDRMATCH CCC is being handled by I3C. This field is for notification only, but it may result in updates to this register. **NOTE** This field behaves differently for register reads and writes. When reading 0 - CCC handling not in progress 1 - CCC handling in progress When writing 0 - No effect 1 - Clear the flag
16 HDRMATCH	High Data Rate Command Match Flag Indicates whether the HDR command matched the I3C dynamic address of this device. The HDR command is available as the first byte, with RXPEND = 1. The MSB of the command byte indicates whether it is a read or a write command. If the HDR command is a read, and there are to-bus bytes waiting, then the command is ACKed and the data is sent back. Otherwise, the HDR command is NACKed.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE When this field is 1, you must check SSTATUS[ERRWARN] because the HPAR error may occur after signaling this HDR command. The parity occurs after the destination address and command. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Did not match 1 - Matched the I3C dynamic address When writing 0 - No effect 1 - Clear the flag
15 ERRWARN	Error Warning Indicates that an error or warning has occurred, such as data underrun, data overrun, parity error, HDR-DDR CRC error, or other error or warning condition (see Target Errors and Warnings (SERRWARN) for more information).
14 CCC	Common Command Code Flag Indicates whether a CCC has been received, and is not handled by I3C. There are two types of common command codes: • Broadcast CCC, which corresponds with RXPEND, and the first byte is the CCC (command). • Direct CCC, which may never be directed to this device. If the direct CCC is directed to this device, then TXSEND or RXPEND are triggered, and RXPEND contains the command. **NOTE** This field behaves differently for register reads and writes. When reading 0 - CCC not received 1 - CCC received When writing 0 - No effect 1 - Clear the flag
13 DACHG	Dynamic Address Change Flag Indicates an occurrence of dynamic address (DA) change. Actual DA can be seen in the DYNADDR register. If this field is 1, DA change is detected. The target DA has been assigned, reassigned, or reset (lost) and is now in the state of being valid or none.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This field is also used when the MAP auto feature is configured, changing one or more MAP items. See DYNADDR and MAPCTRL*n* for more information. DYNAADDR for the main DA (0) indicates whether the last change was because of Auto-MAP. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No DA change detected 1 - DA change detected When writing 0 - No effect 1 - Clear the flag
12 TXNOTFULL	Transmit Buffer Not Full Indicates that the transmit buffer is not full. If DMA is enabled for transmitting, then it is also signaled to provide more data. To-bus buffer or FIFO can accept more data to be transmitted. For all but external FIFOs, this process uses SDATACTRL[TXTRIG], which defaults to "not full". 0 - Transmit buffer full 1 - Transmit buffer not full
11 RX_PEND	Received Message Pending Indicates whether a received message is pending. The field indicates when a message from the controller that is not being handled by I3C (not a CCC message) is received. I3C processes such messages internally. For all but external FIFOs, this process uses SDATACTRL[RXTRIG], which defaults to "not empty". If DMA is enabled for receiving, then DMA is signaled as well. This field automatically becomes 0 if data is read (from FIFO and non-FIFO sources). 0 - No received message pending 1 - Received message pending
10 STOP	Stop Flag Indicates whether the Stopped state is detected. The STNOTSTOP state also indicates when the module is in Stop mode. A fast STOP and START combination may not trigger the Stop status. In that case, the Start status is always set. If this field is 1, it indicates that the Stop state was present on the bus since the bus was last cleared. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No Stopped state detected

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Stopped state detected When writing 0 - No effect 1 - Clear the flag
9 MATCHED	Matched Flag Indicates whether an incoming header matched the I3C dynamic or I2C static address (if any) of this device since the bus was last cleared. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Header not matched 1 - Header matched When writing 0 - No effect 1 - Clear the flag
8 START	Start Flag Indicates whether a START or Repeated START was detected after this flag was last cleared. This flag is not usually needed, but can be used for wake events. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not detected 1 - Detected When writing 0 - No effect 1 - Clear the flag
7 —	Reserved
6 STHDR	Status High Data Rate Indicates whether the I3C bus is in HDR-DDR mode, regardless of whether HDR mode is supported by this module, and regardless of whether the message is intended for this module or some other module. 0 - I3C bus not in HDR-DDR mode 1 - I3C bus in HDR-DDR mode

Table continues on the next page...

Table continued from the previous page...

Field	Description
5 STDAA	Status Dynamic Address Assignment Indicates whether the I3C bus is in Enter Dynamic Address Assignment (ENTDAA) mode, regardless of whether this bus target has a dynamic address. 0 - Not in ENTDAA mode 1 - In ENTDAA mode
4 STREQWR	Status Request Write Indicates whether the REQ in process is SDR write data from the controller to this bus target (or all targets), but not in ENTDAA mode. See status high data rate (STHDR) for double data rate (DDR) handling. 0 - Not an SDR write 1 - SDR write data from the controller, but not in ENTDAA mode
3 STREQRD	Status Request Read Indicates whether the REQ in process is an SDR read from this target. See status high data rate (STHDR) for double data rate (DDR) handling. 0 - Not an SDR read 1 - SDR read from this target or an IBI is being pushed out
2 STCCCH	Status Common Command Code Handler Indicates whether a CCC message is being handled automatically. 0 - No CCC message handled 1 - Handled automatically
1 STMSG	Status Message Indicates whether the bus target is busy (listening to the bus traffic or responding). If STNOSTOP = 1, STMSG is 0 when a nonmatching address is seen, until the next Repeated START or STOP condition occurs. 0 - Idle 1 - Busy
0 STNOTSTOP	Status not Stop Indicates the status of the bus. If this field is 0, I3C is in a STOP condition. If this field is 1, the bus is busy (has activity). Other fields of this register may also be set when busy. STNOTSTOP can also become 1 after a TE0 or TE1 error, when I3C is waiting for an exit pattern. 0 - In STOP condition 1 - Busy

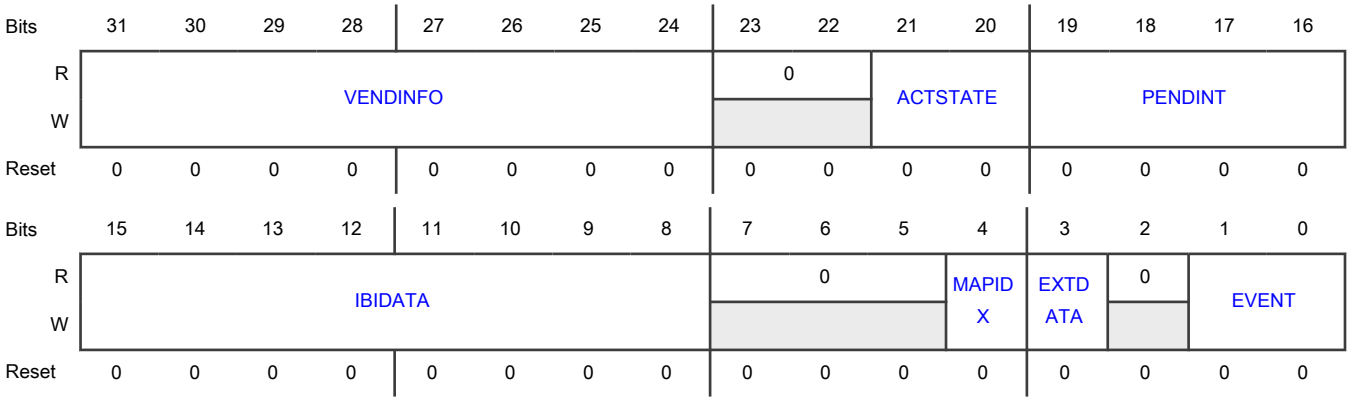
48.7.5 Target Control (SCTRL)

Contains controls for the active use of the I3C bus (for example, event generation such as interrupts to the controller). Only if I3C is configured to support various special operations for the target, this register is used to activate those operations. These events include IBI and GETSTATUS fields (except the protocol error, which is automatically set).

Offset

Register	Offset
SCTRL	Ch

Diagram



Fields

Field	Description
31-24 VENDINFO	Vendor Information Controls vendor information that the GETSTATUS CCC returns. You must set this field to the Vendor Reserved field that the GETSTATUS CCC returns. The application must maintain the vendor information because the controller reads this field. If this field is not configured, then the GETSTATUS field always returns 0.
23-22 —	Reserved
21-20 ACTSTATE	Activity State of Target Controls the activity state of the target. You must set this field to the activity state of the target that the GETSTATUS CCC command returns as activity mode. The application must maintain the activity state because the controller reads this field. If you do not configure the activity state, then the GETSTATUS command always returns 0.
19-16 PENDINT	Pending Interrupt Specifies whether an IBI interrupt is pending. You must set this field to the pending interrupt that the GETSTATUS CCC command returns. The application must maintain the pending interrupt because the controller reads this field.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If PENDINT = 0: • The GETSTATUS command returns 1 if an IBI interrupt is pending. • The GETSTATUS field returns 0 if an IBI interrupt is not pending.
15-8 IBIDATA	In-Band Interrupt Data Controls the data byte accompanying the IBI, if the module is enabled for IBI. If SCTRL[IBIDATA] is enabled, then IBI is required.
7-5 —	Reserved
4 MAPIDX	Map Index Controls the index of the dynamic address of the IBI. This index is 0 for the main or base dynamic address. This field is used only if mapping is enabled. See Controller Dynamic Address (MDYNADDR) for more information.
3 EXTDATA	Extended Data Enables extended data. After IBIDATA is emitted, extended data is acquired from IBIEXT1 and IBIEXT2, if configured. If extended data is used with time control, the data follows the time information. See IBIEXT1[MAX] for more information. 0 - Disable 1 - Enable
2 —	Reserved
1-0 EVENT	Event Requests an event. If this field is 0b, it indicates Normal mode, in which if this field becomes 0 from a nonzero value and event processing has not yet started, the event processing is canceled. However, event processing is not canceled if it has already started. If this field is 1b, an IBI is pushed onto the I3C bus. If there is data associated with the IBI, the data is read from SCTRL[IBIDATA]. If time control is enabled, this data includes any time-control-related bytes. Additionally, SCTRL[IBIDATA][7] becomes 1 automatically (as is required for time control). The IBI interrupt occurs after the first (mandatory) IBIDATA, if any. If this field is 10b, a controller request is started; the meaning depends on SIDEXT[BCR] configured in I3C. If this field is 11b, a hot-join (HJ) request is started, which is used when the device is powered on after the I3C bus is already powered up. It is also used when the device is connected using hot-insertion methods (the device is powered up when it is physically inserted in the powered-up I3C bus). The HJ waits for Bus Idle, and SCTRL[EVENT] = HOT_JOIN_REQUEST must be set before the target enable (SCONFIG[SLVENA]). If this field is a nonzero value, it requests an event. After the request, SSTATUS[EVENT] and SSTATUS[EVDET] show the status as it progresses. After completion, this field automatically returns to 0.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	After this field becomes a nonzero value, you can write only 0 it (to cancel) until the event processing is finished. 00 - NORMAL_MODE 01 - IBI 10 - CONTROLLER_REQUEST 11 - HOT_JOIN_REQUEST

48.7.6 Target Interrupt Set (SINTSET)

Sets interrupt enables for select Target Status (SSTATUS) fields. Reading this register (SINTSET) returns the status of the interrupt enable:

- To activate an interrupt enable, write 1 to its corresponding field in this register (SINTSET).
- To disable an interrupt, write 1 to its corresponding field in Target Interrupt Clear (SINTCLR). Writing 0 to the interrupt enable in this register (SINTSET) does not disable the interrupt.

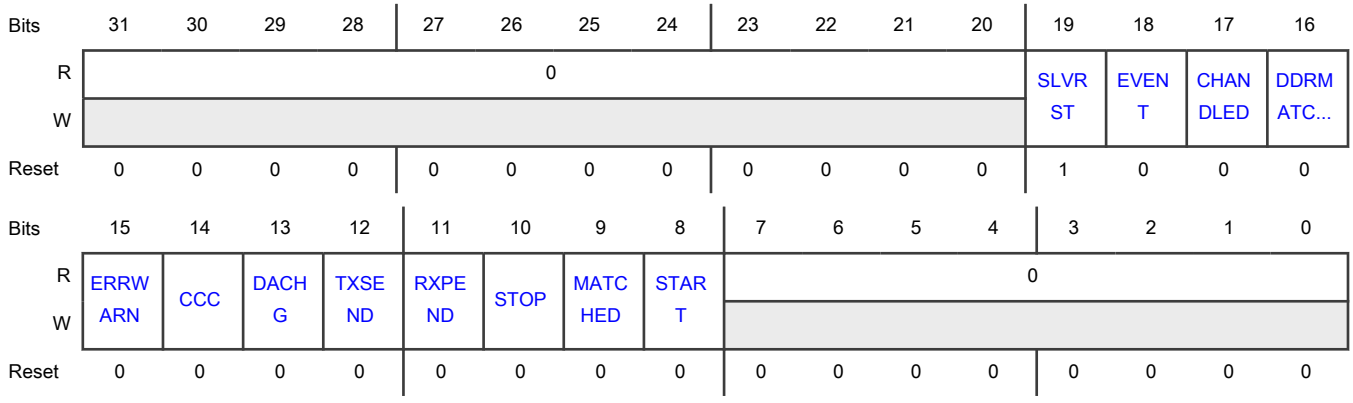
The Interrupt registers allow the masking of interrupt sources. They also allow the checking of which interrupts are activated. The normal method is to enable an interrupt, and then after the interrupt occurs, clear the interrupt either by writing to Target Status (SSTATUS) or by performing an action on the corresponding data register. The interrupt is level-held, meaning the interrupt stays set until the cause is cleared by some method. The module prevents races; if a new event occurs, that new event is not lost:

- SINTSET sets interrupt enables for Target Status (SSTATUS) fields. Reading the SINTSET register returns the status of the interrupt enables.
- SINTCLR clears interrupt enables for the SSTATUS fields.
- SINTMASKED returns the value of the SSTATUS fields ANDed with their interrupt enables.

Offset

Register	Offset
SINTSET	10h

Diagram



Fields

Field	Description
31-20 —	Reserved
19 SLVRST	Target Reset Enables target reset interrupt. This field specifies whether target reset pattern is detected and action is set to reset peripheral. The field helps you perform follow-up tasks such as reinitialization. You must reset peripheral or verify that it is correct. This interrupt must not be unmasked. Used only if SLVRST is configured. 0 - Disable 1 - Enable
18 EVENT	Event Interrupt Enable Enables event interrupts. This field indicates, for a target, whether a pending in-band interrupt (IBI), controller request (CR), or hot-join (HJ) has been sent as requested. The field is configured to support events. See SSTATUS[EVDET] for more information. 0 - Disable 1 - Enable
17 CHANDLED	Common Command Code (CCC) Interrupt Enable Enables CCC interrupts. This field specifies whether CCC is being handled by I3C. Target Status (SSTATUS) shows new results. You can use this field to track when activity states and masks on events (for example, IBIs) occur. The field is used for CCCs that are enabled. 0 - Disable 1 - Enable
16 DDRMATCHED	Double Data Rate Interrupt Enable Enables DDR match for read or write command. This field indicates when DDR matches for read or write command, and the field is used only if HDR is enabled. 0 - Disable 1 - Enable
15 ERRWARN	Error or Warning Interrupt Enable Enables error or warning interrupts.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This field indicates whether an error or warning has occurred, such as data underrun, data overrun, parity error, or HDR-DDR CRC error, or any other error or warning condition. See Target Errors and Warnings (SERRWARN) for cause of error. Only available for errors related to configured features. 0 - Disable 1 - Enable
14 CCC	Common Command Code (CCC) Interrupt Enable Enables CCC interrupts. This field indicates whether a CCC has been received, and is not handled by I3C. For CCCs that the block does not handle, RXPEND also interrupts, and SSTATUS[STREQRD] indicates that it is a CCC sending a read request. 0 - Disable 1 - Enable
13 DACHG	Dynamic Address Change Interrupt Enable Enables dynamic address change interrupts: interrupt on dynamic address defined (SETDASA or ENTDAA) or lost (RSTDAA). See Controller Dynamic Address (MDYNADDR) for more information. 0 - Disable 1 - Enable
12 TXSEND	Transmit Interrupt Enable Enables transmit interrupts. This field indicates whether to-bus buffer or FIFO can accept more data to be transmitted. The corresponding interrupt occurs when the controller requests data to read from this target. This interrupt occurs on the first request (header) as well as when it is ready for more data. The corresponding interrupt occurs when the controller requests data to be read from this target. If this interrupt is for a FIFO, it triggers on the transmit emptiness trigger. If this interrupt is for DMA, then it indicates message end (DMA end or termination). 0 - Disable 1 - Enable
11 RXPEND	Receive Interrupt Enable Enables receive interrupts. This field specifies when a message from the controller that is not being handled by the module is received. For example, where data is consumed by hardware directly when it goes into the FIFO (excludes CCCs being handled automatically). If this interrupt is for a FIFO, it indicates a receive fullness trigger. If this interrupt is for DMA, then it indicates message end. 0 - Disable

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Enable
10 STOP	Stop Interrupt Enable Enables stop interrupts. This field detects the Stopped state present on the bus since the bus was last cleared. Use SINTSET[START] as the preferred interrupt when needed. This interrupt may not trigger for a quick STOP and START combination because it relates to the state of being stopped. 0 - Disable 1 - Enable
9 MATCHED	Match Interrupt Enable Enables match interrupts. Incoming header matched the I3C dynamic or I2C static address of this device since the bus was last cleared. If configured and if no dynamic address is set, this interrupt is also for matching a header on an I2C static address. See Controller Dynamic Address (MDYNADDR) for related information. 0 - Disable 1 - Enable
8 START	Start Interrupt Enable Enables start interrupts. A START or Repeated START (such as wakeup) is seen after this field last became 0. See SINTSET[STOP] for related information. 0 - Disable 1 - Enable
7-0 —	Reserved

48.7.7 Target Interrupt Clear (SINTCLR)

Clears interrupt enables for select Target Status (SSTATUS) fields. To clear an interrupt enable, write 1 to the corresponding field in this register (SINTCLR). Writing 0 has no effect.

Offset

Register	Offset
SINTCLR	14h

Fields

Field	Description
31-22 —	Reserved
21 —	Reserved
20-18 —	Reserved
17 OWRITE	Over-Write Error Flag Indicates that Target Write Data Byte (SWDATAB) or Target Write Data Byte End (SWDATABE) was written to when full. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No overwrite error

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Overwrite error When writing 0 - No effect 1 - Clear the flag
16 OREAD	Over-Read Error Flag Indicates that Target Read Data Byte (SRDATAB) was read for more bytes than were available, by the application. This field also indicates over-read errors for Target Read Data Halfword (SRDATAH), if it is enabled. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No over-read error 1 - Over-read error When writing 0 - No effect 1 - Clear the flag
15-14 —	Reserved
13 —	Reserved
12 —	Reserved
11 S0S1	TE0 or TE1 Error Flag Indicates whether a TE0 or TE1 error occurred and the target is locked and waiting for an HDR exit pattern. Writing 1 to S0S1 causes I3C to release the lock, but this method must be used with great care. S0S1 becomes 0 automatically when an exit pattern is detected, so writing 1 to S0S1 must be used under controlled circumstances to avoid problems. Before starting to operate normally after this error, I3C waits for a START (or Repeated START) or STOP state. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No TE0 or TE1 error occurred 1 - TE0 or TE1 error occurred

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When writing 0 - No effect 1 - Clear the flag
10 HCRC	HDR-DDR CRC Error Flag Indicates whether an HDR-DDR CRC error occurred on a message from the controller. Error reasons include an HDR restart and an exit being issued before an HDR-DDR message from the controller has finished. This error calls into question the data from the entire DDR command frame. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No HDR-DDR CRC error occurred 1 - HDR-DDR CRC error occurred When writing 0 - No effect 1 - Clear the flag
9 HPAR	HDR Parity Error Flag Indicates when an HDR parity error or framing error on a message from the controller occurs. The corresponding command or data that has the error is usually in the RX buffer, which can be read using Target Read Data Byte (SRDATAB). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No HDR parity error 1 - HDR parity error When writing 0 - No effect 1 - Clear the flag
8 SPAR	SDR Parity Error Flag Indicates when an SDR parity error on a message from the controller occurs. This error also sets the GETSTATUS protocol error field (which becomes 0 after a GETSTATUS read). For read operations, this field becomes 1 when a read abort (timeout) occurs because of the controller not driving clock for more than 100 µs during an SDR read. **NOTE** This field behaves differently for register reads and writes.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	When reading 0 - No SDR parity error 1 - SDR parity error When writing 0 - No effect 1 - Clear the flag
7-5 —	Reserved
4 INVSTART	Invalid Start Error Flag Indicates an invalid condition with SCL falling before SDA falls, so there is no start. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No invalid start error 1 - Invalid start error When writing 0 - No effect 1 - Clear the flag
3 TERM	Terminated Error Flag Indicates when the controller terminates a read from a target, if an END is not set by the target (on the same read or the previous read). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No terminated error 1 - Terminated error When writing 0 - No effect 1 - Clear the flag
2 URUNNACK	Underrun and Not Acknowledged (NACKed) Error Flag Indicates when the internal to-bus buffer or FIFO is underrun in the read header and so the module NACKed the header.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE This field behaves differently for register reads and writes. When reading 0 - No underrun; not acknowledged error 1 - Underrun; not acknowledged error When writing 0 - No effect 1 - Clear the flag
1 URUN	Underrun Error Flag Indicates when the internal to-bus buffer or FIFO is underrun during data read (the application is not providing the data fast enough). The END field or register must be used if the read was the last one. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No underrun error 1 - Underrun error When writing 0 - No effect 1 - Clear the flag
0 ORUN	Overrun Error Flag Indicates when the internal from-bus buffer or FIFO has overrun (arrival of too many characters that you cannot process fast enough). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No overrun error 1 - Overrun error When writing 0 - No effect 1 - Clear the flag

48.7.10 Target DMA Control (SDMACTRL)

Allows DMA to be used for inbound and outbound messages. This register is limited in value for target use because the target must be reactive. These are the two common use case models:

- To avoid an overrun in from-bus collection: if SCONFIG[MATCHSS] becomes 1, then the processor enables the interrupts for START and STOP and enables the DMA to collect the data. The START or STOP interrupt only occurs after a message is directed to the target (MATCHED is 1). The DMA copied data can then be examined.
- To perform larger reads from the to-bus: I3C and I2C reads are preceded by a write that indicates what will be read (or in response to an IBI from the target). Because of this process, the DMA can be used to push through the data:
  - For I3C, the processor must manage the last value, unless the DMA moves wider words and is able to write 1 to the END field. These values are 16-bit values when in Byte mode or 32-bit values when in Halfword mode.
  - For I2C, the controller determines the last value, so the DMA may end early or run out when the controller expects more values.

Offset

Register	Offset
SDMACTRL	20h

Diagram

Fields

Field	Description
31-8 —	Reserved
7 BULKTB	Bulk Transfer to Bus Enables bulk transfers to bus. If BULKTB is enabled, SDATACTRL[TXTRIG] is used to make DMA requests. Enable this field only if the DMA supports bulk transfers (more than a byte, halfword, or word at a time, that is, SDATACTRL[TXTRIG] < 3). 0 - Disable 1 - Enable
6 BULKFB	Bulk Transfer from Bus

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Enables bulk transfers from bus. If BULKFB is enabled, SDATACTRL[RXTRIG] is used to make DMA requests. Enable this field only if the DMA supports bulk transfers (more than a byte, halfword, or word at a time, that is, SDATACTRL[RXTRIG] > 0). 0 - Disable 1 - Enable
5-4 DMAWIDTH	Width of DMA Operations Indicates the width of DMA operations, if configured to allow halfword data accesses. 00,01 - Byte 10 - Halfword (16 bits) (this value ensures that two bytes are available in the FIFO) 11 - Reserved
3-2 DMATB	DMA Write (To-Bus) Trigger Enables DMA writes. If this field is enabled, it starts a request DMA on a transmit trigger (see Target Data Control (SDATACTRL)). DMATB requests until full, unless the DMA is set up as a trigger. DMATB becomes 0 when MSTATUS[ERRWARN] becomes 1. If you write 1b to this field, DMA is enabled for one frame (ended by DMA or terminated). DMATB automatically becomes 0 after a STOP or repeated START. See SCONFIG[MATCHSS] for more information. If you write 10b to this field, DMA is enabled until turned off. The value must only be used with Controller Message mode. 00 - DMA not used 01 - DMA enabled for one frame 10 - DMA enabled until turned off. Recommended mode, instead of 01b, to enable DMA. This setting provides better software control. 11 - Reserved
1-0 DMAFB	DMA Read (From-Bus) Trigger Enables DMA reads. If this field is enabled, DMAFB requests DMA on receive trigger (see SDATACTRL). It requests until empty, unless the DMA is set up as a trigger. This field becomes 0 when SSTATUS[ERRWARN] becomes 1. If this field is 1b (DMA is enabled for one frame), it automatically becomes 0 on STOP or repeated START. See SCONFIG[MATCHSS] for more information. **NOTE** Do not enable DMA after a transaction starts. It must be enabled only when enabling the target and interrupts to avoid any kind of RX FIFO overrun. 00 - DMA not used

Table continues on the next page...

Table continued from the previous page...

Field	Description
	01 - DMA enabled for one frame 10 - DMA enabled until turned off. Recommended mode, instead of 01b, to enable DMA. This setting provides better software control. 11 - Reserved

48.7.11 Target Data Control (SDATACTRL)

Assists in data control when no FIFO is used. Also assists in data control of FIFO when the FIFO is available (regardless of size) allowing some control over the FIFO behavior. This register controls when to interrupt based on fullness or emptiness of a buffer or FIFO. It also controls behavior related to width, when the buffer or FIFO is not 1 byte wide.

Offset

Register	Offset
SDATACTRL	2Ch

Fields

Field	Description
31 RXEMPTY	Receive is Empty Indicates whether the receive FIFO or buffer is empty. 0 - Not empty 1 - Empty
30 TXFULL	Transmit is Full Indicates whether the transmit FIFO or buffer is full.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Not full 1 - Full
29 —	Reserved
28-24 RXCOUNT	Count of Entries in Receive Contains the count of entries in the receive FIFO or buffer. Entry size for SDR and HDR-DDR is in bytes.
23-22 —	Reserved
21 —	Reserved
20-16 TXCOUNT	Count of Entries in Transmit Contains the count of entries waiting in the TXFIFO. This count is the number of entries that the application has written to the transmit FIFO that have not yet gone onto the bus. Entry size for SDR and HDR-DDR is in bytes.
15-8 —	Reserved
7-6 RXTRIG	Receive Trigger Level Indicates the trigger level for receive fullness when using a FIFO. The field affects the RXPEND interrupt and DMA (if enabled). 00 - Trigger when not empty (default) 01 - Trigger when 1/4 or more full 10 - Trigger when 1/2 or more full 11 - Trigger when 3/4 or more full
5-4 TXTRIG	Transmit Trigger Level Indicates the trigger level for transmit emptiness when using a FIFO. The field affects the TXNOTFULL interrupt and DMA (if enabled). 00 - Trigger when empty 01 - Trigger when 1/4 full or less 10 - Trigger when 1/2 full or less 11 - Default (trigger when 1 less than full or less)
3	Unlock

Table continues on the next page...

Table continued from the previous page...

Field	Description
UNLOCK	Indicates whether the RXTRIG and TXTRIG fields can be changed on a write. This field must be 1 in the same cycle while writing to TXTRIG or RXTRIG. 0 - Cannot be changed 1 - Can be changed
2 —	Reserved
1 FLUSHFB	Flush From-Bus Buffer or FIFO Not normally used. **NOTE** Before using FLUSHFB, disable the DMA (SDMACTRL[DMAFB] = 0). Then use FLUSHFB to flush the FIFO and then re-enable the DMA. 0 - No action 1 - Flush the buffer
0 FLUSHTB	Flush To-Bus Buffer or FIFO Indicates when the controller terminates a to-bus (read) message prematurely. **NOTE** Before using FLUSHTB, disable the DMA (SDMACTRL[DMATB] = 0). Then use FLUSHTB to flush the FIFO and then re-enable the DMA. 0 - No action 1 - Flush the buffer

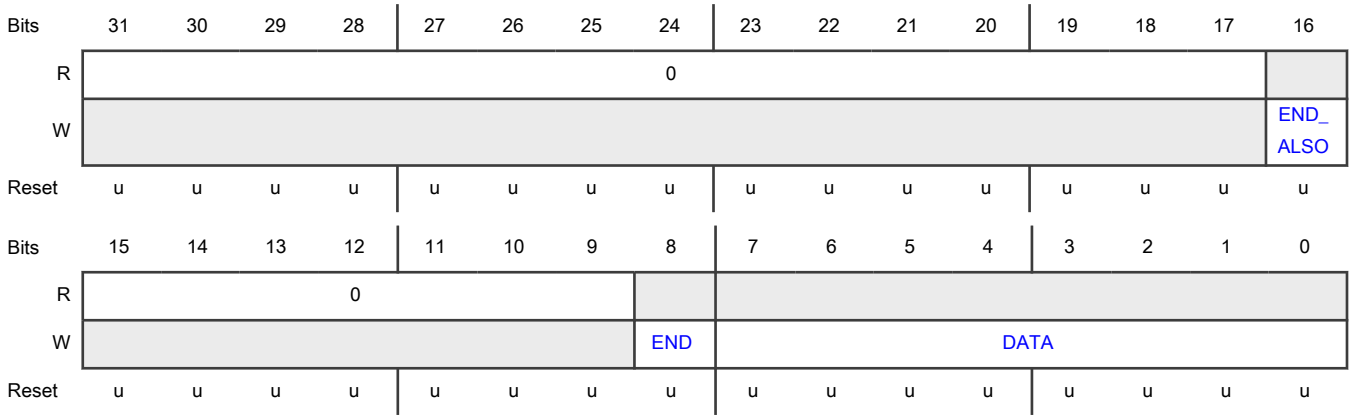
48.7.12 Target Write Data Byte (SWDATAB)

Allows writing a byte to the bus (to the controller) unless an external FIFO is used. Writing a byte requires a byte plus an end-of-data (last) marker bit. A byte must not be written unless there is room, indicated by SSTATUS[TXNOTFULL] = 1.

Offset

Register	Offset
SWDATAB	30h

Diagram



Fields

Field	Description
31-17 —	Reserved
16 END_ALSO	End Also Marks the last byte of the message. This field is required for I3C, but is optional for I2C. If this field is 0, it indicates that there are more bytes in the message. For HDR-DDR, the byte with END_ALSO must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. 0 - Not the end 1 - End
15-9 —	Reserved
8 END	End Marks the last byte of the message. If this field is 0, it indicates that there are more bytes in the message. This field is required for I3C, but is optional for I2C. For HDR-DDR, the byte with END must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. 0 - Not the end 1 - End
7-0 DATA	Data Indicates the data byte to be sent to the controller.

48.7.13 Target Write Data Byte End (SWDATABE)

Allows writing a byte to the bus (to the controller) unless an external FIFO is used.

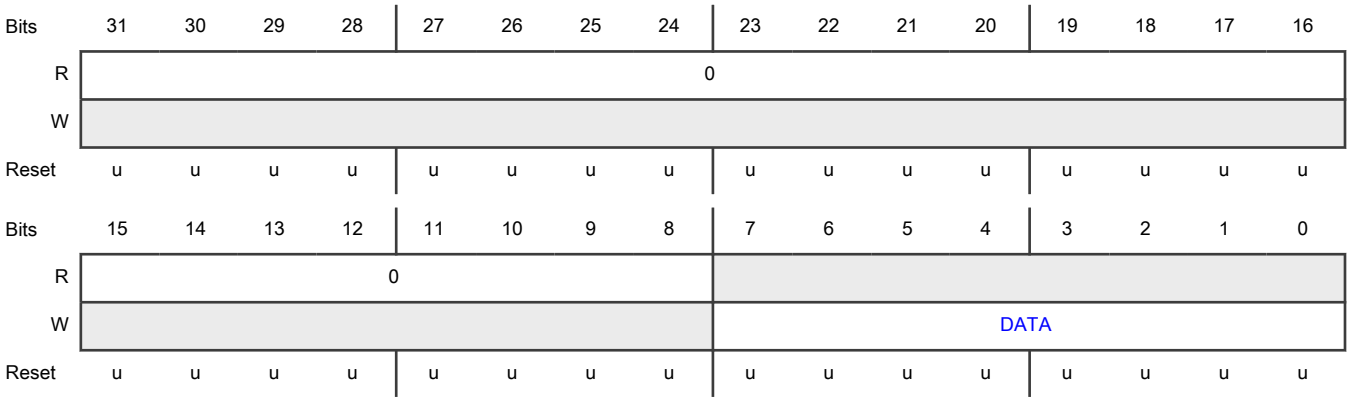
Unlike Target Write Data Byte (SWDATAB), writing a byte only requires the byte itself, and is marked as end-of-data (last byte). A byte must not be written unless there is room, indicated by SSTATUS[TXNOTFULL] = 1.

For HDR-DDR, the byte with the END must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs.

Offset

Register	Offset
SWDATABE	34h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 DATA	Data Indicates the data byte to be sent to the controller.

48.7.14 Target Write Data Halfword (SWDATAH)

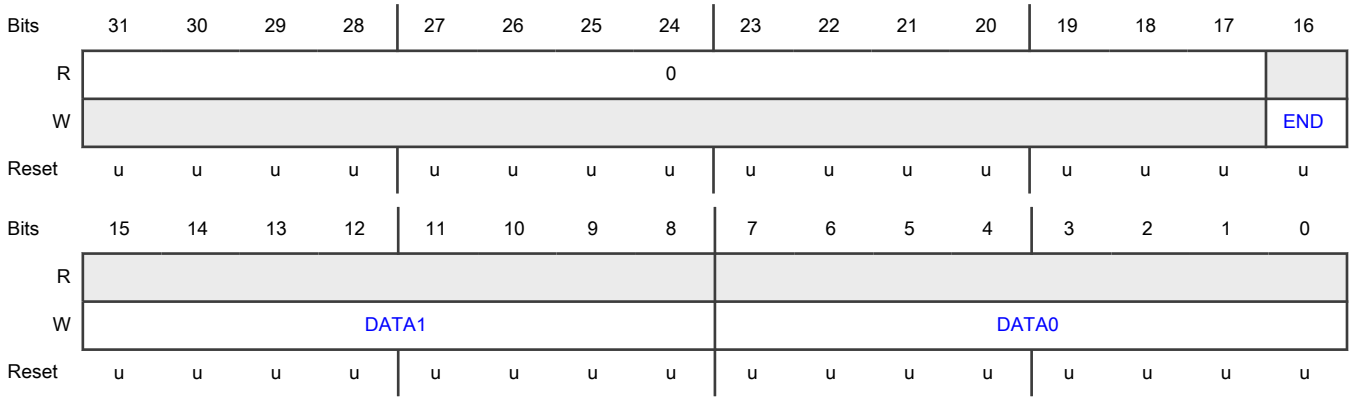
Allows writing a halfword (pair of bytes) to the bus unless an external FIFO is used. The low byte is followed by the high byte. The 16th bit marks the end; that is, the last byte of the halfword is the end.

An end-of-data (last) marker bit is allowed (or must be 0). A halfword must not be written unless there is room for both, as indicated by the use of transmit FIFO level trigger or SDATACTRL[TXCOUNT].

Offset

Register	Offset
SWDATAH	38h

Diagram



Fields

Field	Description
31-17 —	Reserved
16 END	End of Message Marks the last byte of the message. This field always marks DATA1 as the end. The field is required for I3C, but is optional for I2C. If this field is 0, it indicates that there are more bytes in the message. For HDR-DDR, the byte with the END must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. 0 - Not the end 1 - End
15-8 DATA1	Data 1 Indicates the second byte to be sent to the controller.
7-0 DATA0	Data 0 Indicates the first byte to be sent to the controller.

48.7.15 Target Write Data Halfword End (SWDATAHE)

Allows writing a halfword of data, which is the end (the last byte of the halfword is the end). The target writes the halfword (byte pair) in the same way it writes to Target Write Data Halfword (SWDATAH), but marks the second byte as end-of-data (last byte).

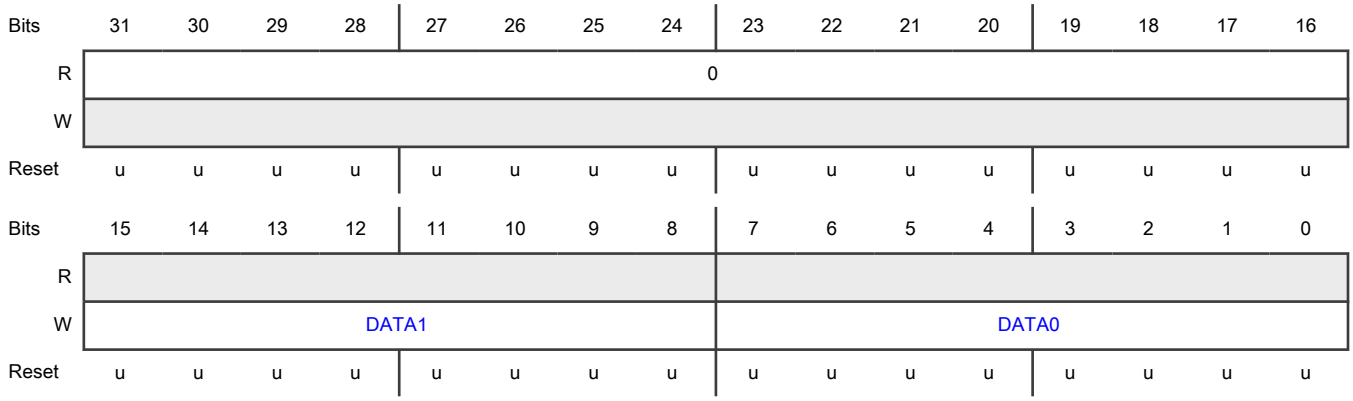
For HDR-DDR, the byte with the END must be even (second, fourth, sixth, and so on) because DDR uses byte pairs.

A halfword must not be written unless there is room for both, as indicated by the use of transmit FIFO level trigger or SDATACTRL[TXCOUNT].

Offset

Register	Offset
SWDATAHE	3Ch

Diagram



Fields

Field	Description
31-16 —	Reserved
15-8 DATA1	Data 1 Indicates the second byte to be sent to the controller.
7-0 DATA0	Data 0 Indicates the first byte to be sent to the controller.

48.7.16 Target Read Data Byte (SRDATAB)

Allows reading a byte from the bus (controller). A byte must not be read unless there is data waiting, as indicated by SSTATUS[RX_PEND] = 1.

Offset

Register	Offset
SRDATAB	40h

Fields

Field	Description
31-8 —	Reserved
7-0 DATA0	Data 0 Indicates the byte read from the controller.

48.7.17 Target Read Data Halfword (SRDATAH)

Allows reading a halfword (byte pair) written by the target after an SDR read or DAA or DDR. This register is used only when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively. A halfword must not be read unless there are at least two bytes of data waiting, as indicated by the use of receive FIFO level trigger or SDATACTRL[RXCOUNT].

15-8 MSB	High Byte Indicates the second byte read from the target.
7-0 LSB	Low Byte Indicates the first byte read from the target.

48.7.18 Target Write Data Byte (SWDATAB1)

Allows writing a single byte to the bus (to the controller) in a way that only bits 7:0 are used.

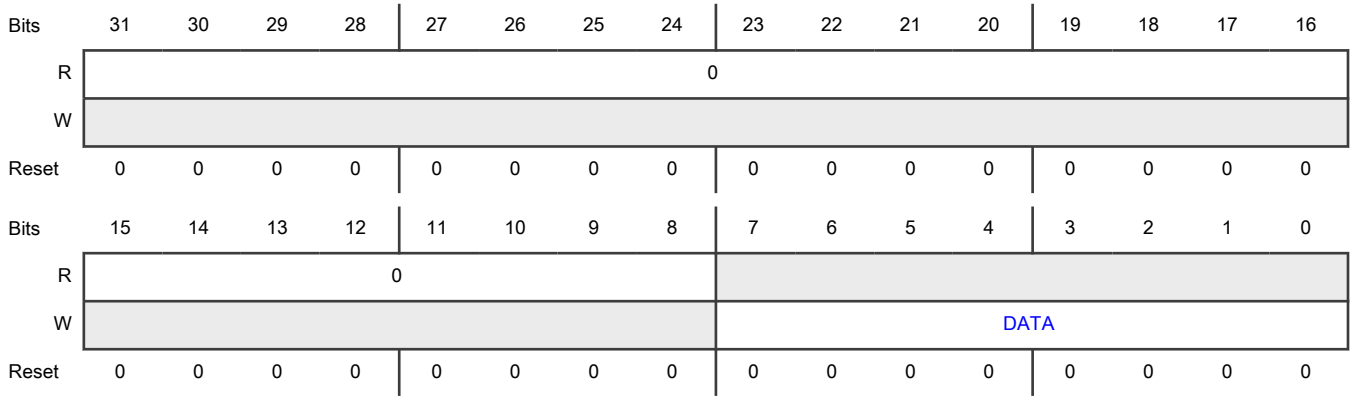
This register is intended to be used by DMAs (the upper bytes of the APB word are ignored).

A byte must not be written unless there is room, as indicated by SSTATUS[TXNOTFULL] = 1.

Offset

Register	Offset
SWDATAB1	54h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 DATA	Data Indicates the byte to be sent to the controller.

48.7.19 Target Write Data Halfword (SWDATAH1)

Shares the same address as Target Write Data Byte (SWDATAB1), and SDMACTRL[DMAWIDTH] determines which one is set.

This register allows writing a single-byte pair (halfword) to the bus (to the controller) in a way that only bits 15:0 are used.

This register is intended for use by DMAs, which do not format the upper part of the APB word.

A halfword must not be written unless there is room, as indicated by SSTATUS[TXNOTFULL] = 1.

Offset

Register	Offset
SWDATAH1	54h

Fields

Field	Description
31-24 —	Reserved
23 SSTWR	Target-Target(s)-Tunnel Write Capable Indicates whether target-target(s)-tunnel is write capable. 0 - Not write capable 1 - Write capable
22 SSTSUB	Target-Target(s)-Tunnel Subscriber Capable Indicates whether target-target(s)-tunnel is subscriber capable. 0 - Not subscriber capable 1 - Subscriber capable
21 AASA	SETAASA Supports the set static address as dynamic address CCC (SETAASA) feature. 0 - SETAASA not supported 1 - SETAASA supported
20 —	Reserved
19-18 GROUP	Group Indicates whether v1.1 group addressing is supported. Groups use mapping, so MAPCNT must be the same or greater than GROUP. 00 - v1.1 group addressing not supported 01 - One group supported

Table continues on the next page...

Table continued from the previous page...

Field	Description
	10 - Two groups supported 11 - Three groups supported
17 SLVRST	Target Reset Indicates whether v1.1 target reset is supported. 0 - Not supported 1 - Supported
16 V1_1	Version 1.1 Indicates whether I3C v1.1 GETCAPS is supported. 0 - Not supported 1 - Supported
15-10 —	Reserved
9 IBIXREG	In-Band Interrupt Extended Register Supports extended registers for IBIs. This field indicates whether Extended IBI Data 1 (IBIEXT1) is available. Extended IBI Data 2 (IBIEXT2) is available if IBIEXT1[MAX] > 3. 0 - Not supported 1 - Supported
8 IBIEXT	In-Band Interrupt EXTDATA Supports SCTRL[EXTDATA] to allow data beyond the mandatory data byte (MDB) for IBIs. 0 - Not supported 1 - Supported
7 —	Reserved
6 I2CDEVID	I2C Device ID Indicates whether I2C device ID is supported. 0 - Not supported 1 - Supported
5 —	Reserved
4	I2C 10-bit Address

Table continues on the next page...

Table continued from the previous page...

Field	Description
I2C10B	Supports 10-bit I2C address in MAP 1. If this field is 1, MAPCNT must be 1 or greater. 0 - Not supported 1 - Supported
3-0 MAPCNT	Map Count Indicates the number of maps that are allowed. If there is no mapping, this field is 0. (DYNADDR is used to add more static and/or dynamic addresses to act as virtual targets.)

48.7.21 Target Capabilities (SCAPABILITIES)

Indicates which features are available and supported in this module, including controller and/or target capabilities, HDR modes, and others.

Offset

Register	Offset
SCAPABILITIES	60h

Fields

Field	Description
31 DMA	Direct Memory Access Indicates whether DMA is supported. 0 - Not supported 1 - Supported
30	Interrupts

Table continues on the next page...

Table continued from the previous page...

Field	Description
INT	Indicates whether interrupts are supported. 0 - Not supported 1 - Supported
29-28 FIFORX	FIFO Receive Indicates the size of receive (from-bus) FIFO. **NOTE** Controller and target use the same receive FIFO, so size is the same for the controller receive FIFO as well. FIFO size of SDR and HDR-DDR is in bytes. 00 - Two or three 01 - Four 10 - Eight 11 - 16 or larger
27-26 FIFOTX	FIFO Transmit Indicates the size of transmit (to-bus) FIFO. **NOTE** Controller and target use the same transmit FIFO, so size is the same for the controller transmit FIFO as well. FIFO size of SDR and HDR-DDR is in bytes. 00 - Two 01 - Four 10 - Eight 11 - 16 or larger
25-23 EXTFIFO	External FIFO Indicates whether external FIFOs are enabled. If they are not enabled, then check FIFOTX and FIFORX for the internal FIFO. 000 - No external FIFO available 001 - Standard available or free external FIFO 010 - Request track external FIFO All other values are reserved.
22 —	Reserved
21	Time Control

Table continues on the next page...

Table continued from the previous page...

Field	Description
TIMECTRL	Specifies whether any time-control type is supported. 0 - No time control supported 1 - At least one time-control type supported
20-16 IBI_MR_HJ	In-Band Interrupts, Controller Requests, Hot-Join Events Indicates which events (IBI, CR, and HJ) are allowed. For example, if this field is 00011b, IBI (bit 0) and IBI_HAS_DATA (bit 1) functionality are both enabled. 0_0000 - Application cannot generate IBI, CR, or HJ 1_xxxx - Application can use SCONFIG[BAMATCH] for bus-available timing x_1xxx - Application can generate a Hot-Join event x_x1xx - Application can generate a controller request for a secondary controller x_xx1x - When bit 0 = 1, the IBI has data from the SCTRL register x_xxx1 - Application can generate an IBI
15-12 CCCHANDLE	Common Command Codes Handling Indicates what manages CCC between I3C and the application. 0000 - All handling features disabled 1xxx - GETSTATUS CCC returns the value of SCTRL[VENDINFO] x1xx - GETSTATUS CCC returns the values of SCTRL[PENDINT] and SCTRL[ACTSTATE] xx1x - The I3C module manages maximum read and write lengths, and max data speed xxx1 - The I3C module manages events, activities, status, HDR, and if enabled for it, ID and static-address-related items
11-10 SADDR	Static Address Indicates how the static address is managed. 00 - No static address 01 - Static address is fixed in hardware 10 - Hardware controls the static address dynamically (for example, from the pin strap) 11 - SCONFIG register supplies the static address
9 MASTER	Controller Specifies whether controller capability is supported. 0 - Not supported 1 - Supported
8 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
7-6 HDRSUPP	High Data Rate Support Indicates which HDR modes are supported. 00 - No HDR modes supported 01 - DDR mode supported All other values are reserved.
5-2 IDREG	ID Register Indicates which ID features are available in the configurable registers. 0000 - All ID register features disabled 1xxx - A Bus Characteristics Register (BCR) is available x1xx - A Device Characteristic Register (DCR) is available xx1x - An ID Random field is available xxx1 - ID Instance is a register; used if there is no PARTNO register
1-0 IDENA	ID 48b Handler Indicates what handles the 48-bit ID value. 00 - Application 01 - Hardware 10 - Hardware, but the I3C module instance handles ID 48b 11 - A part number register (PARTNO)

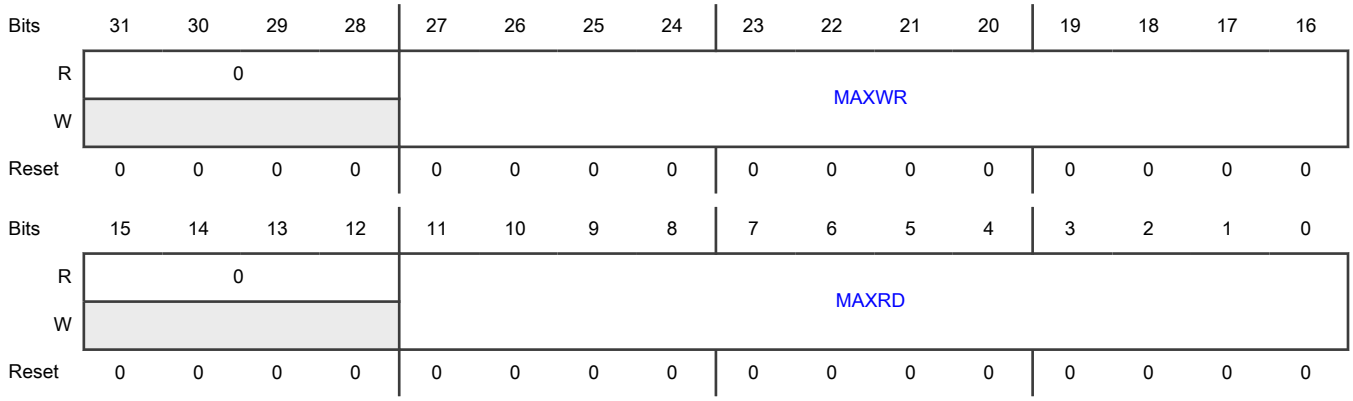
48.7.22 Target Maximum Limits (SMAXLIMITS)

Indicates the limits set by the controller (or the originally requested limits). The maximum limits are not enabled in the hardware design, including maximum read and write lengths. If the maximum read and write lengths are enabled, then the current setting (including the default request) shows up in this register (SMAXLIMITS).

Offset

Register	Offset
SMAXLIMITS	68h

Diagram



Fields

Field	Description
31-28 —	Reserved
27-16 MAXWR	Maximum Write Length Indicates the maximum write length, which must be between 8 to 4095 (saturation). The application must not set the maximum write length to a higher value than the maximum write length set by the controller.
15-12 —	Reserved
11-0 MAXRD	Maximum Read Length Indicates the maximum read length, which must be between 16 to 4095 (saturation). The application must not set the maximum read length to a higher value than the maximum read length set by the controller.

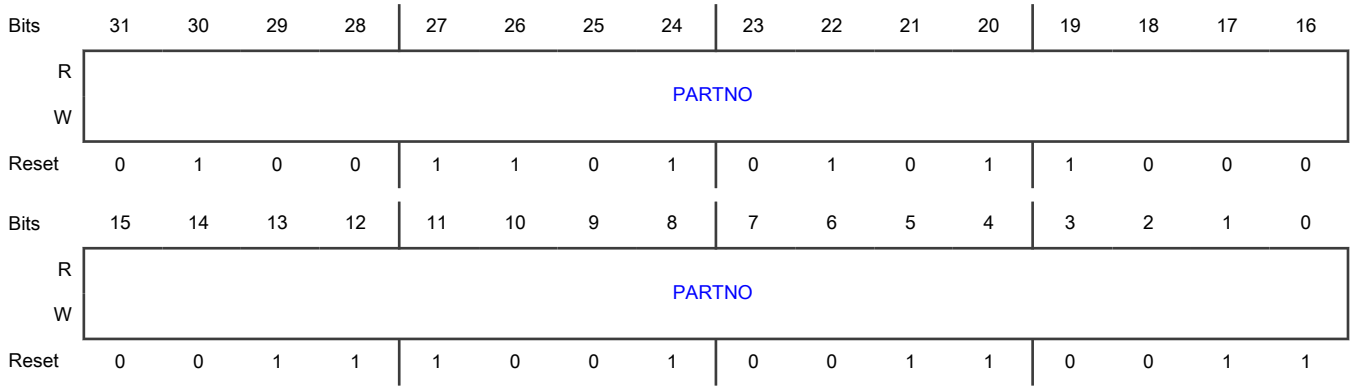
48.7.23 Target ID Part Number (SIDPARTNO)

Allows you to write the ID part number. You must write a nonzero value into the PARTNO field because 0 is not valid.

Offset

Register	Offset
SIDPARTNO	6Ch

Diagram



Fields

Field	Description
31-0 PARTNO	Part Number

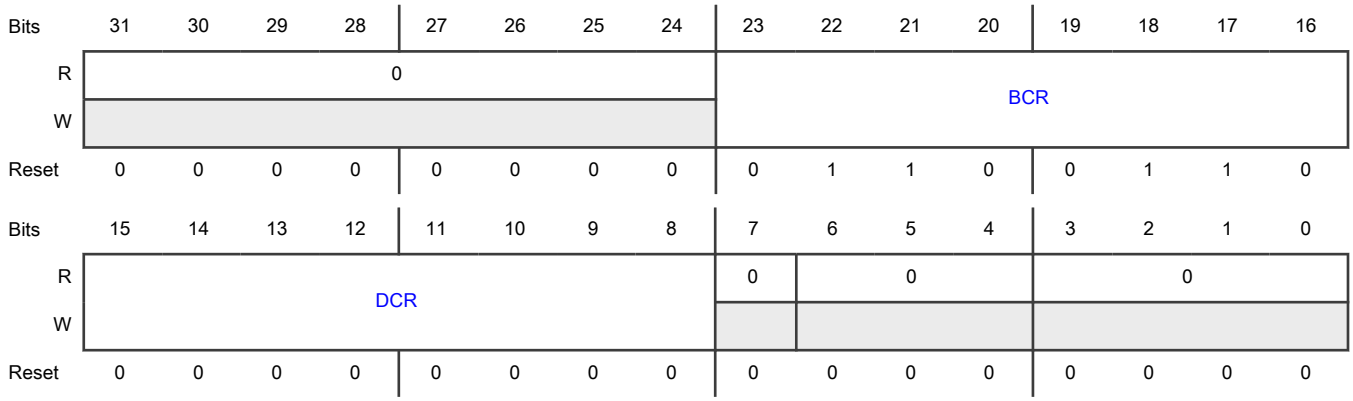
48.7.24 Target ID Extension (SIDEXT)

Allows you to write the ID extension of DCR and/or BCR.

Offset

Register	Offset
SIDEXT	70h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 BCR	Bus Characteristics Register Sets the value for BCR, if this field is configured. Otherwise, the default value is considered. This field controls features such as secondary controller and slow-speed requirements.
15-8 DCR	Device Characteristic Register Sets the value for DCR, if this field is configured. Otherwise, the default value is considered.
7 —	Reserved
6-4 —	Reserved
3-0 —	Reserved

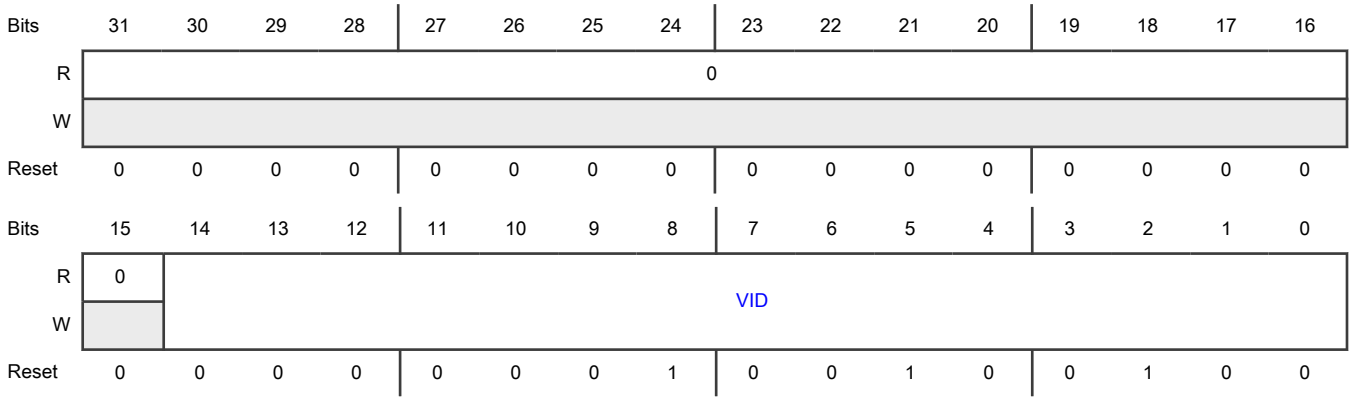
48.7.25 Target Vendor ID (SVENDORID)

Allows you to write the vendor ID. The default value is the chip vendor ID, and is set from the constant field. When using the chip vendor ID, the part number (PARTNO) does not collide with other uses. The MIPI vendor ID is available to all companies (MIPI membership is not required). To get a vendor ID, make a request at the mipi.org website.

Offset

Register	Offset
SVENDORID	74h

Diagram



Fields

Field	Description
31-15 —	Reserved
14-0 VID	Vendor ID Configures the 15-bit MIPI vendor ID. If not configured, the default value is considered.

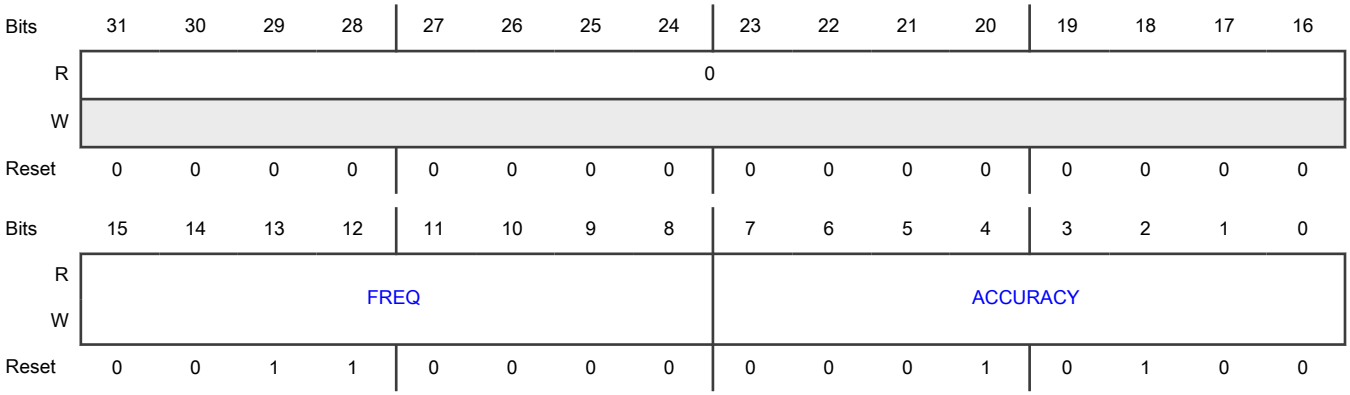
48.7.26 Target Time Control Clock (STCCLOCK)

Allows you to dynamically set the time control clock and accuracy information. The clock frequency and accuracy are constants set by the hardware. If the clock can be adjusted (that is, divided) or if the accuracy could vary with knowable information, then the clock may be set via this register, which must be updated whenever the clock source is changed.

Offset

Register	Offset
STCCLOCK	78h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-8 FREQ	Clock Frequency Indicates the clock frequency in 0.5 MHz steps. For example, a value of 20 in this field indicates a frequency of 10 MHz. Default set by parameters if configured.
7-0	Clock Accuracy

Table continues on the next page...

Table continued from the previous page...

Field	Description
ACCURACY	Indicates the clock accuracy in 1/10ths of %. For example, a value of 15 indicates an accuracy of 1.5%. Default set by parameters if configured.

48.7.27 Target Message Map Address (SMSGMAPADDR)

Allows you to determine which address is matched when STATUS[MATCHED] = 1. This register is used when the DYNADDR register builds a list of extra DAs or SAs to match. It holds the last three matches.

Offset

Register	Offset
SMSGMAPADDR	7Ch

Field	Description
31-20 —	Reserved
19-16 MAPLASTM2	Matched Previous Index 2 Indicates index 2 of the previous matched address (0 for the base address).
15-12 —	Reserved
11-8 MAPLASTM1	Matched Previous Address Index 1 Indicates index 1 of the previous matched address (0 for the base address).

Table continues on the next page...

Table continued from the previous page...

Field	Description
7-5 —	Reserved
4 LASTSTATIC	Last Static Address Matched Indicates whether the last matched address was an I2C static address or an I3C dynamic address. 0 - I3C dynamic address 1 - I2C static address
3-0 MAPLAST	Matched Address Index Indicates the matched address index for current or last matched message (0 for the base address).

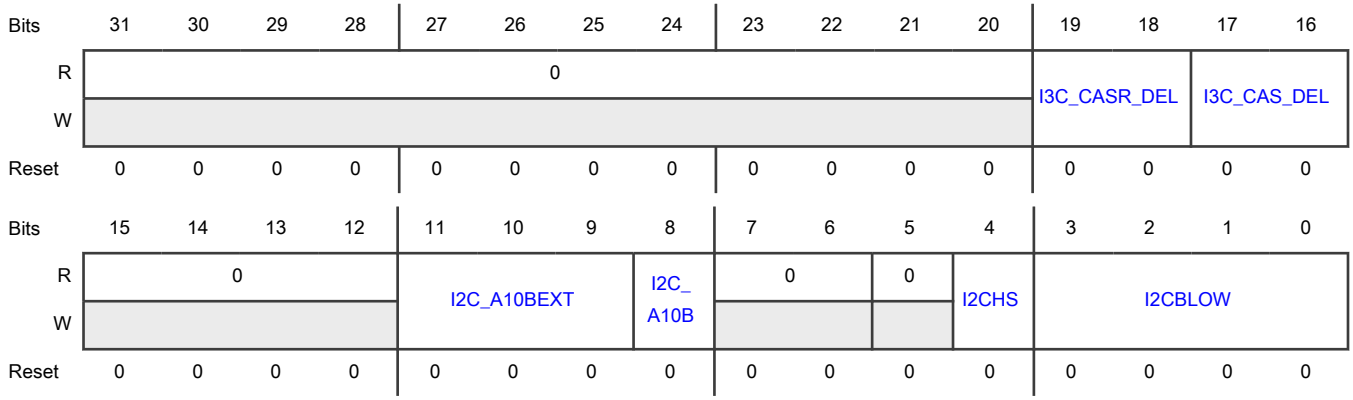
48.7.28 Controller Extended Configuration (MCONFIG_EXT)

Allows special extended configurations, including for I2C use.

Offset

Register	Offset
MCONFIG_EXT	80h

Diagram



Fields

Field	Description
31-20 —	Reserved
19-18	I3C CAS Delay After Repeated START

Table continues on the next page...

Table continued from the previous page...

Field	Description
I3C_CASR_DEL	Increases SCL clock period by a certain value. You can configure this field to delay the clock after a Repeated START to provide more time for slow I3C devices. The maximum value may be less if the internal clock is very fast. 00 - No delay 01 - Increases SCL clock period by 1/2 10 - Increases SCL clock period by 1 11 - Increases SCL clock period by 1 1/2
17-16 I3C_CAS_DEL	I3C CAS Delay After START Increases SCL clock period by a certain value. By increasing the SCL clock period, you can delay the clock to be longer after the START. The maximum value may be less if the internal clock is very fast. 00 - No delay 01 - Increases SCL clock period by 1/2 10 - Increases SCL clock period by 1 11 - Increases SCL clock period by 3/2
15-12 —	Reserved
11-9 I2C_A10BEXT	I2C_A10BEXT Works with MCTRL[DA] and specifies the upper 3 bits of 10-bit address.
8 I2C_A10B	I2C_A10B Enables 10-bit addressing. When enabled for 10-bit addressing, the extra 3 bits are in bits 9 to 11. 0 - Disable 1 - Enable
7-6 —	Reserved
5 —	Reserved
4 I2CHS	I2C HS Uses the push-pull clock for I2C, and I2CBAUD and I2CBLOW must be used for 3.4MHz if this field is 1.
3-0 I2CBLOW	I2C Baud Low Overrides the I2CBAUD low period if not 0. So, I2CBAUD is used for high period, and I2CBLOW is used for low. This can allow an extended low such as for 400 kHz, as well as HS duty cycle. Note that this is 0 relative, so 1 is 1 × ODBAUD.

48.7.29 Controller Control (MCTRL)

Starts activities on the I3C or I2C bus (see the MWMSG registers). A request cannot be changed when a message is in progress; the REQUEST field becomes 0 automatically.

You must write to MCTRL fields as per use case or as mentioned in Operating modes. Bit read and write checking may not work independently.

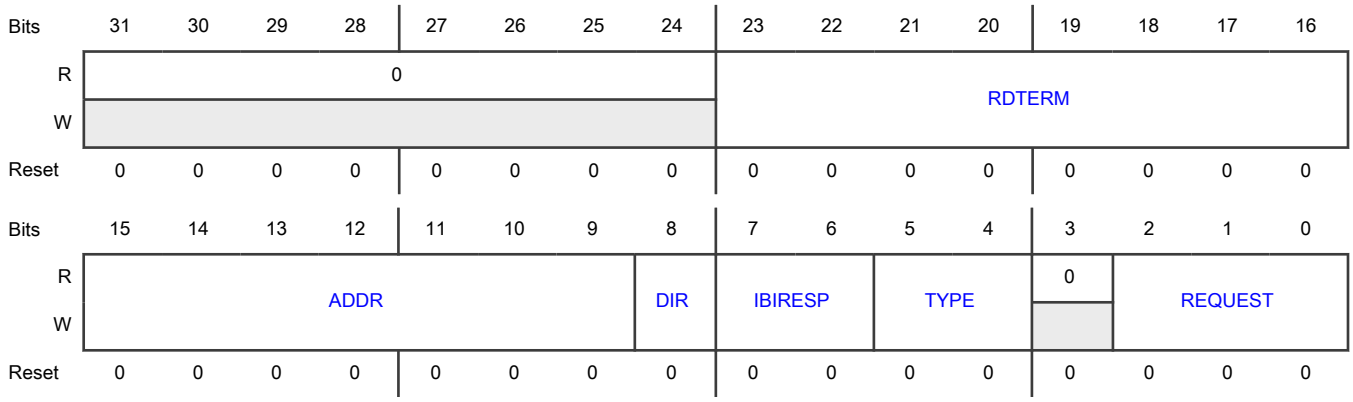
NOTE

If MCONFIG[MSTENA] is configured for I2C Controller mode (legacy I2C), only REQUEST = 1 and REQUEST = 2 are accepted. Also, fields are constrained to I2C-supported fields.

Offset

Register	Offset
MCTRL	84h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 RDTERM	Read Terminate Counter Determines when to terminate a read operation: • For I2C, this field controls when to NACK a read. • For I3C, this field can be used to terminate (end) a read: — If RDTERM is 0, it has no effect. — If RDTERM is 1, the read terminates after the next character. — If RDTERM is 2, the read terminates after the next two characters. The field supports up to 255 characters. In DDR mode, RDTERM terminates the read based on word counts (for DDR) instead of byte counts (for SDR).

Table continues on the next page...

Table continued from the previous page...

Field	Description
	The field self-clears when MSTATUS[COMPLETE] becomes 1. **NOTE** You may write 1 to this field anytime, but a value greater than 1 must be written when starting EmitStartAddress.
15-9 ADDR	Address Indicates the type of address: I3C dynamic address or I2C static address. Some values are not allowed based on the bus that is used (I3C or I2C).
8 DIR	Direction Indicates the direction, write or read. 0 - Write 1 - Read
7-6 IBIRESP	In-Band Interrupt Response Indicates the response to use when you get an IBI from START, and when to force using an IBI ACK NACK request when completing a manual IBI. Completion of a manual IBI means that the target DA is known, and so the mandatory byte (or not) is specified by the application when acknowledging. This field is also used when a message is emitted in Message mode using the MWMSG_SDR or MWMSG_DDR registers. If an IBI with MDB (mandatory byte) is ACKed, the controller limits it to a maximum of eight more bytes after the MDB. RDTERM = 1 can be used with REQUEST = NONE to terminate data from a target sooner. If this field is 0b, it indicates ACK (acknowledge). When REQUEST = 1 (EmitStartAddr) or REQUEST = 7 (AutoIBI), Controller In-band Interrupt Registry and Rules (MIBIRULES) decides whether to ACK with mandatory byte. When REQUEST = 3 (IBIAckNack), ACK with no mandatory byte. If this field is 1b, it indicates NACK (reject) or no acknowledgement. If this field is 10b, it indicates acknowledge with mandatory byte. When REQUEST = 1 or REQUEST = 7, ignore Controller In-band Interrupt Registry and Rules (MIBIRULES). Do not use this setting unless only targets with a mandatory byte can cause an IBI. When REQUEST = 3, ACK with mandatory byte. If this field is 11b, it indicates manual. When REQUEST = 1 or REQUEST = 7, stop and wait for a decision using the IBI ACK NACK request. When REQUEST = 3, this field is reserved. **NOTE** A CR and HJ always cause IBIRESP to become 3 (manual) so the application must decide. 00 - ACK (acknowledge) 01 - NACK (reject) 10 - Acknowledge with mandatory byte 11 - Manual
5-4	Bus Type with EmitStartAddr

Table continues on the next page...

Table continued from the previous page...

Field	Description
TYPE	Works with REQUEST to determine the bus type. See Determining bus types and modes for more information. The following values are valid only if REQUEST is 1. 00 - I3C 01 - I2C 10 - DDR 11 - Reserved
3 —	Reserved
2-0 REQUEST	Request Emits the requested operation when performing in pieces, instead of performing by message. You must check Controller Status (MSTATUS) because some requests can only be made in some states. For example, the system cannot enter SDR mode from DDR mode, and it cannot use an incorrect request in DAA mode. If this field is 0b, it indicates that no request is present (NONE). The REQUEST field returns to NONE after finishing a request. Controller Status (MSTATUS) indicates the state of the controller. See AutoIBI mode. NONE is written as 0 only in these cases: when writing 1 to MCTRL[RDTERM] (to stop a read in progress) or when configuring MCTRL[IBIRESP] for MSG use. If this field is 1b, it emits START with address and direction (EMITSTARTADDR), either from Stopped state or in the middle of a single data rate (SDR) message. If from Stopped state (Idle), then EmitStart may be prevented by an event (such as IBI, CR, HJ). In this case, an appropriate interrupt is signaled. EmitStart can be resubmitted. If this field is 10b, it emits a STOP on bus (EMITSTOP). Must be in SDR mode. In DAA mode, emitting STOP exits DAA mode. If this field is 11b, it indicates manual IBI ACK or NACK (IBIACKNACK). When MCTRL[IBIRESP] indicates a hold on an IBI to allow a manual decision, this request completes it. The field uses MCTRL[IBIRESP] to provide the information. If this field is 100b, and if currently not in DAA mode, it emits START, 7E, ENTDAA sequence, and then emits 7E/R to process the first target (PROCESSDAA). Stops just before the new dynamic address (DA) is to be emitted. The DA is written using Controller Write Data Byte (MWDATAB), then process DAA is requested again to write the new address, and then it starts the next unless marked to STOP. An MSTATUS indicating NACK means DA was not accepted (for example, parity error). If PROCESSDAA is NACKed on the 7E/R request, meaning no more targets need a DA, then a COMPLETE is signaled (along with DONE) and a STOP issued. If TYPE = 2 or 3, the DA is assigned and then it emits a STOP (instead of starting a new 7E/R request). If TYPE = 1 or 3, then the DA is taken from the ADDR field (bits 6:0). If this field is 110b, it emits an exit pattern from any state (force exit and target reset). End DDR mode (including MSGDDR), including a STOP afterward. If MCTRL[TYPE] is 2, perform a target reset action (RSTACT can prevent the reset in the target). Target reset may follow immediately after RSTACT CCC or STOP.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If this field is 111b, the target is held in a Stopped state, but autoemits a START, 7E sequence when the target holds SDA low for an IBI (AUTOIBI). Actual IBI handling is defined by MCTRL[IBIRESP]. 000 - NONE 001 - EMITSTARTADDR 010 - EMITSTOP 011 - IBIACKNACK 100 - PROCESSDAA 101 - Reserved 110 - Force Exit and Target Reset 111 - AUTOIBI

48.7.30 Controller Status (MSTATUS)

Indicates the controller status, including which events cause interrupts. The peripherals share the IRQ (called parallel-to-target status).

Because a peripheral can either be in Controller or Target mode, but not both at the same time, only one (target or controller peripheral) can cause the IRQ. If there is an IRQ and the peripheral is a controller, then this register (MSTATUS) indicates the status.

If there is an IRQ and the peripheral is a target, then Target Status (SSTATUS) indicates the status.

This register self-clears if the COMPLETE field becomes 1.

If the MCONFIG register is configured only for I2C, some states and fields never remain active (for example, DAA or IBI).

Offset

Register	Offset
MSTATUS	88h

Field	Description
31 —	Reserved
30-24 IBIADDR	IBI Address Indicates the address of: • The IBI when MSTATUS[IBITYPE] = 1. • The CR, when MSTATUS[IBITYPE] = 2. • 7'h2 when HJ, when MSTATUS[IBITYPE] = 3.
23-20 —	Reserved
19 NOWMASTER	Module is now Controller Flag Indicates whether the module is now a controller. That is, it was previously a target, and controllership acceptance was requested from the previous controller and controllership was accepted. The reverse operation (controller becomes a target) does not need an interrupt because the application grants it through the GETACCMST CCC. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not a controller 1 - Controller When writing 0 - No effect 1 - Clear the flag
18-16 —	Reserved
15 ERRWARN	Error or Warning Indicates whether an error occurred, such as improper register use, overrun, or underrun of FIFO or buffer, or invalid parity or CRC in a DDR read. See Controller Errors and Warnings (MERRWARN) for more information. 0 - No error or warning 1 - Error or warning
14 —	Reserved
13	In-Band Interrupt (IBI) Won Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
IBIWON	Indicates whether an IBI, CR, or HJ has won the arbitration on a header address, regardless of whether it was NACKed or ACKed. Arbitration requires manual intervention for CR and HJ, and optionally requires it for IBI if MCTRL[IBIRESP] = 3 (manual). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No IBI arbitration won 1 - IBI arbitration won When writing 0 - No effect 1 - Clear the flag
12 TXNOTFULL	TX Buffer or FIFO Not Full Indicates whether the buffer, FIFOm, or message register can accept another byte or halfword. FIFO uses trigger level. If DMA is enabled for transmitting, it transfers data as long as it is not full. 0 - Receive buffer or FIFO full 1 - Receive buffer or FIFO not full
11 RXPEND	RXPEND Indicates whether a message is being received from a target and bytes are in the input buffer or FIFO: • When using a FIFO, this message is at least one FIFO trigger's worth (a minimum of one byte in the FIFO). • When DMA is enabled for receiving, the DMA is signaled. RXPEND becomes 0 when the data is read. 0 - No receive message pending 1 - Receive message pending
10 COMPLETE	Complete Flag Indicates whether a message is complete: • With MWMSG_SDR or MWMSG_DDR, the COMPLETE condition occurs when MWMSG_SDR_CONTROL[LEN] or MWMSG_DDR_CONTROL[LEN] reaches 0. • When MCTRL[REQUEST] = 1 (EmitStartAddr), this COMPLETE condition occurs after the end of a write operation, or after a read operation has terminated or ended. • With an IBI (AutoIBI or EmitStartAddr), the COMPLETE condition occurs at the end of IBI data (if any).

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE This field behaves differently for register reads and writes. When reading 0 - Not complete 1 - Complete When writing 0 - No effect 1 - Clear the flag
9 MCTRLDONE	Controller Control Done Flag Indicates whether the module has completed an MCTRL request. MCTRLDONE automatically becomes 0 when writing a new control. If MCTRL[REQUEST] = 1 (EmitStartAddr), MCTRLDONE becomes 1 when the address goes out (and is ACKed, NACKed, or ended in an IBI). If ACKed, MSTATUS[COMPLETE] becomes 1 after the write or read data is complete. If MCTRL[REQUEST] = 4 (ProcessDAA), MCTRLDONE becomes 1 when the module is ready to emit the dynamic address (DA) for the target, or when no more targets are ACKing. This condition can be determined by using the MSTATUS[BETWEEN] and MSTATUS[STATE] fields. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Not done 1 - Done When writing 0 - No effect 1 - Clear the flag
8 SLVSTART	Target Start Flag Indicates whether a target is or was requesting a START by holding SDA low. Handling starts automatically when MCTRL[REQUEST] = 7 (AutoIBI). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Target not requesting START 1 - Target requesting START When writing

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - No effect 1 - Clear the flag
7-6 IBITYPE	In-Band Interrupt (IBI) Type Indicates the type of IBI of the last event that won the arbitration, whether the interrupt was ACKed, NACKed, or pending. 00 - NONE (no IBI: this status occurs when MSTATUS[IBIWON] becomes 0) 01 - IBI 10 - CR 11 - HJ
5 NACKED	Not Acknowledged Indicates whether the last start and address sequence was NACKed (was not ACKed by the addressed target). 0 - Not NACKed 1 - NACKed (not acknowledged)
4 BETWEEN	Between Indicates whether the controller is active between messages or dynamic address assignments (DAA). It is active when: • MSTATUS[STATE] is MSGSDR, DDR, or DAA, or NORMACT, and the state is between messages or DAAs. It is expecting a new message or DAA to start (or STOP or exit). • MSTATUS[STATE] is NORMACT. The module is waiting for the transmit FIFO to be not empty or the receive FIFO to be not full. 0 - Inactive (for other cases) 1 - Active
3 —	Reserved
2-0 STATE	State of the Controller Indicates the current controller state. If this field is 0b, it indicates that the controller is idle (the bus has stopped.) If this field is 1b, it indicates target request. The bus has stopped but a target is holding SDA low. When using auto-emit IBI (MCTRL[REQUEST] = 7), the controller does not remain in this state. If this field is 10b, it indicates entry into Single Data Rate Message mode, using MWMSG_SDR. If this field is 11b, it indicates entry into normal active SDR mode, using MCTRL, MWDATA*n*, and MRDATA*n* registers. The controller remains in this state until a STOP is issued.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If this field is 100b, it indicates entry into Double Data Rate Message mode, using MWMSG_DDR or the normal method with DDR. The controller remains in the DDR state until the controller exits using EXIT (emitting the Exit pattern). If this field is 101b, it indicates entry into Dynamic Address Assignment (ENTDAA) mode. If this field is 110b, it indicates wait for an IBI ACK/NACK decision. If this field is 111b, it indicates receiving an IBI. This state is used after IBI, CR, or HJ has won an arbitration. The IBIRCV state is also used for IBI mandatory byte (if any) and any bytes that follow. 000 - IDLE (bus has stopped) 001 - SLVREQ (target request) 010 - MSGSDR 011 - NORMACT 100 - MSGDDR 101 - DAA 110 - IBIACK 111 - IBIRCV

48.7.31 Controller In-band Interrupt Registry and Rules (MIBIRULES)

Contains the rules for using IBI, and keeps a registry of the targets that use the IBI byte.

This register defines the IBI mandatory byte rules for the targets and determines which targets do (or do not) have a mandatory byte.

Concerning ADDR*n* fields: The address has 6 bits. Assuming that MIBIRULES[MSB0] = 1, the most significant bit of each address is 0. In this case, each address is 7 bits (usually written as A7 to A1) and A7 must be 0. If the application does not use that optimal convention, the "manual" method of IBI ACK handling must be used (see MCTRL[IBIRESP] for more information).

By default, the ADDR*n* values indicate the targets with a mandatory byte. If MIBIRULES[NOBYTE] = 1, the ADDR*n* values indicate targets that do not have a mandatory IBI byte.

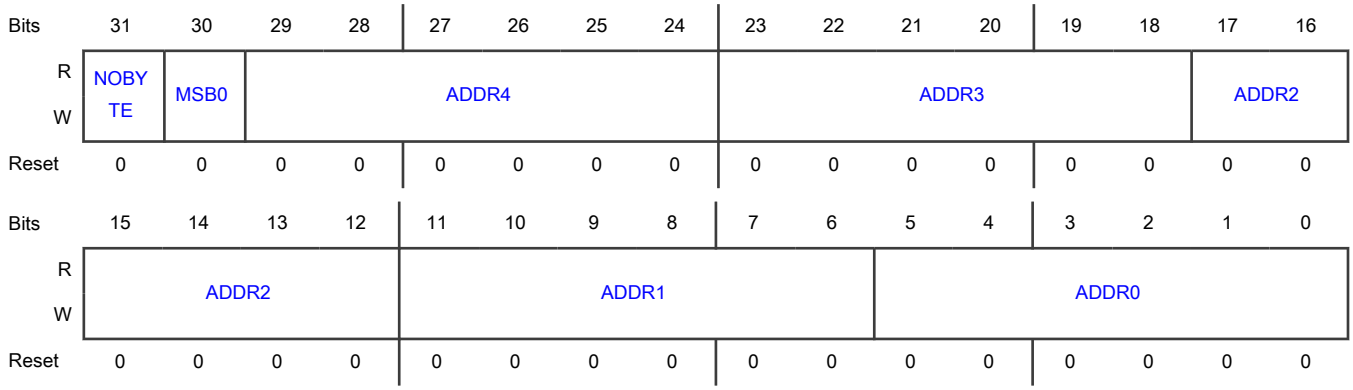
NOTE

A7 = 0 is only needed for targets that use IBI. For legacy I2C devices, A7 can use any valid value because I2C devices cannot cause an IBI.

Offset

Register	Offset
MIBIRULES	8Ch

Diagram



Fields

Field	Description
31 NOBYTE	No IBI byte Specifies whether the ADDR*n* fields refer to targets with or without a mandatory IBI byte. 0 - With mandatory IBI byte 1 - Without mandatory IBI byte
30 MSB0	Most Significant Address Bit is 0 Specifies whether MSB is 0 for all I3C dynamic addresses. Assigning 1 to this field allows the START header to be optimized. 0 - MSB is not 0 1 - MSB is 0
29-24 ADDR4	ADDR4 Specifies the address of the target with or without mandatory IBI byte. If 0, then the address does not apply.
23-18 ADDR3	ADDR3 Specifies the address of the target with or without mandatory IBI byte. If 0, then the address does not apply.
17-12 ADDR2	ADDR2 Specifies the address of the target with or without mandatory IBI byte. If 0, then the address does not apply.
11-6 ADDR1	ADDR1 Specifies the address of the target with or without mandatory IBI byte. If 0, then the address does not apply.
5-0 ADDR0	ADDR0 Specifies the address of the target with or without mandatory IBI byte. If 0, then the address does not apply.

48.7.32 Controller Interrupt Set (MINTSET)

Returns the status of the interrupt enables when read. This register sets interrupt enables for select fields in Controller Status (MSTATUS):

- To activate an interrupt enable, write 1 to its corresponding field.
- To disable an interrupt enable, write 1 to the appropriate field in Controller Interrupt Clear (MINTCLR). Writing 0 to the interrupt enable in MINTSET does not disable the interrupt.

The interrupt registers allow masking of interrupt sources as well as checking which interrupts are activated in Controller Status (MSTATUS). The normal method is to enable an interrupt and then after that interrupt fires, clear the interrupt either by writing to Controller Status (MSTATUS) or via an action on the corresponding data register. The interrupt is level-held, meaning that the interrupt remains 1 until the cause is cleared by some method. The module prevents races; if a new event comes in, that new event is not lost.

These interrupts are parallel to Target Interrupt Set (SINTSET) and Target Interrupt Clear (SINTCLR), and only one interrupt set is active depending on the state (controller or target operation):

- MINTSET: Sets interrupt enables for MSTATUS fields. Reading the MINTSET register returns the status of the interrupt enables.
- MINTCLR: Clears interrupt enables for MSTATUS fields.
- MINTMASKED: Returns the value of the MSTATUS fields ANDed with their interrupt enables.

Offset

Register	Offset
MINTSET	90h

Field	Description
31-20 —	Reserved
19	Now Controller Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
NOWMASTER	Enables the corresponding interrupt to indicate whether the module is now a controller (now this I3C module is a controller). That is, it was previously a target; controllership acceptance was requested from the previous controller and it was accepted. 0 - Disable 1 - Enable
18-16 —	Reserved
15 ERRWARN	Error or Warning (ERRWARN) Interrupt Enable Enables the corresponding interrupt to indicate whether an error occurred, such as improper register use, overrun or underrun of FIFO or buffer, or invalid parity or CRC in a DDR read. 0 - Disable 1 - Enable
14 —	Reserved
13 IBIWON	IBI Won Interrupt Enable Enables the corresponding interrupt to indicate whether an IBI, CR, or HJ has won the arbitration on a header address, regardless of whether it was NACKed or ACKed. 0 - Disable 1 - Enable
12 TXNOTFULL	Transmit Buffer/FIFO Not Full Interrupt Enable Enables the corresponding interrupt to indicate whether the buffer, FIFOm, or message register can accept another byte or halfword. 0 - Disable 1 - Enable
11 RXPEND	Receive Pending Interrupt Enable Enables the corresponding interrupt to indicate whether a message is being received from a target and bytes are in the input buffer or FIFO.
10 COMPLETE	Completed Message Interrupt Enable Enables the corresponding interrupt to indicate whether a message is complete. 0 - Disable 1 - Enable
9 MCTRLDONE	Controller Control Done Interrupt Enable Enables the corresponding interrupt to indicate whether the module has completed an MCTRL request.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Disable 1 - Enable
8 SLVSTART	Target Start Interrupt Enable Enables the corresponding interrupt to indicate whether a target is or was requesting a START by holding SDA low. 0 - Disable 1 - Enable
7-0 —	Reserved

48.7.33 Controller Interrupt Clear (MINTCLR)

Clears interrupt enables for select fields in Controller Status (MSTATUS). Writing 1 clears the corresponding interrupt enable. Writing 0 has no effect.

Offset

Register	Offset
MINTCLR	94h

7-0 —	Reserved

48.7.35 Controller Errors and Warnings (MERRWARN)

Contains errors and warnings. When any errors or warnings are not 0, then MSTATUS[ERRWARN] is 1.

Parallel-to-target ERRWARN:

- In Controller mode, use this register (MERRWARN).
- In Target mode, use Target Errors and Warnings (SERRWARN).

The error fields in both registers (MERRWARN and SERRWARN) are similar in meaning.

Offset

Register	Offset
MERRWARN	9Ch

Fields

Field	Description
31-22 —	Reserved
21 —	Reserved
20 TIMEOUT	Timeout Error Flag Indicates an error caused by the module stalling for too long in a frame. This stalling occurs when: • The transmit FIFO or receive FIFO is not handled, and the bus is stuck in the middle of a message. • No STOP is issued after data transfer (there is a gap between messages). • IBI manual is used and no decision has been made. The maximum stall period is 10 kHz or 100 µs. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
19 INVREQ	Invalid Request Error Flag Indicates an error caused by an invalid use of a request: • Not using IBI ACK NACK when stopped in manual hold for IBI acknowledgment.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	• Using a request other than ForceStop or ForceExit when in a message. Other requests are valid when the message is done. • Other mismatched uses (for example, IBI ACK NACK in normal states). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
18 MSGERR	Message Error Flag Indicates an error caused by: • Trying to write to or read from the MWMSG_SDR register when in a DDR message. • Trying to write to or read from the MWMSG_DDR register when in an SDR message. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
17 OWRITE	Overwrite Error Flag Indicates an error caused by trying to write to Controller Write Data Byte (MWDATAB) when the FIFO is full. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Clear the flag
16 OREAD	Overread Error Flag Indicates an error caused by: • Trying to read from Controller Read Data Byte (MRDATAB) when the FIFO is empty. • Trying to read from the MRMSG_SDR register or the MRMSG_DDR register when no message has yet started. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
15-13 —	Reserved
12 —	Reserved
11 —	Reserved
10 HCRC	High Data Rate CRC Error Flag Indicates that a cyclic redundancy check (CRC) error occurred from a DDR read. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
9	High Data Rate Parity Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
HPAR	Indicates a parity error from a DDR read, including a bad preamble on a read. This does not stop the read because it is not safe to terminate; the read data may become misframed. Ends on a run of 1 second. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
8-5 —	Reserved
4 TERM	Terminate Error Flag Indicates an error when this controller terminates a target read because the read exceeded the count for the message. This error is valid only when using the MWMSG_SDR or MWMSG_DDR register. If you write to the MWMSG_SDR or MWMSG_DDR register, this field automatically becomes 0. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
3 WRABT	Write Abort Error Flag Indicates an error caused by the I2C target NACKing the write data, terminating the message. For example, the controller is writing in I2C and the target NACKed the write. If you write to the MCTRL register, this field automatically becomes 0. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Error When writing 0 - No effect 1 - Clear the flag
2 NACK	Not Acknowledge Error Flag Indicates an error caused by the target or targets NACKing (not acknowledging) the last address. If 7Eh is the address, then it indicates all targets NACKed the last address. If you write to the MCTRL register, this field automatically becomes 0. **NOTE** In HDR mode, this error occurs when an address is not accepted (as opposed to NACKed). **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
1 URUN	Underrun Error Flag Indicates an underrun for HDR-BT. This error occurs when attempting to write from an empty transmit FIFO. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error 1 - Error When writing 0 - No effect 1 - Clear the flag
0 —	Reserved

48.7.36 Controller DMA Control (MDMACTRL)

Allows DMA to be used for inbound and outbound messages. DMA is much more useful for a controller than for a target because the controller directs the bus traffic and actions. DMA can be used with a controller in these ways:

- Push or pull data for MCTRL[REQUEST] = 1 (EmitStartAddr) request written by the processor.
- Implementing message mode, completely controlled by DMA.

Offset

Register	Offset
MDMACTRL	A0h

Diagram

R	0								BULKTB	BULKFB	DMAWIDTH		DMATB		DMAFB	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Fields

Field	Description
31-8 —	Reserved
7 BULKTB	Bulk Transfer to Bus Enables bulk transfers to bus. This field indicates whether the MDATACTRL transmit trigger (MDATACTRL[TXTRIG]) is used to make DMA requests. The field is used only if the DMA supports bulk transfers (more than a byte, halfword, or word at a time, that is, MDATACTRL[TXTRIG] < 3). 0 - Disable 1 - Enable
6 BULKFB	Bulk Transfer from Bus Enables bulk transfers from bus. This field indicates whether the MDATACTRL receive trigger (MDATACTRL[RXTRIG]) is used to make DMA requests. The field is used only if the DMA supports bulk transfers (more than a byte, halfword, or word at a time, that is, MDATACTRL[RX_TRIG] > 0). 0 - Disable 1 - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
5-4 DMAWIDTH	DMA Width Specifies the data width of DMA operations. The halfword (16 bits) setting ensures that two bytes are free or available in FIFO. 00,01 - Byte 10 - Halfword (16 bits) 11 - Reserved
3-2 DMATB	DMA to Bus Represents the DMA write (to-bus) trigger. When DMAFB = 1 or DMAFB = 2, I3C requests DMA when a transmit trigger occurs (see Controller Data Control (MDATACTRL)). I3C requests until full, unless the DMA is set up as a trigger. DMAFB becomes 0 when MSTATUS[ERRWARN] = 1. If this field is 1b, STOP or repeated START causes DMATB to become 0 (see SCONFIG[MATCHSS]). Normally, DMA enable must be used only in Controller Message mode. 00 - DMA not used 01 - Enable DMA for one frame (ended by DMA or terminated) 10 - Enable DMA until DMA is turned off. Recommended mode, instead of 01b, to enable DMA. This setting provides better software control. 11 - Reserved
1-0 DMAFB	DMA from Bus Represents the DMA read (from-bus) trigger. When DMAFB = 1 or DMAFB = 2, I3C requests DMA when a receive trigger occurs (see Controller Data Control (MDATACTRL)). I3C requests until empty unless the DMA is set up as a trigger. DMAFB becomes 0 when MSTATUS[ERRWARN] = 1. If this field is 1b, STOP or Repeated START causes DMAFB to automatically become 0 (see SCONFIG[MATCHSS]). **NOTE** Do not enable DMA after a transaction starts. It must be enabled only when enabling the controller and interrupts to avoid any kind of RX FIFO overrun. 00 - DMA not used 01 - Enable DMA for one frame 10 - Enable DMA until DMA is turned off. Recommended mode, instead of 01b, to enable DMA. This setting provides better software control. 11 - Reserved

48.7.37 Controller Data Control (MDATACTRL)

Assists in data control when there is no FIFO. This register also assists the FIFO when FIFO is available (regardless of size), and this assistance allows some control over the FIFO behavior. In particular, the register provides control over when to interrupt when a particular state of fullness or emptiness is reached. It also controls behavior related to width, when the width is not 1 byte wide.

This register acts as an alias of Target Data Control (SDATACTRL).

NOTE

When flushing a FIFO if DMA is in use, disable the DMA channel first. You must not use FIFO flush when a message (in that direction) is in flight.

Offset

Register	Offset
MDATACTRL	ACh

28-24 RXCOUNT	Receive Entry Count Contains the count of entries in the receive FIFO or buffer. Entry size for SDR and HDR-DDR is in bytes.
23-22 —	Reserved
21 —	Reserved
20-16 TXCOUNT	Transmit Entry Count Contains the count of entries waiting in the TXFIFO. This count is the number of entries that the application has written to the transmit FIFO that have not yet gone onto the bus. Entry size for SDR and HDR-DDR is in bytes.
15-8 —	Reserved
7-6 RXTRIG	Receive Trigger Level Indicates the trigger level for receive fullness when using a FIFO. This field affects the RXPEND interrupt and DMA (if enabled). 00 - Trigger when not empty (default) 01 - Trigger when 1/4 full or more 10 - Trigger when 1/2 full or more 11 - Trigger when 3/4 full or more
5-4 TXTRIG	Transmit Trigger Level Indicates the trigger level for transmit emptiness when using a FIFO. This field affects the TXNOTFULL interrupt and DMA (if enabled). 00 - Trigger when empty 01 - Trigger when 1/4 full or less 10 - Trigger when 1/2 full or less 11 - Trigger when 1 less than full or less (default)
3 UNLOCK	Unlock Unlocks the functionality so that the RXTRIG and TXTRIG fields can be changed on a write. This field must be 1 (unlocked) in the same cycle when writing to TXTRIG or RXTRIG. If this field is 0 (locked), RXTRIG and TXTRIG fields cannot be changed on a write. 0 - Locked

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Unlocked
2 —	Reserved
1 FLUSHFB	Flush From-Bus Buffer or FIFO Flushes from-bus buffer or FIFO. You normally do not use this field. **NOTE** Before using FLUSHFB, disable the DMA (MDMACTRL[DMAFB] = 0). Then use FLUSHFB to flush the FIFO and then re-enable the DMA. 0 - No action 1 - Flush the buffer
0 FLUSHTB	Flush To-Bus Buffer or FIFO Flushes to-bus buffer or FIFO. This field is used when the controller terminates a to-bus message (read) prematurely. **NOTE** Before using FLUSHTB, disable the DMA (MDMACTRL[DMATB] = 0). Then use FLUSHTB to flush the FIFO and then re-enable the DMA. 0 - No action 1 - Flush the buffer

48.7.38 Controller Write Data Byte (MWDATAB)

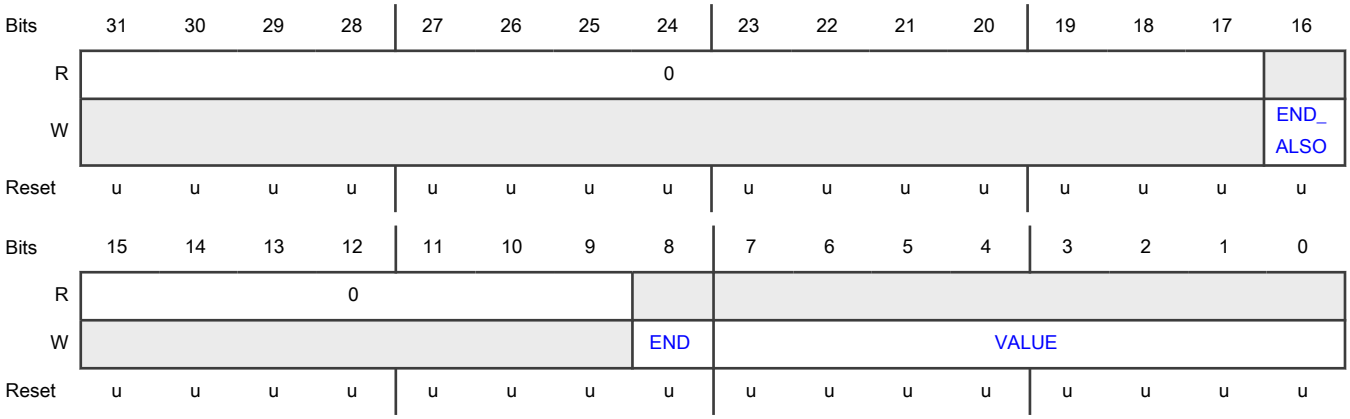
Allows writing bytes to send onto the bus. This register is used only when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

This register acts as an alias of Target Write Data Byte (SWDATAB).

Offset

Register	Offset
MWDATAB	B0h

Diagram



Fields

Field	Description
31-17 —	Reserved
16 END_ALSO	End of Message ALSO Indicates end of message, used to end an outbound message normally. Every message must indicate when it is the last message to be sent. This method can be used with the MDATABE register. This field is required for I3C and is optional for I2C. For HDR-DDR, the byte with END_ALSO must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. If this field is 0, more bytes are assumed to be in the message. If this field is 1, the END bit marks the last byte of the message. 0 - Not the end 1 - End
15-9 —	Reserved
8 END	End of Message Indicates the end of a message. This field is required for I3C and is optional for I2C. For HDR-DDR, the byte with the END must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. If this field is 0, more bytes are assumed to be in the message. If this field is 1, the END bit marks the last byte of the message. 0 - Not the end 1 - End
7-0 VALUE	Data Byte Represents the byte written to the target (stored in transmit FIFO): • I3C computes the parity. • I2C manages the ACK or NACK.

48.7.39 Controller Write Data Byte End (MWDATABE)

Allows writing the last byte to send onto the bus. This register is used only when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

This register acts as an alias of Target Write Data Byte End (SWDATABE).

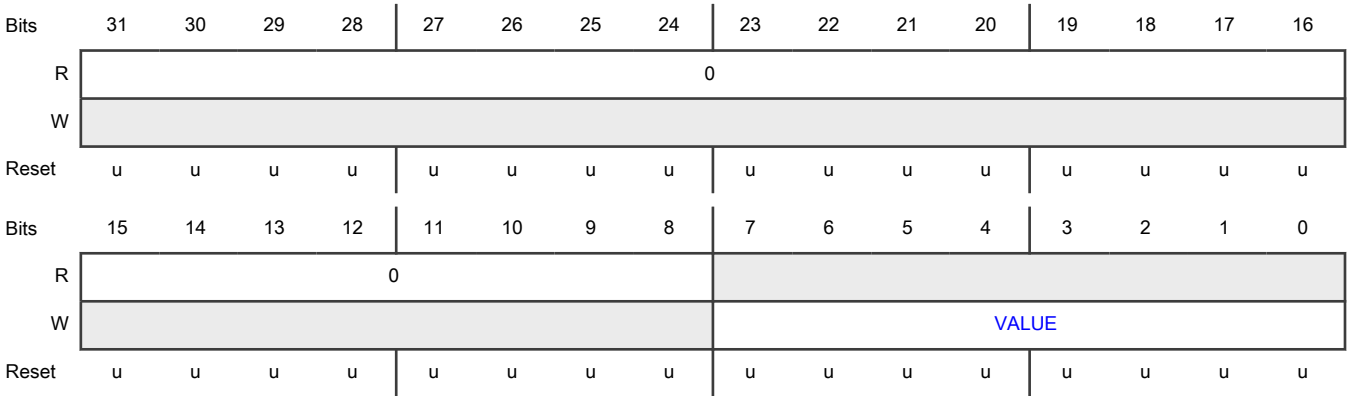
NOTE

MWDATABE can also indicate END using bit 8.

Offset

Register	Offset
MWDATABE	B4h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 VALUE	Data Represents the last byte written to the target (stored in transmit FIFO): • I3C computes the parity. • I2C manages the ACK or NACK.

48.7.40 Controller Write Data Halfword (MWDATAH)

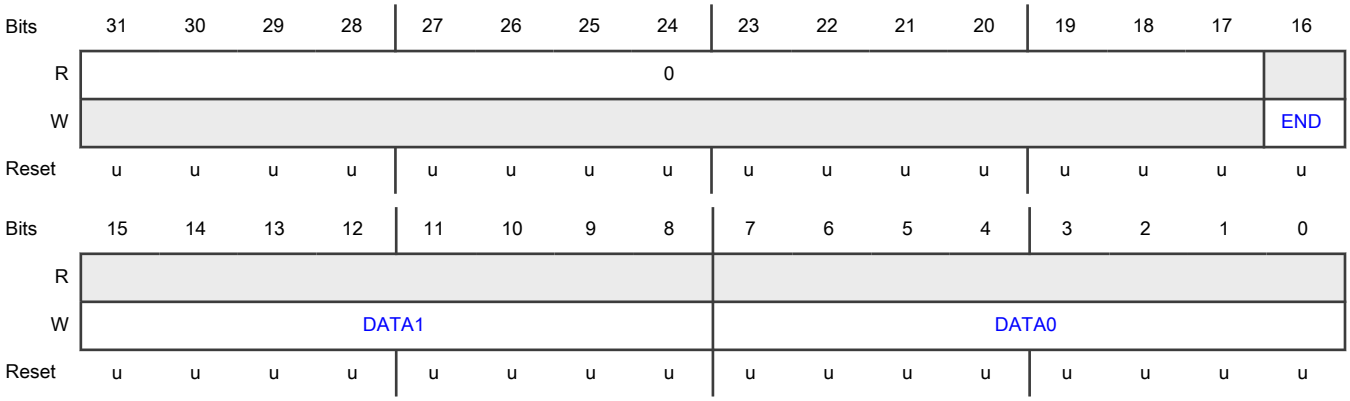
Allows writing a halfword (pair of bytes) to the bus unless an external FIFO is used, sending the low byte followed by the high byte. An end-of-data (last) marker bit is allowed (or must be 0). A halfword must not be written unless there is room for both, as indicated by the use of transmit FIFO level trigger or MDATACTRL[TXCOUNT].

This register acts as an alias of Target Write Data Halfword (SWDATAH).

Offset

Register	Offset
MWDATAH	B8h

Diagram



Fields

Field	Description
31-17 —	Reserved
16 END	End of Message Indicates the end of a message. For this register, this field always marks DATA1 as the end. This field is required for I3C and is optional for I2C. For HDR-DDR, the byte with the END must be an even byte (second, fourth, sixth, and so on) because DDR uses byte pairs. If this field is 0, more bytes are assumed to be in the message. If this field is 1, the END bit marks the last byte of the message. 0 - Not the end 1 - End
15-8 DATA1	Data Byte 1 Represents the second byte that is sent to the target (written to transmit FIFO).
7-0 DATA0	Data Byte 0 Represents the first byte that is sent to the target (written to transmit FIFO).

48.7.41 Controller Write Data Halfword End (MWDATAHE)

Allows writing a halfword of data, which is the end (the last byte of the halfword is the end). The target writes the halfword (byte pair) in the same way as it does to Controller Write Data Halfword (MWDATAH), but marks the second byte as end-of-data (last byte).

For HDR-DDR, the byte with the END must be even (second, fourth, sixth, and so on) because DDR uses byte pairs.

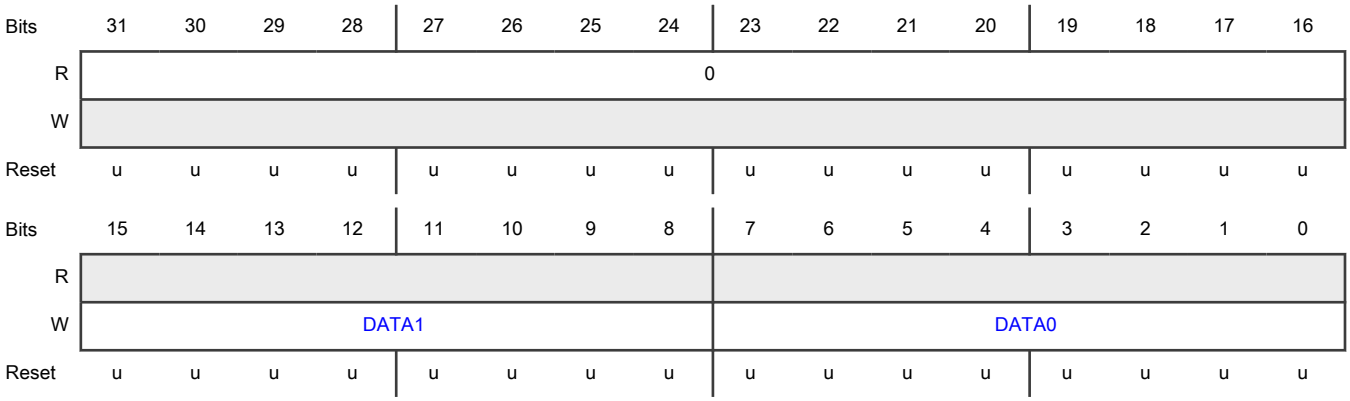
You must not write a halfword unless there is room for both, as indicated by the use of transmit FIFO level trigger or MDATACTRL[TXCOUNT].

This register acts as an alias of Target Write Data Halfword End (SWDATAHE).

Offset

Register	Offset
MWDATAHE	BCh

Diagram



Fields

Field	Description
31-16 —	Reserved
15-8 DATA1	Data Byte 1 Represents the second byte that is sent to the target (written to transmit FIFO).
7-0 DATA0	Data Byte 0 Represents the first byte that is sent to the target (written to transmit FIFO).

48.7.42 Controller Read Data Byte (MRDATAB)

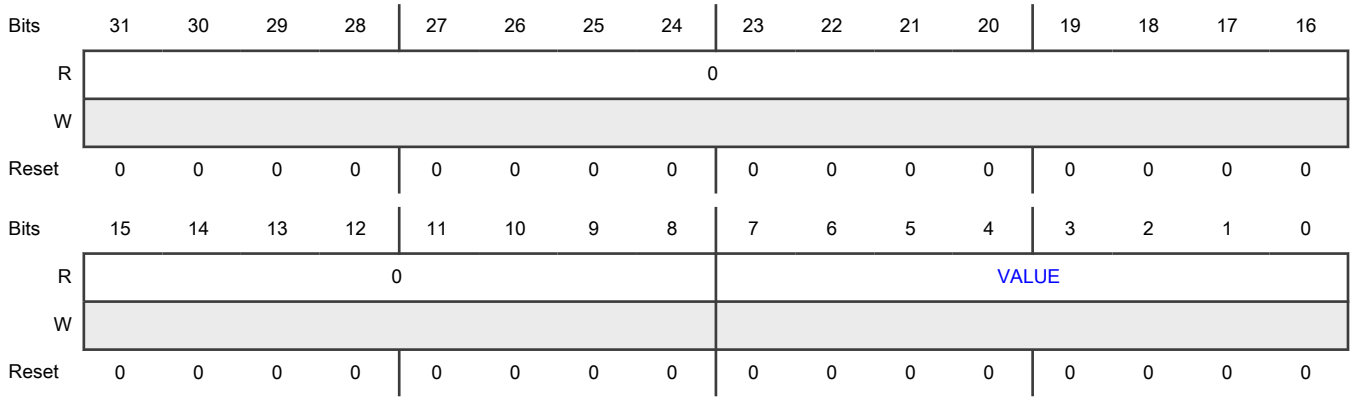
Allows reading bytes written by the target after an SDR read, or DAA or DDR. This register is used only when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

This register acts as an alias of Target Read Data Byte (SRDATAB).

Offset

Register	Offset
MRDATAB	C0h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 VALUE	Value Represents the byte read from the controller (and written by the target).

48.7.43 Controller Read Data Halfword (MRDATAH)

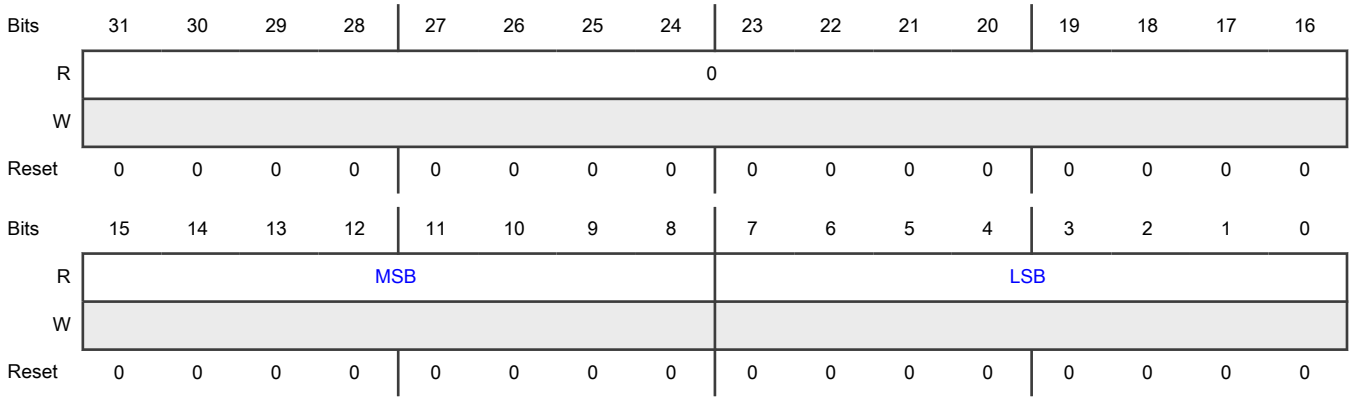
Allows reading a halfword (byte pair) written by the target after an SDR read or DAA or DDR. This register is used only when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

A halfword must not be read unless there are at least two bytes of data waiting, as indicated by the receive FIFO level trigger or MDATACTRL[RXCOUNT].

Offset

Register	Offset
MRDATAH	C8h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-8 MSB	High Byte Represents the second byte read from the controller (and written by the target).
7-0 LSB	Low Byte Represents the first byte read from the controller (and written by the target).

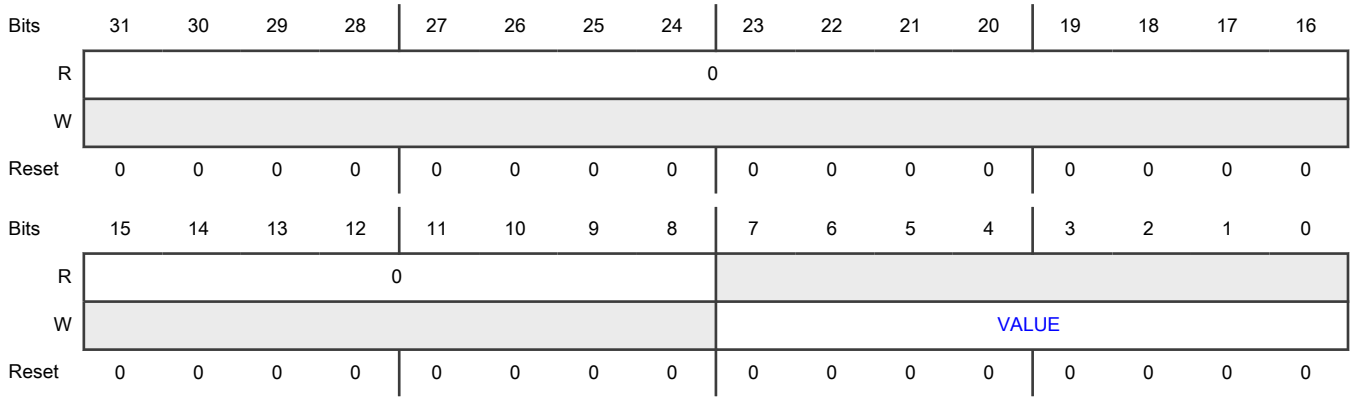
48.7.44 Controller Write Byte Data 1 (to Bus) (MWDATAB1)

Allows writing bytes to send onto the bus, and is intended for DMAs that do not clear the upper bits of the word. This register does not have the END bits and is only used when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

Offset

Register	Offset
MWDATAB1	CCh

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 VALUE	Value Represents the byte to write out. The I3C module computes the parity for I3C, or manages the ACK or NACK for I2C.

48.7.45 Controller Write Halfword Data (to Bus) (MWDATAH1)

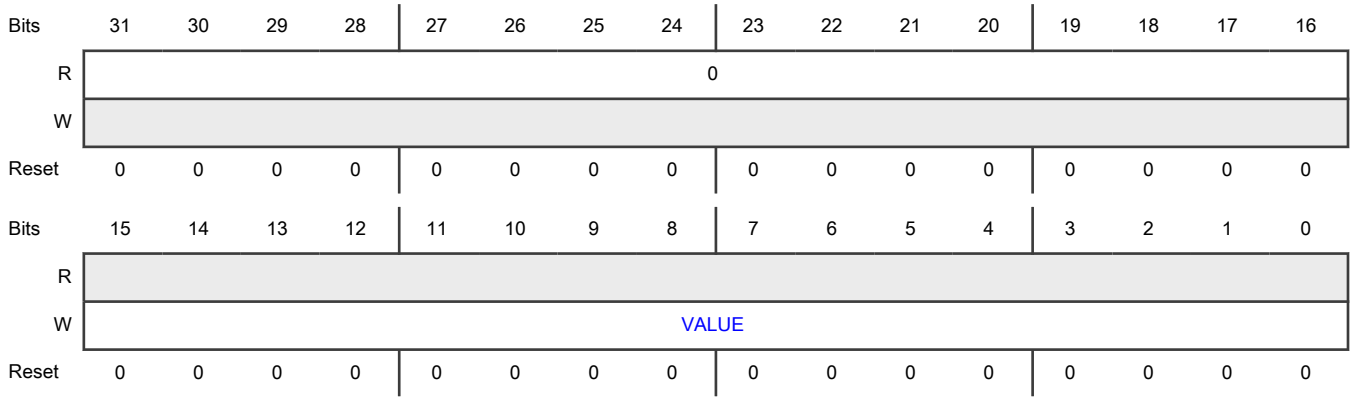
Allows writing a byte pair (halfword) to send onto the bus, and is intended for DMAs that do not clear the upper bits of the word. It does not have the END bits as present in Controller Write Data Halfword (MWDATAH). This register is only used when using Controller Control (MCTRL) to start the message. If MWMSG_SDR or MWMSG_DDR is used to start a message, that interface must be used exclusively.

MWDATAH1 shares the same address as MWDATAB1. MDMACTRL[DMAWIDTH] determines which one is set.

Offset

Register	Offset
MWDATAH1	CCh

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 VALUE	Value Represents the byte to write out. The I3C module computes the parity for I3C, or manages the ACK or NACK for I2C.

48.7.46 Controller Write Message Control in SDR mode (MWMSG_SDR_CONTROL)

Allows setting up and writing 16-bit words in Single Data Rate (SDR) mode. The MWMSG_SDR_ register is modal and has two modes—control and data:

- For the first write to set up a new message, this register functions as the MWSMSG_SDR_CONTROL register.
- For subsequent writes, this register functions as MWMSG_SDR_DATA.
- The control information is not pipelined. You must write to control information registers for a start and do not write to them until data is sent.

When not in the middle of a message, the MWMSG_SDR_CONTROL register is used to start a new message (or emit a STOP). After starting a message, the MWMSG_SDR_DATA register is used until the length (see the LEN field) counts down, or until data with END = 1 is used.

The MWMSG_SDR_CONTROL register is written with the 16-bit control word if currently stopped or after the end of the previous message. If MSTATUS[STATE] = 2 (MSGSDR) and MSTATUS[BETWEEN] = 0, the register (at this offset address) functions as the MWMSG_SDR_DATA register. Otherwise, this register (at this offset address) functions as the MWMSG_SDR_CONTRL register, as long as MSTATUS[STATE] is not in another mode.

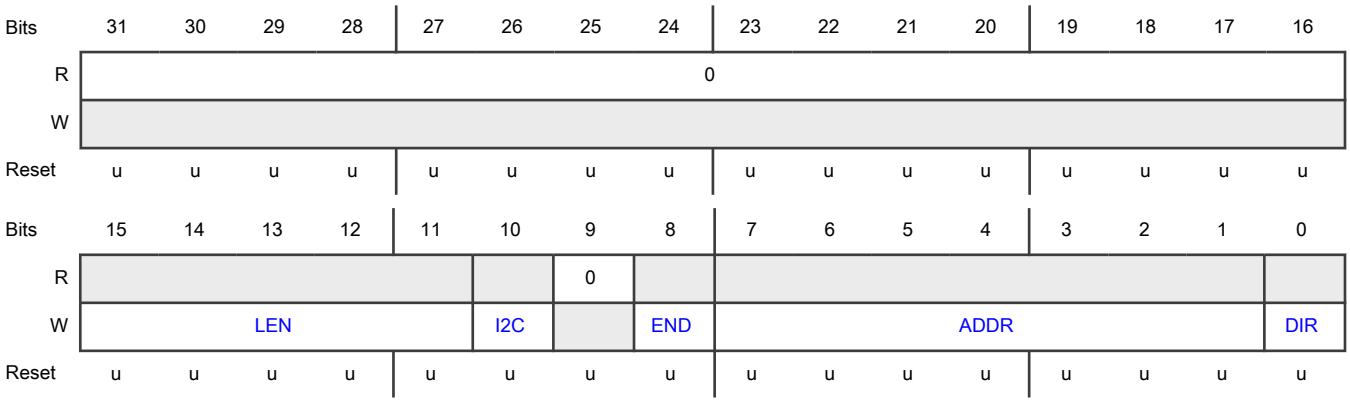
The control word contains the byte length (6-bit), address, direction, and how it ends (stop, ready for next, continuation with more length). If the command is START and an event (IBI, CR, HJ) occurs, MCTRL[IBIRESP] is used to determine action, and the corresponding interrupt occurs. In that case, the message is restarted.

The MWMSG_SDR_CONTROL and MWMSG_SDR_DATA registers are only targeted for DMA operations, but the processor can also write to the MWMSG_SDR_CONTROL register (instead of using MCTRL and MxDATAB).

Offset

Register	Offset
MWMSG_SDR_CONTROL	D0h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-11 LEN	Length Indicates the byte length of the message. If LEN = 0, then only END is used (and it does not use the address if stopped). LEN = 1 must not be used. The minimal LEN size is 2 bytes (LEN = 2).
10 I2C	I2C Specifies whether the message is I2C or I3C. 0 - I3C message 1 - I2C message
9 —	Reserved
8 END	End of SDR Message Indicates the end of SDR message. MSTATUS[COMPLETE] = 1 when done. The end can happen: • Before LEN bytes are read in I3C mode, if a target ends sooner. • Before LEN bytes are written in I2C mode, if a target NACKs. If this field is 0, the SDR message ends waiting for a new SDR message (issues a Repeated START for a new message).

Table continues on the next page...

Table continued from the previous page...

Field	Description
	If this field is 1, the SDR message ends at the STOP. 0 - Not the end 1 - End
7-1 ADDR	Address Contains the address to be written.
0 DIR	Direction 0 - Write 1 - Read

48.7.47 Controller Write Message Data in SDR mode (MWMSG_SDR_DATA)

Contains the 16-bit word to be written in Single Data Rate (SDR) mode. This register functions in a way similar to MWMSG_SDR_CONTROL.

Offset

Register	Offset
MWMSG_SDR_DATA	D0h

Diagram

15-0 DATA16B	Data

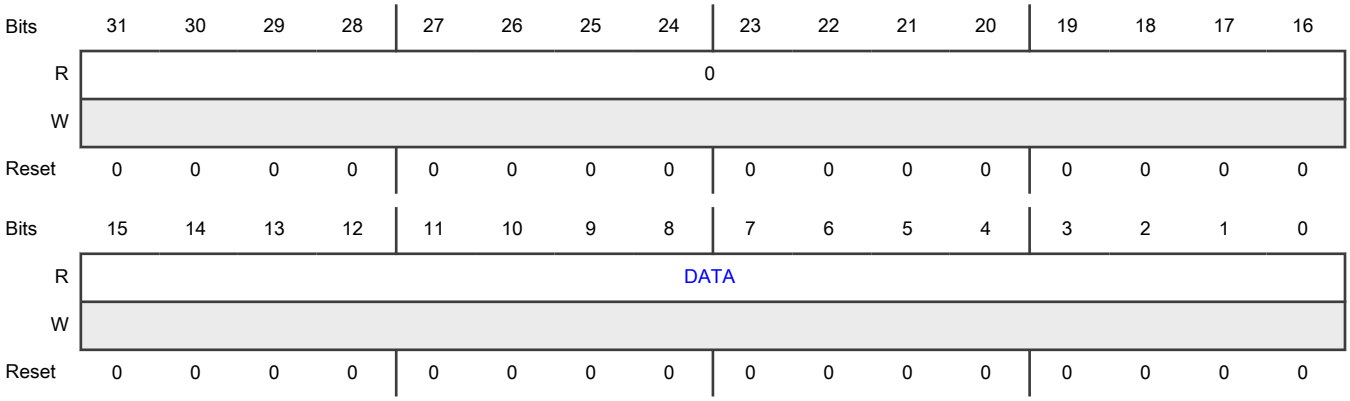
48.7.48 Controller Read Message in SDR mode (MRMSG_SDR)

Allows reading 16-bit words from a target in SDR Message mode. The MRMSG_SDR register is used to read 16-bit words from an active message started with MWMSG_SDR. These words are intended to be read by DMA.

Offset

Register	Offset
MRMSG_SDR	D4h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 DATA	Data Contains the 16-bit word read from the target: • If the length (LEN) is an odd number, the upper byte is 0. • If the target ends before LEN is finished, the module treats the read as completed. • If the target is not done before LEN is finished and END is not a continuation, the read is terminated.

48.7.49 Controller Write Message in DDR mode: First Control Word (MWMSG_DDR_CONTROL)

Allows setting up and writing 16-bit words in DDR mode. The register has three modes:

- The first write to set up a new message functions as the MWSMSG_DDR_CONTROL register.
- The second write contains the functions as shown in the MWMSG_DDR_CONTROL2 register.
- For subsequent writes, this register functions in a way similar to Controller Write Message Data in DDR mode (MWMSG_DDR_DATA).
- The control information is not pipelined. You must write to control information registers for a start and do not write to them until data is sent.

When not in the middle of a message, the MWMSG_DDR_CONTROL register is used to start a new message (or emit a STOP). After starting a message, the MWMSG_DDR_DATA register is used until the length (see LEN field) counts down or until data with END = 1 is used.

The MWMSG_DDR_CONTROL register is written with the 16-bit control word if currently stopped or after the end of the previous message. If MSTATUS[STATE] = 4 (MSGDDR) and MSTATUS[BETWEEN] = 0, then the register (at this offset address) functions as the MWMSG_DDR_DATA register. Otherwise, this register (at this offset address) functions as the MWMSG_DDR_CONTROL register, as long as MSTATUS[STATE] is not in another mode.

The main control word contains the 16-bit word length and how it ends (stop, ready for next, continuation with more length). Then the command word contains the command and address for read or write. If the command is START and an event (IBI, CR, HJ) occurs, MCTRL[IBIRESP] is used to determine action, and the corresponding interrupt occurs. In that case, the message is restarted.

The MWMSG_DDR_CONTROL, MWMSG_DDR_CONTROL2, and MWMSG_DDR_DATA registers are only targeted for DMA operations, but the processor can also write to the MWMSG_DDR_CONTROL register (instead of using MCTRL and MxDATAB).

NOTE

The module handles preamble, parity, and CRC.

Offset

Register	Offset
MWMSG_DDR_CONTROL	D8h

Fields

Field	Description
31-16 —	Reserved
15-0 ADDRCMD	Address Command Indicates the first data write after control write, with LEN ≠ 0. This is formatted as: • Bits 15:9: target address to read or write • Bit 8: reserved, must be 0 • Bit 7: 1 if read, 0 if write • Bits 6:0: CMD as 7-bit value, always for controller

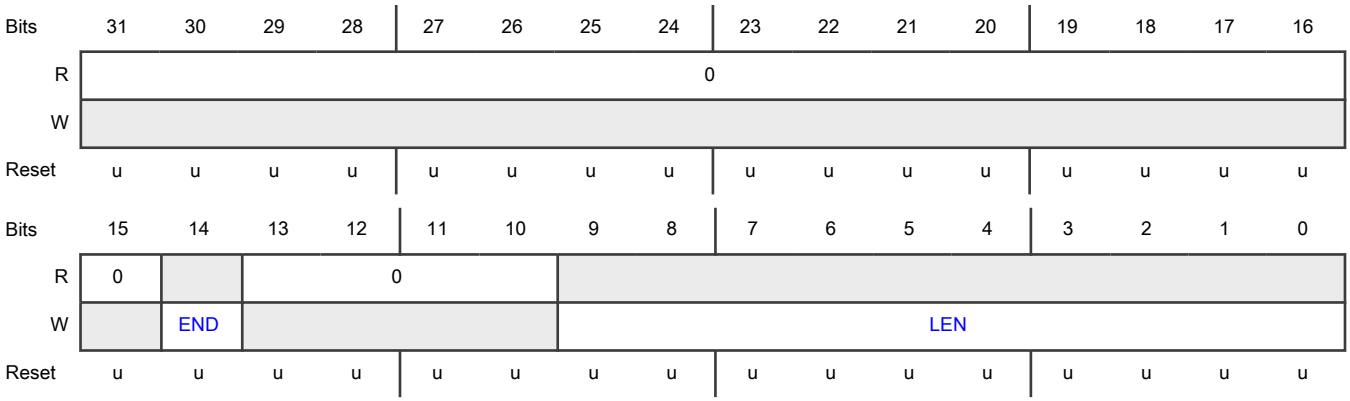
48.7.50 Controller Write Message in DDR Mode Control 2 (MWMSG_DDR_CONTROL2)

Contains the second control word instructions with the length of message and end.

Offset

Register	Offset
MWMSG_DDR_CONTROL2	D8h

Diagram



Fields

Field	Description
31-16 —	Reserved
15	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
14 END	End of Message Indicates the end of DDR message. MSTATUS[COMPLETE] becomes 1 when done. The end can happen before LEN bytes are read if the target ends sooner. If this field is 0, DDR message ends waiting for a new DDR message (issues an HDR restart for the new message). If this field is 1, DDR message ends on HDR exit. 0 - Not the end 1 - End
13-10 —	Reserved
9-0 LEN	Length of Message Contains the length of the message (including the command) in halfwords, up to 2046 bytes. If LEN = 0, then only END is applied: • For reads, + 1 for the CRC. For example, to read 4 bytes (2 halfwords), use 1 + 2 + 1 for CMD + 2 halfwords + CRC. • For writes, LEN is the number of halves of data bytes + 1 (for command).

48.7.51 Controller Write Message Data in DDR mode (MWMSG_DDR_DATA)

Contains the 16-bit word to be written in DDR mode. This register functions in a way similar to Controller Write Message in DDR mode: First Control Word (MWMSG_DDR_CONTROL).

Offset

Register	Offset
MWMSG_DDR_DATA	D8h

Diagram

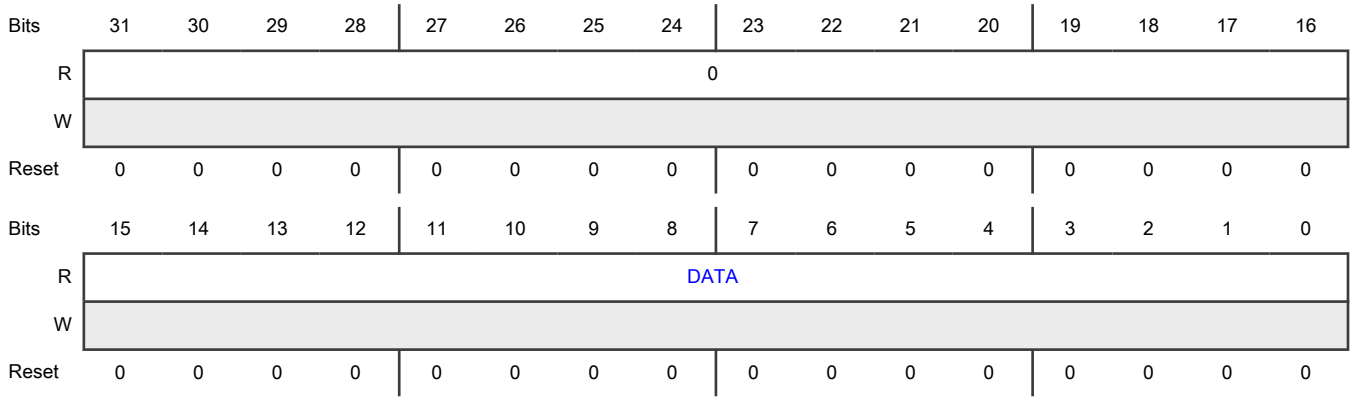
48.7.52 Controller Read Message in DDR mode (MRMSG_DDR)

Allows reading 16-bit words from a target in DDR Message mode from an active message started with MWMSG_DDR. These words are intended to be read by DMA.

Offset

Register	Offset
MRMSG_DDR	DCh

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 DATA	Data Contains the 16-bit word read from a target. The first byte is the LSB, and is in DATA[7:0]. The second byte is the MSB, and is in DATA[15:8]: • If the target ends before the entire length of the message (MWMSG_DDR[LEN]) is read, the module considers the DATA read as completed. In I3C mode, the target can indicate the end of message (the last byte). Otherwise, the controller terminates the message if the message is more than the controller can accept. • If the target has not yet finished sending DATA before the entire length of the message (MWMSG_DDR[LEN]) is read and END is not a continuation, the DATA read is terminated.

48.7.53 Controller Dynamic Address (MDYNADDR)

Allows the I3C module to write its own dynamic address (DA) when the module changes from Controller mode to Target mode.

If this device is the main controller (the controller during bus initialization), then the device may use this mechanism to assign itself its DA. When the device hands off control to a secondary controller, it becomes a target itself. This DA must be written before switching to Target mode and must not be changed once in Target mode (it is not clock-safe to do so). It must be written with a valid address value in DADDR if DAVALID = 1.

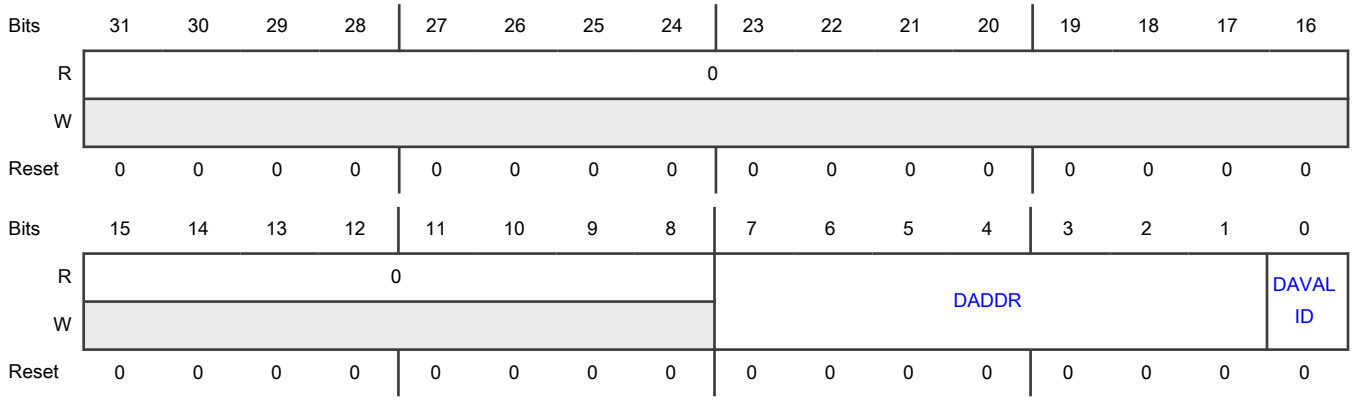
NOTE

The main controller also uses DEFSLVS CCC to define the target addresses, including itself. This mechanism is how secondary controllers know this address. If the controller is not the main controller, then this mechanism must not be used.

Offset

Register	Offset
MDYNADDR	E4h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-1 DADDR	Dynamic Address Contains the assigned dynamic address when DAVALID = 1.
0 DAVALID	Dynamic Address Valid 0 - No valid DA assigned 1 - Valid DA assigned

48.7.54 Timing Rules for Target Reset Recovery (SRSTACTTIME)

Indicates the timing rules for a recovery following a TargetReset.

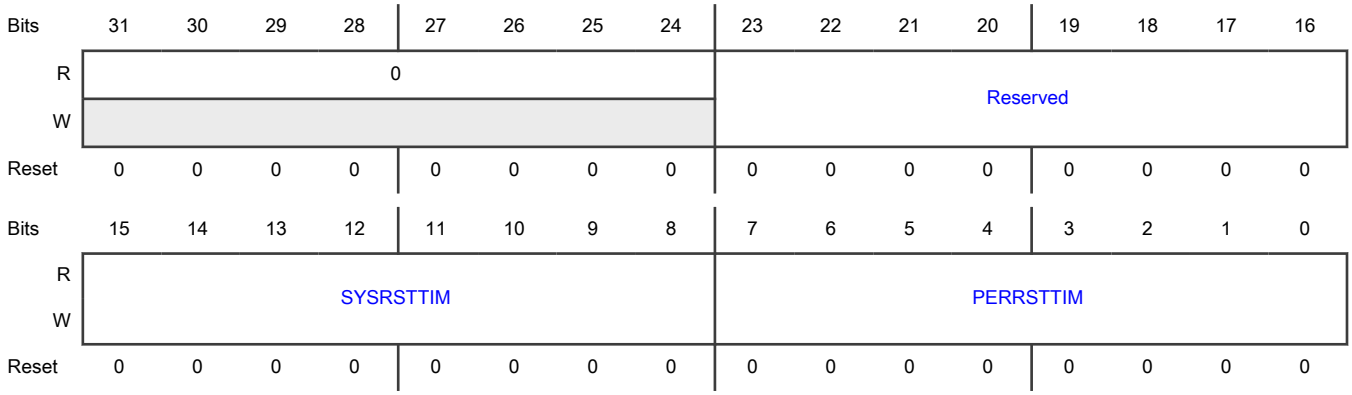
When the controller issues a TargetReset, some part of the device may be reset, such as a peripheral, the whole device, or some subset of the device. The controller must know how long the device takes to recover and be ready for new I3C messages. This behavior may be hard-coded or configured using this register.

This register is used if the device is enabled for MMR.

Offset

Register	Offset
SRSTACTTIME	100h

Diagram



Fields

Field	Description
31-24 —	Reserved
23-16 —	Reserved
15-8 SYSRSTTIM	Time to Recover from Chip Reset Specifies the time to recover, in seconds, from a full system or chip reset.
7-0 PERRSTTIM	Time to Recover from the I3C Peripheral Specifies the time to recover, in milliseconds, from the I3C peripheral reset.

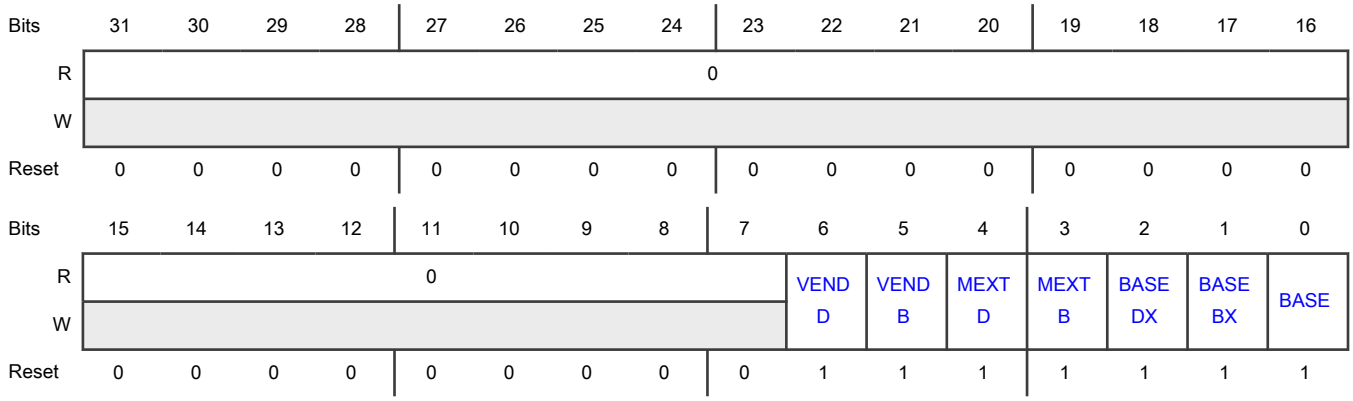
48.7.55 CCC Mask for Unhandled CCCs (SCCCMASK)

Allows masking of unhandled (not handled by hardware) CCC commands, when enabled.

Offset

Register	Offset
SCCCMASK	10Ch

Diagram



Fields

Field	Description
31-7 —	Reserved
6 VENDD	VENDD Determines whether any unhandled CCC commands in the range of E4h to FFh are passed to the application or suppressed. 0 - Suppressed 1 - Passed to application

Field	Description
BASEDX	Determines whether any unhandled CCC commands in the range of A0h to BFh are passed to the application or suppressed. 0 - Suppressed 1 - Passed to application
1 BASEBX	BASEBX Determines whether any unhandled CCC commands in the range of 20h to 48h are passed to the application or suppressed. 0 - Suppressed 1 - Passed to application
0 BASE	Base Determines whether any unhandled CCC commands in the range of 0h to 1Fh and 80h to 8Fh are passed to the application or suppressed. 0 - Suppressed 1 - Passed to application

48.7.56 Target Errors and Warnings Mask (SERRWARNMASK)

Allows masking of target errors and warnings.

Target Errors and Warnings (SERRWARN) contains I3C protocol errors and issues detected on the line. If any are 1, SSTATUS[ERRWARN] becomes 1. The corresponding interrupt field also becomes 1, if enabled. SERRWARNMASK allows masking them, so only some form the status bit.

Offset

Register	Offset
SERRWARNMASK	110h

1 URUN	URUN Mask Determines whether to allow SERRWARN[URUN] to contribute to the status of SSTATUS[ERRWARN]. 0 - Deny 1 - Allow
0 ORUN	ORUN Mask Determines whether to allow SERRWARN[ORUN] to contribute to the status of SSTATUS[ERRWARN]. 0 - Deny 1 - Allow

48.7.57 Map Feature Control 0 (SMAPCTRL0)

Provides map feature control.

The SMAPCTRL*n* registers are named SMAPCTRL0, SMAPCTRL1, and so on based on the number of mapped addresses. MAPCTRL0 represents the primary DA or SA with SMAPCTRL1 onwards being the mapped addresses.

The features of the SMAPCTRL*n* registers depend on configuration. SMAPCTRL0 acts differently, as described in this chapter.

In general, this mechanism is intended to replace the DYNADDR register for all MAP-related uses.

When using the Auto-MAP and DASA or AASA, the slot is changed from SA to DA. If the controller then issues RSTDAA, the application must rewrite the static addresses and enable them because they are marked disabled.

Offset

Register	Offset
SMAPCTRL0	11Ch

Field	Description
31-17 —	Reserved
16 —	Reserved
15-11 —	Reserved
10-8 CAUSE	Cause Indicates the cause of the most recent DA assignment, which lead to SSTATUS[DACHG] interrupt. This field has MAP enabled. If this field is 100b (auto MAP change happened last), the change may have changed this DA as well (for example, ENTDAA and SETAASA), but at least one MAP entry automatically changed after that. 000 - No information (this value occurs when not configured to write DA) 001 - Set using ENTDAA 010 - Set using SETDASA, SETAASA, or SETNEWDA 011 - Cleared using RSTDAA 100 - Auto MAP change happened last All other values are reserved.
7-1 DA	Dynamic Address Contains primary DA when ENA = 1. When ENA = 0, static address is used (but not described here). This field has MAP enabled.
0 ENA	Enable Primary Dynamic Address Indicates whether the MAP is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Disabled 1 - Enabled

48.7.58 Map Feature Control 1 (SMAPCTRL1)

The SMAPCTRL*n* registers are named SMAPCTRL0, SMAPCTRL1, and so on based on the number of mapped addresses. SMAPCTRL0 represents the primary DA or SA, with SMAPCTRL1 onwards being mapped addresses.

The features of the SMAPCTRL*n* registers depend on configuration. SMAPCTRL0 acts somewhat differently, as described in this chapter.

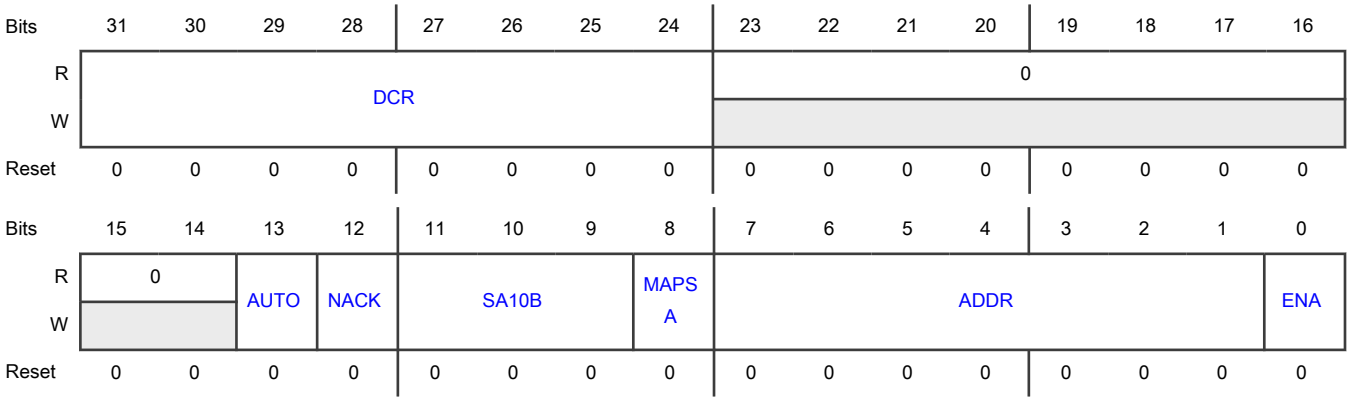
In general, this mechanism is intended to replace the DYNADDR register for all MAP-related uses.

When using the AutoMAP and DASA or AASA, the slot is changed from static address to dynamic address. If the controller then issues RSTDAA, the application must rewrite the SAs and enable them because as they are marked disabled.

Offset

Register	Offset
SMAPCTRL1	120h

Diagram



Fields

Field	Description
31-24 DCR	DCR Specifies DCR value. If DCR is to be replaced by register, this field provides the DCR value. Applicable if enabled for auto DAA using MMR. If no DCR, this field is used as extension of PID field for a total of 18 bits.

Table continues on the next page...

Table continued from the previous page...

Field	Description
23-14 —	Reserved
13 AUTO	Auto DAA Indicates whether this slot is enabled for Auto DAA, if ENA = 0. This field is used if enabled for auto DAA using MMR. 0 - Disabled 1 - Enabled
12 NACK	Not Acknowledged Indicates whether messages to this address are always NACKed, if enabled. 0 - Do not always NACK messages 1 - Always NACK messages
11-9 SA10B	Static Address 10-Bit Extension Contains a 10-bit extension for a static address, if this field is in MAPCTRL1. In the case of a normal address, this field is 0; otherwise, it contains the 10-bit extension. This field is used if enabled for 10-bit.
8 MAPSA	MAP Static Address Indicates whether MAP entry is a static address or a dynamic address, if ENA = 1. This field has MAP enabled. 0 - I3C dynamic address 1 - Static address (I2C style)
7-1 ADDR	Address Contains static or dynamic address. If ENA = 1, contains static address or dynamic address (as indicated by the MAPSA field) with MAP enabled.
0 ENA	Enable Enables MAP entry. This entry could be a static or dynamic address with MAP enabled. 0 - Disable 1 - Enable

48.7.59 Extended IBI Data 1 (IBIEXT1)

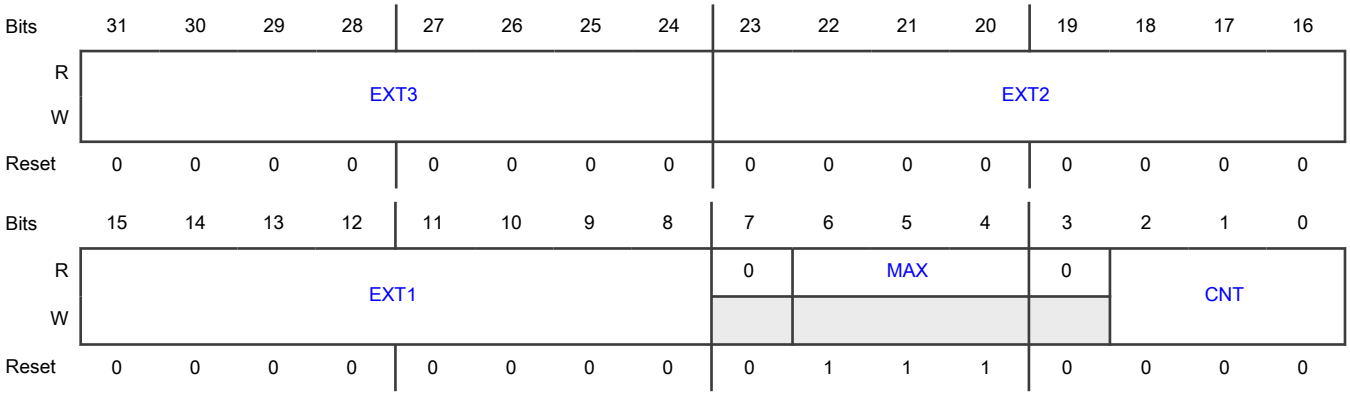
Contains extended IBI data.

The CTRL register is used to submit IBI, CR, and Hot-Join when enabled to do so. If allowed, an IBI may have additional bytes following the mandatory data byte (MDB). Extended IBI data is allowed when SCTRL[EXTDATA] = 1. If allowed, the extra bytes are indicated using these registers.

Offset

Register	Offset
IBIEXT1	140h

Diagram



Fields

Field	Description
31-24 EXT3	Extra Byte 3 Contains the third extra byte.
23-16 EXT2	Extra Byte 2 Contains the second extra byte.
15-8 EXT1	Extra Byte 1 Contains the first extra byte.
7 —	Reserved
6-4 MAX	Maximum Indicates the maximum number of extra bytes allowed by configuration. This field is 0 if there are no extra bytes.
3 —	Reserved
2-0 CNT	Count Contains the number of extra bytes beyond the MDB to be used. This field is 0 if there are no extra bytes.

48.7.60 Extended IBI Data 2 (IBIEXT2)

Contains extended IBI data.

The CTRL register is used to submit IBI, CR, and Hot-Join when enabled to do so. If allowed, an IBI may have additional bytes following the mandatory data byte (MDB). Extended IBI data is allowed when SCTRL[EXTDATA] = 1. If allowed, the extra bytes are indicated using these registers.

Offset

23-16 EXT6	Extra Byte 6 Contains the sixth extra byte.
15-8 EXT5	Extra Byte 5 Contains the fifth extra byte.
7-0 EXT4	Extra Byte 4 Contains the forth extra byte.

48.7.61 Self Reset (SELFRESET)

Resets the whole I3C module, if enabled. The reset is accepted if the key value is correct.

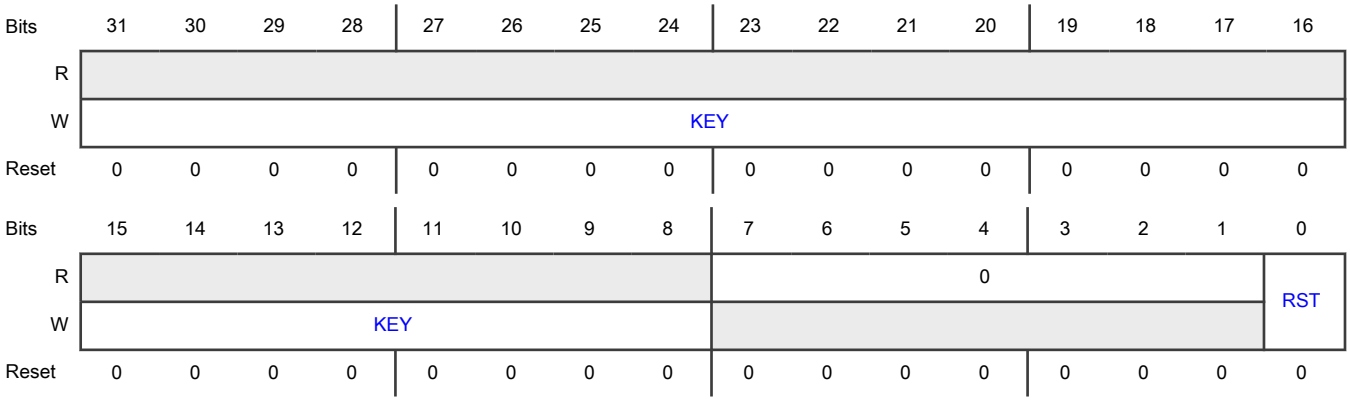
NOTE

In controller + target module, the controller is reset as well because they share resources.

Offset

Register	Offset
SELFRESET	FF0h

Diagram



Fields

Field	Description
31-8 KEY	Key Indicates information related to KEY. When requesting a reset (RST = 1), this field must be written with the key of B216E9h. Field reads back as 0.
7-1 —	Reserved
0 RST	Reset Starts a reset. Write 1 to start a reset (with a valid key). Reads back as 1 during the few bus cycles while the module is being reset. 0 - No reset 1 - Reset

CR	Controller Request
PIO	Programmable I/O
SDR	Single Data Rate

Chapter 49
Timers Overview

49.1 Overview

The following timers are supported in this chip:

- Low Power Periodic Interrupt Timer (LPIT): Two 32-bit counter timers that feature programmable count modulus, clock division features.
- Low-Power Timer (LPTMR): Two LPTMR timers, each with four timer channels with variety of controls for individual and multi-channel features.
- Timer/PWM Module (TPM): Six TPM modules, each has its own CCM clock root.
- Global System Counter (SCTR)
- Timestamp Timer Modules (TSTMR): Two satellite read-only Timestamp Timer Modules
- Watchdog timers (WDOG1-WDOG5): It is a high reliability independent timer that is available for system use

49.1.1 Low Power Periodic Interrupt Timer (LPIT)

LPIT is a low power periodic interrupt timer with four timer channels. It is a 32 bit resolution timer with programmable count modulus, clock division features, periodic interrupt generation, and ability to chain adjacent timers to achieve longer interval

49.1.2 Low-Power Timer (LPTMR)

The low-power timer (LPTMR) can be configured to operate as a time counter with optional prescaler, or as a pulse counter with optional glitch filter, across all power modes, including the Low-Leakage Stop mode.

49.1.3 Global System Counter (SCTR)

The SCTR supports both a timer bus interface to the Cortex-A55 MPCore generic timers. Three 64kB regions are supported in the memory map: CNTControlBase, CNTReadBase and CNTCompareBase.

49.1.4 Low Power Timer/PWM (LPTPM)

TPM is a 32-bit timer with 4 channels. LPTPM1-2 in AONMIX, LPTPM3-6 in WAKEUPMIX. LPTPM1 and LPTPM3 timers are clocked from the bus clock, to ensure that LPTPM1 and LPTPM3's are synchronous with the CAN1 and CAN2. The other LPTPM instances have their own CCM clock root.

Each TPM includes 6 channels that can be configured for input capture, output compare, edge-aligned PWM mode, or center-aligned PWM mode.

49.1.5 Timestamp Timer Modules (TSTMR)

The TSTMR instances provide a 64-bit read-only snapshot of the value of the free-running incrementing counter generated by the SCTR.

49.1.7 Watchdog Timer (WDOG)

The WDOG module is an high reliability independent timer that is available for system use. It provides a safety feature to ensure that software is executing as planned and that the CPU is not stuck in an infinite loop or executing unintended code. If the WDOG module is not serviced (refreshed) within a certain period, it resets the CPU.

Main features of the WDOG module are:

- Configurable independent clock source input from bus clock

- Programmable time-out period
- Robust write sequence for counter refresh
- Windowed refresh option
- Optional timeout interrupt to allow post-processing diagnostics
- Configuration bits are write-once-after-reset to ensure watchdog configuration cannot be mistakenly altered
- Robust write sequence for unlocking write-once control/configuration bits

Chapter 50
Low-Power Timer (LPTMR)

50.1 Chip-specific LPTMR information

Table 496. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes two LPTMR Timer Modules (LPTMR1 in AONMIX and LPTMR2 in WAKEUPMIX). For each LPTMR, ALT1/2/3 are connected to pins, but ALT0 is connected to ADC trigger inputs. LPTMR input clocks in PSR[PCS] bits are connected as follows:

- 00 - ipg_clk_irclk: From CCM
- 01 - ipg_clk_1kHz: 32k_clk_root
- 10 - ipg_clk_32kHz: Fixed 32kHz
- 11 - ipg_clk_erclk: 32k_clk_root

50.2 Overview

You can configure LPTMR to operate as a time counter with an optional prescaler, or as a pulse counter with an optional glitch filter, across all power modes, including low-power modes. It is reset only on WatchDog Timer 1 (WDOG1), allowing it to be used as a time-of-day counter.

50.2.1 Block diagram

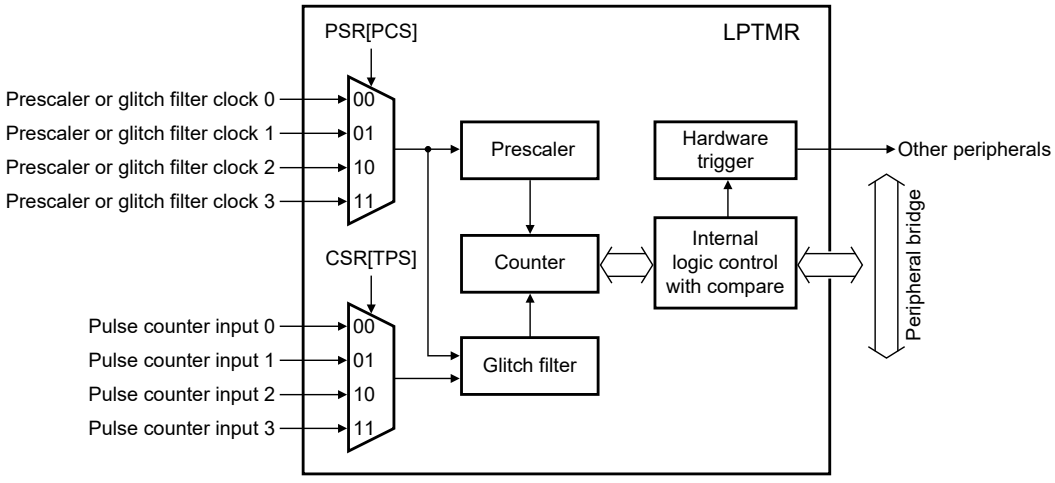

Figure 255. Block diagram

50.2.2 Features

- 32-bit time counter or pulse counter with compare:
  - Optional interrupt that can generate an asynchronous wake-up from any low-power mode
  - Hardware trigger output
  - Counter that supports a free-running mode or reset on compare
- Configurable clock source for prescaler and glitch filter
- Configurable input source for pulse counter (rising-edge or falling-edge)

50.3 Functional description

50.3.1 Low-power modes

In low-power modes, LPTMR continues to operate normally. You can configure LPTMR to exit a low-power mode by generating either an interrupt or a DMA request.

50.3.2 Clocks

The LPTMR prescaler and glitch filter can be clocked by one of the clocks that you configure by using PSR[PCS]. You must enable the clock source before you enable LPTMR.

In Pulse Counter mode, with the glitch filter bypassed, the selected input source directly clocks Counter (CNR), and no other clock source is required. To minimize power in this case, configure the glitch filter clock source for a clock that is disabled.

NOTE

- You may need to configure the clock source that you select in PSR[PCS] for it to remain enabled in low-power modes. Otherwise, LPTMR does not operate in low-power modes.
- The clock source or pulse input source selected for LPTMR must not exceed the maximum frequency of f_{LPTMR} defined in the chip data sheet.

50.3.3 Reset

LPTMR is reset only on WatchDog Timer 1 (WDOG1). When configuring LPTMR registers, you must initially write to Control Status (CSR) with LPTMR disabled, before configuring Prescaler and Glitch Filter (PSR) and Compare (CMR). Then, you must write 1 to CSR[TEN] as the last step in the initialization. Doing so ensures that LPTMR is configured correctly and the LPTMR counter is reset to zero following a WatchDog Timer 1 (WDOG1).

50.3.4 Prescaler and glitch filter

The LPTMR prescaler and glitch filter share the same logic, which operates as a prescaler in Time Counter mode and as a glitch filter in Pulse Counter mode.

NOTE

You must not alter the prescaler and glitch filter configuration when LPTMR is enabled.

50.3.4.1 Prescaler enabled

In Time Counter mode, when the prescaler is enabled, the output of the prescaler directly clocks Counter (CNR). When LPTMR is enabled, CNR increments every 2^1 to 2^{16} prescaler clock cycles. After LPTMR is enabled, the first increment of CNR takes an additional one or two prescaler clock cycles because of the synchronization logic.

50.3.4.2 Prescaler bypassed

In Time Counter mode, when the prescaler is bypassed, the selected prescaler clock increments Counter (CNR) on every clock cycle. When LPTMR is enabled, the first increment takes an additional one or two prescaler clock cycles because of the synchronization logic.

50.3.4.3 Glitch filter enabled

In Pulse Counter mode, when the glitch filter is enabled, the output of the glitch filter directly clocks Counter (CNR). When LPTMR is first enabled, the output of the glitch filter is asserted, that is, logic 1 for active-high and logic 0 for active-low. The following table shows the change in glitch filter output with the selected input source.

Table 497. Glitch filter output with the selected input source

If	Then
The selected input source remains deasserted for at least 2^1 to 2^{15} consecutive prescaler clock rising edges	The glitch filter output also deasserts.
The selected input source remains asserted for at least 2^1 to 2^{15} consecutive prescaler clock rising edges	The glitch filter output also asserts.

NOTE

The input is sampled only on the rising clock edge.

The value of CNR increments each time the glitch filter output asserts. In Pulse Counter mode, the maximum rate at which CNR can increment is once every 2^2 to 2^{16} glitch filter clock edges. When first enabled, the glitch filter waits for an additional one or two glitch filter clock edges because of the synchronization logic.

50.3.4.4 Glitch filter bypassed

In Pulse Counter mode, when the glitch filter is bypassed, the selected input source increments the value of Counter (CNR) every time it asserts. Before LPTMR is first enabled, the selected input source is forced to be asserted. This prevents CNR from incrementing if the selected input source is already asserted when LPTMR is first enabled.

50.3.5 Counter

The value of Counter (CNR) increments by 1 on every:

- Prescaler clock in Time Counter mode, with prescaler bypassed.
- Prescaler output in Time Counter mode, with prescaler enabled.
- Input source assertion in Pulse Counter mode, with glitch filter bypassed.
- Glitch filter output in Pulse Counter mode, with glitch filter enabled.

CNR is reset when LPTMR is disabled or if the counter register overflows. If CSR[TFC] = 0, then CNR is also reset whenever CSR[TCF] = 1.

When the core is halted in Debug mode:

- CNR continues incrementing if configured for Pulse Counter mode.
- CNR stops incrementing if configured for Time Counter mode.

You cannot initialize CNR but can read it at any time. On each read of CNR, you must first write a value to it. This synchronizes and registers the current value of CNR into a temporary register. The contents of the temporary register are returned on each read of CNR.

When reading CNR, the bus clock must be at least two times faster than the rate at which the LPTMR counter is incrementing; otherwise, incorrect data may be returned.

50.3.6 Compare

After the next Counter (CNR) increment (when its value is equal to that of Compare (CMR)), the following events occur:

- CSR[TCF] is read as 1b.
- LPTMR generates an interrupt if CSR[TIE] is 1 as well.
- LPTMR generates a hardware trigger.
- LPTMR writes 0 to CNR if CSR[TFC] is 0.

When LPTMR is enabled, you can modify the value of CMR only when CSR[TCF] is 1. When updating CMR, you must write to it and clear CSR[TCF] before the LPTMR counter increments past the new LPTMR compare value.

NOTE

When LPTMR is enabled in Time Counter mode, the first increment takes an additional one or two clock cycles because of the synchronization logic. This results in the first compare (and therefore interrupt and hardware trigger) occurring slightly later. A faster prescaler clock or larger prescaler value minimizes this impact.

50.3.7 Interrupt

LPTMR generates an interrupt whenever CSR[TIE] and CSR[TCF] are 1. CSR[TCF] is cleared by disabling LPTMR or writing a logic 1 to it.

You can modify the value of CSR[TIE] and write 1 to CSR[TCF] when LPTMR is enabled.

LPTMR generates an interrupt asynchronously to the system clock. The interrupt can be used to generate a wake-up from any low-power mode, provided LPTMR is enabled as a wake-up source.

50.3.8 Hardware trigger

The LPTMR hardware trigger asserts at the same time CSR[TCF] is set and can be used to trigger hardware events in other peripherals without your intervention. The hardware trigger is always enabled.

Table 498. Hardware trigger

When	Then
CMR[COMPARE] and CSR[TFC] are 0	The LPTMR hardware trigger asserts on the first compare and does not deassert.
CMR[COMPARE] is set to a nonzero value, or if CSR[TFC] = 1	The LPTMR hardware trigger asserts on each compare and deasserts on the following increment of Counter (CNR).

50.4 External signals

Table 499. External signals

Signal	Description		Direction
LPTMR_ALT*n*	Pulse Counter Input LPTMR can select one of the input pins to be used in Pulse Counter mode.		Input
	State meaning	Assertion—If configured for Pulse Counter mode with an active-high input, assertion causes Counter (CNR) to increment.	

Table continues on the next page...

Table 499. External signals (continued)

Signal	Description		Direction
		Deassertion—If configured for Pulse Counter mode with an active-low input, deassertion causes CNR to increment.	
	Timing	Assertion or deassertion may occur at any time; input may assert asynchronously to the bus clock.	

50.5 Initialization

Perform the following procedure to initialize LPTMR:

1. Configure Control Status (CSR) for the selected mode and pin configuration, when CSR[TEN] is 0. This resets the counter and clears the flag.
2. Configure Prescaler and Glitch Filter (PSR) with the selected clock source and prescaler or glitch filter configuration.
3. Configure Compare (CMR) with the selected compare point.
4. Write 1 to CSR[TEN] to enable LPTMR.

50.6 Application information

50.6.1 Application 1: Generate an interrupt every 100 ms using 32.768 kHz clock source

1. Disable LPTMR by writing 0 to CSR[TEN].
2. Select a 32.768 kHz clock source by configuring PSR[PCS].
3. Bypass the prescaler and glitch filter by writing 1 to PSR[PBYP].
4. Assert an interrupt every 3277 cycles by configuring CMR[COMPARE] = 0CCCh.
5. Enable LPTMR by writing 1 to CSR[TEN].
6. Enable the LPTMR interrupt by writing 1 to CSR[TIE].

NOTE

This is just an example. See the chip-specific LPTMR information for the clocks supported on a given chip.

50.6.2 Application 2: Generate an interrupt once a minute using 32.768 kHz clock source

1. Disable LPTMR by writing 0 to CSR[TEN].
2. Select a 32.768 kHz clock source by configuring PSR[PCS].
3. Select the prescaler to divide the prescaler clock by 32768 to increment the counter once a second by configuring PSR[PRESCALE] = 0Eh.
4. Assert an interrupt every 60 seconds by configuring CMR[COMPARE] = 003Bh.
5. Enable LPTMR by writing 1 to CSR[TEN].
6. Enable the LPTMR interrupt by writing 1 to CSR[TIE].

NOTE

This is just an example. See the chip-specific LPTMR information for the clocks supported on a given chip.

50.7 Memory map and register definition

NOTE

The LPTMR registers are reset only on WatchDog Timer 1 (WDOG1). See Reset for more information.

50.7.1 LPTMR register descriptions

50.7.1.1 LPTMR memory map

LPTMR1 base address: 4430_0000h

LPTMR2 base address: 424D_0000h

Fields

Field	Description
31-9 —	Reserved
8 TDRE	Timer DMA Request Enable Enables the timer DMA request. When TDRE is 1, the LPTMR DMA request is generated whenever CSR[TCF] is also set. Then, CSR[TCF] is cleared after the DMA controller completes execution. 0 - Disable 1 - Enable
7 TCF	Timer Compare Flag Compares the timer. TCF sets on the next Counter (CNR) increment when LPTMR is enabled and Counter (CNR) equals Compare (CMR). TCF is cleared when LPTMR is disabled or a logic 1 is written to it. **NOTE** You must clear this flag before enabling the timer interrupt or DMA request. **NOTE** This field behaves differently for register reads and writes. When reading 0 - CNR ≠ (CMR + 1) 1 - CNR = (CMR + 1) When writing 0 - No effect 1 - Clear the flag
6 TIE	Timer Interrupt Enable Enables the timer interrupt. If TIE is 1, then LPTMR generates an interrupt if CSR[TCF] is 1 as well. 0 - Disable 1 - Enable
5-4 TPS	Timer Pin Select Configures the input source to be used in Pulse Counter mode. The input connections vary by chip. For details, see the chip configuration information about connections to these inputs. You must modify this field only when LPTMR is disabled. 00 - Input 0 01 - Input 1 10 - Input 2 11 - Input 3

Table continues on the next page...

Table continued from the previous page...

Field	Description
3 TPP	Timer Pin Polarity Configures the polarity of the input source in Pulse Counter mode. If TPP is 0, then the pulse counter input source is active-high, and Counter (CNR) increments on the rising edge. If TPP is 1, then the pulse counter input source is active-low, and CNR increments on the falling edge. You must modify this field only when LPTMR is disabled. 0 - Active-high 1 - Active-low
2 TFC	Timer Free-Running Counter Specifies when the counter resets. If TFC is 0, Counter (CNR) resets on the count cycle following Counter (CNR) becoming equal to Compare (CMR). If TFC is 1, CNR resets on overflow. In both cases, CSR[TCF] sets to 1 on the cycle after CNR and CMR match. You must modify this field only when LPTMR is disabled. 0 - Reset when TCF asserts 1 - Reset on overflow
1 TMS	Timer Mode Select Configures the mode of LPTMR. You must modify this field only when LPTMR is disabled. 0 - Time Counter 1 - Pulse Counter
0 TEN	Timer Enable Enables the LPTMR timer. If TEN is 0, it resets the LPTMR internal logic, including CNR[COUNTER] and CSR[TCF]. If TEN is 1, LPTMR is enabled. Do not alter CSR[5:1] when writing 1 to this field. 0 - Disable 1 - Enable

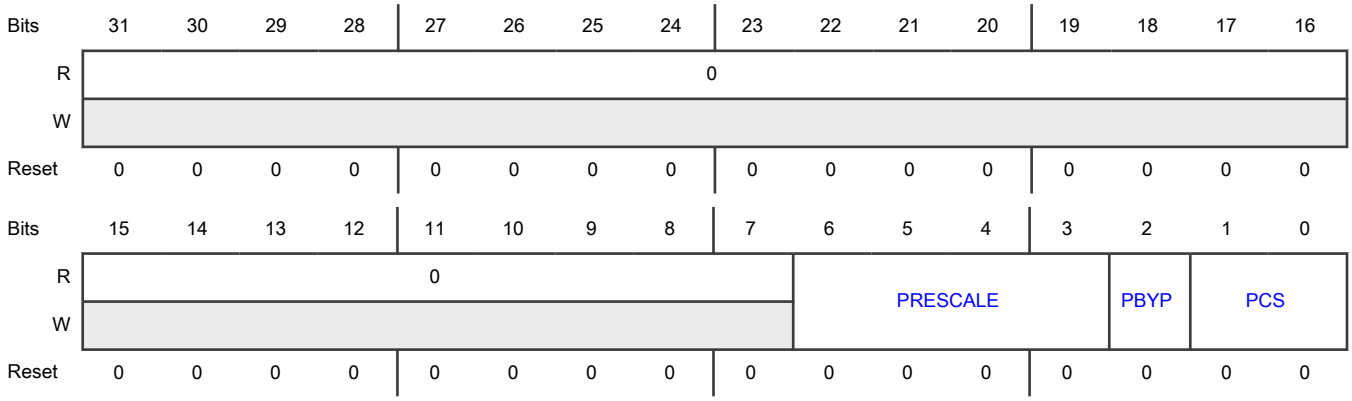
50.7.1.3 Prescaler and Glitch Filter (PSR)

Configures features related to the prescaler and glitch filter.

Offset

Register	Offset
PSR	4h

Diagram



Fields

Field	Description
31-7 —	Reserved
6-3 PRESCALE	Prescaler and Glitch Filter Value Configures the size of the prescaler in Time Counter mode and the width of the glitch filter in Pulse Counter mode. The width of the glitch filter can vary by one cycle because of the pulse counter input synchronization. You must modify this field only when LPTMR is disabled. 0000 - Prescaler divides the prescaler clock by 2; glitch filter does not support this configuration 0001 - Prescaler divides the prescaler clock by 4; glitch filter recognizes change on input pin after two rising clock edges 0010 - Prescaler divides the prescaler clock by 8; glitch filter recognizes change on input pin after four rising clock edges 0011 - Prescaler divides the prescaler clock by 16; glitch filter recognizes change on input pin after eight rising clock edges 0100 - Prescaler divides the prescaler clock by 32; glitch filter recognizes change on input pin after 16 rising clock edges 0101 - Prescaler divides the prescaler clock by 64; glitch filter recognizes change on input pin after 32 rising clock edges 0110 - Prescaler divides the prescaler clock by 128; glitch filter recognizes change on input pin after 64 rising clock edges 0111 - Prescaler divides the prescaler clock by 256; glitch filter recognizes change on input pin after 128 rising clock edges 1000 - Prescaler divides the prescaler clock by 512; glitch filter recognizes change on input pin after 256 rising clock edges 1001 - Prescaler divides the prescaler clock by 1024; glitch filter recognizes change on input pin after 512 rising clock edges

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1010 - Prescaler divides the prescaler clock by 2048; glitch filter recognizes change on input pin after 1024 rising clock edges 1011 - Prescaler divides the prescaler clock by 4096; glitch filter recognizes change on input pin after 2048 rising clock edges 1100 - Prescaler divides the prescaler clock by 8192; glitch filter recognizes change on input pin after 4096 rising clock edges 1101 - Prescaler divides the prescaler clock by 16,384; glitch filter recognizes change on input pin after 8192 rising clock edges 1110 - Prescaler divides the prescaler clock by 32,768; glitch filter recognizes change on input pin after 16,384 rising clock edges 1111 - Prescaler divides the prescaler clock by 65,536; glitch filter recognizes change on input pin after 32,768 rising clock edges
2 PBYP	Prescaler and Glitch Filter Bypass Controls the clocking of Counter (CNR). If PBYP is 0, the output of the prescaler or glitch filter clocks CNR. If PBYP is 1, the selected prescaler clock in Time Counter mode, or else the selected input source in Pulse Counter mode, directly clocks CNR. You must modify this field only when LPTMR is disabled. 0 - Prescaler and glitch filter enable 1 - Prescaler and glitch filter bypass
1-0 PCS	Prescaler and Glitch Filter Clock Select Selects the clock to be used by the LPTMR prescaler and glitch filter. In Time Counter mode, PCS selects the input clock to the prescaler. In Pulse Counter mode, PCS selects the input clock to the glitch filter. See the chip configuration details for information on connections to these inputs. You must modify this field only when LPTMR is disabled. 00 - Clock 0 01 - Clock 1 10 - Clock 2 11 - Clock 3

50.7.1.4 Compare (CMR)

Configures the compare values to Counter (CNR) (see Compare for more information).

Offset

Register	Offset
CMR	8h

Chapter 51
Low Power Periodic Interrupt Timer (LPIT)

51.1 Chip-specific LPIT information

Table 500. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

This chip includes two instances of LPIT timers (LPIT1 in AONMIX and LPIT2 in WAKEUPMIX).

LPIT has no IO interfaces to/from Pins.

NOTE

LPIT1 is clocked by AON bus and LPIT2 is clocked by WAKEUP bus. LPIT1 and LPIT2 have their trigger output 0 used as input by CAN1 and CAN2 respectively. Because of this, these LPIT timer instances are clocked by the bus clock - the same clock used to clock the respective CAN module (bus_aon_clk_root and bus_wakeup_clk_root respectively) in order to ensure that these signals are timed synchronously between these modules.

For more information about LPIT triggers supported on this chip, see Hardware Triggers.

51.2 Overview

LPIT is a low-power periodic interrupt timer with multiple timer channels. After a timer reaches a programmed count, the respective timer channels generate pre-trigger and trigger output signals, and these outputs can be used to trigger other modules on the chip.

51.2.1 Block diagram

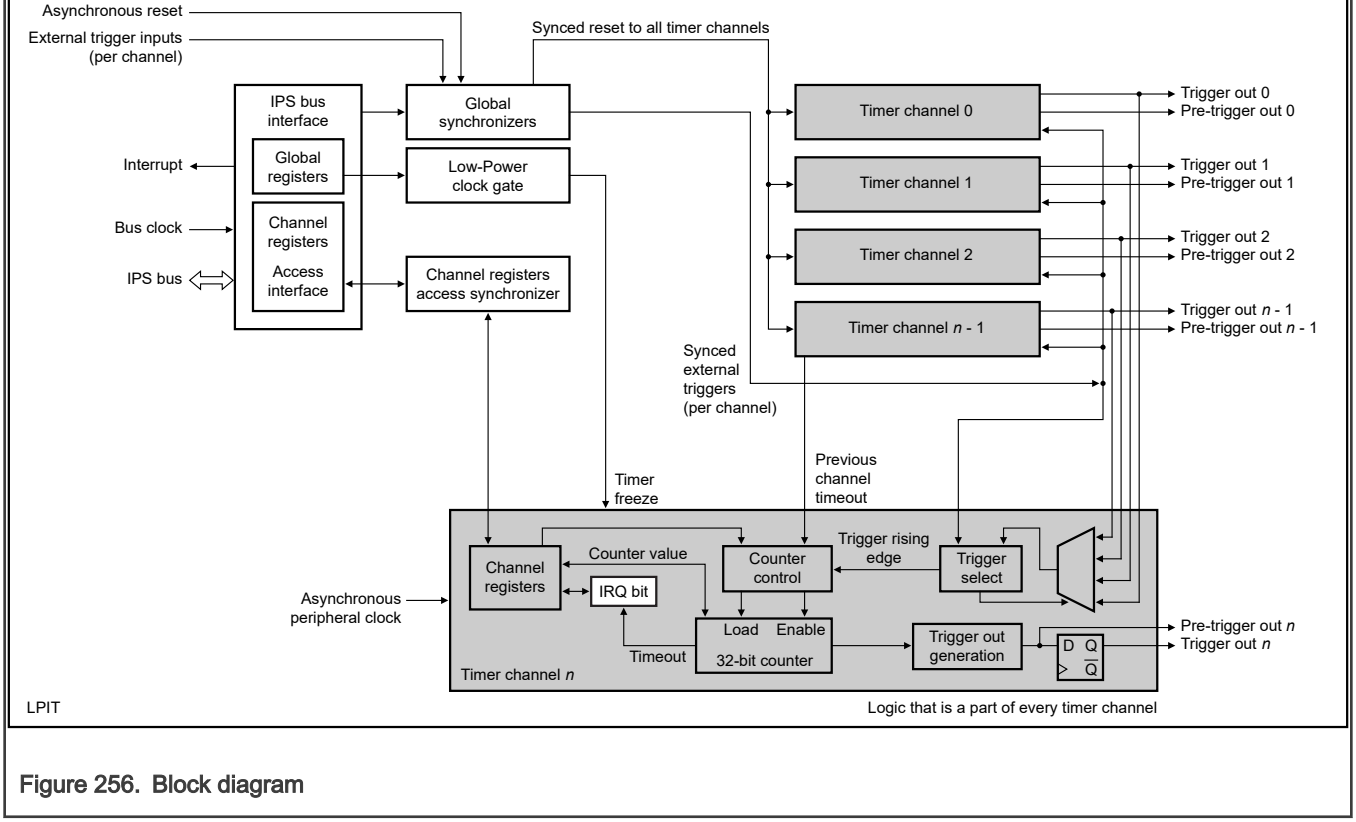

Figure 256. Block diagram

51.2.2 Features

LPIT allows you to configure timer channels in a way that they could be:

- Controlled using external triggers (triggers from outside LPIT).
- Controlled using internal triggers (triggers from other timer channels inside LPIT).
- Chained together, to form a larger width timer.
- Reloaded and counted again, or stopped after reaching the programmed count, depending on the timer modes used.

51.3 Functional description

51.3.1 Programming model

The LPIT programming model (see Figure 257) comprises:

- A global register set (common to all timer channels).
- Registers for each timer channel (that control their respective timer channels).

Access to these registers is synchronized with the asynchronous peripheral clock and then affects the timer channel registers:

- Each timer channel contains a 32-bit counter that loads the starting value and down counts after every peripheral clock's positive edge.
- After reaching a zero value (a channel timer timeout), a trigger output is generated.
- A timer enable register control field, external or internal triggers, or a previous channel timeout (when using timer chaining) control the counter enable.

- After a channel timer timeout, an interrupt flag is also set to tell the CPU about the timer timeout.

You must configure the following global registers only once:

- Module Control (MCR)
- Module Status (MSR)
- Module Interrupt Enable (MIER)
- Set Timer Enable (SETTEN)
- Clear Timer Enable (CLRTEN)

You must configure the following channel registers for each channel:

- Timer Value (TVAL0 - TVAL3)
- Timer Control (TCTRL0 - TCTRL3)

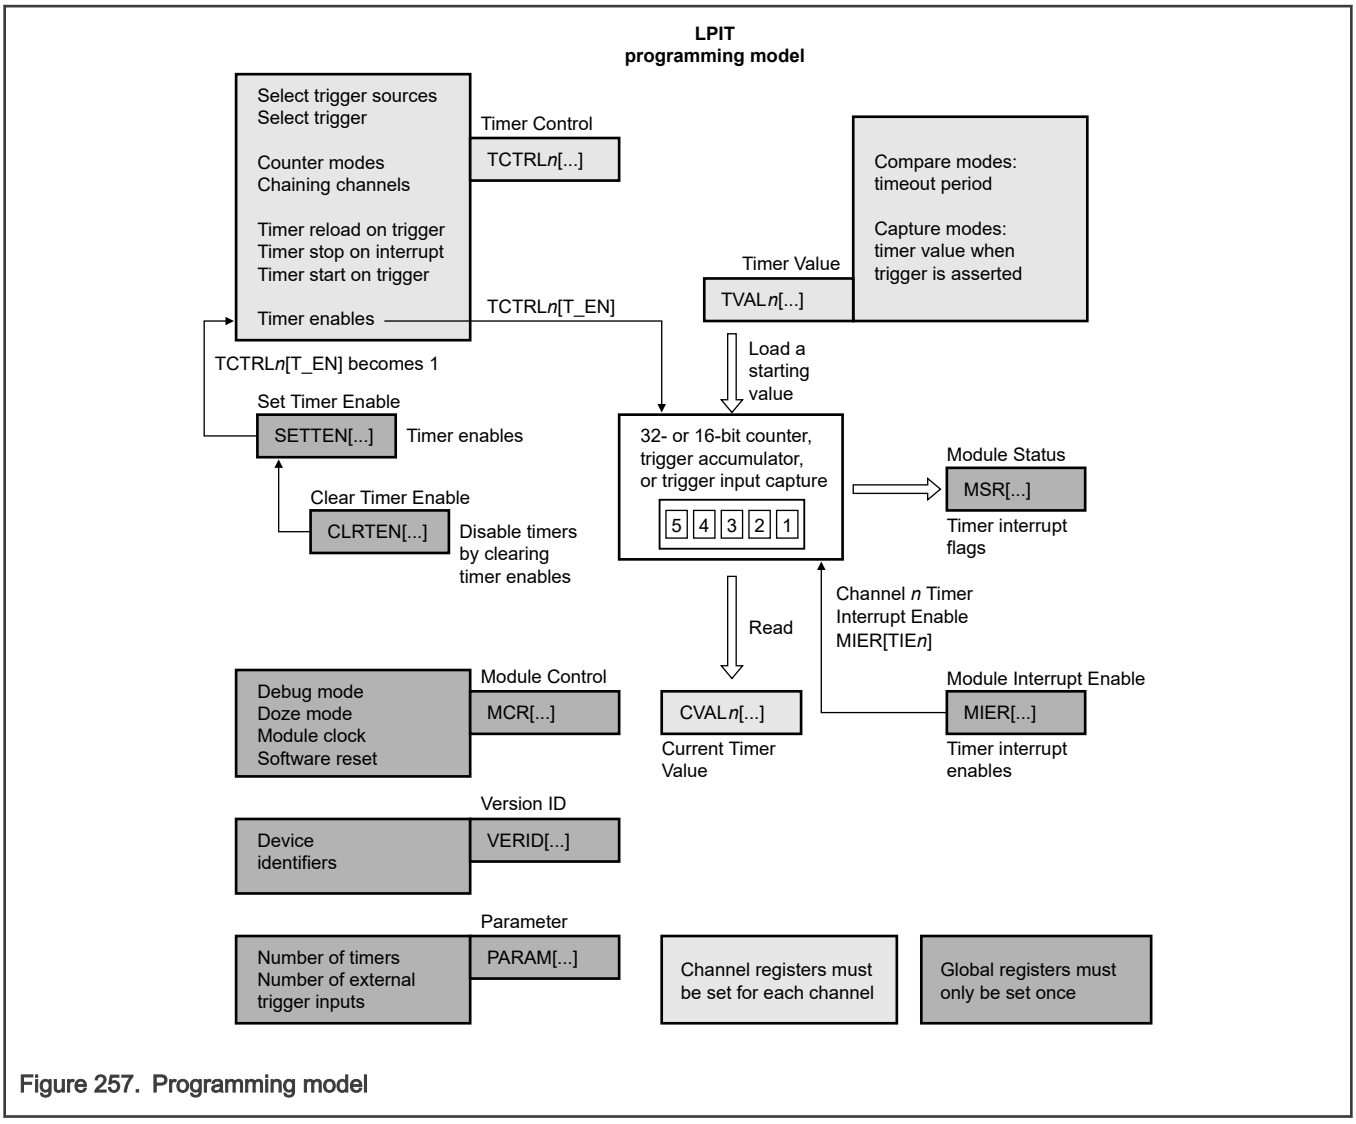

Figure 257. Programming model

51.3.2 Interfacing with other modules

The following figure shows the interface of an LPIT module with other modules on the chip:

- The CPU interface provides the clock, reset, and register read and write bus interface. It handles LPIT interrupts.

- The LPIT trigger output signals may trigger other modules on the chip.
- Similarly, other timer modules may provide trigger inputs to LPIT to control when an LPIT timer channel must start.

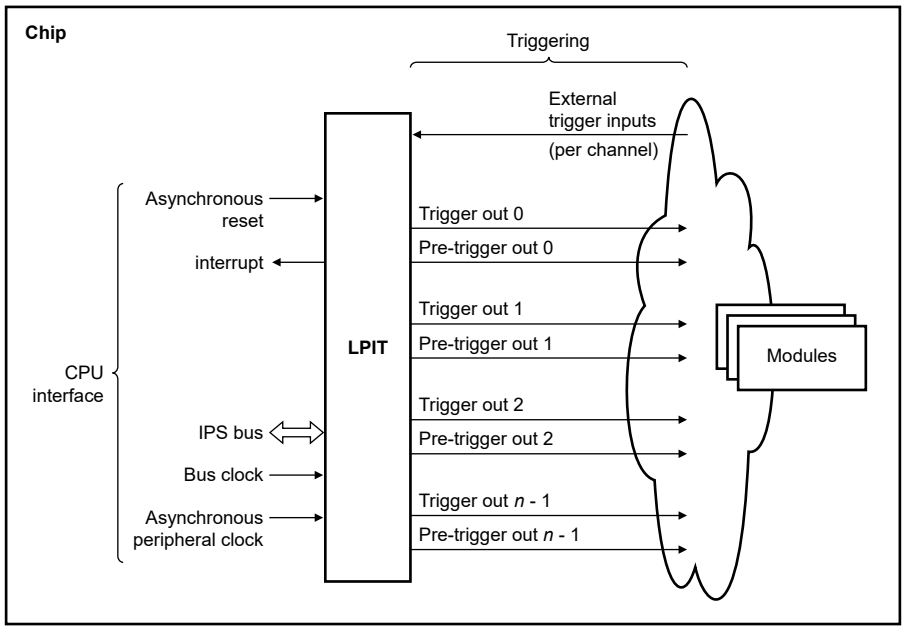

Figure 258. Interfacing with other modules

51.3.3 Chip power modes

LPIT supports the following chip power modes.

Table 501. Chip power modes

Chip mode	LPIT operation
Run	Normal operation
Stop and Wait	Can continue operating in this mode if MCR[DOZE_EN] = 1 and LPIT is using an external or internal clock source that remains operational during Stop and Wait modes.
Debug	Can continue operating in this mode if MCR[DBG_EN] = 1

51.3.4 Supported timer modes

To configure a timer mode, you must select an appropriate value using TCTRL*n*[MODE].

Table 502. Supported timer modes

Timer mode	Operation
32-bit periodic counter	The counter loads and decrements down to 0, and this sets the timer interrupt flag and asserts the output pretrigger.

Table continues on the next page...

Table 502. Supported timer modes (continued)

Timer mode	Operation
Dual 16-bit periodic counter	• The counter loads and then the lower 16 bits decrement down to 0. This asserts the output pretrigger. • The upper 16 bits then decrement down to 0. This sets the timer interrupt flag and negates the output pretrigger.
32-bit trigger accumulator	The counter loads after the first trigger rising edge and then decrements down to 0 after each trigger rising edge. This sets the timer interrupt flag and asserts the output pretrigger.
32-bit trigger input capture	• The counter loads with a value of FFFF_FFFFh and then decrements down to 0. • If a trigger rising edge is detected, it stores the inverse of the current counter value in Timer Value (TVAL0 - TVAL3). This sets the timer interrupt flag and asserts the output pretrigger.

TCTRL*n*[TSOT], TCTRL*n*[TSOI], and TCTRL*n*[TROT] control the timer operation. These fields control the timer load, reload, start, and restart of the timers.

NOTE

- The trigger output is asserted one peripheral timer clock cycle after the pre-trigger output. The trigger and pre-trigger outputs deassert at the same time.
- The pre-trigger output is asserted for two clock cycles and the trigger output is asserted for one clock cycle (except in 16-bit Periodic Counter mode, where both pre-trigger and trigger outputs are asserted for many cycles depending on the value of TVAL*n*[TMR_VAL][31:16]).
- Timer changes (that are based on external triggers) take effect after four peripheral clocks, after the actual external trigger assertion. This is because of clock synchronization, rise edge detection, and timer update.

51.3.5 Timer channel modes

You can configure each timer channel in LPIT to work in either compare modes or capture modes.

The timer channels operate on an asynchronous clock, which is independent of the register read and write access clock. Clock synchronization between clock domains ensures normal operations.

Table 503. Timer channel modes

Mode	Function
Compare	The timers decrement when enabled and generate an output pretrigger and trigger output. The trigger output is one clock cycle delayed of the pre-trigger pulse. You can configure certain control fields to control each timer channel's start, reload, and restart (see Trigger control for timers for more information). You can also configure the timer to always decrement from a programmed start value, on selected trigger inputs, or previous channel timeout (when channels are chained). By chaining timer channels, applications can achieve larger timeout durations.
Capture	You can use the timer to perform measurements by using Timer Value (TVAL0 - TVAL3), as the timer value is captured when a selected trigger input is asserted. The timer can support once-off or multiple measurements, such as frequency measurements.

51.3.6 Trigger control for timers

You can configure various LPIT register fields to control how trigger inputs and the timer operate:

- TCTRL*n*[TRG_SEL] helps you select the input trigger for the channel from all other channels' trigger outputs.
- TCTRL*n*[TRG_SRC] helps you select between the internal and external trigger inputs to the channel.

The selected trigger affects how the timer operates, using the configuration of TCTRL*n*[TSOT], TCTRL*n*[TSOI], and TCTRL*n*[TROT] (see Table 504).

Table 504. Fields that control timer operations

If	=	Then
Timer stop on interrupt (TCTRL*n*[TSOI])	1	The counter stops after MSR[TIF*n*] assertion. To reload and decrement, it requires: • A trigger (if TCTRL*n*[TSOT] = 1). • A T_EN rising edge (if TCTRL*n*[TSOT] = 0).
	0	The counter does not stop after timeout.
Timer reload on trigger (TCTRL*n*[TROT])	1	The counter is loaded after each trigger.
	0	The counter is loaded after every T_EN rising edge or timeout rising edge (timeout is not used in Capture modes).
Timer start on trigger (TCTRL*n*[TSOT])	1	The counter starts decrementing after a trigger. Subsequent triggers are ignored until the counter times out.
	0	The counter decrements immediately after the next clock edge. When the channel is chained or is in Capture mode, TCTRL*n*[TSOT] has no effect.

In different timer modes, the programmable fields listed in Table 505 affect the timer operation differently.

Table 505. Timer modes and programmable fields

Mode (TCTRL*n*[MODE])	Fields affecting timer operations
32-bit periodic counter	TCTRL*n*[TSOT], TCTRL*n*[TSOI], and TCTRL*n*[TROT] affect the timer operation as described in Table 504.
Dual 16-bit periodic counter	
32-bit trigger accumulator	• Only TCTRL*n*[TSOI] controls the timer function. • TCTRL*n*[TROT] and TCTRL*n*[TSOT] have no effect on timer operations.
32-bit input trigger capture	• Only TCTRL*n*[TSOI] and TCTRL*n*[TROT] control the timer function. • TCTRL*n*[TSOT] has no effect on timer operations.

51.3.7 Channel chaining

You can chain individual timer channels together to achieve a larger value of timeout. Chaining enables these channels to work in a "nested loop" manner, thereby leading to an effective timeout value of $TVAL_{CHn} \times (TVAL_{CHn-1} + 1)$.

To chain the channels together, write 1 to TCTRL*n*[CHAIN] for the corresponding channel. When a channel is chained, that channel's timer decrements after the previous channel's timeout pulse, regardless of the timer mode that TCTRL*n*[MODE] defines.

TCTRL*n*[TSOT] does not have any effect if you chain the channel timer (channel *n*) to the previous channel's timer (channel *n* - 1).

51.3.8 Detailed timing

The following table represents various timing diagrams. The diagrams are not "cycle-accurate," which means, they may not show some of the cycles, but they do show the timer channel behavior across several clock cycles.

Table 506. Timing diagrams

Mode (TCTRL*n*[MODE]) setting		Timing diagram	TCTRL*n*[TSOT]	TCTRL*n*[TROT]	TCTRL*n*[TSOI]	TCTRL*n*[CHAIN]
32-bit periodic counter (Compare mode)	00	Case 1: TCTRL*n*[MODE] = 0 • For a use case requiring repeated interrupts with reload • Trigger outputs have equal periods	0	0	0	0
		Case 2: TCTRL*n*[MODE] = 0 • Useful for One-Shot Trigger mode • Trigger starts again after TCTRL*n*[T_EN] becomes 1	0	0	1	0
		Case 3: TCTRL*n*[MODE] = 0 • For a use case requiring repeated interrupts with reload • Trigger outputs have unequal periods	0	1	0	0
		Case 4: TCTRL*n*[MODE] = 0 • For a one-shot timer with reload before timeout of Timer mode • Timer starts again after you write 1 to TCTRL*n*[T_EN]	0	1	1	0
		Case 5: TCTRL*n*[MODE] = 0 • Useful for generating periodic interrupts after a predefined event (input trigger) • Output triggers have equal periods	1	0	0	0
		Case 6: TCTRL*n*[MODE] = 0 • Triggers One-Shot Timer mode • Output trigger period depends on the input trigger	1	0	1	0
		Case 7: TCTRL*n*[MODE] = 0 • Repeated interrupts with Reload Timer mode • Outputs triggers have unequal periods	1	1	0	0
		Case 8: TCTRL*n*[MODE] = 0 • Case shown for a nonperiodic input trigger (might not be a use case)	1	1	1	0

Table continues on the next page...

Table 506. Timing diagrams (continued)

Mode (TCTRL*n*[MODE]) setting		Timing diagram	TCTRL*n*[TSOT]	TCTRL*n*[TROT]	TCTRL*n*[TSOI]	TCTRL*n*[CHAIN]
		• If input trigger is periodic and greater than timer timeout, it is the same as TCTRL*n*[TROT] = 0 • If input trigger is periodic and less than timer timeout, the timer never times out and always reloads on the input trigger (not a valid use case)				
16-bit dual periodic counter (Compare mode)	01	Case 1: TCTRL*n*[MODE] = 1 • The effect of TCTRL*n*[TSOT], TCTRL*n*[TROT], and TCTRL*n*[TSOI] is the same as that of TCTRL*n*[MODE] = 0 (32-bit Counter Compare mode) • Both halves of the counter are affected in the same way	0	0	0	0
32-bit trigger accumulator mode	10	Case 1: TCTRL*n*[MODE] = 10 • Useful for a continuous pulse counting mode • Trigger and timeout generated after programmed number of pulses are accumulated	X	X	0	0
		Case 2: TCTRL*n*[MODE] = 10 • Useful for One-Shot Pulse Counting mode • Trigger and timeout generated after programmed number of pulses are accumulated	X	X	1	0
32-bit trigger capture mode	11	Case 1: TCTRL*n*[MODE] = 11 • Useful for determining the duration between pulses • Proper clock selection can ensure that the timer does not rollover more than once between two pulses	X	0	0	0
		Case 2: TCTRL*n*[MODE] = 11 • Useful for determining the duration between pulses • Selecting a fast timer clock provides accurate measurements but it can also cause timer rollover between pulses	X	1	0	0

Table continues on the next page...

51.3.8.1 Case 1: TCTRL*n*[MODE] = 0

The following figure represents case 1 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 0
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

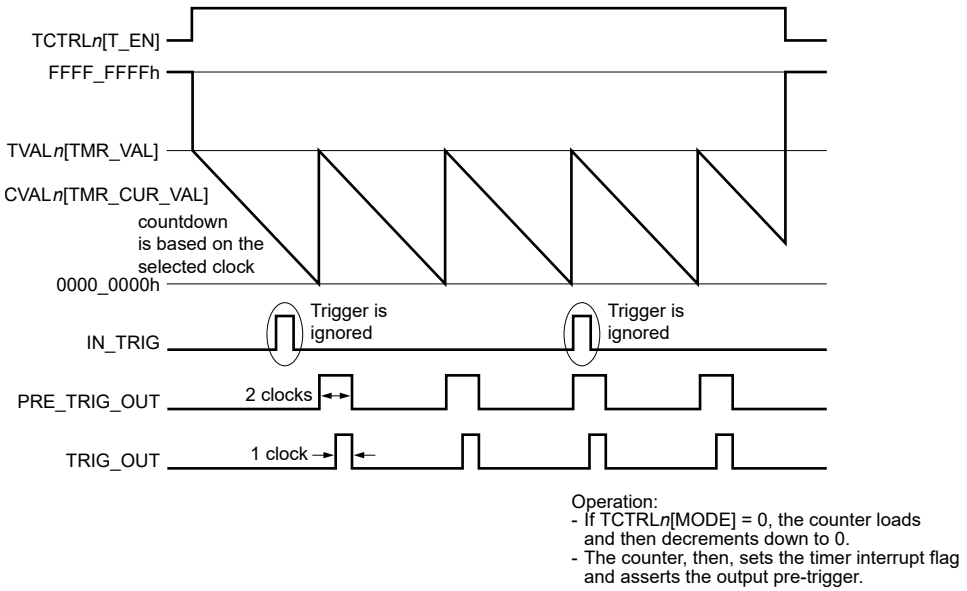

Figure 259. Case 1: TSOT = 0, TROT = 0, TSOI = 0, CHAIN = 0

51.3.8.2 Case 2: TCTRL*n*[MODE] = 0

The following figure represents case 2 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 0
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

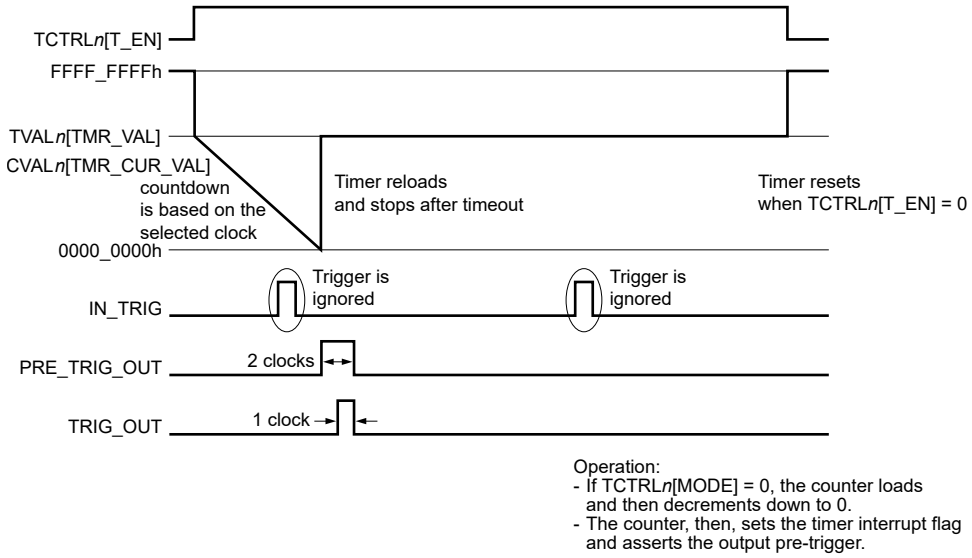

Figure 260. Case 2: TSOT = 0, TROT = 0, TSOI = 1, CHAIN = 0

51.3.8.3 Case 3: TCTRL*n*[MODE] = 0

The following figure represents case 3 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 0
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

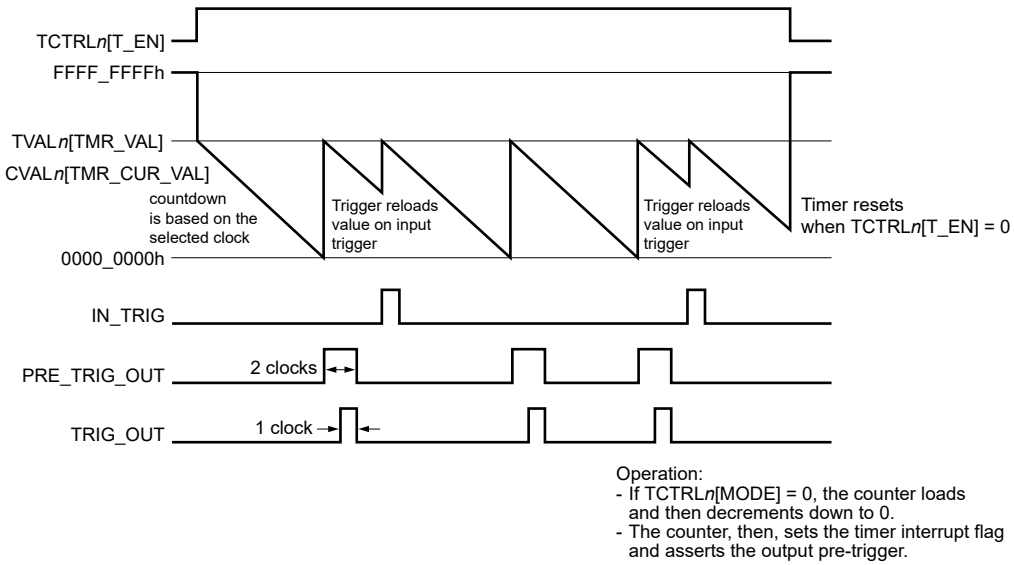

Figure 261. Case 3: TSOT = 0, TROT = 1, TSOI = 0, CHAIN = 0

51.3.8.4 Case 4: TCTRL*n*[MODE] = 0

The following figure represents case 4 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 0
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

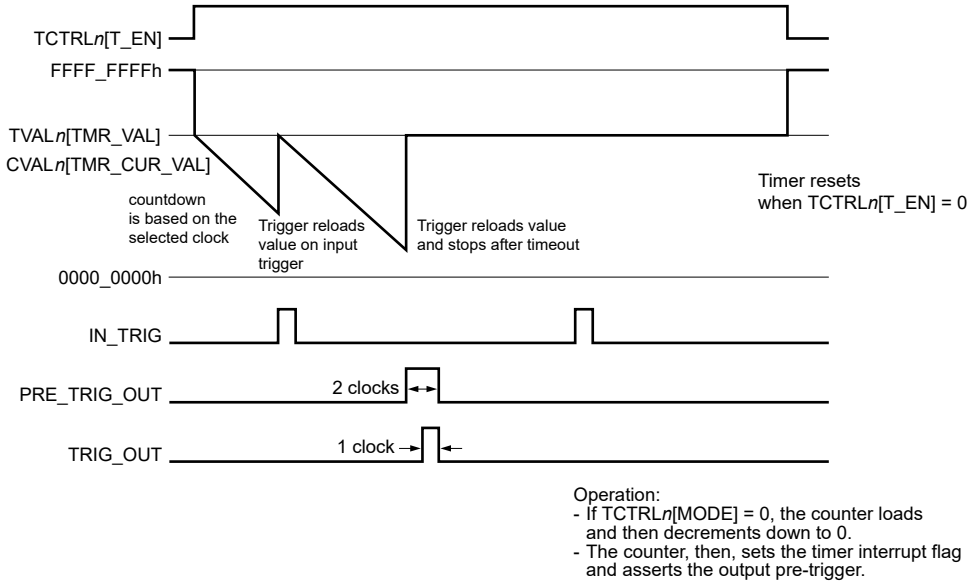

Figure 262. Case 4: TSOT = 0, TROT = 1, TSOI = 1, CHAIN = 0

51.3.8.5 Case 5: TCTRL*n*[MODE] = 0

The following figure represents case 5 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 1
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

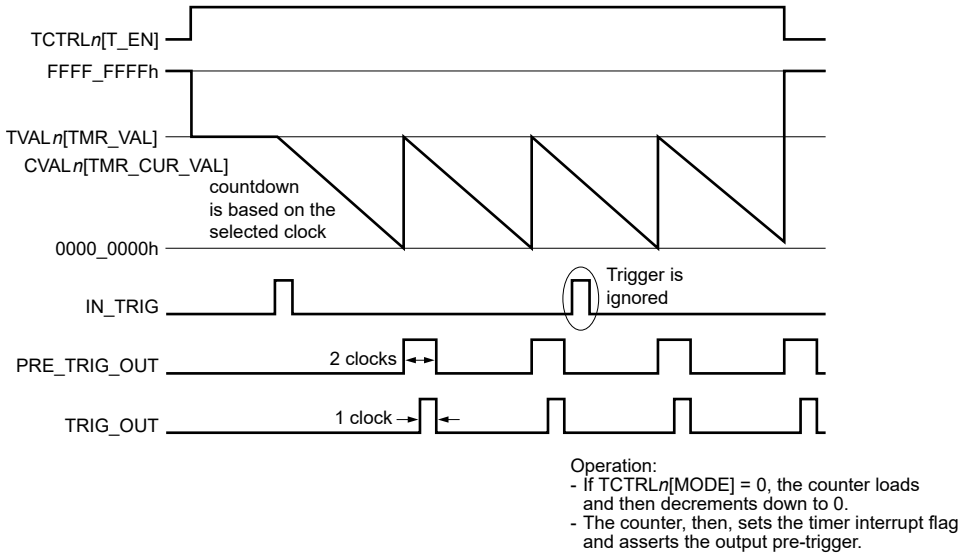

Figure 263. Case 5: TSOT = 1, TROT = 0, TSOI = 0, CHAIN = 0

51.3.8.6 Case 6: TCTRL*n*[MODE] = 0

The following figure represents case 6 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 1
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

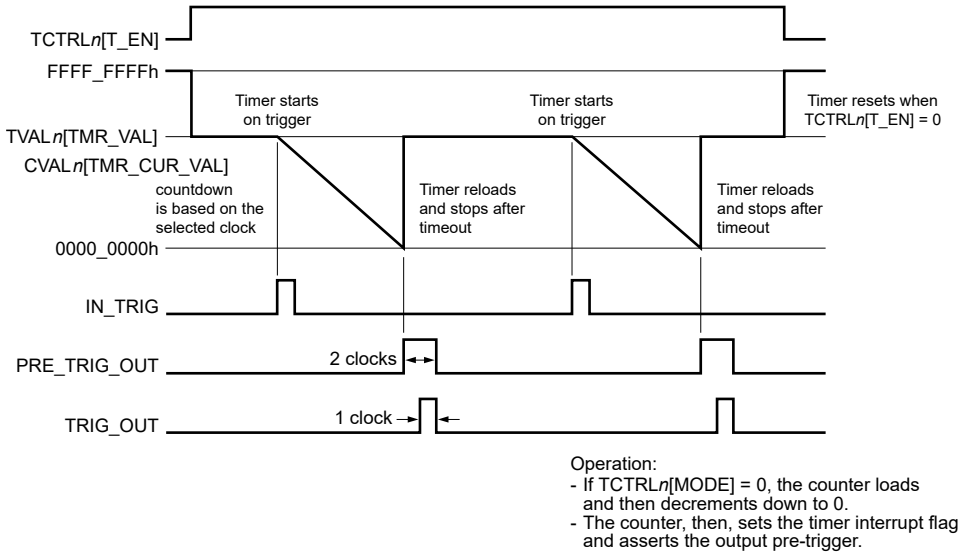

Figure 264. Case 6: TSOT = 1, TROT = 0, TSOI = 1, CHAIN = 0

51.3.8.7 Case 7: TCTRL*n*[MODE] = 0

The following figure represents case 7 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 1
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

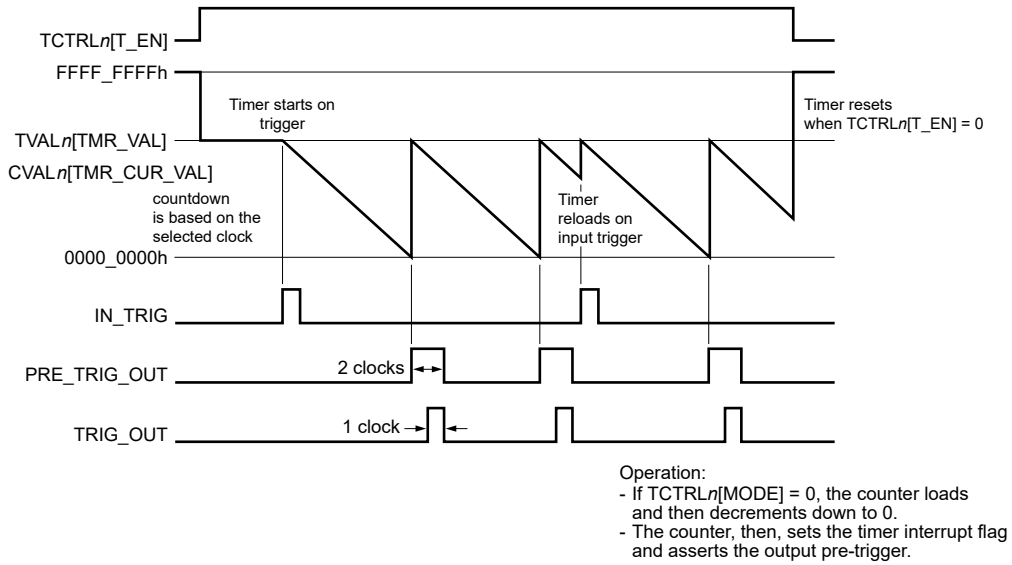

Figure 265. Case 7: TSOT = 1, TROT = 1, TSOI = 0, CHAIN = 0

51.3.8.8 Case 8: TCTRL*n*[MODE] = 0

The following figure represents case 8 in which TCTRL*n*[MODE] = 0 (32-bit periodic counter).

LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 1
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

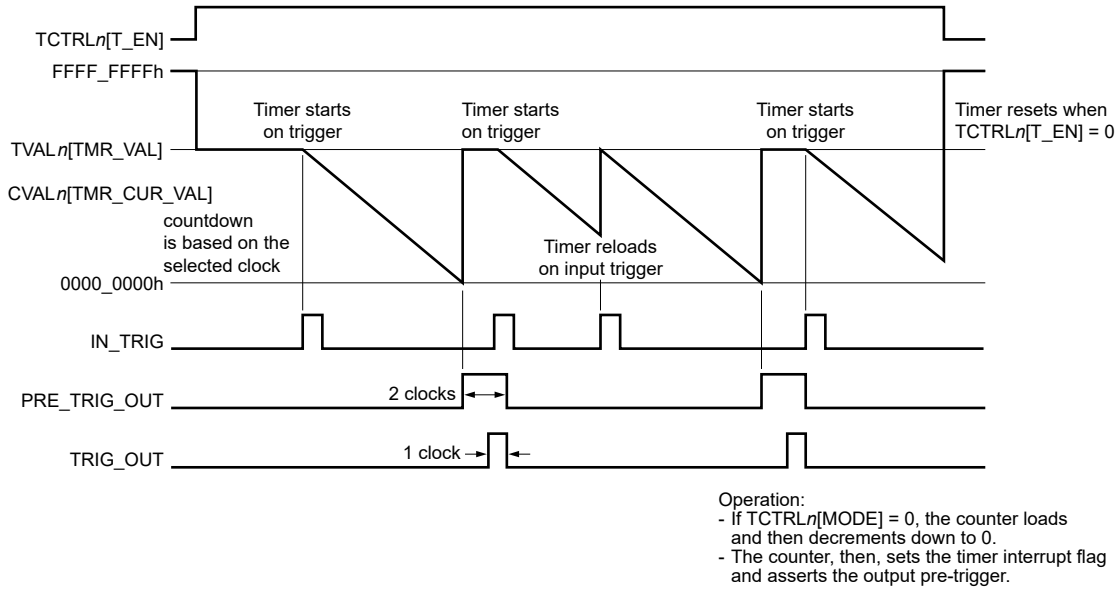

Figure 266. Case 8: TSOT = 1, TROT = 1, TSOI = 1, CHAIN = 0

51.3.8.9 Case 1: TCTRL*n*[MODE] = 1

The following figure represents case 1 in which TCTRL*n*[MODE] = 1 (16-bit dual periodic counter). LPIT works in Compare mode and is configured as follows:

- TCTRL*n*[TSOT] = 0
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

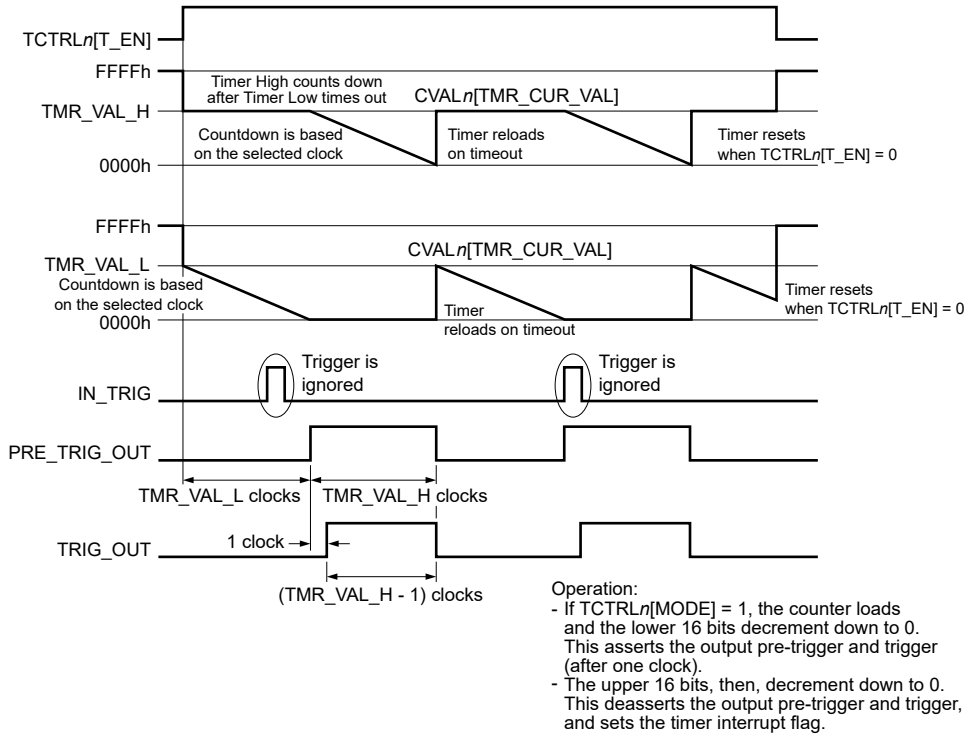

Figure 267. Case 1: TSOT = 0, TROT = 0, TSOI = 0, CHAIN = 0

If TCTRL*n*[MODE] = 1:

- The effect of timing control fields is similar to the effect of timer control fields when TCTRL*n*[MODE] = 0. See the individual timing diagrams for cases with TCTRL*n*[MODE] = 0 for more information.
- The timer interrupt (timeout) asserts when {TMR_H,TMR_L} = 0000_0000h.

See the following table for the behavior of timer control fields when TCTRL*n*[MODE] = 1.

Table 507. Timer control fields when TCTRL*n*[MODE] = 1

TCTRL*n*[TSOT]	TCTRL*n*[TROT]	TCTRL*n*[TSOI]	Function	Effect on timer
0	0	0	• For repeated interrupts with reload • Trigger outputs have equal periods	Similar to Case 1: TCTRL*n*[MODE] = 1.
0	0	1	One-shot mode	• Similar to Case 2: TCTRL*n*[MODE] = 0. • Both timers stop after first count down and then time out. • Timers do not count again until TCTRL*n*[T_EN] becomes 1.
0	1	0	• For repeated interrupts with reload • Trigger outputs have unequal periods	• Similar to Case 3: TCTRL*n*[MODE] = 0 . • Both timers reload the value of TVAL*n*[TMR_VAL] after the trigger rising edge.

Table continues on the next page...

Table 507. Timer control fields when TCTRL*n*[MODE] = 1 (continued)

TCTRL*n*[TSOT]	TCTRL*n*[TROT]	TCTRL*n*[TSOI]	Function	Effect on timer
				• Output triggers clear after reload, if asserted.
0	1	1	Reloadable one-shot mode	• Similar to Case 4: TCTRL*n*[MODE] = 0. • If a trigger occurs before timeout, then both timers reload and count down (as shown); the timers stop after timeout. • A trigger assertion after timeout reloads the value of TVAL*n*[TMR_VAL] into the timers. • The timers do not count again until TCTRL*n*[T_EN] becomes 1 again.
1	0	0	• For generating periodic interrupts after a predefined event (input trigger) • Output triggers have equal periods	• Similar to Case 5: TCTRL*n*[MODE] = 0. • After TCTRL*n*[T_EN] rises, the timers do not start until after the first trigger's rising edge. • Subsequent triggers have no effect.
1	0	1	• Triggered one-shot timer mode • Output trigger period depends on the input trigger	• Similar to Case 6: TCTRL*n*[MODE] = 0. • After TCTRL*n*[T_EN] becomes 1, the timers do not start until after the first trigger's rising edge. • The timer stops counting after a timeout assertion. • The timer does not start counting again until a new trigger's rising edge is detected.
1	1	0	• For repeated interrupts with reload timer mode • Output triggers have unequal periods	• Similar to Case 7: TCTRL*n*[MODE] = 0. • After TCTRL*n*[T_EN] becomes 1, the timers do not start until the first trigger's rising edge. • Subsequent triggers cause the timer to reload the value of TVAL*n*[TMR_VAL] into both counters. • The output triggers clear after a reload, if asserted.
1	1	1	• For a nonperiodic input trigger • If input trigger is periodic and greater than timer timeout, then it is the	• Similar to Case 8: TCTRL*n*[MODE] = 0. • After TCTRL*n*[T_EN] becomes 1, the timers do not start until the first trigger's rising edge.

Table continues on the next page...

Table 507. Timer control fields when TCTRL*n*[MODE] = 1 (continued)

TCTRL*n*[TSOT]	TCTRL*n*[TROT]	TCTRL*n*[TSOI]	Function	Effect on timer
			same as TCTRL*n*[TROT] = 0 (which is triggered one-shot timer mode; output trigger period depends on the input trigger)	• The timers stop counting after a timeout assertion. • A trigger's rising edge causes the timers to reload and then count down.

51.3.8.10 Case 1: TCTRL*n*[MODE] = 10

The following figure represents case 1 in which TCTRL*n*[MODE] = 10. LPIT works in 32-bit trigger accumulator mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = X
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

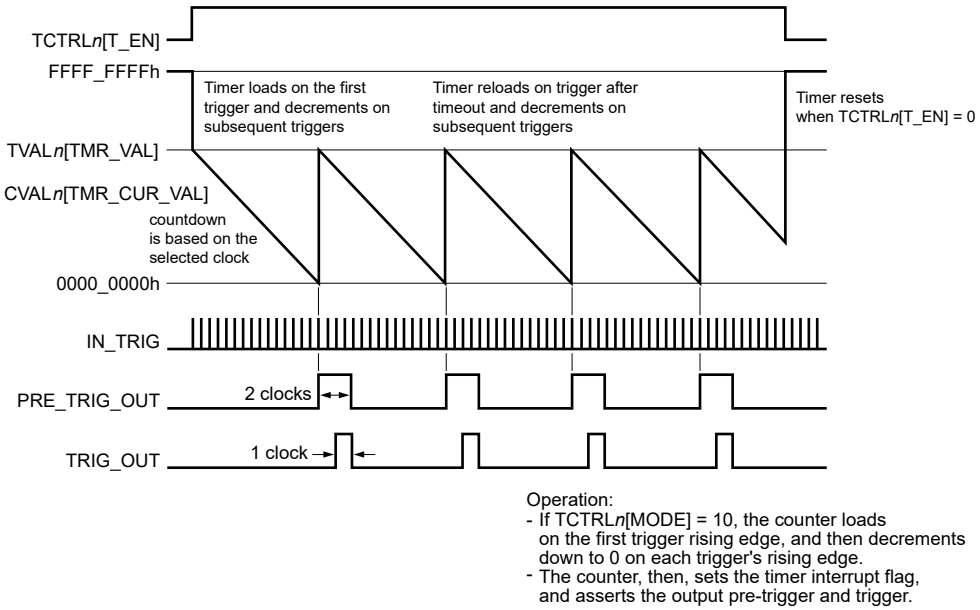

Figure 268. Case 1: TSOT = X, TROT = X, TSOI = 0, CHAIN = 0

51.3.8.11 Case 2: TCTRL*n*[MODE] = 10

The following figure represents case 2 in which TCTRL*n*[MODE] = 10. LPIT works in 32-bit trigger accumulator mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = X
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

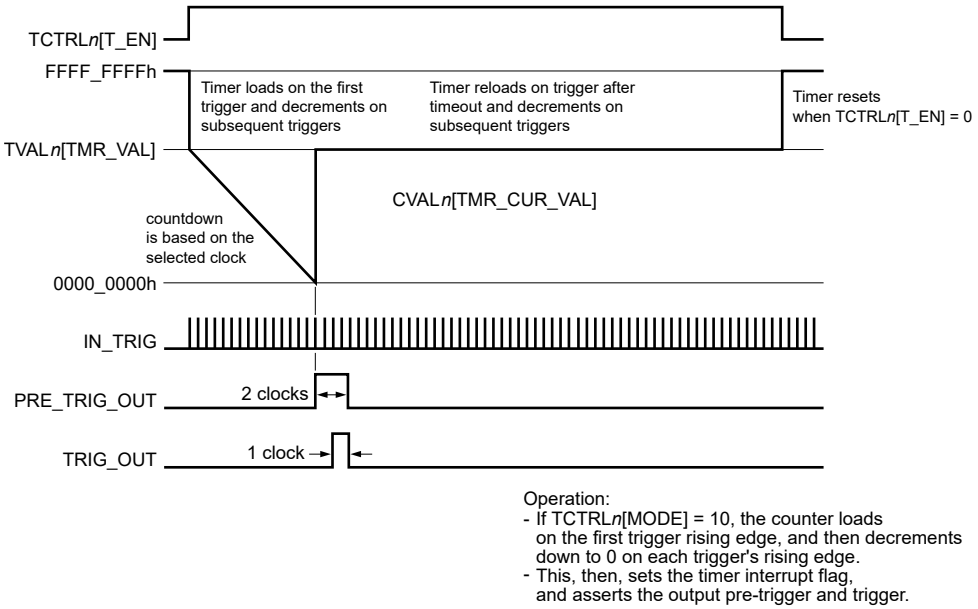

Figure 269. Case 2: TSOT = X, TROT = X, TSOI = 1, CHAIN = 0

51.3.8.12 Case 1: TCTRL*n*[MODE] = 11

The following figure represents case 1 in which TCTRL*n*[MODE] = 11. LPIT works in 32-bit trigger capture mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

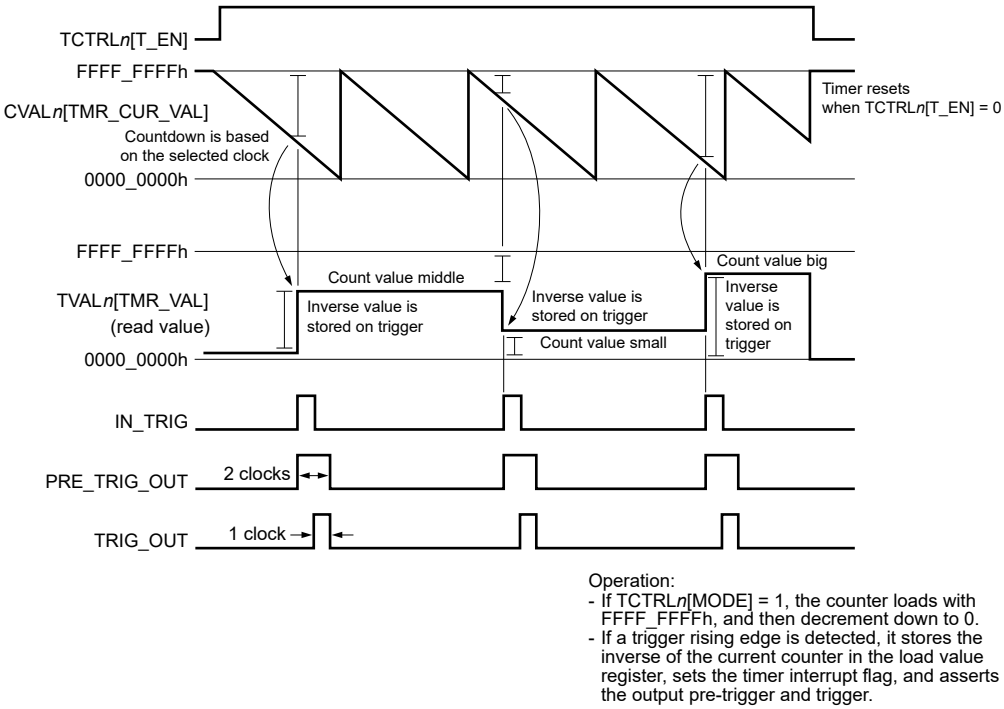

Figure 270. Case 1: TSOT = X, TROT = 0, TSOI = 0, CHAIN = 0

51.3.8.13 Case 2: TCTRL*n*[MODE] = 11

The following figure represents case 2 in which TCTRL*n*[MODE] = 11. LPIT works in 32-bit trigger capture mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 0
- TCTRL*n*[CHAIN] = 0

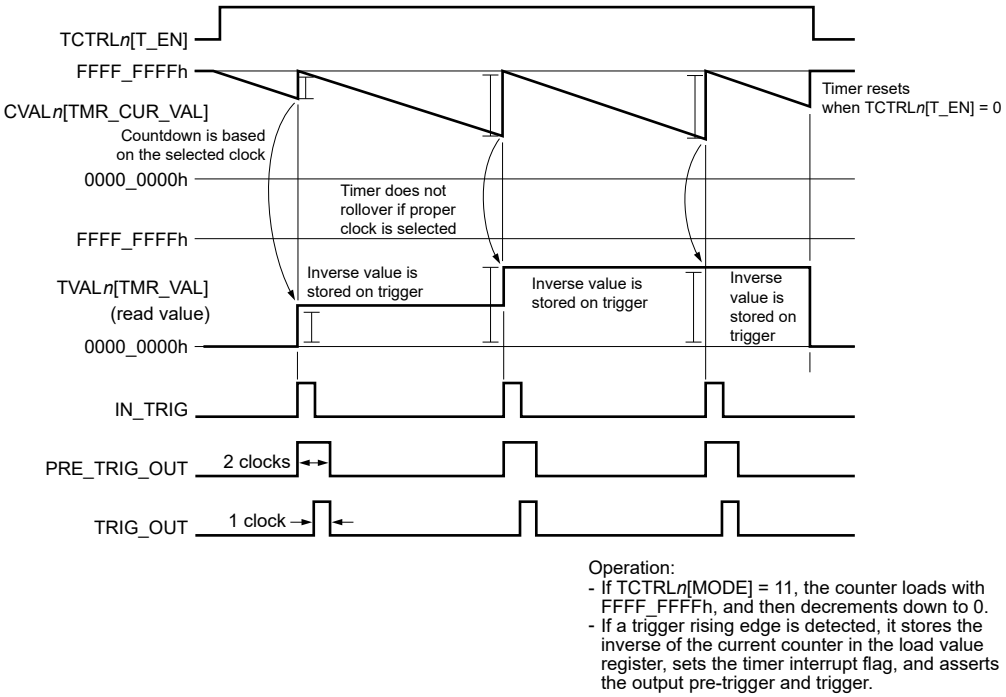

Figure 271. Case 2: TSOT = X, TROT = 1, TSOI = 0, CHAIN = 0

51.3.8.14 Case 3: TCTRL*n*[MODE] = 11

The following figure represents case 3 in which TCTRL*n*[MODE] = 11. LPIT works in 32-bit trigger capture mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = 0
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

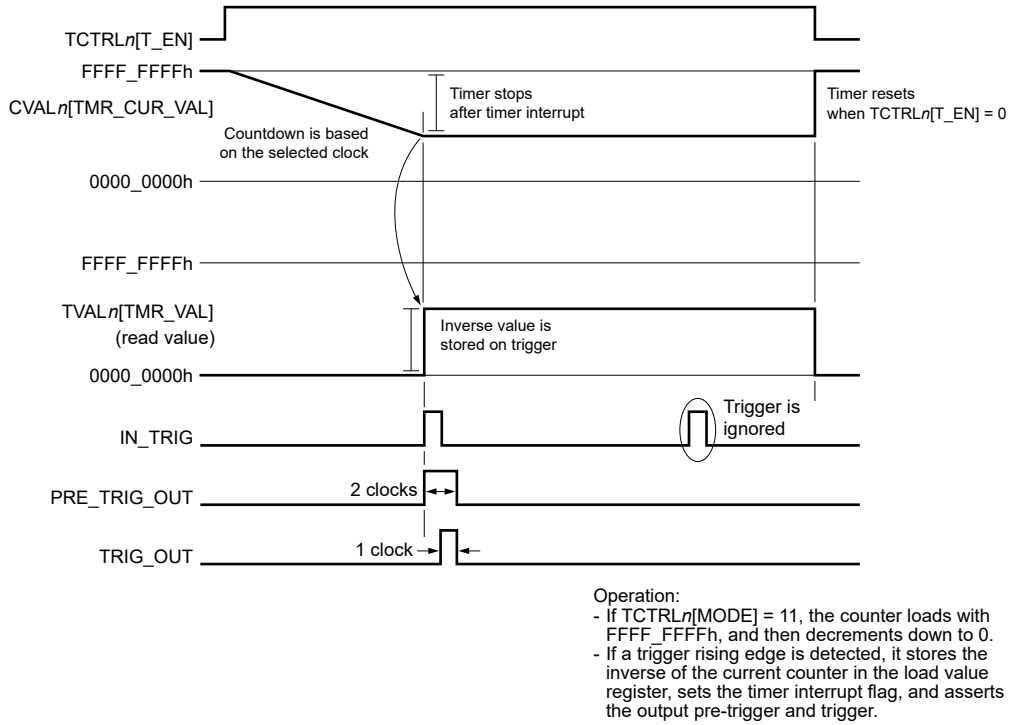

Figure 272. Case 3: TSOT = X, TROT = 0, TSOI = 1, CHAIN = 0

51.3.8.15 Case 4: TCTRL*n*[MODE] = 11

Case 4, in which TCTRL*n*[MODE] = 11, is the same as case 3, except that the timer reloads to FFFF_FFFFh and then stops. The timer does not start until TCTRL*n*[T_EN] becomes 1 again. In this case, LPIT works in 32-bit trigger capture mode and is configured as follows:

- TCTRL*n*[TSOT] = X
- TCTRL*n*[TROT] = 1
- TCTRL*n*[TSOI] = 1
- TCTRL*n*[CHAIN] = 0

51.3.9 Timer chaining

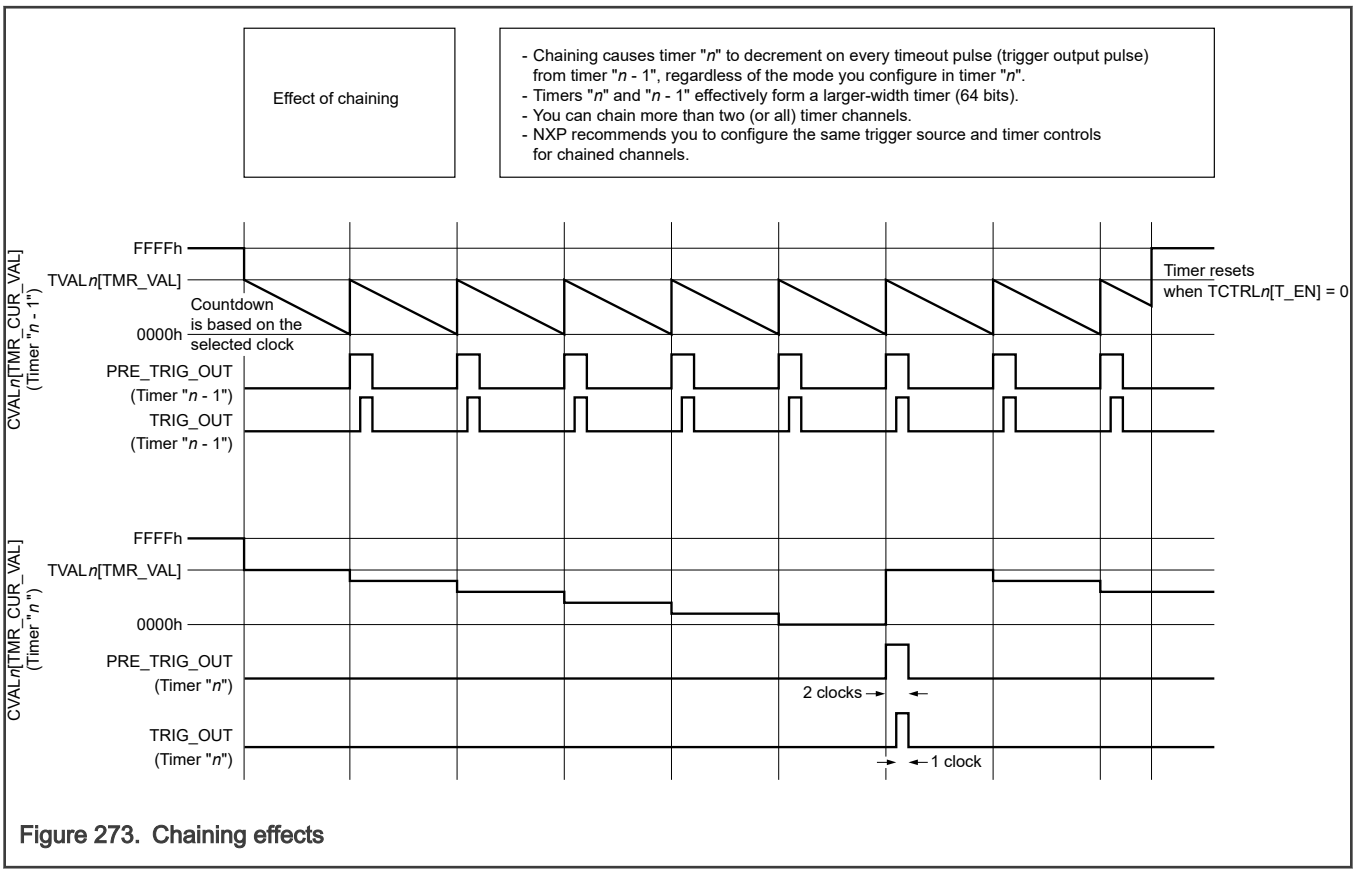

Figure 273. Chaining effects

51.4 Initialization

Table 508. Initializing LPIT

Step	Action	How or why to perform the step
1	Enable the peripheral clock	By writing 1 to MCR[M_CEN]. **NOTE** • Accessing certain registers (Module Status (MSR), Set Timer Enable (SETTEN), Clear Timer Enable (CLRTEN), Timer Value (TVAL0 - TVAL3), Current Timer Value (CVAL0 - CVAL3), and Timer Control (TCTRL0 - TCTRL3)) while MCR[M_CEN] = 0 leads to the assertion of a transfer error for that bus access. However, writing to CVAL*n* and reserved registers generates a transfer error. • There might be additional clock gating fields in the chip that gate the peripheral clock to this module. When enabling the clock to this module, you must configure those additional clock gating fields (in addition to configuring MCR[M_CEN]).
2	Wait for four peripheral clock cycles	To allow time for clock synchronization and reset deassertion.

Table continues on the next page...

Table 508. Initializing LPIT (continued)

Step	Action	How or why to perform the step
3	Configure timer control fields	For each timer channel that is to be enabled: • Timer mode of operation fields, TCTRL*n*[MODE] • Trigger source selection fields, TCTRL*n*[TRG_SEL] and TCTRL*n*[TRG_SRC] • Trigger control fields, TCTRL*n*[TROT], TCTRL*n*[TSOT], and TCTRL*n*[TSOI] **NOTE** You must not update timer control fields when the timer is disabled. You can disable a timer by using any one of the following methods: • Write 1 to the specific timer's CLRTEN[CLR_T_EN_*n*] field. • Write 0 to TCTRL*n*[T_EN] for that channel.
4	Configure the channels that are to be chained	By writing 1 to TCTRL*n*[CHAIN] in the corresponding channel's Timer Control (TCTRL0 - TCTRL3).
5	Set the timer timeout value	By programming an appropriate value in TVAL*n*[TMR_VAL] for the channels that you configure in Compare mode.
6	Configure MIER[TIE*n*]	For those channels that are required to generate interrupts after timer timeouts.
7	Configure the low-power modes of the module	By writing 1 to MCR[DBG_EN] and MCR[DOZE_EN]. This is common to all timer channels.
8	Enable the channel timers	By writing 1 to the corresponding TCTRL*n*[T_EN].

NOTE

When you enable a timer channel in Compare mode, the first decrement takes an additional one or two clock cycles because of synchronization logic. This results in the first compare (and therefore interrupt and hardware trigger) occurring slightly later. A faster counter clock minimizes this impact.

Additionally,

- For channels that you configure in Capture mode, you can read the timer value from Timer Value (TVAL0 - TVAL3) when a channel timeout occurs.
- At any time, you can read the current value of the timer for any channel by reading the corresponding channel's Current Timer Value (CVAL0 - CVAL3). Ensure that MCR[M_CEN] = 1 when doing so.
- MSR[TIF*n*] are asserted after timer timeout. To clear these timer interrupt flags, write 1 to them.

51.5 Memory map and registers

51.5.1 LPIT register descriptions

The LPIT memory map comprises 32-bit aligned registers, which you can access via 8-bit, 16-bit, or 32-bit accesses. Read and write accesses to reserved locations generate a transfer error, and the read bus shows all 0s.

NOTE

- The memory map and complete module are in big-endian (BE) format.
- LPIT does not check whether programmed values in these registers are correct—you must write the correct values.

51.5.1.1 LPIT memory map

LPIT1 base address: 442F_0000h

LPIT2 base address: 424C_0000h

15-8 EXT_TRIG	Number of External Trigger Inputs Specifies the number of external triggers implemented in this chip.
7-0 CHANNEL	Number of Timer Channels Specifies the number of timer channels implemented in this chip.

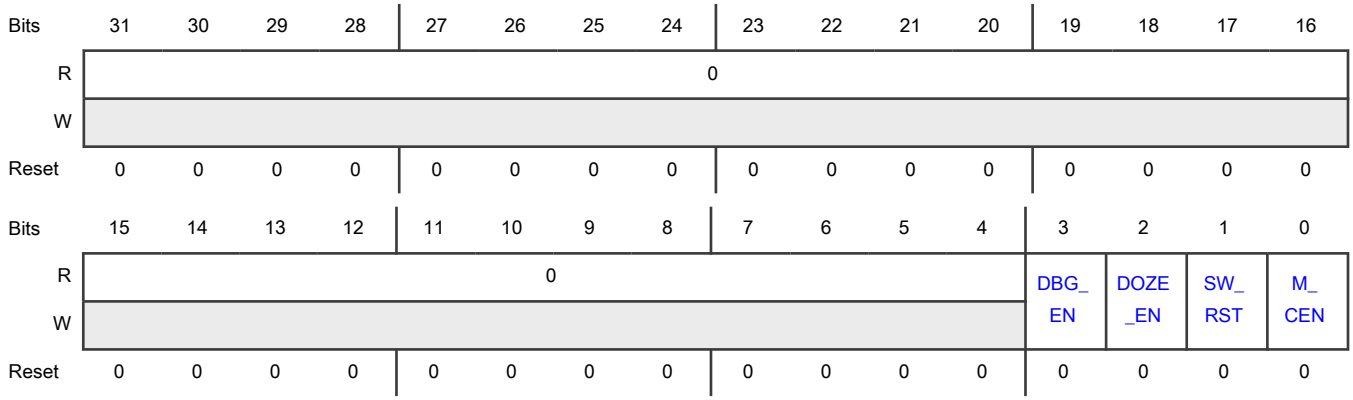
51.5.1.4 Module Control (MCR)

Contains software reset, clock enable, and mode enable fields.

Offset

Register	Offset
MCR	8h

Diagram



Fields

Field	Description
31-4 —	Reserved
3 DBG_EN	Debug Mode Enable Stops the timer channels when the chip enters Debug mode. 0 - Stops timer channels

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Allows timer channels to continue running
2 DOZE_EN	DOZE Mode Enable Stops the timer channels when the chip enters Doze mode. 0 - Stops timer channels 1 - Allows timer channels to continue running
1 SW_RST	Software Reset Resets all timer channels and registers, except Module Status (MSR). This field remains 1 until software clears it. Before clearing this field, software must wait for four peripheral clocks (for clock synchronization and reset propagation). 0 - Does not reset 1 - Resets
0 M_CEN	Module Clock Enable Enables the peripheral clock to LPIT module timers. This field must become 1 when accessing the following registers: • Module Status (MSR) • Set Timer Enable (SETTEN) • Clear Timer Enable (CLRTEN) • Timer Value (TVAL0 - TVAL3) • Current Timer Value (CVAL0 - CVAL3) • Timer Control (TCTRL0 - TCTRL3) The following considerations apply when using this field: • You must enable both the bus and peripheral clocks to allow clock synchronization and update of the aforementioned registers. Accessing these registers when MCR[M_CEN] = 0 asserts a transfer error for that bus cycle. • Writing to Current Timer Value (CVAL0 - CVAL3) and reserved registers always generates a transfer error. **NOTE** There may be additional clock gating fields available in this chip that gate the peripheral clock to LPIT. You must configure those additional clock gating fields appropriately to enable the peripheral clock to LPIT. 0 - Disable 1 - Enable

51.5.1.5 Module Status (MSR)

Contains channel timer interrupt flags.

NOTE

Unless the peripheral clock to the timers is enabled (MCR[M_CEN] = 1), reading or writing to this register generates a transfer error.

1 TIE1	Channel 1 Timer Interrupt Enable Enables interrupt generation when: • This field = 1. • The corresponding timer interrupt flag, MSR[TIF1] = 1. 0 - Disable 1 - Enable
0 TIE0	Channel 0 Timer Interrupt Enable Enables interrupt generation when: • This field = 1. • The corresponding timer interrupt flag, MSR[TIF0] = 1. 0 - Disable 1 - Enable

51.5.1.7 Set Timer Enable (SETTEN)

Allows the simultaneous enabling of timer channels.

You can enable timer channels by using either of the following ways:

- Writing 1 to TCTRL*n*[T_EN] in the respective TCTRL*n* register.
- Writing 1 to the corresponding SETTEN[SET_T_EN_*n*] field.

To disable timer channels simultaneously, use Clear Timer Enable (CLRTEN). Writing 0 to the fields of this register has no effect.

NOTE

Unless the peripheral clock to the timers is enabled (MCR[M_CEN] = 1), reading or writing to this register generates a transfer error.

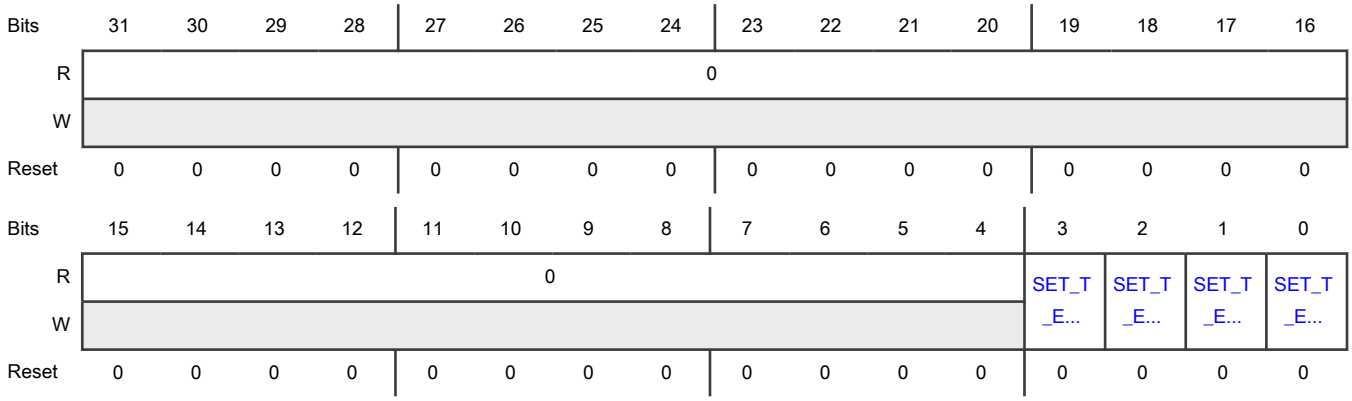
Diagram



Fields

Field	Description
31-0 TMR_CUR_VAL	Current Timer Value Represents the current timer value, if the timer is enabled.

51.5.1.11 Timer Control (TCTRL0 - TCTRL3)

Contains control fields for each timer channel:

- TRG_SEL for trigger selection
- TRG_SRC for trigger source selection
- TROT for timer reload
- TSOI for timer stoppage
- TSOT for timer decrementing
- MODE for timer operation mode selection
- CHAIN for channel chaining

You must update timer controls when the timer is disabled, and use either of the following ways to disable a timer:

- By writing 1 to the specific timer's CLRTEN[CLR_T_EN_*n*] field.
- By writing 0 to T_EN for that channel.

NOTE

Unless the peripheral clock to the timers is enabled (MCR[M_CEN] = 1), reading or writing to this register generates a transfer error.

27-24 TRG_SEL	Trigger Select Selects the trigger to use for starting and/or reloading the LPIT timer. This field selects one trigger from the set of internal or external triggers that TRG_SRC provides. TRG_SRC helps you make a choice between internal and external trigger signals for each channel. **NOTE** You must change the value of this field when the LPIT timer channel is disabled. 0000-0011 - Timer channel 0–3 trigger source 0100-1111 - Reserved
23 TRG_SRC	Trigger Source Selects whether to use internal or external trigger sources.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	You can select the trigger to be used by using this field or the TRG_SEL field. If a channel does not have an associated external trigger, write 1 to TRG_SRC. See LPIT chip-specific information for the available external trigger options. 0 - External 1 - Internal
22-19 —	Reserved
18 TROT	Timer Reload on Trigger Specifies whether the timer reloads after the selected trigger. If this field = 1, the LPIT timer reloads when a rising edge is detected on the selected trigger input. The trigger input is ignored if LPIT is disabled during Debug mode (MCR[DBG_EN] = 0) or Doze mode (MCR[DOZE_EN] = 0). 0 - Does not reload 1 - Reloads
17 TSOI	Timer Stop on Interrupt Controls whether the channel timer stops after being timed out. If this field = 0, the channel timer does not stop after timeout. If this field = 1, the channel timer stops after a timeout and then restarts based on the configuration of TSOT. If TSOT = 0, the channel timer restarts after a rising edge on T_EN is detected, which means that the timer channel is disabled and then enabled. If TSOT = 1, the channel timer restarts after a rising edge on the selected trigger is detected. 0 - Does not stop 1 - Stops
16 TSOT	Timer Start on Trigger Controls when the timer starts decrementing. If this field = 0, the timer starts decrementing immediately based on the restart condition (controlled by TSOI). If this field = 1, the timer starts decrementing when a rising edge on a selected trigger is detected. 0 - Immediately 1 - When a rising edge is detected
15-4 —	Reserved
3-2 MODE	Timer Operation Mode Configures the channel timer's mode of operation. This field controls how the timer decrements. 00 - 32-bit periodic counter 01 - Dual 16-bit periodic counter

Table continues on the next page...

Table continued from the previous page...

Field	Description
	10 - 32-bit trigger accumulator 11 - 32-bit trigger input capture
1 CHAIN	Chain Channel Specifies whether channel chaining is enabled. If channel chaining is enabled, the timer channel decrements after the previous channel's timeout (when timer channel N-1 trigger asserts). Timer channel 0 cannot be chained. If channel chaining is disabled, the channel timer runs independently. 0 - Disabled 1 - Enabled
0 T_EN	Timer Enable Enables the timer channel. 0 - Disable 1 - Enable

Chapter 52
Timer/PWM Module (TPM)

52.1 Chip-specific TPM information

Table 509. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

The chip includes six instances of TPM timers. LPTPM1, LPTPM2 are in AONMIX and LPTPM3, 4, 5, 6 are in WAKEUPMIX. Each TPM has its own clock root.

NOTE

TPM1_CH1, TPM1_CH3 are only supported as outputs, not inputs.

NOTE

TPM1 is clocked by AON bus and TPM3 is clocked by WAKEUP bus. TPM1 and TPM3 have their trigger output 0 used as input by CAN1 and CAN2 respectively. Because of this, these instances are clocked by the bus clock - the same clock used to clock the respective CAN module (bus_aon_clk_root and bus_wakeup_clk_root respectively) in order to ensure that these signals are timed synchronously between these modules.

NOTE

All the output triggers and input triggers are unused in this chip. So the descriptions related to output triggers and input triggers are not applicable.

52.2 Overview

TPM is a 4-channel timer that controls electric motor and power management applications by supporting:

- Input capture
- Output comparison
- Generation of PWM signals

An asynchronous clock that can remain enabled in low-power modes clocks the counter, compare, and capture registers.

52.2.1 Block diagram

TPM uses one input/output (I/O) pin per channel: CH*n* (TPM channel *n*) where *n* is the channel number.

The central component of TPM is a 32-bit counter with a programmable final value. Its counting can be up or up-down.

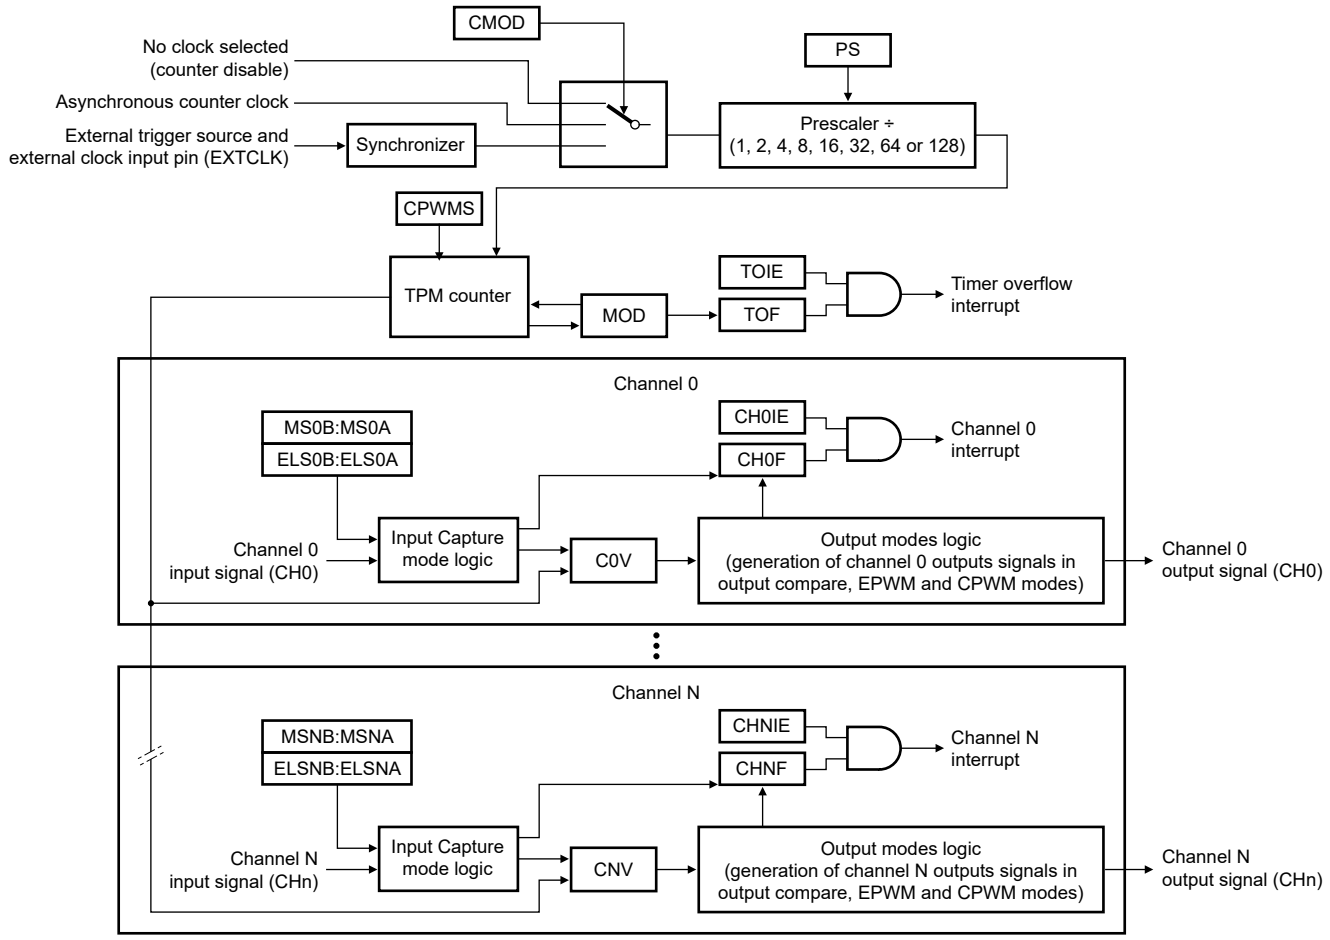

Figure 274. Block diagram

52.2.2 Features

- Supports selectable clock modes:
  - Can increment on every edge of the asynchronous counter clock
  - Can increment on the rising edge of an external clock input that is synchronized to the asynchronous counter clock
- Includes a prescaler divided by 1, 2, 4, 8, 16, 32, 64, or 128
- Includes a 32-bit TPM counter:
  - Can be a free-running counter or a modulo counter
  - The counting can be up or up-down
- Includes 4 channels that can be configured as follows:
  - Input Capture mode: the capture can occur on rising edges, falling edges, or both edges.
  - Output Compare mode: the output signal can be set, cleared, pulsed, or toggled on the match.
  - Edge-Aligned or Center-Aligned PWM mode for all channels.
- Supports the generation of an interrupt and DMA request per channel
- Supports the generation of an interrupt and DMA request when the counter overflows

- Supports selectable trigger input to either reset the counter to 0 or else cause the counter to start incrementing
  - The counter can also optionally stop incrementing on counter overflow.
- Supports the generation of hardware triggers per channel when the channel-interrupt-status flag is set
- Supports the generation of a hardware trigger when the counter overflows

52.3 Functional description

52.3.1 Counter

TPM has a 32-bit counter that the channels use for either input or output modes. The counter updates from the selected clock after it has been divided by the prescaler. The TPM counter can perform one of the following modes of operation:

- Up counting
- Up-down counting

52.3.1.1 Counter Clock mode

SC[CMOD] either disables the TPM counter or enables one of the three possible clock sources for the TPM counter. After any reset, SC[CMOD] becomes 0, which disables the TPM counter. You can configure SC[CMOD] for one of the following counter clock sources:

- Asynchronous counter clock
- External clock input pin
- External trigger source

You can read or write to SC[CMOD] at any time. Disabling the TPM counter by writing 0 to SC[CMOD] does not affect the TPM counter value or other registers, but the TPM counter clock domain must acknowledge this disabling action before SC[CMOD] becomes 0.

The external clock input and external trigger source pass through a synchronizer. The TPM counter clock clocks this synchronizer to ensure that counter transitions are properly aligned to counter clock transitions. Therefore, to meet Nyquist criteria, and also considering jitter, the frequency of the external clock source must be less than half of the counter clock frequency.

52.3.1.2 Prescaler

The counter clock source that you select passes through a prescaler that is a 7-bit counter. SC[PS] defines the value of the prescaler. The following figure shows an example of the prescaler counter and TPM counter.

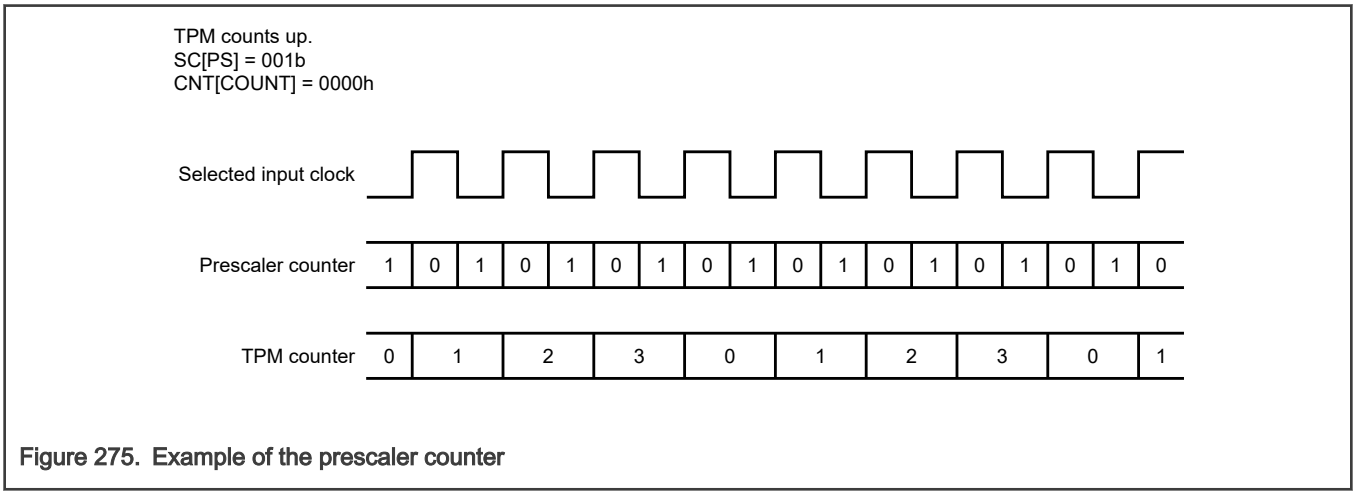

Figure 275. Example of the prescaler counter

52.3.1.3 Up counting

Up counting is enabled when you write 0 to SC[CPWMS].

In this mode, the TPM counter loads with value 0 and increments until it reaches the value defined in MOD[MOD], then the counter reloads with 0.

The TPM period when using up counting is (MOD[MOD] + 0001h) × period of the TPM counter clock.

SC[TOF] becomes 1 when the TPM counter changes from the value defined in MOD[MOD] to 0.

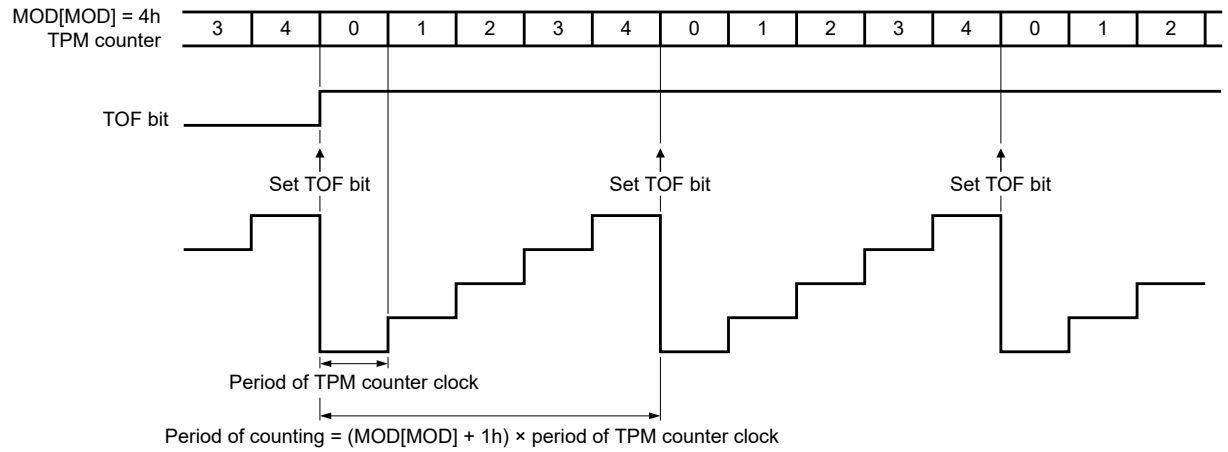

Figure 276. Example of TPM up counting

NOTE

- Configuring MOD[MOD] = 0 is a redundant condition. In this case, the TPM counter is always equal to the value of MOD[MOD], and SC[TOF] remains 1 for each rising edge of the TPM counter clock.
- Configuring MOD[MOD] = 1 and SC[PS] = 0 causes TPM to attempt to set SC[TOF] every second TPM counter clock. Because of synchronization delays between the TPM counter clock and the bus clock, you must write 1 to SC[TOF] to clear it two counter clock cycles before SC[TOF] can become 1 again.

52.3.1.4 Up-down counting

You enable up-down counting when you write 1 to SC[CPWMS]. This mode does not support configuring the value of Modulo (MOD) to be less than 2.

In this mode, the TPM counter loads with value 0 and increments until it reaches the value defined in MOD[MOD]. Then the counter starts decrementing until it returns to 0 and the up-down counting restarts.

The TPM period when using up-down counting is 2 × MOD[MOD] × period of the TPM counter clock.

TPM writes 1 to SC[TOF] when the TPM counter changes from the value defined in MOD[MOD] to (MOD[MOD] – 1).

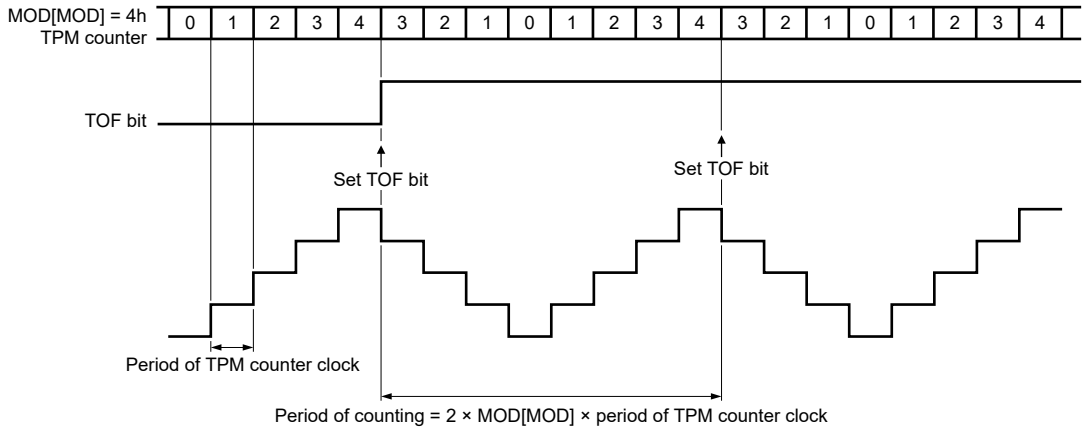

Figure 277. Example of up-down counting

52.3.1.5 Counter reset

Any write to CNT[COUNT] resets the TPM counter and forces the channel outputs to their initial values (except for channels in Output Compare mode).

52.3.1.6 Counter trigger

You can configure the TPM counter to start, stop, or reset in response to a hardware trigger input. The trigger input synchronizes with the asynchronous counter clock, so there is a three-counter-clock delay between the trigger assertion and counter response.

- When CONF[CSOT] = 1, the counter does not start incrementing until the trigger input detects a rising edge.
- When CONF[CSOO] = 1, the counter stops incrementing whenever SC[TOF] = 1. The counter does not increment again unless:
  - It is disabled.
  - CONF[CSOT] = 1 and the trigger input detects a rising edge.
- When CONF[CROT] = 1, the counter resets to 0, as if an overflow occurred, whenever the trigger input detects a rising edge. Any PWM channels are updated to their reload state.
- When CONF[CPOT] = 1, the counter pauses incrementing whenever you assert the trigger input. The counter continues incrementing when the trigger input negates. PWM output channels are forced to their default state.

You can configure the polarity of the external input trigger with CONF[TRGPOL].

When you enable an internal trigger source, the trigger input is selected from one or more channel input capture events. The input capture filters are used with the internal trigger sources. You can use POL[POL*n*] fields to invert the polarity of the input channels.

The following restrictions apply with input capture channel sources:

- When CONF[CSOT] = 1, the counter starts incrementing only on a rising edge on the channel input, if C*n*SC[ELS*n*A] = 1.
- When CONF[CROT] = 1, the counter resets to 0 on either edge of the channel input, as you configure it using C*n*SC[ELS*n*B] and C*n*SC[ELS*n*A].
- When CONF[CPOT] = 1, the counter pauses incrementing whenever you assert the channel input. PWM output channels are forced to their default state.

52.3.2 Registers updated from write buffers

52.3.2.1 MOD register update

If SC[CMOD] = 0, then Modulo (MOD) updates whenever you write to MOD[MOD].

If SC[CMOD] ≠ 0, then the MOD register updates accordingly as below:

- CPWM mode is disabled (SC[CPWMS] = 0), then the MOD register updates whenever you write to MOD[MOD], and the TPM counter value changes from the value defined in MOD[MOD] to 0.
- CPWM mode is enabled (SC[CPWMS] = 1), then the MOD register updates whenever you write to MOD[MOD], and the TPM counter value changes from the value defined in MOD[MOD] to (MOD[MOD] – 1).

52.3.2.2 C*n*V register update

If SC[CMOD] = 0, then the C*n*V register updates whenever you write to C*n*V[VAL].

If SC[CMOD] ≠ 0, then the C*n*V register updates according to the selected mode:

- If you select Output Compare mode, then the C*n*V register updates on the next TPM counter increment (end of the prescaler counting) after you write to C*n*V[VAL].
- If you select EPWM mode, then the C*n*V register updates after you write to C*n*V[VAL], and the TPM counter value changes from the value defined in MOD[MOD] to 0.
- If you select CPWM mode, then the C*n*V register updates after you write to C*n*V[VAL], and the TPM counter value changes from the value defined in MOD[MOD] to (MOD[MOD] – 1).

52.3.3 Peripheral triggers

See the chip-specific TPM information for more details.

52.3.3.1 Output triggers

TPM generates output triggers for the counter and for each channel that you can use to trigger events in other peripherals. The counter trigger asserts whenever SC[TOF] is 1 and remains asserted until the next increment.

Each TPM channel generates both a pre-trigger output and a trigger output.

1. The pre-trigger output asserts whenever C*n*SC[CH*n*F] sets.
2. The trigger output asserts on the first counter increment after the pre-trigger asserts.
3. Both the trigger and pre-trigger negate on the first counter increment after the trigger asserts.

When (COMBINE[COMBINE*n*] = 1) in Output Compare mode, the pre-trigger output for both channel *n* and channel *n* + 1 asserts when the CH*n*F flag is set and negates when the CH(*n* + 1)F flag is set. The trigger continues to assert on the first counter increment, after the pre-trigger asserts and negates at the same time as the pre-trigger negation.

52.3.3.2 Input trigger

You can configure the TPM input trigger to perform the following operations with configurable polarity:

- Increment the counter on trigger rising edge
- Start incrementing the counter on trigger rising edge
- Reset or reload the counter on trigger rising edge
- Pause the counter while trigger high

The TPM input trigger is synchronized and must remain asserted for at least two counter clock cycles, so that the input trigger can be detected.

52.3.4 Modes of operations

52.3.4.1 Input Capture mode

Input Capture mode is enabled when:

- (SC[CPWMS] = 0)
- (MS*n*B:MS*n*A = 0:0)
- (ELS*n*B:ELS*n*A ≠ 0:0)

When a selected edge occurs on the channel input:

- The C*n*V register captures the current value of the TPM counter.
- It also writes 1 to C*n*SC[CH*n*F] and generates a channel interrupt if C*n*SC[CH*n*IE] = 1 (see Figure 278).

When you configure a channel for input capture, the CH*n* pin is an edge-sensitive input. ELS*n*B:ELS*n*A control fields determine which edge, falling or rising, triggers the input-capture event. To detect the input signal correctly and to meet Nyquist criteria for signal sampling, the maximum frequency for the channel input signal is the counter clock divided by 4.

Input Capture mode ignores any writes to the C*n*V register.

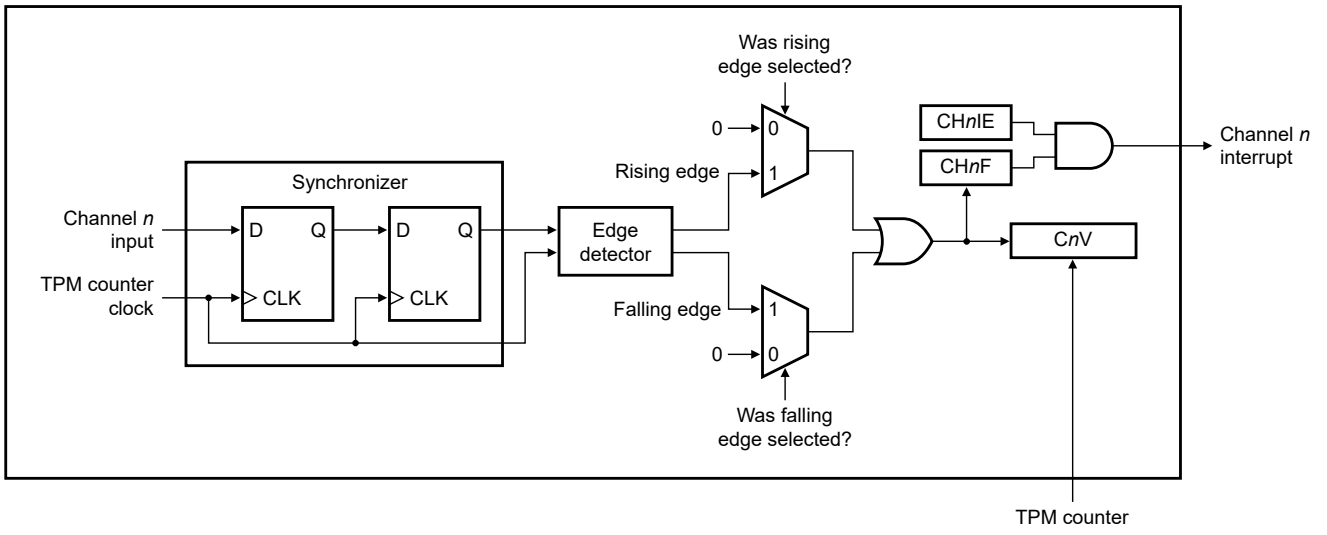

Figure 278. Input Capture mode

The CH*n*F flag is set on the third rising edge of the TPM counter clock after a valid edge occurs on the channel input.

52.3.4.1.1 Input capture filter

The input capture filter function is only available in Input Capture or Software Compare mode when Quadrature Decoder mode is enabled.

First, the TPM counter clock synchronizes the input signal. After synchronization, the input signal enters the filter block (see Figure 279).

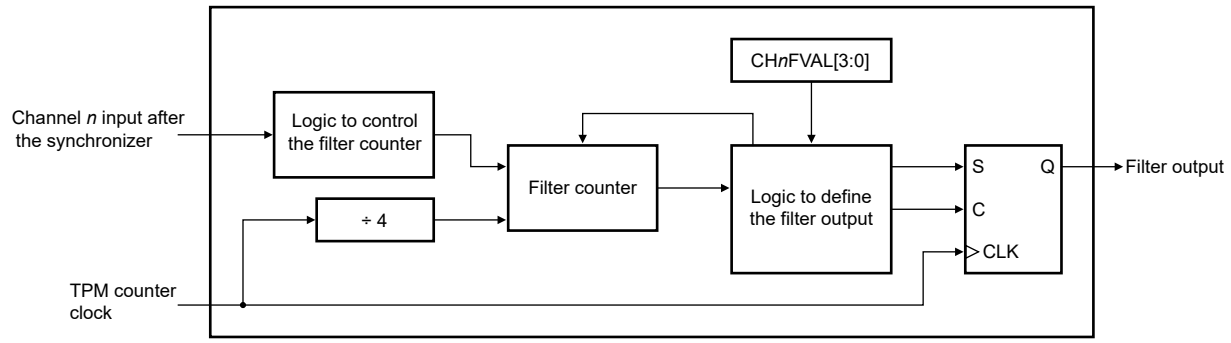

Figure 279. Channel input filter

When there is a state change in the input signal, TPM resets the counter, and it starts counting up. As long as the new state is stable on the input, the counter continues to increment. When the counter is equal to (CH*n*FVAL[3:0] × 4), the state change of the input signal is validated.

TPM resets the counter if the opposite edge appears on the input signal before it is validated. At the next input transition, the counter starts counting again. Any pulse that is less than the minimum value selected by (CH*n*FVAL[3:0] × 4 counter clocks) is considered as a glitch and does not pass through the filter. Figure 280 shows a timing diagram of the input filter.

The filter function is disabled when CH*n*FVAL[3:0] = 0. In this case, the input signal is delayed by 2 rising edges of the counter clock. If CH*n*FVAL[3:0] ≠ 0000, then the input signal is delayed by the minimum pulse width (CH*n*FVAL[3:0] × 4 system clocks) plus a further 3 rising edges of the system clock: two rising edges to the synchronizer, plus one more to the edge detector. In other words, the CH*n*F flag is set for (3 + (4 × CH*n*FVAL[3:0])) counter clock periods after a valid edge occurs on the channel input (see Figure 280).

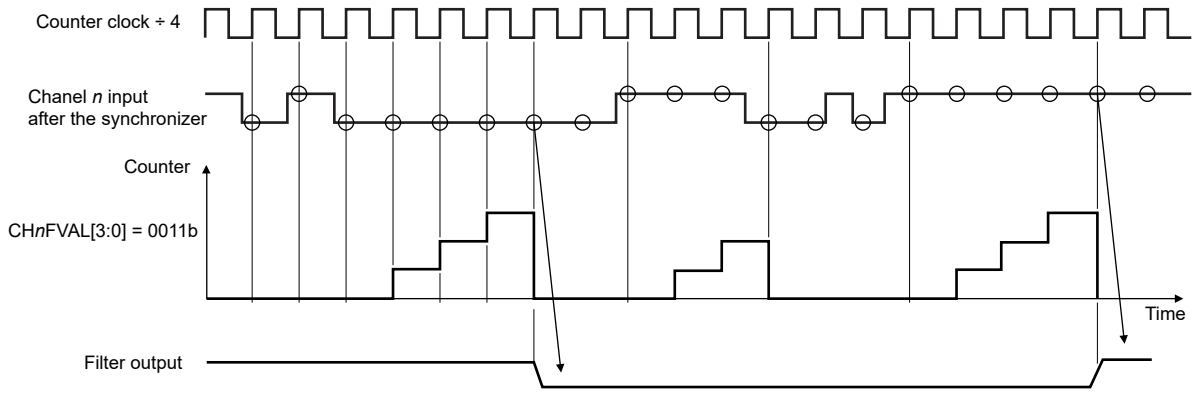

Figure 280. Channel input filter example

52.3.4.2 Output Compare mode

Output Compare mode is enabled when SC[CPWMS] = 0 and MS*n*B:MS*n*A = X:1.

In this mode, TPM can generate timed pulses with programmable:

- Position
- Polarity
- Duration
- Frequency

When the TPM counter matches the value defined in C*n*V[VAL] of an output compare channel, then channel *n* output can be set, cleared, or toggled if MS*n*B = 0. If MS*n*B = 1, then channel *n* output is pulsed high or low (as long as the TPM counter matches the value defined in C*n*V[VAL]).

When you initially configure a channel to Output Compare mode, the channel output is updated with its negated value (logic 0 for set/toggle/pulse high and logic 1 for clear/pulse low).

The channel *n* match (TPM counter = C*n*V[VAL]) writes 1 to C*n*SC[CH*n*F] and generates a channel *n* interrupt (if C*n*SC[CH*n*IE] = 1).

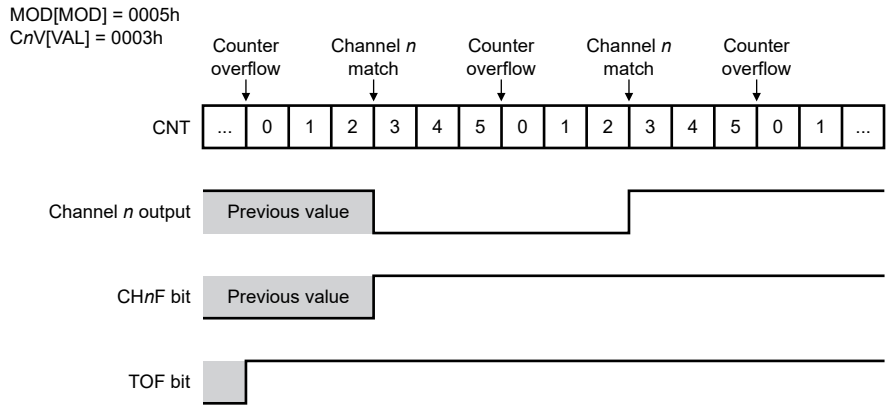

Figure 281. Example of Output Compare mode when a match toggles the channel output

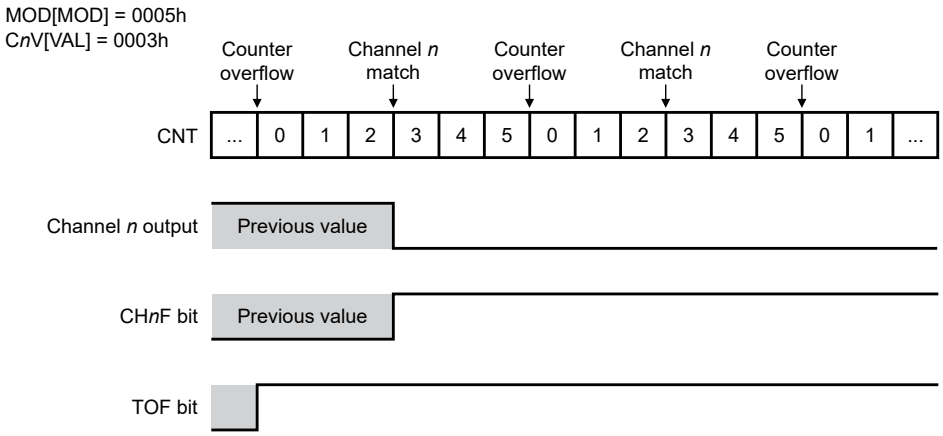

Figure 282. Example of Output Compare mode when a match clears the channel output

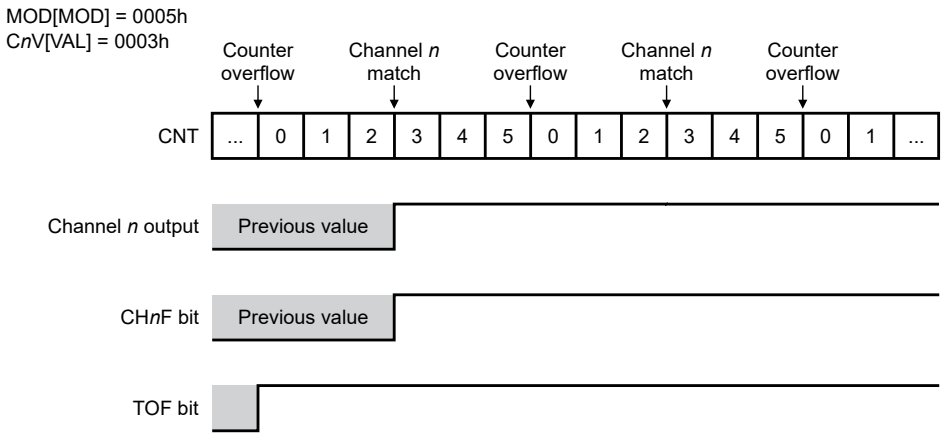

Figure 283. Example of Output Compare mode when a match sets the channel output

You can also use Output Compare mode with:

- SC[CPWMS] = 0 and MS*n*B:MS*n*A = 0:1
- SC[CPWMS] = 0 and ELS*n*B:ELS*n*A = 0:0

This condition is known as Software Compare mode. This mode sets the CH*n*F flag and generates a channel *n* interrupt (if CH*n*IE = 1) when the TPM counter reaches the value defined in the C*n*V register; however, TPM does not modify or control the channel *n* output.

52.3.4.3 Edge-Aligned PWM (EPWM) mode

EPWM mode is enabled when SC[CPWMS] = 0 and MS*n*B:MS*n*A = 1:0. The EPWM period is determined by (MOD[MOD] + 0001h) and the pulse width (duty cycle) is determined by C*n*V[VAL].

The channel *n* match (TPM counter = C*n*V[VAL]) writes 1 to C*n*SC[CH*n*F] and generates a channel *n* interrupt (if C*n*SC[CH*n*IE] = 1) at the end of the pulse width (see Figure 284).

This type of PWM signal is called edge-aligned because the leading edges of all PWM signals are aligned with the beginning of the period, which is the same for all channels within TPM.

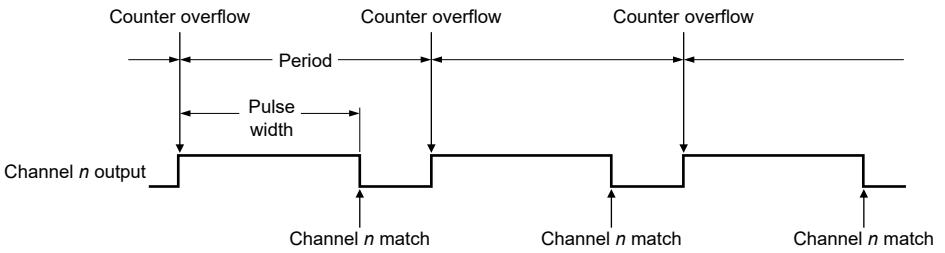

Figure 284. EPWM period and pulse width with ELS*n*B:ELS*n*A = 1:0

If ELS*n*B:ELS*n*A = 1:0, then the channel *n* output is forced high at the counter overflow or reload (when the TPM counter loads with 0), and it is forced low at the channel *n* match (TPM counter = C*n*V[VAL]). The channel *n* output is forced high when you first enable or whenever you pause the TPM counter (see Figure 285).

If ELS*n*B:ELS*n*A = 0:0, then the channel *n* output is forced high at the counter overflow or reload (when the TPM counter loads with 0), and it is forced low at the channel *n* match (TPM counter = C*n*V[VAL]). The channel *n* output is forced low when you first enable or whenever you pause the TPM counter.

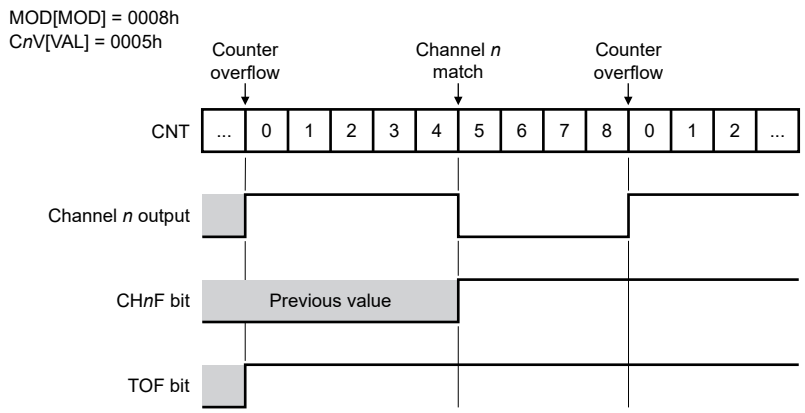

Figure 285. EPWM signal with ELS*n*B:ELS*n*A = 1:0

If ELS*n*B:ELS*n*A = 0:1, then the channel *n* output is forced low at the counter overflow or reload (when the TPM counter loads with 0), and it is forced high at channel *n* match (TPM counter = C*n*V[VAL]). Channel *n* output is forced low when you first enable or whenever you pause the TPM counter (see Figure 286).

If ELS*n*B:ELS*n*A = 1:1, then the channel *n* output is forced low at the counter overflow or reload (when the TPM counter loads with 0), and it is forced high at the channel *n* match (TPM counter = C*n*V[VAL]). Channel *n* output is forced high when you first enable or whenever you pause the TPM counter.

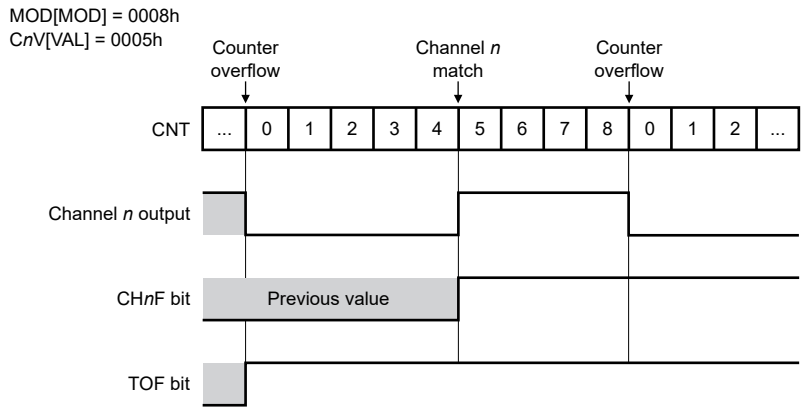

Figure 286. EPWM signal with ELS*n*B:ELS*n*A = 0:1

If C*n*V[VAL] = 0000h, then the channel *n* output is a 0% duty cycle EPWM signal.

If C*n*V[VAL] > MOD[MOD], then the channel *n* output is a 100% duty cycle EPWM signal and the CH*n*F flag is not set because there is never a channel *n* match. Therefore, MOD[MOD] must be less than FFFFFFFFh to get a 100% duty cycle EPWM signal.

52.3.4.4 Center-Aligned PWM (CPWM) mode

CPWM mode is enabled when (SC[CPWMS] = 1) and (MS*n*B:MS*n*A = 1:0).

The CPWM pulse width (duty cycle) is determined by 2 × C*n*V[VAL] and the period is determined by 2 × MOD[MOD] (see Figure 287). You must keep MOD[MOD] in the range of 0001h to 7FFFFFFF because values outside this range can produce ambiguous results.

In CPWM mode, the TPM counter counts up until it reaches the value defined in MOD[MOD], and then counts down until it reaches 0.

The channel *n* match (TPM counter = C*n*V[VAL]) sets C*n*SC[CH*n*F] and generates a channel *n* interrupt (if C*n*SC[CH*n*IE] = 1) when TPM is counting down (at the begin of the pulse width), and when TPM is counting up (at the end of the pulse width).

This type of PWM signal is called center-aligned because the pulse width centers for all channels are at the same place when the TPM counter is 0.

The other channel modes are not designed to be used with the up-down counter when SC[CPWMS] = 1. Therefore, you must use all TPM channels in CPWM mode when SC[CPWMS] = 1.

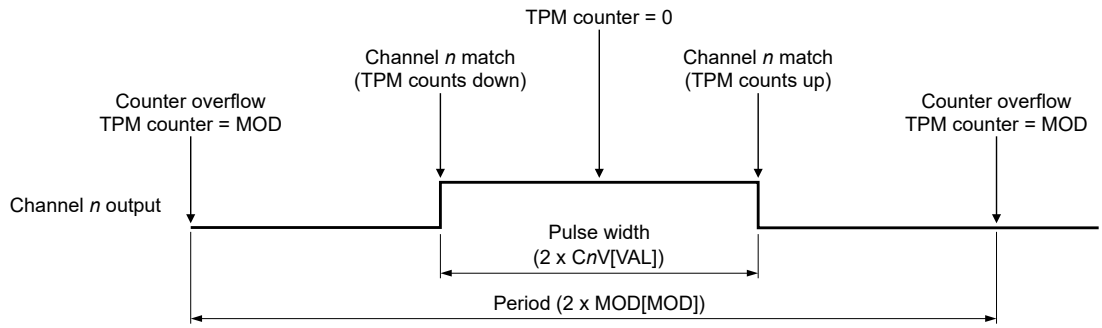

Figure 287. CPWM period and pulse width with ELS*n*B:ELS*n*A = 1:0

If (ELS*n*B:ELS*n*A = 1:0) then the channel *n* output is forced high at the channel *n* match (TPM counter = C*n*V) when counting down, and it is forced low at the channel *n* match when counting up. The channel *n* output is forced high when you first enable or reload the TPM counter, or whenever you pause it (see Figure 288).

If (ELS*n*B:ELS*n*A = 0:0) then the channel *n* output is forced high at the channel *n* match (TPM counter = C*n*V) when counting down, and it is forced low at the channel *n* match when counting up. The channel *n* output is forced low when you first enable or reload the TPM counter, or whenever you pause it.

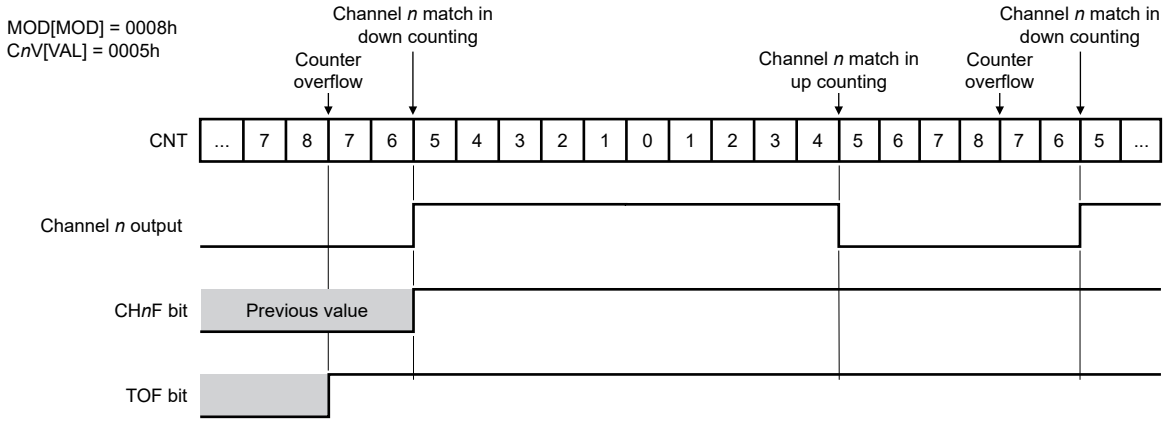

Figure 288. CPWM signal with ELS*n*B:ELS*n*A = 1:0

If (ELS*n*B:ELS*n*A = 0:1) then the channel *n* output is forced low at the channel *n* match (TPM counter = C*n*V) when counting down, and it is forced high at the channel *n* match when counting up. The channel *n* output is forced low when you first enable or reload the TPM counter, or whenever you pause it (see Figure 289).

If (ELS*n*B:ELS*n*A = 1:1) then the channel *n* output is forced low at the channel *n* match (TPM counter = C*n*V) when counting down, and it is forced high at the channel *n* match when counting up. The channel *n* output is forced high when you first enable or reload the TPM counter, or whenever you pause it.

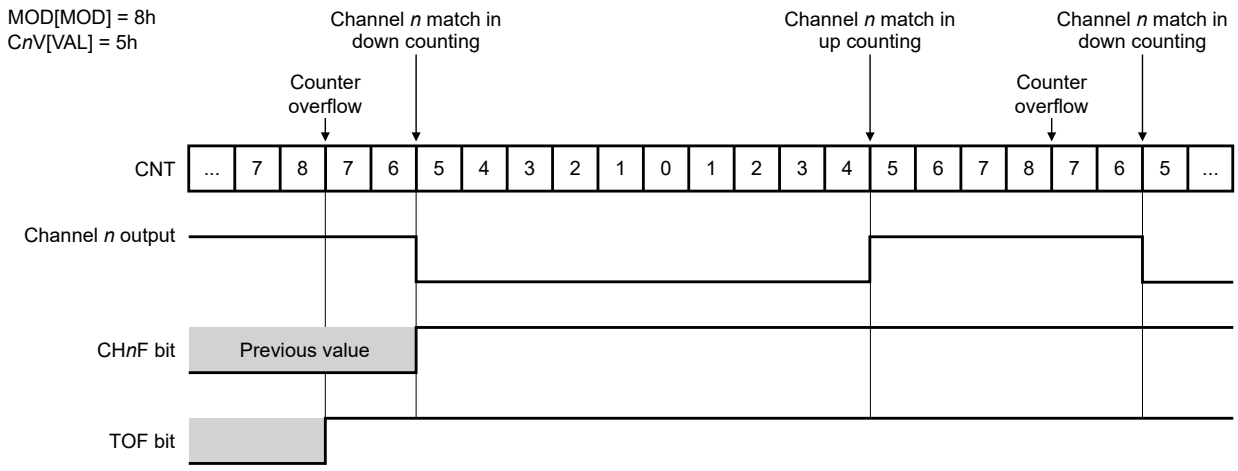

Figure 289. CPWM signal with ELS*n*B:ELS*n*A = 0:1

If (C*n*V[VAL] = 0000h) then the channel *n* output is a 0% duty cycle CPWM signal.

If (C*n*V[VAL] > MOD[MOD]) then the channel *n* output is a 100% duty cycle CPWM signal, although the CH*n*F flag is set when the counter changes from incrementing to decrementing. Therefore, MOD[MOD] must be less than 7FFFFFFF in order to get a 100% duty cycle CPWM signal.

52.3.4.5 Combine PWM mode

Combine PWM mode is enabled when:

- MS*n*B:MS*n*A = 1:0
- COMBINE[COMBINE*n*] = 1
- QDCTRL[QUADEN] = 0
- SC[CPWMS] = 0

In Combine PWM mode, an even channel *n* and adjacent odd channel *n* + 1 are combined to generate a PWM signal in the channel *n* output.

Determine the PWM period and pulse width according to Equation 49.

NOTE

Do not configure the second compare to a value that is lower than the first compare.

```
PWM period = MOD[MOD] + 0001h
PWM pulse width (duty cycle) = |C(n + 1)V[VAL] - CnV[VAL]|
```

Equation 49. PWM period and pulse width

- If (C*n*V[VAL] = C(*n* + 1)V[VAL] = 0000h), then the channel *n* output has a 0% duty cycle.
- If (C*n*V[VAL] = C(*n* + 1)V[VAL] > MOD[MOD]), then the channel *n* output has a 100% duty cycle. CH*n*F flag is not set because there is never a channel *n* match.

Therefore, MOD[MOD] must be less than FFFFh in order to get a 100% duty cycle signal.

The channel *n* match (TPM counter = C*n*V[VAL]) writes 1 to C*n*SC[CH*n*F] and generates a channel *n* interrupt (if C*n*SC[CH*n*IE] = 1). The channel *n* + 1 match (TPM counter = C(*n* + 1)V[VAL]), sets the CH(*n* + 1)F flag and generates a channel *n* + 1 interrupt, if CH(*n* + 1)IE = 1.

If channel *n* (ELS*n*B:ELS*n*A = 0:1), then the channel *n* output is forced low at the beginning of the period (TPM counter = 0) and at the channel *n* + 1 match (TPM counter = C(*n* + 1)V[VAL]). It is forced high at the channel *n* match (TPM counter = C*n*V[VAL]).

If channel *n* (ELS*n*B:ELS*n*A = 1:0), then the channel *n* output is forced high at the beginning of the period (TPM counter = 0) and at the channel *n* + 1 match (TPM counter = C(*n* + 1)V[VAL]). It is forced low at the channel *n* match (TPM counter = C*n*V). See Figure 290 for pictorial representation.

When COMBINE[COMSWAP*n*] = 1, then the channel *n* output is forced low or high at the beginning of the period (TPM counter = 0) and at the channel *n* match (TPM counter = C*n*V[VAL]). It is forced high or low at the channel *n* + 1 match (TPM counter = C(*n* + 1)V[VAL]).

Channel *n* + 1 generates the same output as the channel *n* output, but the channel *n* + 1 (ELS*n*B:ELS*n*A) configuration controls the output polarity.

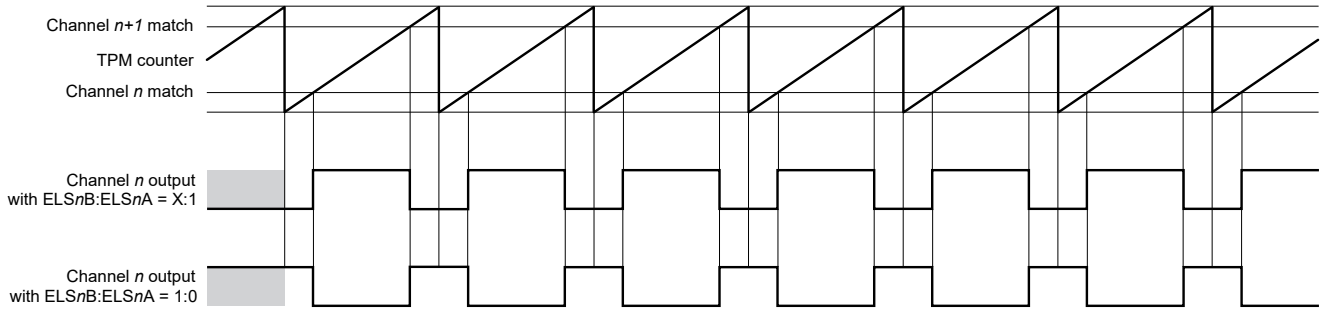

Figure 290. Combine mode

The following figures illustrate generation of PWM signals using the Combine mode.

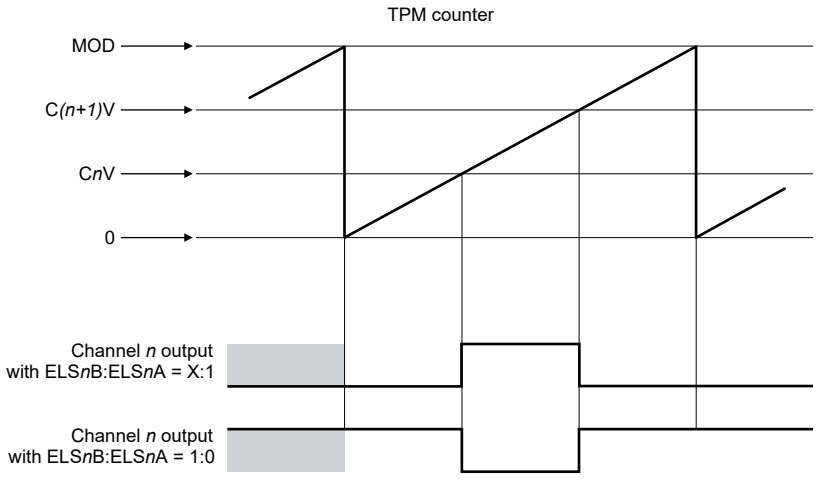

Figure 291. Channel *n* output if (C*n*V < MOD) and (C(*n* + 1)V < MOD) and (C*n*V < C(*n* + 1)V)

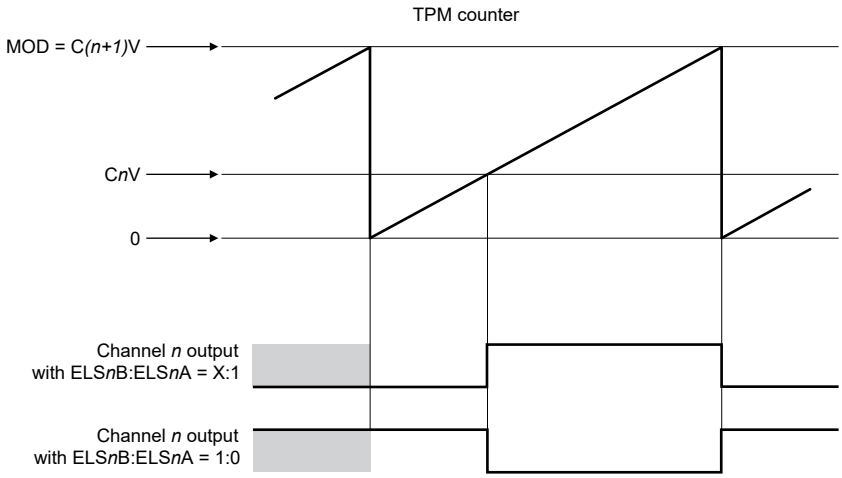

Figure 292. Channel *n* output if (C*n*V < MOD) and (C(*n* + 1)V = MOD)

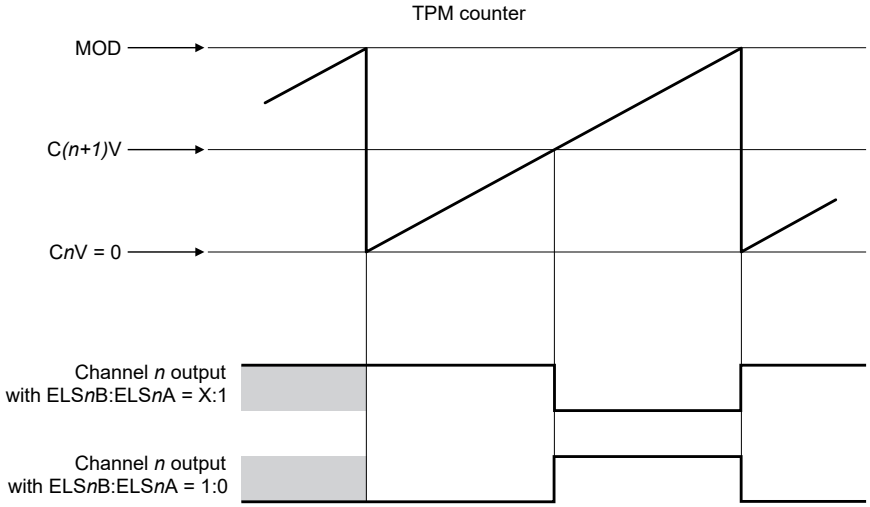

Figure 293. Channel *n* output if (C*n*V = 0) and (C(*n* + 1)V < MOD)

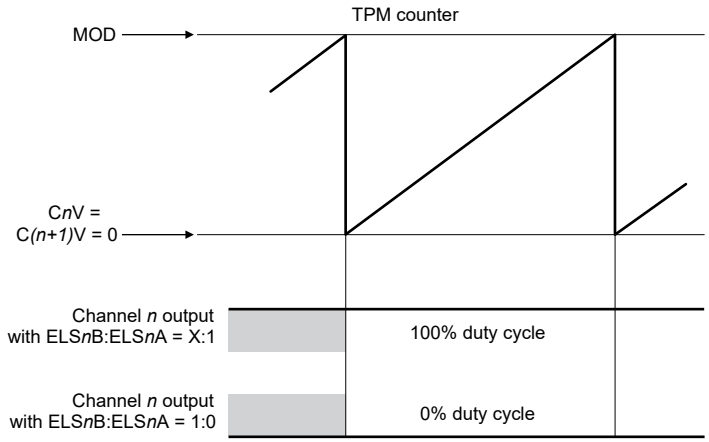

Figure 294. Channel (n) output if (C*n*V = C(*n* + 1)V = 0)

52.3.4.5.1 Dead time insertion

Dead time insertion is enabled in PWM Combine mode for each pair of channels when CH*n*FVAL and CH(*n* + 1)FVAL are non-zero. The dead time delay that is used for each TPM channel is defined as (CH(*n* + 1)FVAL[3:0] × 4) + (CH*n*FVAL[3:0] × 4).

The dead time delay insertion ensures that two complementary signals (even channel *n* and odd channel *n* + 1) do not drive the active state at the same time.

If ELS*n*B:ELS*n*A = 0:1, ELS(*n* + 1)B:ELS(*n* + 1)A = 1:0, COMBINE[COMSWAP*n*] = 0 and dead time is enabled, then:

- When a channel *n* match (TPM counter = C*n*V) occurs, the channel *n* output remains at the low value until the end of the dead time delay, when the channel *n* output is set.
- When a channel *n* + 1 match (TPM counter = C(*n* + 1)V) occurs, the channel *n* + 1 output remains at the low value until the end of the dead time delay, when the channel *n* + 1 output is set (see Figure 295).

If ELS*n*B:ELS*n*A = 1:0, ELS(*n*+1)B:ELS(*n*+1)A = 0:1, COMBINE[COMSWAP*n*] = 1, and dead time is enabled, then:

- When a channel *n* + 1 match (TPM counter = C(*n* + 1)V) occurs, the channel (*n* + 1) output remains at the low value until the end of the dead time delay, when channel *n* + 1 output is set.
- When a channel *n* match (TPM counter = C*n*V) occurs, the channel *n* output remains at the low value until the end of the dead time delay, when channel *n* output is set (see Figure 296).

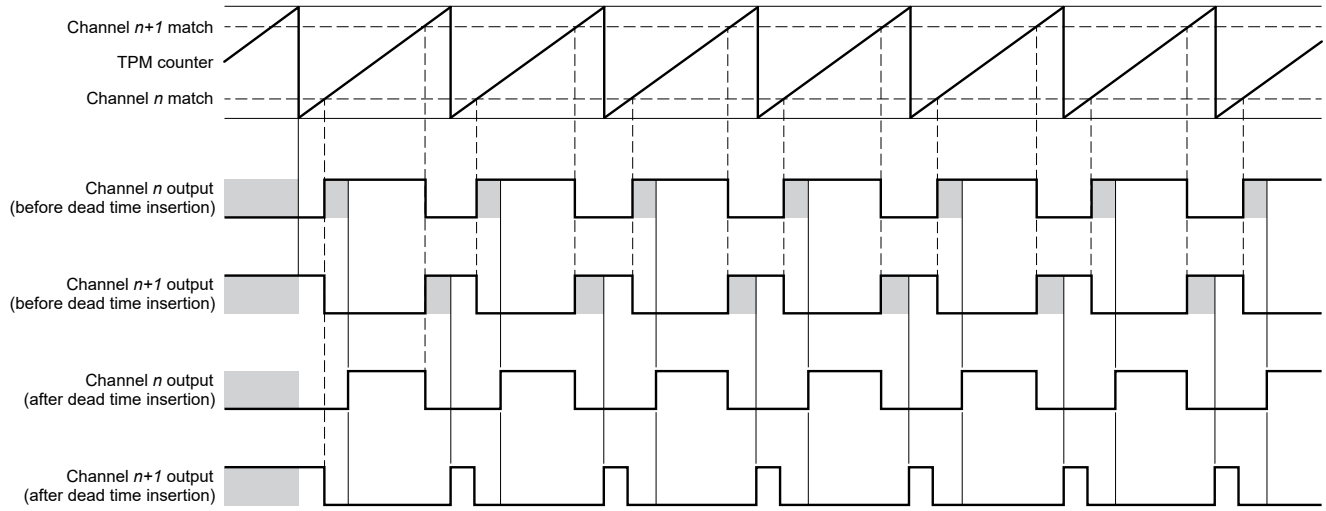

Figure 295. Dead time insertion with ELS*n*B:ELS*n*A = 0:1, ELS(*n* + 1)B:ELS(*n* + 1)A = 1:0, COMBINE[COMSWAP*n*] = 0

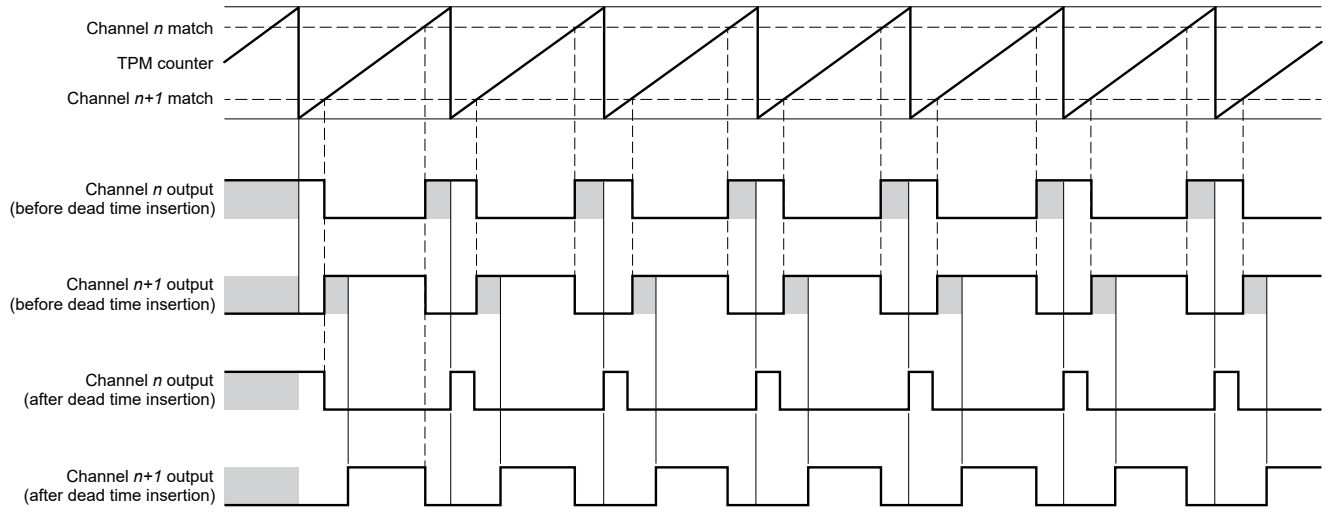

Figure 296. Dead time insertion with ELS*n*B:ELS*n*A = 1:0, ELS(*n* + 1)B:ELS(*n* + 1)A = 0:1, COMBINE[COMSWAP*n*] = 1

52.3.4.6 Combine Input Capture mode

Combine Input Capture mode is enabled if:

- (COMBINE[COMBINE*n*] = 1)
- (MS*n*B:MS*n*A = 0:0)
- (ELS*n*B:ELS*n*A ≠ 0:0)

This mode allows you to measure the pulse width of the signal at the input of channel *n* of a channel pair. The channel *n* filter can be active in this mode.

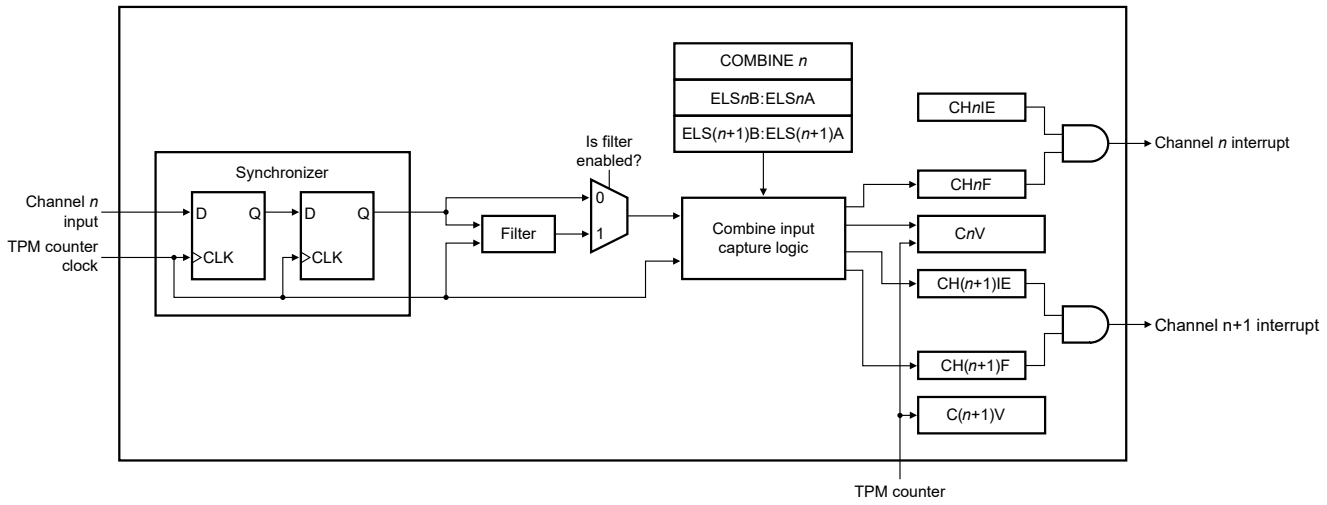

Figure 297. Block diagram

ELS*n*B:ELS*n*A fields select the edge that channel *n* captures. ELS(*n* + 1)B:ELS(*n* + 1)A fields select the edge that channel *n* + 1 captures.

This mode uses only the channel *n* input and ignores the channel *n* + 1 input. If COMBINE[COMSWAP*n*] = 1, then it uses only the channel *n* + 1 input and ignores the channel *n* input.

Detection of the edge selected by channel *n* fields at channel *n* input writes 1 to C*n*SC[CH*n*F] and generates a channel *n* interrupt (if C*n*SC[CH*n*IE] = 1). Detection of the edge selected by channel *n* + 1 fields at channel *n* input sets the CH(*n* + 1)F flag and generates the channel *n* + 1 interrupt (if CH(*n* + 1)IE = 1).

The C*n*V register stores the value of the TPM counter when the channel *n* input detects the edge selected by channel *n*. The C(*n* + 1)V register stores the value of the TPM counter when a channel *n* input detects the edge selected by channel *n* + 1.

NOTE

- Channel *n* fields are:
  - CH*n*F
  - CH*n*IE
  - MS*n*A
  - ELS*n*B
  - ELS*n*A
- Channel *n* + 1 fields are:
  - CH(*n* + 1)F
  - CH(*n* + 1)IE
  - MS(*n* + 1)A
  - ELS(*n* + 1)B
  - ELS(*n* + 1)A
- Use the Combine Input Capture mode with (ELS*n*B:ELS*n*A = 0:1 or 1:0) and (ELS(*n* + 1)B:ELS(*n* + 1)A = 0:1 or 1:0).

52.3.4.7 Quadrature Decoder mode

Quadrature Decoder mode is enabled if (QDCTRL[QUADEN] = 1). This mode uses channel 0 (phase A) and channel 1 (phase B) input signals to control the TPM counter increment and decrement (see Figure 298).

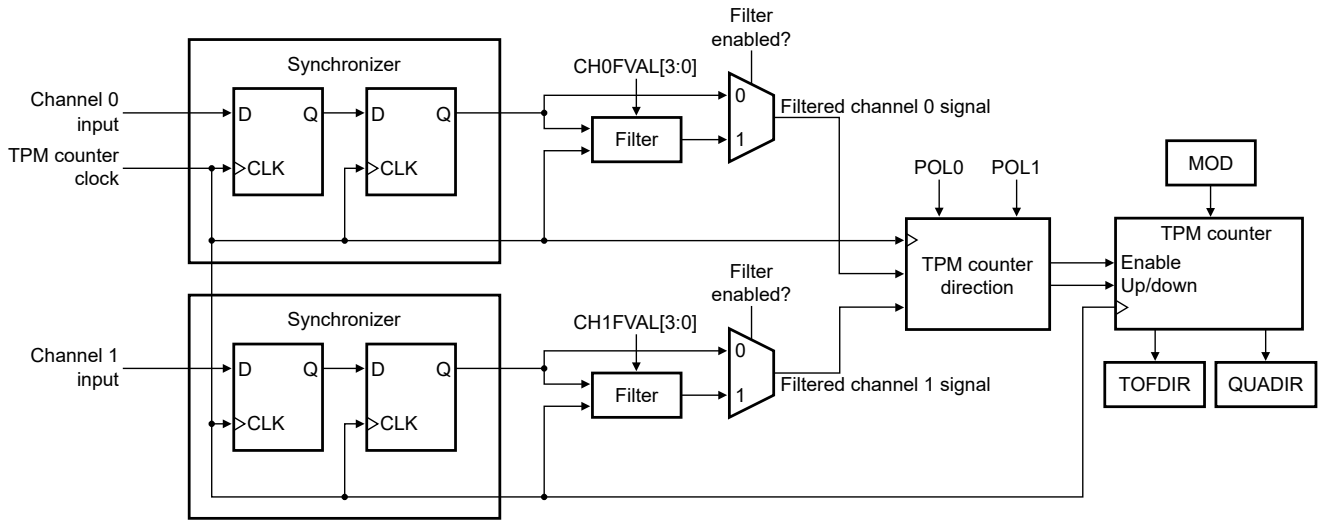

Figure 298. Block diagram

You can configure the input filter and polarity for channel 0 and channel 1 inputs in Quadrature Decode mode using Filter Control (FILTER) and Channel Polarity (POL).

NOTE

When Quadrature Decoder mode is enabled, then channel 0 and channel 1 input signals clock the TPM counter. Therefore, in this mode, you can only use Software Compare mode for channel 0 and channel 1, and you can only use Input Capture or Output Compare mode for other TPM channels.

QDCTRL[QUADMODE] defines the encoding mode that you use in Quadrature Decoder mode.

- If QDCTRL[QUADMODE] = 1, then count and direction encoding mode is enabled.
- If QDCTRL[QUADMODE] = 0, then phase encoding mode is enabled.

In count and direction encoding mode, the channel 1 input value indicates the counting direction, and the channel 0 input value defines the counting rate. A rising edge at the channel 0 input signal updates the TPM counter (see Figure 299).

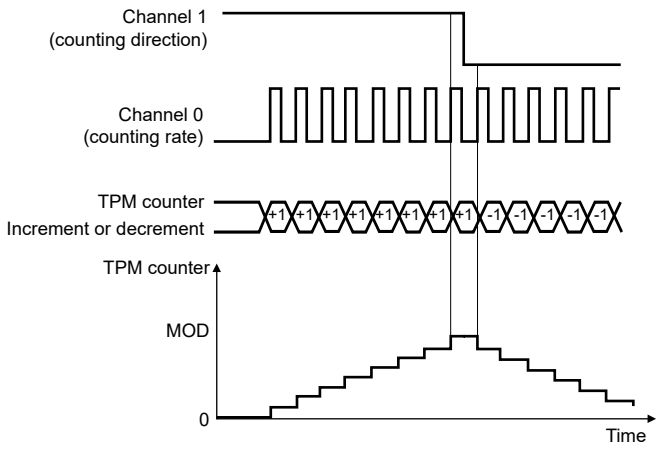

Figure 299. Quadrature Decoder—count and direction encoding mode

In phase encoding mode, the relationship between channel 0 and channel 1 signals indicates the counting direction, and channel 0 and channel 1 signals define the counting rate. An edge at either channel 0 or channel 1 signals updates the TPM counter (see Figure 300).

If POL[POL0] = 0 and POL[POL1] = 0, then:

- The TPM counter increment happens at:
  - A rising edge at channel 0 signal, and channel 1 signal is at logic 0
  - A rising edge at channel 1 signal, and channel 0 signal is at logic 1
  - A falling edge at channel 1 signal, and channel 0 signal is at logic 0
  - A falling edge at channel 0 signal, and channel 1 signal is at logic 1
- The TPM counter decrement happens at:
  - A falling edge at channel 0 signal, and channel 1 signal is at logic 0
  - A falling edge at channel 1 signal, and channel 0 signal is at logic 1
  - A rising edge at channel 1 signal, and channel 0 signal is at logic 0
  - A rising edge at channel 0 signal, and channel 1 signal is at logic 1

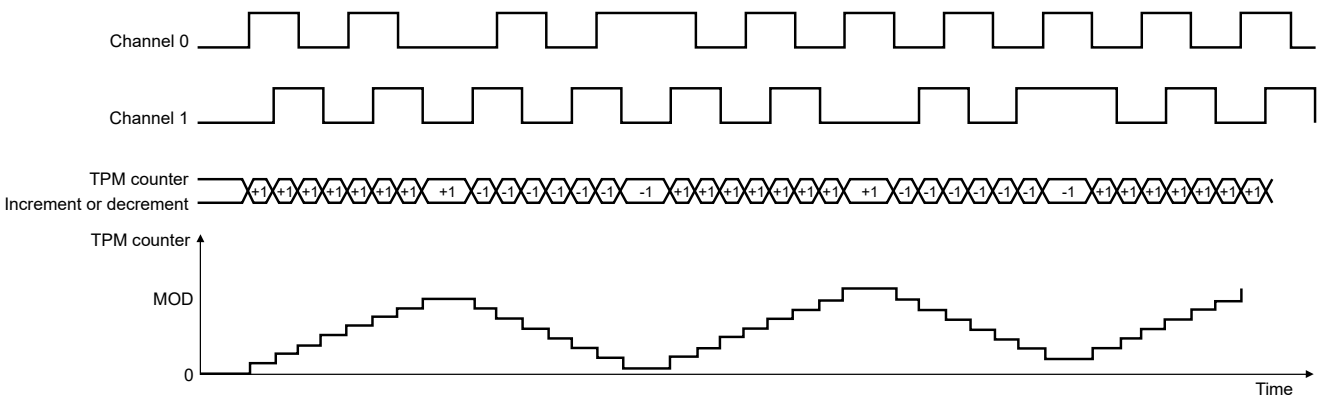

Figure 300. Quadrature Decoder—phase encoding mode

In Figure 301, when the TPM counter changes from the value defined in MOD[MOD] to 0, then SC[TOF] is 1 and QDCTRL[TOFDIR] becomes 1. SC[TOF] indicates that a TPM counter overflow has occurred. QDCTRL[TOFDIR] indicates that TPM was counting up when the TPM counter overflow occurred.

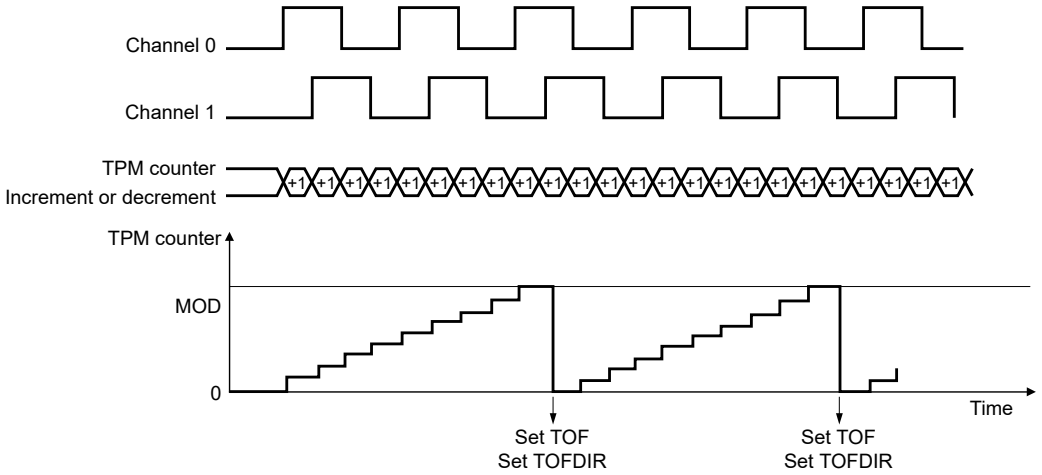

Figure 301. TPM counter overflow in up counting for Quadrature Decoder mode

In Figure 302, when the TPM counter changes from 0 to MOD[MOD], then SC[TOF] is 1 and QDCTRL[TOFDIR] becomes 0. SC[TOF] indicates that a TPM counter overflow has occurred. QDCTRL[TOFDIR] indicates that TPM was counting down when the TPM counter overflow occurred.

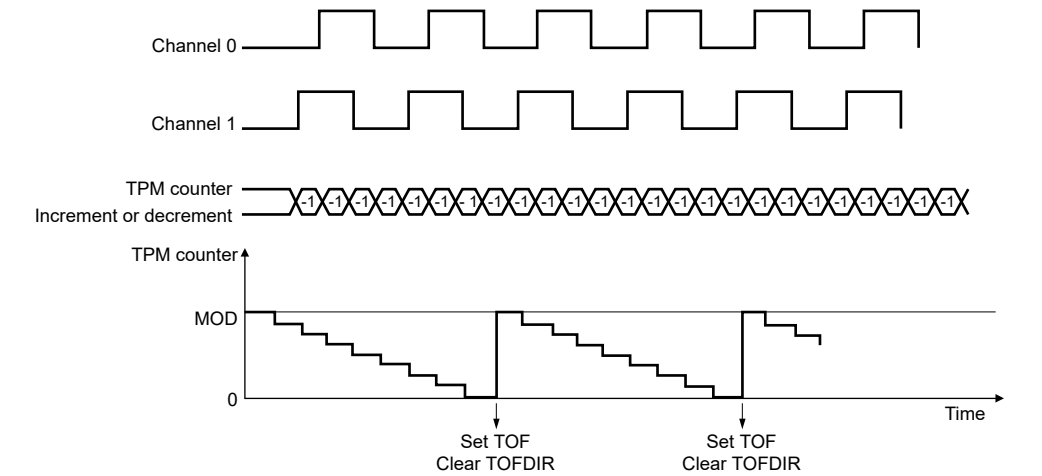

Figure 302. TPM counter overflow in down counting for Quadrature Decoder mode

52.3.5 Low-Power mode

During chip Low-Power mode, you can configure TPM to operate normally or to pause all counting.

Chip mode	TPM operation
Low-Power mode	• When CONF[DOZEEN] = 0, and TPM uses an external or internal clock source that remains functional, then counting continues. TPM can generate an asynchronous interrupt to exit the chip from Low-Power mode. • When CONF[DOZEEN] = 1, then counting pauses during Low-Power mode. Trigger inputs and input capture events are ignored, and PWM outputs are forced to their initial state.

52.3.6 Debug mode

During chip Debug mode, you can configure TPM to operate normally or to pause all counting temporarily.

Chip mode	TPM operation
Debug (core is in Debug or Halted mode)	• When CONF[DBGMODE] = 00b, then counting pauses until the core returns to normal user operating mode. Trigger inputs and input capture events are ignored, and PWM outputs are forced to their initial state. • When CONF[DBGMODE] = 11b, then counting continues.

52.3.7 Clocking

TPM supports two clock domains.

The bus clock domain is used by the register interface and for synchronizing interrupts and DMA requests.

The TPM counter clock domain clocks the counter and prescaler along with the output compare and input capture logic. The TPM counter clock is considered asynchronous to the bus clock. It can be a higher or lower frequency than the bus clock. It can optionally remain operational in low-power modes. When the global timebase feature is enabled, you must clock any TPM instance that is sharing the global timebase by the same TPM counter clock.

52.3.8 Reset

TPM resets whenever any chip reset occurs.

When TPM exits from reset:

- The TPM counter and the prescaler counter are 0 and are stopped (SC[CMOD] = 0).
- The timer overflow interrupt is 0.
- The channel interrupts are 0.
- The channels are in Input Capture mode.
- The channel outputs are 0.
- TPM does not control the channel pins (ELS*n*B:ELS*n*A = 0:0).

52.3.9 Interrupts

52.3.9.1 Timer overflow interrupt

TPM generates the timer overflow interrupt when (SC[TOIE] = 1) and (SC[TOF] = 1).

52.3.9.2 Channel *n* interrupt

TPM generates the channel *n* interrupt when (C*n*SC[CH*n*IE] = 1) and (C*n*SC[CH*n*F] = 1).

52.3.10 DMA

The channel and overflow flags generate a DMA transfer request according to SC[DMA] and C*n*SC[CH*n*IE]/SC[TOIE] fields. See the following table for more information.

Table 510. DMA transfer request

DMA	CH*n*IE/ TOIE	Channel and overflow DMA transfer request	Channel and overflow interrupt
0	0	Not generated	Not generated
0	1	Not generated	Generated if (CH*n*F/TOF = 1)
1	0	Generated if (CH*n*F/TOF = 1)	Not generated
1	1	Generated if (CH*n*F/TOF = 1)	Generated if (CH*n*F/TOF = 1)

If DMA = 1, the CH*n*F/TOF field can be cleared either by completion of the DMA transfer or by writing 1 to CH*n*F/TOF (see Table 511).

Table 511. Clear CH*n*F/TOF field

DMA	How to clear CH*n*F/TOF
0	CH*n*F/TOF field is cleared by writing 1 to it.
1	CH*n*F/TOF field is cleared either when the DMA transfer is completed or by writing 1 to it.

52.4 External signals

Table 512 shows the user-accessible signals for TPM.

Table 512. TPM signal descriptions

Signal	Description	Direction
EXTCLK	External clock If selected in SC[CMOD], EXTCLK increments the TPM counter on every rising edge synchronized to the TPM counter clock. EXTCLK must be less than half of the TPM counter clock frequency. The TPM counter prescaler selection and settings are also used when EXTCLK is selected.	I
CH*n*	Channel *n* I/O pin (where *n* = 3 to 0) You can configure each CH*n* to operate either as input or output. CH*n* is an output when configured in Output Compare or PWM mode and the TPM counter is enabled; otherwise, CH*n* is an input.	I/O

52.5 Initialization

To initialize TPM:

1. Write to the following registers, in any order, to configure the counter mode of operation:
   - Configuration (CONF)
   - Quadrature Decoder Control and Status (QDCTRL)
   - Modulo (MOD)
2. Write to the following registers, in any order, to configure the mode of operation for each channel:
   - Channel n Value (C0V - C3V)
   - Combine Channel (COMBINE)
   - Channel Trigger (TRIG)
   - Channel Polarity (POL)
   - Filter Control (FILTER)
3. Use Channel n Status and Control (C0SC - C3SC) to configure the mode of operation for each channel and to enable the channel.
4. Use Status and Control (SC) to configure the counter mode of operation and to enable the TPM (TPM is enabled and counting when SC[CMOD] ≠ 00).

52.6 Application information

To configure TPM counter to generate an overflow interrupt every 64,000 cycles:

1. Write any data to CNT to reset the counter.
2. Write MOD[MOD] = F9FFh to configure counter overflow.
3. Write SC = 48h to enable the counter and overflow interrupt.
4. Write STATUS = 100h to clear the flag during the interrupt routine.

To configure TPM channel 0 for input capture on either edge generating an interrupt:

1. Write C0SC = 4Ch to configure channel 0.
2. Optionally, write CONF = 840000h to configure counter to reset on each channel 0 input capture. Write CONF = 850000h to delay starting the counter until the first edge.
3. Write any data to CNT to reset the counter.
4. Write MOD[MOD] = FFFFFFFFh to configure the counter overflow to maximum.
5. Write SC = 48h to enable the counter and overflow interrupt.
6. During the interrupt routine, first check the setting for the STATUS flag:
   - If STATUS[TOF] is set, clear flag by writing STATUS = 100h. Note that software is responsible for tracking number of overflows between consecutive input capture events.
   - If STATUS[CH0F] is set, first read C0V to obtain the input capture value and then clear flag by writing STATUS = 0001h.

To configure TPM channel 0 for output compare to toggle the output pin using an array of counter values:

1. Write C0SC = 54h for interrupt or write C0SC = 15h for DMA.
2. Write C0V = array[0] to configure initial compare value.
3. Write any data to CNT to reset the counter.
4. Write MOD[MOD] = FFFFFFFFh to configure the counter overflow to maximum.
5. Write SC = 08h to enable the counter.
6. Write the next compare value C0V = array[N] during the interrupt routine and then write STATUS = 0001h to clear the flag.

7. Write the next compare value C0V = array[N] during the DMA transfer. DMA transfer will automatically clear the channel flag.

The array is an array of counter values where the first output compare occurs at “array[0]” cycles after the counter is enabled and subsequent output compares occur at “array[N] – array[N-1]” cycles after the last compare. If the output waveform repeats, then MOD can be set to an output compare value where the waveform starts to repeat.

An example of using TPM with the asynchronous DMA is described in AN4631:Using the Asynchronous DMA features of the Kinetis L Series.

52.7 Memory map and register definition

This section provides a detailed description of all TPM registers.

An attempt to access a reserved register location in the TPM memory map generates a bus error.

Table continues on the next page...

Table continued from the previous page...

Field	Description
WIDTH	Specifies the width of the counter and timer channels.
15-8 TRIG	Trigger Count Specifies the number of trigger inputs that TPM implements.
7-0 CHAN	Channel Count Specifies the number of timer channels that TPM implements.

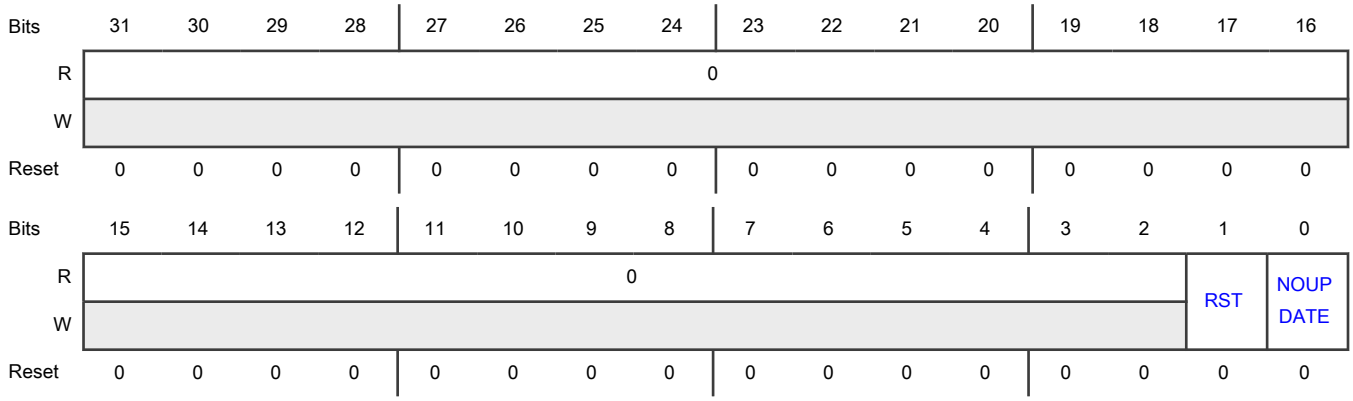
52.7.1.4 TPM Global (GLOBAL)

Includes the software reset control field.

Offset

Register	Offset
GLOBAL	8h

Diagram



Fields

Field	Description
31-2 —	Reserved
1 RST	Software Reset Resets all internal logic and registers, except TPM Global (GLOBAL). This field remains 1 until you write 0 to it. 0 - Module is not reset

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Module is reset
0 NOUPDATE	No Update Blocks updates to all internal double-buffered registers while this field remains 1. You can still update the software visible registers, but changes cannot take effect until you write 0 to this field. At that point they update as normal. 0 - Internal double-buffered registers update as normal 1 - Internal double-buffered registers do not update

52.7.1.5 Status and Control (SC)

Contains the overflow status flag and control fields that you can use to configure:

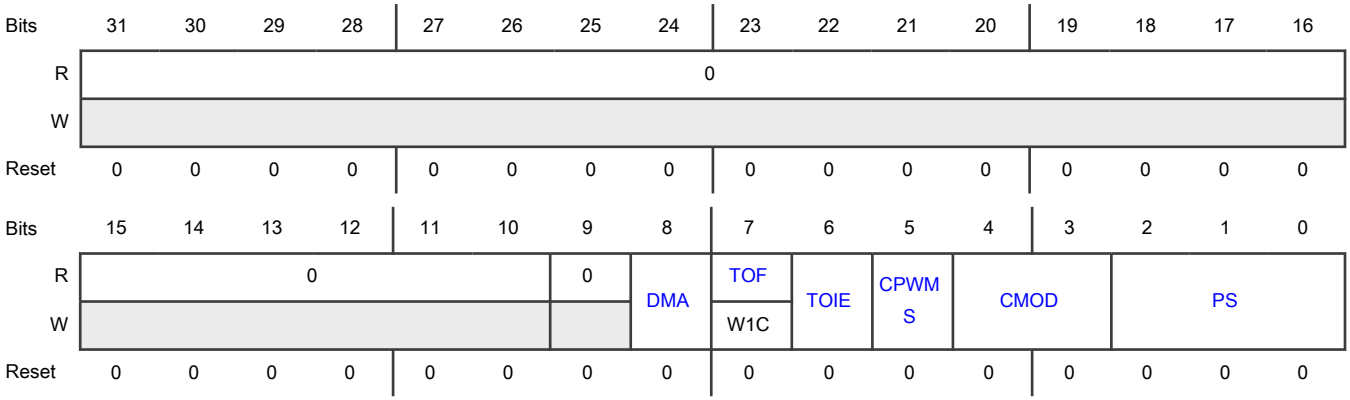
- Interrupt enable
- Module configuration
- Prescaler factor

These controls relate to all channels within this module.

Offset

Register	Offset
SC	10h

Diagram



Fields

Field	Description
31-10	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
9 —	Reserved
8 DMA	DMA Enable Enables DMA transfers for the overflow flag. 0 - Disable 1 - Enable
7 TOF	Timer Overflow Flag Indicates whether a TPM overflow has occurred. Hardware sets this flag when the TPM counter value is equal to the value defined in MOD[MOD], and increments after this value. If another TPM overflow occurs between the flag setting and the flag clearing, then the write operation has no effect. Therefore, TOF remains set, which indicates that another overflow has occurred. In this case, a TOF interrupt request is not lost due to a delay in clearing the previous TOF. 0 - No overflow 1 - Overflow
6 TOIE	Timer Overflow Interrupt Enable Enables TPM overflow interrupts. A TOF interrupt is generated when SC[TOF] = 1. If TOIE = 0, use software polling or DMA request. 0 - Disable 1 - Enable
5 CPWMS	Center-Aligned PWM Select Enables CPWM mode. This mode configures TPM to operate in up-down counting mode. This field is write-protected. Disable the TPM counter before you write to this field. 0 - Up counting mode 1 - Up-down counting mode
4-3 CMOD	Clock Mode Selection Selects the TPM counter clock modes. When disabling the counter, this field remains 1 until acknowledged in the TPM clock domain. 00 - TPM counter is disabled 01 - TPM counter increments on every TPM counter clock 10 - TPM counter increments on the rising edge of EXTCLK synchronized to the TPM counter clock 11 - TPM counter increments on the rising edge of the selected external input trigger
2-0	Prescale Factor Selection

Table continues on the next page...

Table continued from the previous page...

Field	Description
PS	Selects one of 8 division factors for the clock mode selected by SC[CMOD]. This field is write-protected. Disable the TPM counter before you write to this field. 000 - Divide by 1 001 - Divide by 2 010 - Divide by 4 011 - Divide by 8 100 - Divide by 16 101 - Divide by 32 110 - Divide by 64 111 - Divide by 128

52.7.1.6 Counter (CNT)

Contains the TPM counter value. You can write 0 to this register with reset. Writing any value to CNT[COUNT] triggers a reload of the counter and forces PWM outputs to their reload state.

When debug is active, the TPM counter does not increment unless you configure it otherwise. Reading this register adds two wait states to the register access, because of synchronization delays.

Offset

Register	Offset
CNT	14h

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Description
31-0 COUNT	Counter Value Specifies the TPM counter value.

52.7.1.7 Modulo (MOD)

Contains the modulo value for the TPM counter. When the TPM counter reaches the modulo value and increments, SC[TOF] sets and the next value of the TPM counter depends on the selected counting method (see Counter).

Writing to the MOD register latches the value into a buffer. This register updates with the value of its write buffer according to MOD register update. Additional writes to the MOD write buffer are ignored until the register has been updated.

To avoid confusion about occurrence of the first counter overflow, initialize the TPM counter (write to CNT[COUNT]) before writing to the MOD register.

Offset

Register	Offset
MOD	18h

Diagram

R W	MOD															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Fields

Field	Description
31-0 MOD	Modulo Value Specifies the modulo value for the TPM counter. Write a single 16-bit or 32-bit access value to this field.

52.7.1.8 Capture and Compare Status (STATUS)

Contains a copy of the status flag (C*n*SC[CHF]) for each TPM channel, as well as SC[TOF], for software convenience. Each CH*n*F field in STATUS is a mirror of the corresponding C*n*SC[CHF]. You can check all C*n*SC[CHF] fields using only one read of STATUS. Writing all ones to STATUS writes 0 to all C*n*SC[CHF] fields.

Hardware sets the individual channel flags when an event occurs on the channel. If another event occurs between the flag setting and the write operation, the write operation has no effect; therefore, CHF remains set, which indicates that another event has occurred. In this case, a CHF interrupt request is not lost because of the clearing sequence for a previous CHF.

Offset

Register	Offset
STATUS	1Ch

Diagram

Fields

Field	Description
31-8 —	Reserved
7 CHF	Channel Flag Indicates whether an event has occurred on the channel. TPM writes 1 to this field when an event occurs on the channel. If another event occurs between the CHF being set and the write operation, the write operation has no effect; therefore, CHF remains set, which indicates that another event has occurred. In this case, a CHF interrupt request is not lost due to the delay in clearing the previous CHF. 0 - Event not occurred 1 - Event occurred
6 CHIE	Channel Interrupt Enable Enables channel interrupts. 0 - Disable 1 - Enable
5 MSB	Channel Mode Select B Configures further selections in the channel logic. Its functionality depends on the channel mode (see Table 513).

Table continues on the next page...

Table continued from the previous page...

Field	Description
4 MSA	Channel Mode Select A Configures further selections in the channel logic. Its functionality depends on the channel mode (see Table 513).
3 ELSB	Edge or Level Select B Performs the function that depends on the channel mode (see Table 513).
2 ELSA	Edge or Level Select A Performs the function that depends on the channel mode (see Table 513).
1 —	Reserved
0 DMA	DMA Enable Enables DMA transfers for the channel. 0 - Disable 1 - Enable

52.7.1.10 Channel n Value (C0V - C3V)

Contains the captured TPM counter value for the input modes or the match value for the output modes.

Input Capture mode ignores any write to a C*n*V register. In compare modes, writing to a C*n*V register latches the value into a buffer. A C*n*V register updates with the value of its write buffer according to C*n*V register update.

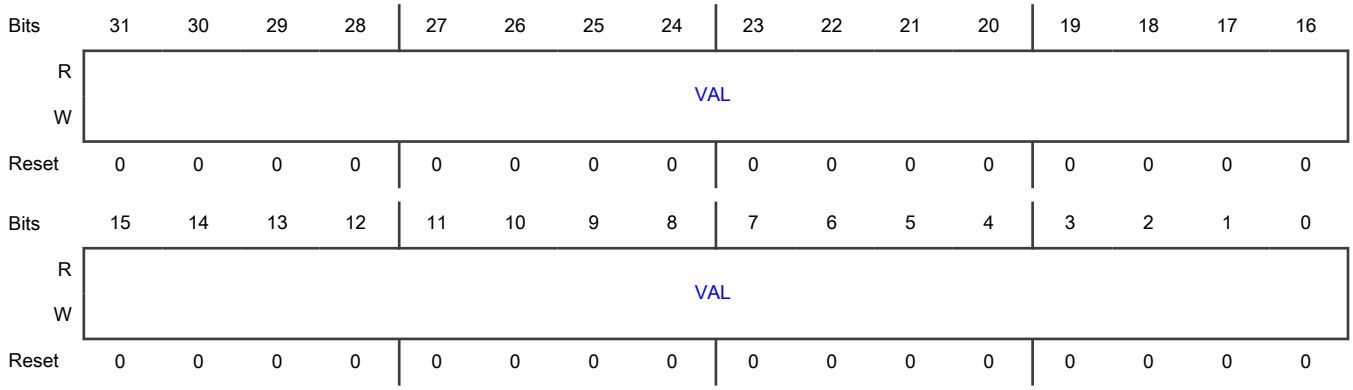
NOTE

Additional writes to the C*n*V write buffer are ignored until the register has been updated.

Offset

Register	Offset
C0V	24h
C1V	2Ch
C2V	34h
C3V	3Ch

Diagram



Fields

Field	Description
31-0 VAL	Channel Value Contains the captured TPM counter value for the input modes, or the match value for the output modes. Write a single 16-bit or 32-bit access value to this field.

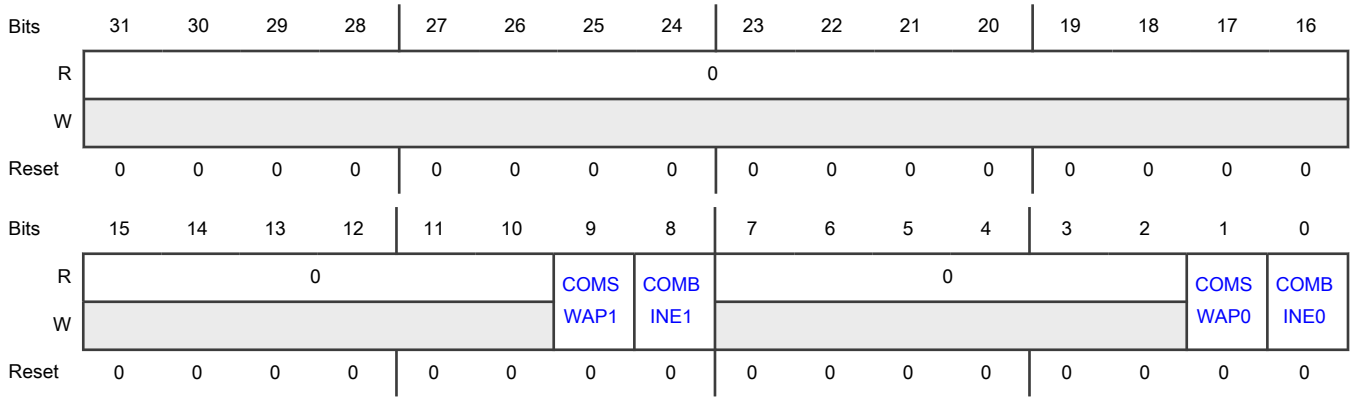
52.7.1.11 Combine Channel (COMBINE)

Contains the control fields used to configure the combine channel modes for each pair of channels *n* and *n*+1, where n is all the even-numbered channels.

Offset

Register	Offset
COMBINE	64h

Diagram



Fields

Field	Description
31-16 —	Reserved
15-10 —	Reserved
9 COMSWAP1	Combine Channels 2 and 3 Swap When set in combine modes, the odd channel is used for the input capture and first compare, while the even channel is used for the second compare. **NOTE** The value of the first compare must not be greater than that of the second compare. 0 - Even channel 1 - Odd channel
8 COMBINE1	Combine Channels 2 and 3 Enables the combine feature for channels 2 and 3. In Input Capture mode, the combined channels use the even channel input. In Software Compare mode, the even channel match asserts the output trigger, and the odd channel match negates the output trigger. In PWM mode, the even channel match is used for the first compare, and odd channel match for the second compare. 0 - Independent 1 - Combined
7-2 —	Reserved
1 COMSWAP0	Combine Channel 0 and 1 Swap When set in combine modes, the odd channel is used for the input capture and first compare, while the even channel is used for the second compare. **NOTE** The value of the first compare must not be greater than that of the second compare. 0 - Even channel 1 - Odd channel
0 COMBINE0	Combine Channels 0 and 1 Enables the combine feature for channels 0 and 1. In Input Capture mode, the combined channels use the even channel input. In Software Compare mode, the even channel match asserts the output trigger, and the odd channel match negates the output trigger. In PWM mode, the even channel match is used for the first compare and odd channel match for the second compare.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Independent 1 - Combined

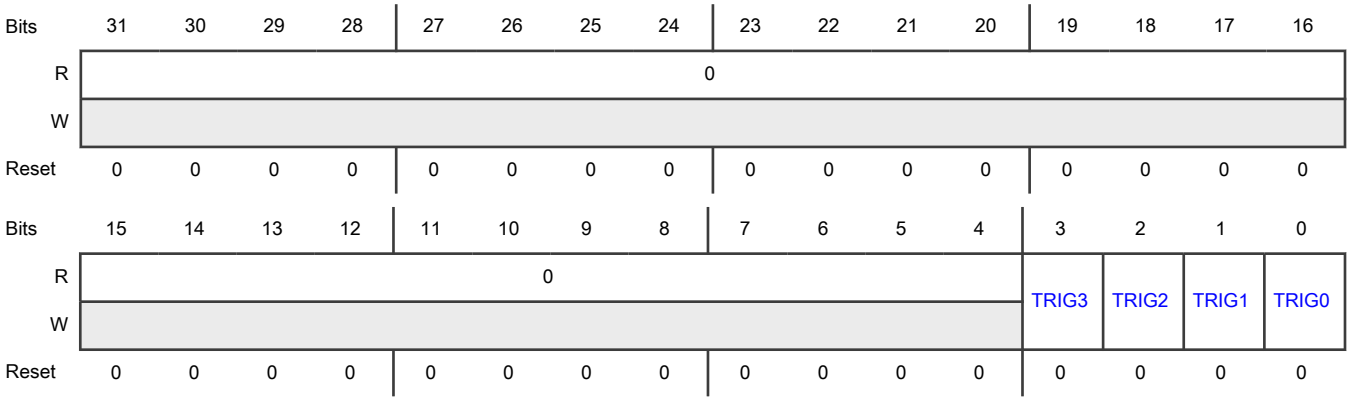
52.7.1.12 Channel Trigger (TRIG)

Configures the trigger input that is used by the channel to capture the counter value in Input Capture mode. In Output Compare or PWM mode, configures the trigger input used to modulate the channel output. When modulating the output, the output is forced to the channel initial value whenever the trigger is not asserted. The even-numbered channels share the first input trigger source, and the odd-numbered channels share the second input trigger source.

Offset

Register	Offset
TRIG	6Ch

Diagram



Fields

Field	Description
31-4 —	Reserved
3 TRIG3	Channel 3 Trigger 0 - No effect 1 - Configures trigger input 1 to be used by channel 3
2 TRIG2	Channel 2 Trigger 0 - No effect

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Configures trigger input 0 to be used by channel 2
1 TRIG1	Channel 1 Trigger 0 - No effect 1 - Configures trigger input 1 to be used by channel 1
0 TRIG0	Channel 0 Trigger 0 - No effect 1 - Configures trigger input 0 to be used by channel 0

52.7.1.13 Channel Polarity (POL)

Defines the input and output polarity of each of the channels.

Offset

Register	Offset
POL	70h

2 POL2	Channel 2 Polarity 0 - Active high 1 - Active low
1 POL1	Channel 1 Polarity 0 - Active high 1 - Active low
0 POL0	Channel 0 Polarity 0 - Active high 1 - Active low

52.7.1.14 Filter Control (FILTER)

Selects the filter value of the channel inputs, and an additional output delay value for the channel outputs. In PWM Combine mode, you can use this field to implement dead-time insertion.

NOTE

To write values to CH*n*FVAL, ensure that the corresponding channel-interrupt status flag and control (C*n*SC[5:2]) fields are set to 0.

Offset

Register	Offset
FILTER	78h

Fields

Field	Description
31-16 —	Reserved
15-12 CH3FVAL	Channel 3 Filter Value When configured for Input Capture or Software Compare mode, configures the filter value for the channel 3 input. The filter is disabled when the value is zero. Otherwise, the filter is configured as (CH3FVAL×4)clock cycles. Sets the dead-time insertion time for channel 3 in PWM modes. Dead time insertion is disabled when CH3FVAL is zero. Otherwise, dead time insertion for channel 3 is configured as (CH3FVAL×4)clock cycles.
11-8 CH2FVAL	Channel 2 Filter Value When configured for Input Capture or Software Compare mode, configures the filter value for the channel 2 input. The filter is disabled when the value is zero. Otherwise, the filter is configured as (CH2FVAL×4)clock cycles. Sets the dead-time insertion time for channel 2 in PWM modes. Dead time insertion is disabled when CH2FVAL is zero. Otherwise, dead time insertion for channel 2 is configured as (CH2FVAL×4)clock cycles.
7-4 CH1FVAL	Channel 1 Filter Value When configured for Input Capture or Software Compare mode, configures the filter value for the channel 1 input. The filter is disabled when the value is zero. Otherwise, the filter is configured as (CH1FVAL×4)clock cycles. Sets the dead-time insertion time for channel 1 in PWM modes. Dead time insertion is disabled when CH1FVAL is zero. Otherwise, dead time insertion for channel 1 is configured as (CH1FVAL×4)clock cycles.
3-0 CH0FVAL	Channel 0 Filter Value When configured for Input Capture or Software Compare mode, configures the filter value for the channel 0 input. The filter is disabled when the value is zero. Otherwise, the filter is configured as (CH0FVAL×4)clock cycles. Sets the dead time insertion time for channel 0 in PWM modes. Dead time insertion is disabled when CH0FVAL is zero. Otherwise, dead time insertion for channel 0 is configured as (CH0FVAL×4)clock cycles.

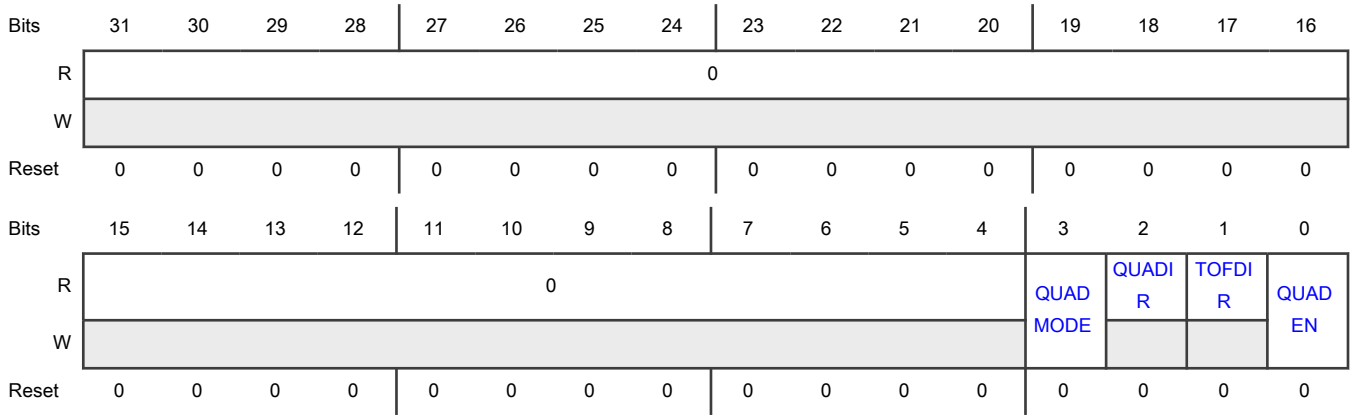
52.7.1.15 Quadrature Decoder Control and Status (QDCTRL)

Contains the control and status fields for Quadrature Decoder mode.

Offset

Register	Offset
QDCTRL	80h

Diagram



Fields

Field	Description
31-4 —	Reserved
3 QUADMODE	Quadrature Decoder Mode Selects the encoding mode used in Quadrature Decoder mode. 0 - Phase encoding mode 1 - Count and direction encoding mode
2 QUADIR	Counter Direction in Quadrature Decode Mode Indicates whether the counting direction is decreasing or increasing. 0 - Decreasing (counter decrement) 1 - Increasing (counter increment)
1 TOFDIR	Timer Overflow Direction Indicates if SC[TOF] was set on the top or bottom of counting. • Field value 0 indicates that SC[TOF] was set on the bottom of counting. There was a TPM counter decrement and TPM counter changes from its minimum value (0) to its maximum value (MOD[MOD]). • Field value 1 indicates that SC[TOF] was set on the top of counting. There was a TPM counter increment and TPM counter changes from its maximum value (MOD[MOD]) to its minimum value (0). 0 - Bottom of counting 1 - Top of counting
0 QUADEN	Quadrature Decoder Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Enables Quadrature Decoder mode. In this mode, the channel 0 and channel 1 inputs control the TPM counter direction and can only be used for Software Compare mode. Quadrature Decoder mode has precedence over the other modes. 0 - Disable 1 - Enable

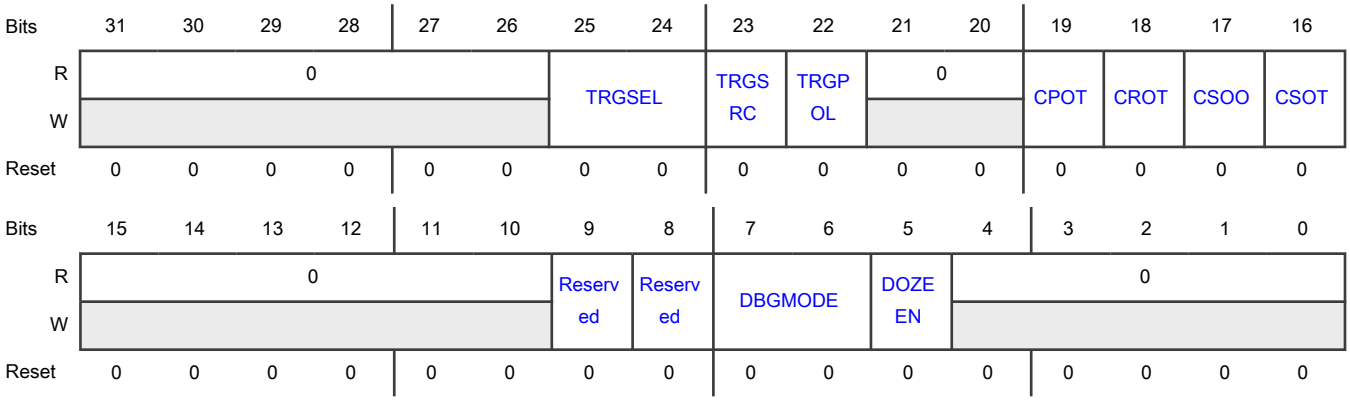
52.7.1.16 Configuration (CONF)

Selects the TPM behavior in Debug mode and Low-Power mode.

Offset

Register	Offset
CONF	84h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-24 TRGSEL	Trigger Select Selects the input trigger that you use to start, reload, and pause the counter. You can configure the source of the trigger (external or internal to TPM) by CONF[TRGSRC]. Disable the TPM counter before you change this field. See the chip-specific TPM information for available external trigger options. The below list shows available internal trigger sources.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	01 - Channel 0 pin input capture 10 - Channel 1 pin input capture 11 - Channel 0 or channel 1 pin input capture
23 TRGSRC	Trigger Source Selects between internal (channel pin input capture) or external trigger sources. CONF[TRGSEL] selects this trigger source. When selecting an internal trigger, configure the selected channel for input captures as follows: • CONF[CSOT] enables you to start the counter initially using only a rising edge input capture. • CONF[CROT] enables you to reload the counter using either a rising edge or falling edge input capture. • CONF[CPOT] enables you to pause the counter using the state of the channel input pin. You can use Channel Polarity (POL) to invert the polarity of the channel input pins. Disable the TPM counter before you change this field. 0 - External 1 - Internal (channel pin input capture)
22 TRGPOL	Trigger Polarity Selects the polarity of the external trigger source. Disable the TPM counter before you change this field. 0 - Active high 1 - Active low
21-20 —	Reserved
19 CPOT	Counter Pause on Trigger Specifies that while the trigger remains asserted (level sensitive), and this field is 1, the counter pauses incrementing. While being paused, the counter ignores the input capture events and forces PWM outputs to their default state. If the TPM counter pauses during Debug mode or Low-Power mode, then the counter ignores the trigger input. Disable the TPM counter before you change this field. 0 - TPM counter continues 1 - TPM counter pauses
18 CROT	Counter Reload on Trigger Specifies that when you detect a rising edge on the selected trigger input and this field is 1, then the TPM counter reloads with 0 (and sets PWM outputs to their reload state). If the TPM counter pauses during Debug mode or Low-Power mode, then the counter ignores the trigger input. Disable the TPM counter before you change this field. 0 - No reload

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Reload
17 CSOO	Counter Stop on Overflow Specifies that the TPM counter pauses when SC[TOF] = 1 and this field is 1. Reloading the counter with 0 by writing to Counter (CNT), or by a trigger input, does not cause the counter to stop incrementing. When stopped, the counter does not start incrementing unless you first disable and then enable it, or if you detect a rising edge on the selected trigger input when CONF[CSOT] is 1. While the counter is paused, it ignores the input capture events and forces PWM outputs to their default state. Disable the TPM counter before you change this field. 0 - TPM counter continues 1 - TPM counter stops
16 CSOT	Counter Start on Trigger Specifies that until you detect a rising edge on the selected trigger input, and this field is 1, the TPM counter pauses incrementing when it is enabled. If the TPM counter pauses due to an overflow, a rising edge on the selected trigger input also causes the TPM counter to start incrementing again. While being paused, the counter ignores the input capture events, and forces PWM outputs to their default state. If the TPM counter pauses during Debug mode or Low-Power mode, then the counter ignores the trigger input. Disable the TPM counter before you change this field. 0 - Counter starts immediately 1 - Counter starts after detection of a rising edge on the selected input trigger
15-10 —	Reserved
9 —	Reserved
8 —	Reserved
7-6 DBGMODE	Debug Mode Configures the TPM behavior in Debug mode (see Debug mode). All other configurations are reserved. 00 - TPM counter pauses 11 - TPM counter continues
5 DOZEEN	Doze Enable Configures the TPM behavior in Low-Power mode (see Low-Power mode). 0 - TPM counter continues 1 - TPM counter pauses

Table continues on the next page...

Table continued from the previous page...

Field	Description
4-0 —	Reserved

Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing

The chip includes two satellite read-only Timestamp Timer Modules (TSTMR) (one in AONMIX and one in WAKEUPMIX). The TSTMR instances each provide a 64-bit read-only snapshot of the value of the free-running incrementing counter generated by the SYS_CTR.

53.2 Overview

TSTMR is a free-running, 56-bit incrementing clock cycle counter that requires two 32-bit reads to read the full timestamp value.

TSTMR:

- Resets after every system reset.
- Is accessible through the LOW and HIGH registers.
- Stops only when the clock to TSTMR is disabled.

53.2.1 Block diagram

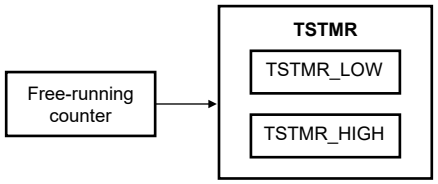

Figure 303. Block diagram

53.2.2 Features

TSTMR has the following features:

- Provides a free-running timer
- Counts the number of clock cycles since the last chip reset

53.3 Functional description

TSTMR starts running after system reset deassertion. You can read the counter at any time to determine software ticks. However, you must follow the read sequence as mentioned in the TSTMR register descriptions for correctly reading TSTMR values.

See the chip-specific TSTMR information for implementation details of this module's instances.

53.3.1 Dual mode

Dual Timer mode is used to implement a second virtual TSTMR for CPU2. The original TSTMR is assumed to be present in the CPU1 domain as a free running timer that resets only when the CPU1 domain power cycles. The CPU2 domain can power cycle independently of the CPU1 domain but it must do that while the CPU1 domain is power cycling. The second virtual TSTMR always runs in sync with the original TSTMR but starts from 0 when the CPU2 domain power cycles.

53.3.2 Clocking

This module has no clocking considerations. It uses the system bus clock to access the registers.

53.3.3 Interrupts

TSTMR has no interrupts.

53.4 External signals

TSTMR has no external signals.

53.5 Initialization

You can initialize TSTMR after the chip is powered up. No additional steps or considerations are necessary.

53.6 TSTMR_A memory map and register definition

NOTE

You can read TSTMR registers with 32-bit accesses only.

53.6.1 Accessing registers

You must always perform the following procedure in full to receive consistent timer values:

- Use a 32-bit access to read Timestamp Timer Low (LOW) register.
- Use a 32-bit access to read Timestamp Timer High (HIGH) register.
- A read to Timestamp Timer Low (LOW) register returns the low-order 32b, and samples the entire 64b.
- A read to Timestamp Timer High (HIGH) register returns the last sampled upper 32b.

53.6.2 TSTMR register descriptions

This section contains detailed register descriptions for the TSTMR registers.

53.6.2.1 TSTMR memory map

TSTMR1.TSTMRA base address: 442C_0000h

TSTMR2.TSTMRA base address: 4248_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	Timestamp Timer Low (LOW)	32	R	0000_0000
4	Timestamp Timer High (HIGH)	32	R	0000_0000

53.6.2.2 Timestamp Timer Low (LOW)

Indicates the lower 32 bits of the full 56-bit timestamp value.

See Accessing registers for information on how to use this register.

54.1.1 WDOG interrupt connections

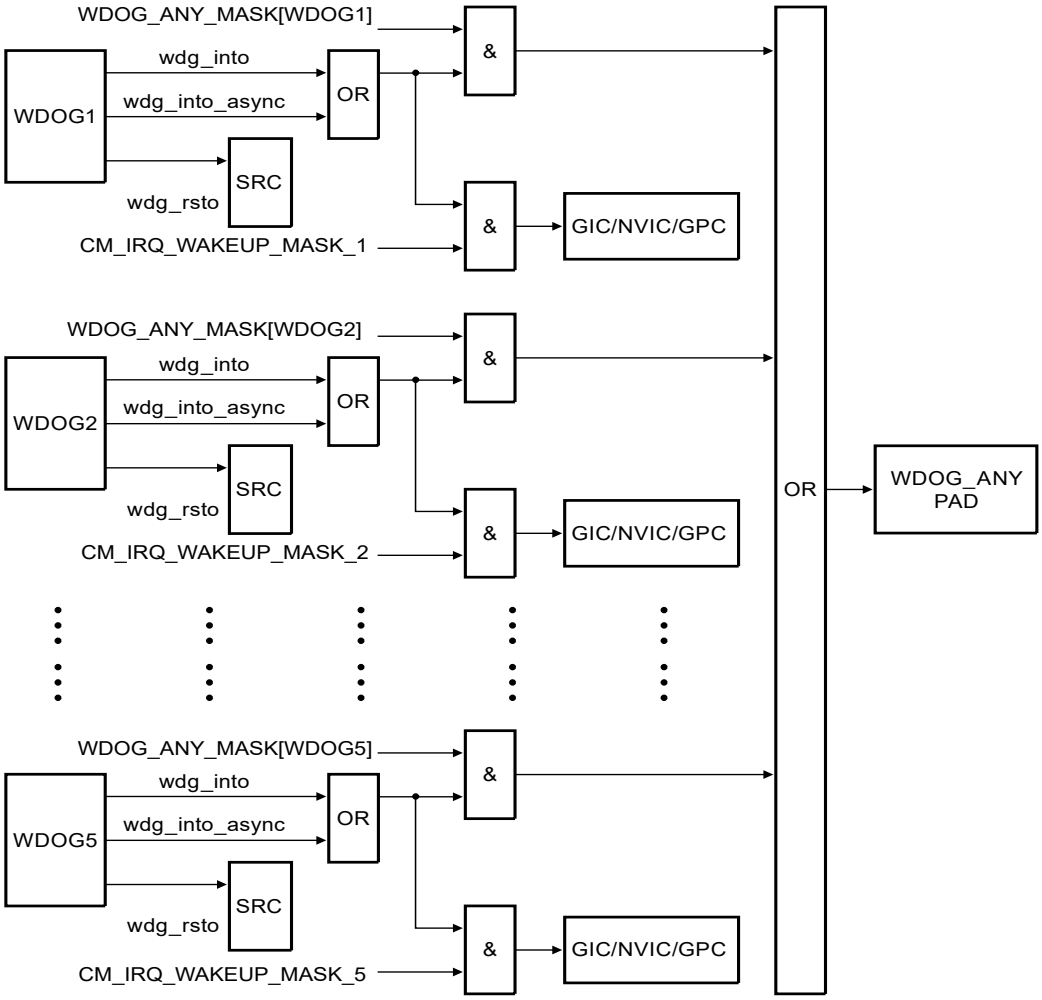

Figure 304. WDOG interrupt connections

54.2 Overview

WDOG is an independent timer that is available for system use. It provides a safety feature to ensure that the software is executing as planned and that the CPU is not stuck in an infinite loop or executing unintended code. If WDOG is not serviced (refreshed) within a certain period, it resets the MCU.

54.2.1 Block diagram

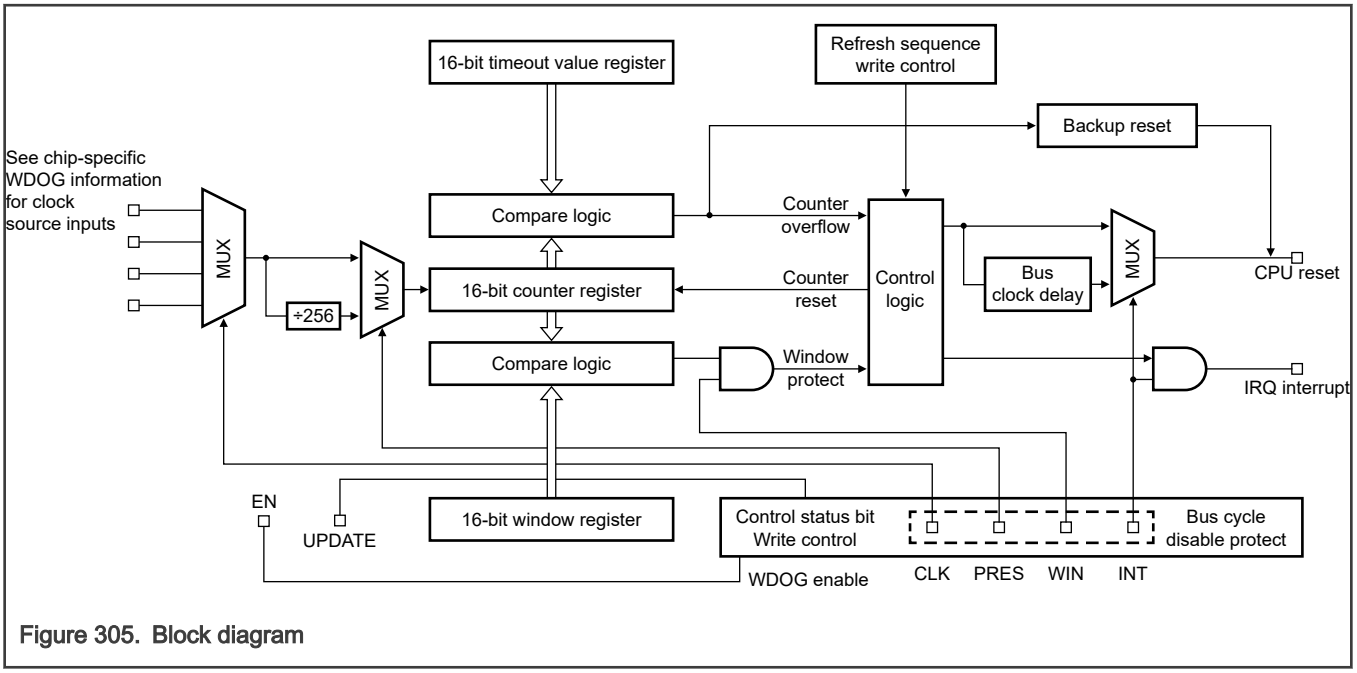

Figure 305. Block diagram

54.2.2 Features

- Configurable clock source inputs independent of the bus clock
- Programmable timeout period
  - Programmable 16-bit timeout value
  - Optional, fixed 256 clock prescaler when longer timeout periods are needed
- Robust write sequences for counter refresh: provision to refresh the sequence of writing to WDOG Counter (CNT)
- Window mode option for the refresh mechanism
  - Programmable 16-bit window value
  - Robust check to ensure that program flow is faster than expected
  - Early refresh attempts that trigger a reset
- Optional timeout interrupt to allow post-processing diagnostics
  - Interrupt request to CPU with an interrupt vector for an interrupt service routine (ISR)
  - Forced reset that occurs 1023 bus clocks after the interrupt vector fetch
- Write-once-after-reset configuration fields to ensure that WDOG configuration is not altered mistakenly
- Robust write sequence for unlocking write-once configuration fields
  - Unlock sequence of writing to WDOG Counter (CNT), for allowing updates to write-once configuration fields
  - You must make updates within 12'd1024 bus clocks after unlocking and before WDOG closing unlock window

54.3 Functional description

WDOG provides a fail-safe mechanism to ensure that you can reset the system to a known state of operation in case of system failure, such as the CPU clock stopping or there being a runaway condition in the software code. The WDOG counter runs continuously off a selectable clock source and expects to be serviced (refreshed) periodically. If it is not refreshed, it generates a reset triggering event.

54.3.1 Refresh mechanism

WDOG resets the MCU if the WDOG counter is not refreshed. A robust refresh mechanism makes it very unlikely for a runaway code to refresh WDOG.

To refresh the WDOG counter, you must execute a refresh write sequence before the timeout period expires. In addition, in case of Window mode, you must not start the refresh sequence until you set the time value in Watchdog Window (WIN). See the following figure for more.

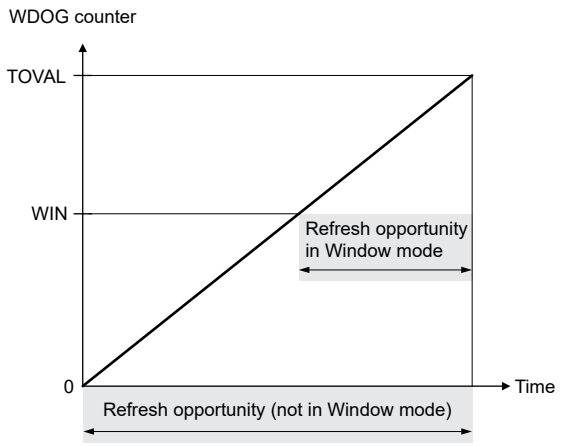

Figure 306. Refresh opportunity for the WDOG counter

54.3.1.1 Using Window mode

Software finishing its main control loop faster than expected could be an indication of a problem. Depending on the requirements of the application, you can program WDOG to force a reset when refresh attempts are early.

When Window mode is enabled, you must refresh WDOG after the counter has reached a minimum expected time value; otherwise, WDOG resets the MCU. The minimum expected time value is specified in Watchdog Window (WIN). Writing 1 to WIN enables Window mode.

54.3.1.2 Refreshing WDOG

The refresh write sequence is based on the following methods:

- Either two 16-bit writes (A602h, B480h) or four 8-bit writes (A6h, 02h, B4h, 80h) to WDOG Counter (CNT) if CMD32EN = 0 [5]
- One 32-bit write (B480_A602h) to WDOG Counter (CNT) if CMD32EN = 1

[5] The example sequence of four 8-bit writes is as below:

— write A6h to WDOG_CNT[CNTHIGH],

— write 02h to WDOG_CNT[CNTLOW],

— write B4h to WDOG_CNT[CNTHIGH],

— write 80h to WDOG_CNT[CNTLOW].

You must apply these methods before WDOG times out; otherwise, it resets the MCU.

Before starting the refresh sequence, disable the global interrupts. Otherwise, an interrupt could effectively invalidate the refresh sequence, if the interrupt occurs before the refresh writes finish. After the sequence finishes, restore the global interrupt control state.

See Application information for example code.

54.3.2 Configuring WDOG

54.3.2.1 Configuring WDOG once

All WDOG control fields, timeout value, and window value are write-once after reset. This means that after a write has occurred, they cannot be changed unless a reset occurs. You can ensure this by configuring the window and timeout values first, followed by the other control fields, when UPDATE = 0.

This provides a robust mechanism to configure WDOG and ensure that a runaway condition cannot mistakenly disable or modify the WDOG configuration, after the module is configured.

The new configuration takes effect only after you write to all registers except WDOG Counter (CNT) after reset. Otherwise, WDOG uses the reset values by default. If you do not use Window mode (WIN), you do not need to write to Watchdog Window (WIN) to bring the new configuration into effect.

54.3.2.2 Reconfiguring WDOG

In some cases (for example, when supporting a bootloader function), you may want to reconfigure or disable WDOG, without forcing a reset first:

- By writing 1 to UPDATE on the initial configuration of WDOG after a reset, you can reconfigure WDOG at any time by executing an unlock sequence.
- Conversely, if UPDATE remains 0, the only way to reconfigure WDOG is by initiating a reset.

The unlock sequence is similar to the refresh sequence but uses different values.

54.3.2.3 Unlocking WDOG

The unlock sequence is based on the following two methods:

- Either two 16-bit writes (C520h, D928h) or four 8-bit writes (C5h, 20h, D9h, 28h) to WDOG Counter (CNT), after WDOG is configured, if CMD32EN = 0 [6]
- One 32-bit write (D928_C520h) to WDOG Counter (CNT), after WDOG is configured, if CMD32EN = 1

An improper unlock sequence causes WDOG to reset. On completing the unlock sequence, you must reconfigure WDOG within 12'd1024 bus clocks; otherwise, WDOG closes the unlock window.

NOTE

Because it requires 12'd1024 bus clocks to reconfigure WDOG, you must insert some delays before executing stop or wait instructions after reconfiguring WDOG. This ensures that WDOG's new configuration takes effect before the MCU enters Low-Power mode. Otherwise, the MCU may not wake up from Low-Power mode.

[6] The example sequence of four 8-bit writes is as below:

- write C5h to WDOG_CNT[CNTHIGH],
- write 20h to WDOG_CNT[CNTLOW],
- write D9h to WDOG_CNT[CNTHIGH],
- write 28h to WDOG_CNT[CNTLOW].

54.3.3 Functionality in Debug and Low-Power modes

By default, WDOG is not functional in Debug, Wait, or Stop modes. However, it can remain functional in these modes as follows:

- For Debug mode, write 1 to DBG (this way WDOG is functional in Debug mode even when Debug mode holds the CPU).
- For Wait mode, write 1 to WAIT.
- For Stop mode, write 1 to STOP and WAIT, and ensure that the clock source is active in Stop mode.

NOTE

WDOG can generate an interrupt in Stop mode.

Don't write 1 to INT in Stop mode. Otherwise, WDOG reset after a delay of 128 bus clocks (lose bus clock) will not occur, but backup reset will take effect.

For Debug and Stop modes, in addition to the aforementioned configuration, you must use a clock source other than the bus clock as the reference clock for the counter; otherwise, WDOG cannot function.

54.3.4 Fast testing of WDOG

Before executing the application code in safety-critical applications, you must test that WDOG works as expected and resets the MCU. Testing every bit of a 16-bit counter by letting it run to the overflow value takes a relatively long time (64 k clocks).

To help minimize the startup delay for application code after reset, WDOG implements a feature that tests its functioning more quickly by splitting the counter into its constituent byte-wide stages. The low and high bytes are run independently and tested for a timeout against the corresponding byte of WDOG Timeout Value (TOVAL). For a complete coverage when testing the high byte of the counter, the test feature feeds the input clock via the 8th bit of the low byte, thus ensuring that the overflow connection from the low byte to the high byte is tested.

Using this test feature reduces the test time to 512 clocks (not including overhead, such as, user configuration and reset vector fetches). To further speed testing, use a faster clock (such as the bus clock) for the counter reference.

On a POR, the POR field in the system reset register becomes 1, indicating that you must perform the WDOG fast test.

54.3.4.1 Testing each byte of the counter

Perform this procedure to test each byte of the counter:

1. Program the preferred WDOG timeout value in WDOG Timeout Value (TOVAL) during the WDOG configuration period.
2. Select a byte of the counter to test by using the configuration TST = 10b for the low byte, and TST = 11b for the high byte.
3. Wait for WDOG to timeout. Optionally, in the idle loop, increment RAM locations as a parallel software counter for later comparison. Because RAM is not affected by a WDOG reset, the timeout period of the WDOG counter can be compared with the software counter to verify whether the timeout period occurred as expected.

   The WDOG counter times out and forces a reset.
4. Confirm that the WDOG flag in the system reset register is set, indicating that WDOG caused the reset (the POR flag remains clear).
5. Confirm that TST showing a test (10b or 11b) was performed.

If confirmed, the count and compare functions work for the selected byte. Repeat the procedure, and then select the next byte in step 2.

NOTE

Only a POR writes 0 to TST, which is not affected by other resets.

54.3.4.2 Entering User mode

After successfully testing the low and high bytes of the WDOG counter, you can configure TST to 01b to indicate that WDOG is ready for use in application User mode. Therefore, if a reset occurs again, you can recognize the reset trigger as a real WDOG reset caused by runaway or faulty application code.

As an ongoing test when using the default clock source, you can periodically read WDOG Counter (CNT) to ensure that the counter is being incremented.

54.3.5 Clocking

You can program CLK to select clock source options in the WDOG counter. See the chip-specific WDOG information for available clock inputs and the default option for this chip.

The option allows you to select a clock source that is independent of the bus clock for applications that need to meet more robust safety requirements. Using a clock source other than the bus clock ensures that the WDOG counter continues to run if the bus clock is somehow halted (see Backup reset).

For WDOG to function properly, you must enable the default WDOG clock source after its functional reset is deasserted.

An optional fixed prescaler for all clock sources allows longer timeout periods. When PRES = 1, the clock source is prescaled by 256 before clocking the WDOG counter.

The following table summarizes examples of the different available WDOG timeout periods. In the table, RCP means "reference clock period".

Table 517. WDOG timeout availability

Reference clock	Prescaler	WDOG timeout availability
REF_CLK	Pass through	1 × RCP to 65535 × RCP
	Enable	256 × RCP to 16776960 × RCP

NOTE

When you switch clock sources during reconfiguration, WDOG holds the counter at zero for 2.5 periods of the previous clock source and 2.5 periods of the new clock source after the configuration period (1024 bus clocks) ends. This delay ensures a smooth transition before restarting the counter with the new configuration.

54.3.6 Backup reset

The backup reset function is a safeguard feature that independently generates a reset in case the main WDOG logic loses its clock (the bus clock) and can no longer monitor the counter. If the WDOG counter overflows twice in succession (without an intervening reset), the backup reset function takes effect and generates a reset.

The backup reset becomes valid when an interrupt is enabled and the WDOG clock is not from a bus clock. If an interrupt is enabled, once the bus clock is cut off before exiting the interrupt routine, the normal watchdog reset is blocked. In this case, the second overflow causes a backup reset directly.

NOTE

You must use a clock source other than the bus clock as a reference clock for the counter; otherwise, the backup reset function becomes unavailable.

54.3.7 Interrupts

WDOG can generate an interrupt request to delay resets.

When interrupts are enabled (INT = 1), and after a reset-triggering event (such as a counter timeout or invalid refresh attempt), WDOG:

1. Generates an interrupt request.
2. Waits 1023 bus clocks (from the interrupt vector fetch, not the reset-triggering event).
3. Forces a reset.

This process allows the ISR to perform tasks such as analyzing the stack to debug code.

When interrupts are disabled (INT = 0), WDOG does not wait before forcing a reset.

54.4 External signals

This module has no external signals.

54.5 Initialization

See Configuring WDOG once.

54.6 Application information

You must disable WDOG or reconfigure it before the first WDOG timeout. Disabling or reconfiguring WDOG must occur at the very beginning of the software code, for example, at the beginning of the startup or main function.

NOTE

- After you configure WDOG, it needs at least 2.5 periods of WDOG clock to take effect. This means you must have a gap of at least 2.5 clocks between two configurations.
- When the chip starts from boot ROM and then jumps to flash memory, you must disable WDOG at the beginning of the bootloader and enable it after the bootloader exits. To reconfigure WDOG using the flash memory program, it also needs the interval of at least 2.5 WDOG clocks after the bootloader exits.

To disable or reconfigure WDOG without forcing a reset, you must write 1 to UPDATE during the initial WDOG configuration. You can use the unlock sequence at any time, within the timeout limit, to reconfigure WDOG.

54.6.1 Disabling WDOG

To disable WDOG, you must first perform the unlock sequence. Then, write 0 to EN. The following code snippet shows an example of a 32-bit write.

```
DisableInterrupts; // disable global interrupt
WDOG_CNT = 0xD928C520; //unlock watchdog
WDOG_CS &= ~WDOG_CS_EN_MASK | WDOG_CS_UPDATE(1); //disable watchdog
EnableInterrupts; //enable global interrupt
```

54.6.2 Disabling WDOG after reset

All WDOG registers are unlocked by reset. Therefore, an unlock sequence is unnecessary but it needs to be written to all WDOG registers to make the new configuration take effect. The following code snippet shows an example of disabling WDOG after reset.

```
DisableInterrupts; // disable global interrupt
WDOG_CS &= ~WDOG_CS_EN_MASK; // disable watchdog
WDOG_TOVAL= 0xFFFF;
while(WDOG_CS[ULK]);  // waiting for lock
while(~WDOG_CS[RCS]); // waiting for new configuration to take effect
EnableInterrupts; // enable global interrupt
```

54.6.3 Configuring WDOG

You can write 0 to UPDATE to configure WDOG. After that, you cannot reconfigure WDOG until a reset. To reconfigure without forcing a reset, write 1 to UPDATE when configuring WDOG. The following example code shows how to configure WDOG without Window mode, clock source as LPO, interrupt enabled, and timeout value to 256 clocks. The following code snippet shows an example of a 32-bit write.

54.6.3.1 Configuring once

```
DisableInterrupts; // disable global interrupt
WDOG_CNT = 0xD928C520; //unlock watchdog
while(WDOG_CS[ULK]==0);  //wait until registers are unlocked
WDOG_TOVAL = 256; //set timeout value
WDOG_CS = WDOG_CS_EN(1) | WDOG_CS_CLK(1) | WDOG_CS_INT(1) |
          WDOG_CS_WIN(0) | WDOG_CS_UPDATE(0);
while(WDOG_CS[RCS]==0); //wait until new configuration takes effect
EnableInterrupts; //enable global interrupt
```

54.6.3.2 Configuring for Reconfigurable mode

```
DisableInterrupts; //disable global interrupt
WDOG_CNT = 0xD928C520; //unlock watchdog
while(WDOG_CS[ULK]==0);  //wait until registers are unlocked
WDOG_TOVAL = 256; //set timeout value
WDOG_CS = WDOG_CS_EN(1) | WDOG_CS_CLK(1) | WDOG_CS_INT(1) |
          WDOG_CS_WIN(0) | WDOG_CS_UPDATE(1);
while(WDOG_CS[RCS]==0); //wait until new configuration takes effect
EnableInterrupts; //enable global interrupt
```

54.6.4 Refreshing WDOG

To refresh WDOG and reset the WDOG counter to zero, you require a refresh sequence. The following code snippet shows an example of a 32-bit write.

```
DisableInterrupts; // disable global interrupt
WDOG_CNT = 0xB480A602; // refresh watchdog
EnableInterrupts; // enable global interrupt
```

15 WIN	WDOG Window Enables Window mode. You can write to this field only once.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Disable 1 - Enable
14 FLG	WDOG Interrupt Flag Acts as an interrupt indicator when INT = 1. 0 - No interrupt occurred 1 - An interrupt occurred
13 CMD32EN	Command 32 Enable Enables or disables WDOG support for 32-bit (otherwise 16-bit or 8-bit) refresh or unlock command write words. If this field = 0, it disables support for 32-bit refresh or unlock command write words. Only a 16-bit or 8-bit write is supported. If this field = 1, it enables support for 32-bit refresh or unlock command write words. A 16-bit or 8-bit write is not supported. This is a write-once field, and you must unlock WDOG after writing to this field for reconfiguration. 0 - Disable 1 - Enable
12 PRES	WDOG Prescaler Enables a fixed 256 prescaling of the WDOG counter reference clock. See Block diagram that shows the clock divider option. This is a write-once field. 0 - Disable 1 - Enable
11 ULK	Unlock Status Indicates whether WDOG is unlocked. 0 - Locked 1 - Unlocked
10 RCS	Reconfiguration Success Indicates whether the reconfiguration is successful. This field becomes 1 when new configuration takes effect, and becomes 0 with a successful unlock command. 0 - Unsuccessful 1 - Successful
9-8 CLK	WDOG Clock Selects the clock source that feeds the WDOG counter. You can write to this field only once.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE See chip-specific WDOG information for details of bit field settings. 00 - IPG 01 - LPO 10 - INT 11 - EXT
7 EN	WDOG Enable Enables the WDOG counter to start counting. You can write to this field only once. 0 - Disable 1 - Enable
6 INT	WDOG Interrupt Configures WDOG to immediately generate an interrupt request upon a reset-triggering event (timeout or illegal write to WDOG), before forcing a reset. After the interrupt vector fetch (that takes place after the reset-triggering event), the reset occurs after a delay of 1023 bus clocks. If this field = 0, it disables WDOG interrupts (WDOG resets are not delayed). If this field = 1, it enables WDOG interrupts (WDOG interrupts are delayed by 128 bus clocks from the interrupt vector fetch). You can write to this field only once. 0 - Disable 1 - Enable
5 UPDATE	Updates Allowed Allows you to reconfigure WDOG without a reset. If this field = 0, you cannot update WDOG after the initial configuration, without forcing a reset. If this field = 1, you can modify the WDOG configuration registers within 1024 bus clocks after performing the unlock write sequence. You can write to this field only once. 0 - Updates not allowed 1 - Updates allowed
4-3 TST	WDOG Test Enables Fast Test mode, which allows you to exercise all bits of the counter to demonstrate that WDOG is functioning properly. See Fast testing of WDOG for more information. If this field = 0, it disables WDOG Test mode. If this field = 1, it enables WDOG User mode and disables WDOG Test mode. After testing WDOG, you must use this setting to indicate that WDOG is functioning normally in User mode. If this field = 10, it enables WDOG Test mode; only the low byte is used. CNTLOW is compared with TOVALLOW. If this field = 11, it enables WDOG Test mode; only the high byte is used. CNTHIGH is compared with TOVALHIGH.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	This write-once field is cleared (0:0) on POR only. Any other reset does not affect the value of this field. 00 - Disable WDOG Test mode 01 - Enable WDOG User mode 10-11 - Enable WDOG Test mode
2 DBG	Debug Enable Enables WDOG to operate when the chip is in Debug mode. You can write to this field only once. 0 - Disable 1 - Enable
1 WAIT	Wait Enable Enables WDOG to operate when the chip is in Wait mode. You can write to this field only once. 0 - Disable 1 - Enable
0 STOP	Stop Enable Enables WDOG to operate when the chip is in Stop mode. You can write to this field only once. 0 - Disable 1 - Enable

54.7.1.3 WDOG Counter (CNT)

Provides access to the value of the free-running WDOG counter. You can read the counter register at any time but cannot write directly to it. However, the following write sequences to this register have special functions:

1. The refresh sequence resets WDOG counter to 0000h. See Refreshing WDOG for more information.
2. The unlock sequence allows WDOG to be reconfigured without forcing a reset (when UPDATE = 1). See Configuring for Reconfigurable mode for more information.

NOTE

All other writes to this register are illegal and force a reset.

Offset

Register	Offset
CNT	4h

15-8 CNTHIGH	Counter High Byte Contains the WDOG high byte.
7-0 CNTLOW	Counter Low Byte Contains the WDOG low byte.

54.7.1.4 WDOG Timeout Value (TOVAL)

Contains the 16-bit value used to set the timeout period of WDOG.

The WDOG counter (CNT) is continuously compared with the timeout value (TOVAL). If the counter reaches the timeout value, WDOG forces a reset triggering event.

NOTE

Do not write 0 to this register (if TST = 11b, then TOVALHIGH cannot be written as 0; if TST = 10b, then TOVALLOW cannot be 0); otherwise, WDOG always generates a reset.

Offset

Register	Offset
TOVAL	8h

Chapter 55
Analog Overview

55.1 Overview

The following analog modules are integrated on the chip:

- Analog-Digital-Converter (ADC)
- Temperature sensor
- XTAL

55.2 Analog-to-Digital Converter (ADC)

i.MX91 integrates 1 ADC. The main features are:

- It includes eight channels, four of them connected to pins in the package.
- Support the 1MS/s frequency of operation
- Multiple modes of starting conversion (Normal, Injected)

  Normal mode supports One-Shot and Scan (continuous) conversion

  Injected mode supports One-Shot conversions only
- Support TRGMUX to allow 16 trigger channels to be used by any ADC channel

55.3 Temperature Sensor

The temperature sensor is included to monitor the die temperature. It has a digital controller which allows software to enable/disable it and read the temperature. The digital controller also provides capability to generate alarm IRQ to the CPU as follows:

- The temperature sensor has two programmable trip points: normal and critical. Each trip point has its corresponding interrupt output.
- When the temperature is above the “normal” point, an interrupt for normal trip point is generated.
- When the temperature is above the “critical” point, an interrupt for critical trip point is generated.

55.3.1 XTAL

The chip has two XTAL modules:

- 24MHz XTAL module for system clock
- 32KHz XTAL module for RTC

Each XTAL includes:

- Crystal oscillator to generate reference clock;
- Digital control logics for the XTAL.

55.3.2 PLL

The chip has multiple PLLs to meet the clock system requirement:

- Integer PLL for ARM PLL.
- Fractional PLL for SYSTEM_PLL1, AUDIO_PLL and VIDEO_PLL. Support spread spectrum.
- Each PLL has independent control to be clocked from either 24MHz XTAL, or CLKIN1 or CLKIN2 or CLKIN1 XOR CLKIN2.

55.3.3 DIGPROG Device ID

The chip has a 32-bit DIGPROG Device ID in OSC register space. Please refer Memory map and register definition for details.

System Debug		System Debug Overview

This device has one instance of the TRGMUX module. It allows any of the 16 trigger channels to be used by any ADC channel.

56.2 Overview

TRGMUX allows you to configure the trigger inputs for various peripherals.

56.2.1 Block diagram

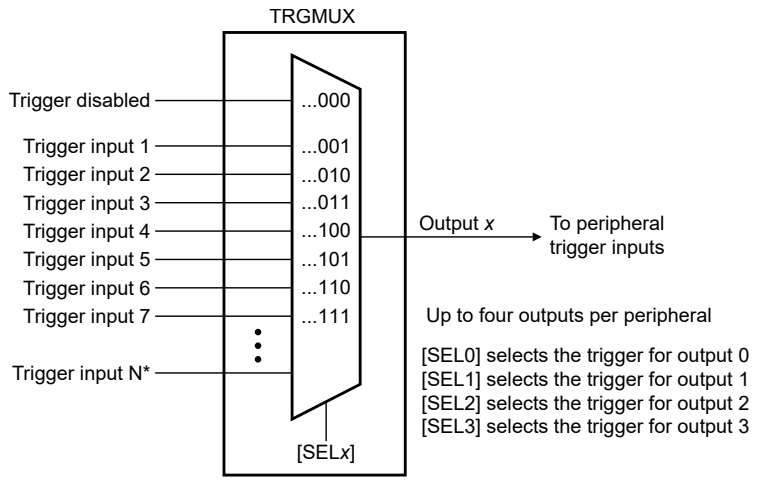

Figure 307. Block diagram

NOTE

Up to 255 trigger inputs may be available for SEL0, SEL1, and SEL2. For SEL3, up to 127 trigger inputs may be available. When the number of trigger inputs is 255, SEL3 is not available and becomes reserved. See the chip-specific TRGMUX information for details about trigger input and output configuration on this chip.

56.2.2 Features

- Configurable trigger sources for peripherals
- Dedicated TRGMUX register for each peripheral

56.3 Functional description

56.3.1 Clocking

This module has no clocking considerations.

56.3.2 Interrupts

This module has no interrupts.

56.4 External signals

This module has no external signals.

56.5 Initialization

This module does not require initialization.

56.6 TRGMUX register descriptions

56.6.1 TRGMUX memory map

You can only write to TRGMUX registers in Supervisor mode.

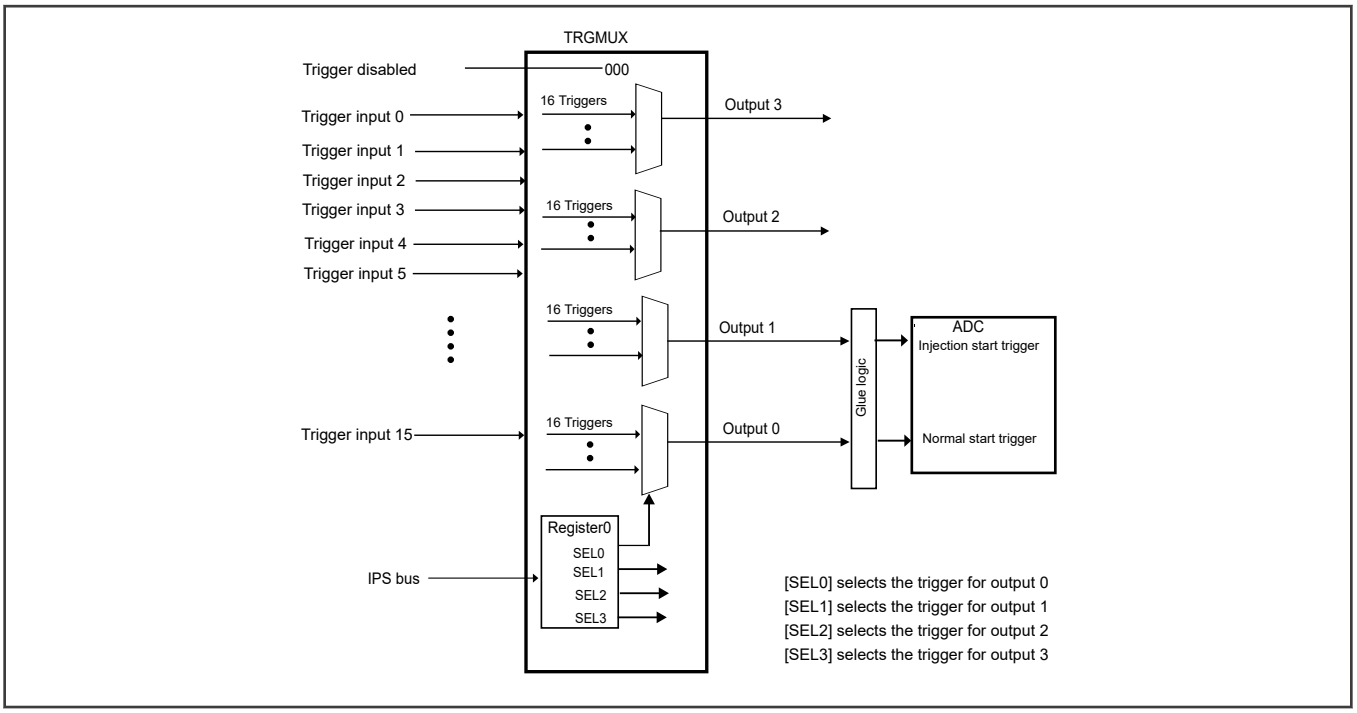
14	Reserved	

The figure below shows the connections between ADC and TRGMUX.

NOTE

Injection start trigger is connected to output 1 and Normal start trigger is connected to output 0 of TRGMUX.



57.2 Overview

SAR_ADC provides fast and accurate analog-to-digital conversion using the Successive Approximation Register (SAR) method. It has 12-bit resolution and is highly configurable for a wide range of applications.

57.2.1 Block diagram

The following figure shows the high-level interface diagram of SAR_ADC.

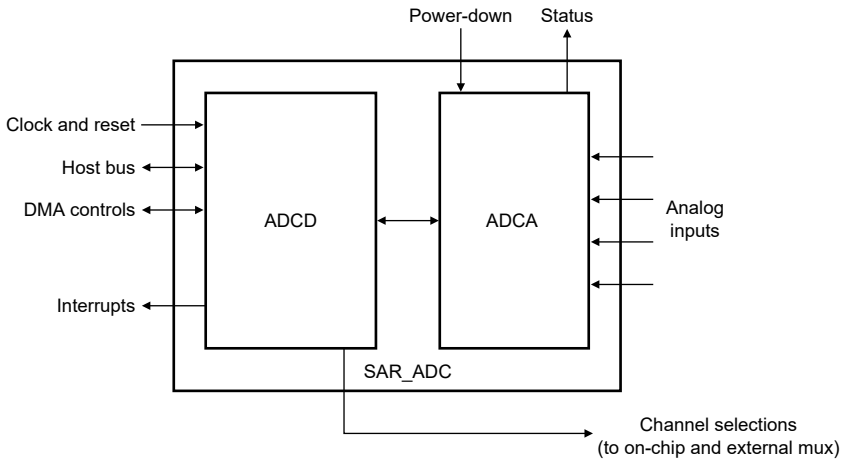


Figure 308. SAR_ADC high-level interface diagram

SAR_ADC interfaces as shown above are as follows:

- Analog inputs to sample the channels to be converted.
- Channel selection controls are provided to use internal or external analog multiplexers.
- Host Bus allows access to configuration, control, and status registers which are used to start/stop conversions, monitor the conversion results, errors, violations, and so on.
- DMA interface transfers conversion results by the DMA controller.
- Interrupts can be generated for various events depending on configuration (data availability, threshold violation, error, and so on).
- External hardware triggers are used to start conversion from sources external to SAR_ADC.
- Power-down controls are used to place the analog block into a deactivated state.

57.2.2 Features

The general feature list of SAR_ADC is shown below. Feature availability is chip-specific and is defined during module integration. See chip-specific SAR_ADC information for details.

- 4'd12-bit resolution
- Multiple modes of starting conversion (Normal, Injected)
  - Normal mode supports One-Shot and Scan (continuous) conversions
  - Injected mode supports One-Shot conversions only
- Software-initiated conversions in Normal and Injected modes, or external hardware trigger
- Two different abort features for either a single or chain conversion in Normal and Injected modes
- Independent data registers for each channel contain information about mode of conversion, data validity, overwrite status, and conversion data
- Alternate analog watchdog thresholds (threshold selected through input ports)
- Programmable DMA enables for each channel
- Individual interrupt flags for the following conditions:

  - End of conversion of a single channel for Normal and Injected modes
  - End of chain conversion for both Normal and Injected modes
  - Watchdog threshold violations
- Programmable presampling for channels
- Auto-Clock-Off feature for improved power performance
- Power-Down mode to place SAR_ADC in power-down state
- Programmable clock prescaler for SAR_ADC (bus clock, or bus clock divided by two or four)
- Software-initiated calibration
- Self-test feature

57.3 Functional description

The ADCD interfaces are shown in Figure 308. The available functionality in the ADCD is described in the following sections (see chip-specific SAR_ADC information for details).

57.3.1 Submodules

SAR_ADC consists of two major functional parts:

- ADC Digital (ADCD)
- ADC Analog hard macro cell (ADCA)

ADCD controls ADCA. ADCD holds the configuration, control, and status registers that are accessible through software using the host interface. ADCD executes the SAR Control algorithm. The selection of channel multiplexers and analog gates is driven by ADCD based on the configuration you perform. Conversion results are stored in registers, and the results can be transferred to memory by DMA or read by host access.

ADCA holds all analog circuitry which consists of a comparator, capacitor bank, bias generation, and so on. Only one channel is processed at a time. Multiple channels are processed sequentially by multiplexing the analog inputs. You can configure the duration for which each channel is sampled. The hold value is used to calculate a channel's digital code by successively comparing it with an analog voltage generated by a Digital to Analog Converter (DAC) inside ADCA.

57.3.2 Special channels

Reference voltages and supply voltages are available at predefined SAR_ADC channels.

57.3.3 Conversion

Conversions are software or external hardware initiated.

The following list shows the methods of initiating conversions in order of priority (highest to lowest):

1. Injection (see Injected Conversion mode)
2. Normal (see Normal Conversion mode)

Each type of conversion method has different processing features.

Injection can start a single chain of conversions one at a time, where a chain may have from one up to the maximum number of channels available (each channel appears once in the chain).

Normal conversion can start a continuous or single chain of conversion one at a time. In continuous mode, the chain of conversions is repeated unless you stop them.

When a normal conversion is in process, the starting injected conversions are done by software or external hardware. This allows a chain of channels that cannot wait to be converted (as selected by JCMR) to be handled immediately.

Analog watchdogs allow continuous hardware monitoring of input channel conversion results.

A built-in self-test function enables periodic checking of ADCA health. If a fault is detected, the FCCU can be signaled. The severity of the fault is programmable (critical/non-critical).

NOTE

ADC configurations must be changed only when ADC is in idle or power-down state (MSR[NSTART]=0 and MSR[ADCSTATUS] = idle/power-down).

57.3.3.1 Normal Conversion mode

The conversion method which is generally used to convert channels is Normal Conversion mode. To select channels for conversion, you program the Normal Conversion Mask Register (NCMR). Each channel can be individually enabled by setting the corresponding field in NCMR:

- NCMR0 selects channels in Group0.
- NCMR1 selects channels in Group32.

The mask registers must be programmed before starting the conversion and cannot be modified until all selected channel conversions have completed. A conversion always starts from the lowest channel number and continues sequentially to the highest channel number.

57.3.3.1.1 Starting conversions in Normal Conversion mode

After programming the required fields of the Main Configuration Register (MCR) and NCMR, conversion starts as follows:

- By software:
  - Conversion chain starts when one is written to MCR[NSTART].
- By hardware trigger:
  - If external trigger is enabled (MCR[TRGEN] = 1), and an external trigger enable is detected, the conversion will start. The enable is checked only during the start of conversion. The hardware trigger needs to be active for a least 2 ADC bus clock cycles in order to recognized and start a conversion.
    - Detection of an active edge is defined by MCR[EDGE] (rising = 1, falling = 0). When an external trigger is recognized, MSR[NSTART] is set and normal conversion starts.

NOTE

An external trigger, or software-initiated conversion, in Normal Conversion mode is ignored during any ongoing conversion chain.

NOTE

There must be a gap of three cycles between configuration of the NCMR and the start of conversion (setting of MCR[NSTART] or arrival of hardware start trigger) for proper SAR_ADC operation. SAR_ADC calculates the total number of channels to be converted during this period.

NOTE

There must be a gap of three cycles between configuration of the NCMR and the start of conversion (setting of MCR[NSTART] or arrival of hardware start trigger) for proper SAR_ADC operation. SAR_ADC calculates the total number of channels to be converted during this period.

57.3.3.1.2 Operation modes in Normal Conversion mode

Two operation modes are available for normal conversions:

- One-Shot Operation mode
- Scan Operation mode

The MCR[MODE] field determines the operating mode in normal conversion. The first phase of any conversion process involves sampling the analog channel. Which is followed by the conversion phase, when the sampled analog value is converted to digital as shown in Figure 309.

Figure 309. Normal conversion flow

In **One-Shot Operation mode** (MCR[MODE] = 0), a sequential conversion specified in the NCMR mask registers is performed once. At the end of each conversion, the digital result of the conversion is stored in the corresponding data register (CDR*n*; *n* = channel number).

For example: Channels A-B-C-D-E-F-G-H are available on the chip, where channels B-D-E are to be converted in One-Shot Operation mode. Conversion starts from channel B, followed by conversion of channels D-E. At the end of conversion of channel E the channel scanning stops.

MSR[NSTART] is automatically set when the normal conversion starts. At that time MCR[NSTART] is reset by hardware, allowing the software to program a new start of conversion in advance. In this case, the new requested conversion starts after completion of the currently running conversion. However, for correct device function, it is required to program MCR[NSTART] for the new conversion only after the current conversion is complete. Software can wait for the end of conversion (ISR[ECH] = 1) prior to setting MCR[NSTART] again.

If the conversion chain starts by external trigger (if MCR[TRGEN] = 1), the ADC cannot monitor the trigger input until the conversion chain finished. After the chain is finished, the next chain starts by subsequent hardware trigger edge.

In **Scan Operation mode** (MCR[MODE] = 1), a sequential conversion of *n* channels specified in the NCMR registers is continuously performed. At the end of each conversion the converted result is stored into the corresponding channel data register, as it is in One-Shot Operation mode.

MSR[NSTART] is automatically set when normal conversion starts. Unlike One-Shot Operation mode, MCR[NSTART] is not reset in Scan Operation mode. It can be reset by software when you need to stop the Scan Operation mode. In that case, the ADC will complete the current chain, and after the last conversion, it clears MSR[NSTART].

For example: Channels A-B-C-D-E-F-G-H are available on the chip, where channels B-D-E are to be converted in Scan Operation mode. Conversion starts from channel B followed by conversion of channels D-E. At the end of conversion of channel E the scanning of channel B starts again, followed by conversion of channels D-E. This sequence repeats itself until MCR[NSTART] is reset by software.

This scan chain can be stopped by writing zero to MCR[NSTART]. The conversion stops when the ongoing chain is finished.

If the conversion is started by an external trigger, MCR[NSTART] is not set. As a consequence, after it is started, the only way to stop a Scan Operation mode conversion started by external trigger is to write MCR[MODE] = 0.

End of conversion:

In both modes, at the end of each conversion an End of Conversion (EOC) interrupt is issued (if enabled by the corresponding mask bit in CIMR and IMR).

After conversion of all the selected channels in NCMR has completed, the conversion operation is considered finished. ISR[ECH] is then set and End of Chain (ECH) interrupt is issued (if enabled in IMR[MSKECH]).

The corresponding channel bit of CEOCFR is updated to indicate data is available in data register CDR*n* of the corresponding channel.

If there is no channel selected in NCMR, and there is a start of conversion trigger, ISR[ECH] is set and an ECH interrupt is issued immediately, if enabled.

NOTE

In scan (continuous) mode, ADC conversions happen very regularly as per timing derived by sample time and resolution. The host reads the result registers after checking ECH flag. The reading time of the host after setting ECH could vary based on the load on it. So, it may occasionally get invalid data (valid bit 0b in data CDR register) in channels. To avoid such scenarios, check the ECH flag twice before reading the conversion results, to ensure that the host gets valid data always for all channels. The host needs to clear the ECH flag each time it finds it set. The sequence will be as below:

1. Host waits for ECH. On ECH, it clears it.
2. Host waits for second ECH. On ECH, it clears it.
3. Host reads data for all channels.
4. Repeat steps 1–3.

57.3.3.2 Injected Conversion mode

An injected conversion is a conversion of a programmed chain that can be injected anytime into an ongoing conversion chain processed in Normal Conversion mode. You require to configure Injected Mask Register(s) (JCMR*n*). In Normal Conversion mode each internal or external channel can be individually selected:

- JCMR0 for channels in Group0
- JCMR1 for channels in Group32

An injected conversion chain can only be run in One-Shot Operation mode and suspends the ongoing conversion chain processed in Normal Conversion mode. When an injected conversion chain is inserted into an ongoing chain processed in Normal Conversion mode, the ongoing chain is suspended and the injected conversion request is processed. After conversion completion of the last channel of the injected chain, conversion resumes from the channel at the chain which was suspended in Normal Conversion mode, as shown in Figure 310.

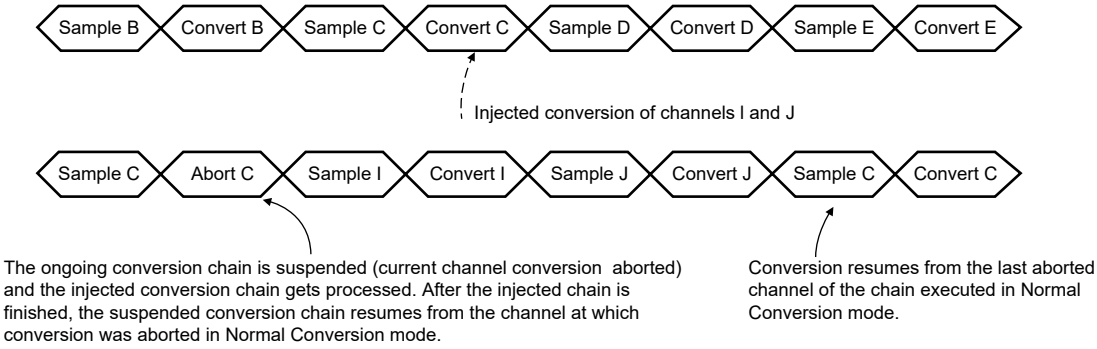

Figure 310. Injected sample/conversion sequence

57.3.3.2.1 Starting conversions in Injected Conversion mode

The injected conversion chain can be started by using one of the following methods:

- By software: When external triggering is disabled (MCR[JTRGEN] = 0), MCR[JSTART] can be set. Setting MCR[JSTART] causes any Normal Conversion mode chain to be suspended and the injected chain to start processing.
- By external trigger: When external triggering is enabled (MCR[JTRGEN] = 1), a programmed event on the external injection input (high or low depending on MCR[JEDGE] setting) starts the Injected Conversion mode. The external trigger needs to be active for a least 2 ADC bus clock cycles in order to recognized and start a conversion.

MSR[JSTART] is automatically set when the injected conversion chain starts, and MCR[JSTART] is cleared. This allows the software to program a new start of conversion in advance. If a new injected conversion request occurs while an injected conversion chain is in progress (for example, setting MCR[JSTART] while MSR[JSTART] is set), then conversion will start after the current conversion has completed.

At the end of each conversion, an End Of Injected Conversion (JEOC) (ISR[JEOC] = 1) interrupt is issued (that is, IMR[MSKJEOC] = 1), and at the end of the chain an End of Injected Chain (JECH) (ISR[JECH] = 1) interrupt is issued (that is, IMR[MSKJECH] = 1).

The corresponding channel bit of CEOCFR*n* is set, indicating that data is available in the CDR of the respective channel.

After it is started, an injected chain conversion cannot be interrupted.

NOTE

If there is no channel selected in JCMR*n*, and an injected conversion is started, then ISR[JECH] is immediately set and the corresponding interrupt is asserted (if enabled). This behavior is independent of normal conversion status.

For correct operation of SAR_ADC, there must be a gap of at least three cycles between configuration of JCMR*n* and the start of a conversion (setting MCR[JSTART] or receiving an external hardware trigger). SAR_ADC calculates the total number of channels to be converted during this period.

57.3.3.3 Abort of conversion

Two different abort functions are provided:

- Abort of a single channel
- Abort of chain

You can abort the ongoing conversion by setting MCR[ABORT]. SAR_ADC then aborts the current conversion and immediately starts the conversion of the next channel of the chain. The abort action may take 1–4 cycles of bus clock to abort the current conversion, depending on the state of the conversion. At the start of any conversion and at the end of a particular conversion, when internal state counters are changing, then the abort get delay by a maximum of three cycles. This allows all states to be placed in stable condition before aborting.

So, you are advised not to change the abort field status for the next three cycles to achieve this effect.

Abort also not to be programmed along with and within three cycles of programming MCR[NSTART] or MCR[JSTART].

In the case of an abort operation, MSR[NSTART/JSTART] remains set if not in the last channel of the chain, and MCR[ABORT] is reset as soon as the channel is aborted. The EOC corresponding to the aborted channel is not generated. This behavior is true for Normal or Injected Conversion modes. If the last channel of a chain is aborted, the end of chain is reported, generating an ECH interrupt.

It is also possible to abort the current chain of conversions by setting MCR[ABORTCHAIN]. In that case, the behavior of the ADC depends on MCR[MODE] (One-Shot/Scan Operation modes). If Scan Operation mode is disabled, MSR[NSTART] is automatically reset together with MCR[ABORTCHAIN]. Otherwise, in Scan Operation mode, a new chain is started. The EOC of the current aborted conversion is not generated but an ECH interrupt is generated to signal the end of the chain.

NOTE

For a single channel chain, ECH is not generated in the case of an abort or abort chain.

When an ABORTCHAIN is requested while an injected chain is running over a suspended normal chain, both injected and normal chains are aborted. Both ISR[ECH] and ISR[JECH] are set. MSR[JSTART] is reset to mark the end of the injected chain. MSR[NSTART] is reset if normal conversion is running in One-Shot mode. Otherwise, in Scan mode it remains set and a new chain is started.

57.3.3.4 Conversion time

Total conversion time depends on SAR_ADC clock (AD_CLK). This clock can be prescaled to half of bus clock. SAR_ADC operating clock (AD_CLK) is always synchronous with the bus clock. The frequency of AD_CLK depends on MCR[ADCLKSE] settings.

- When MCR[ADCLKSE] = 1, AD_CLK = bus clock.
- When MCR[ADCLKSE] = 0, AD_CLK = (bus clock / 2).

Conversion timing detail is shown in the figure below. The description of each time segment follows the figure.

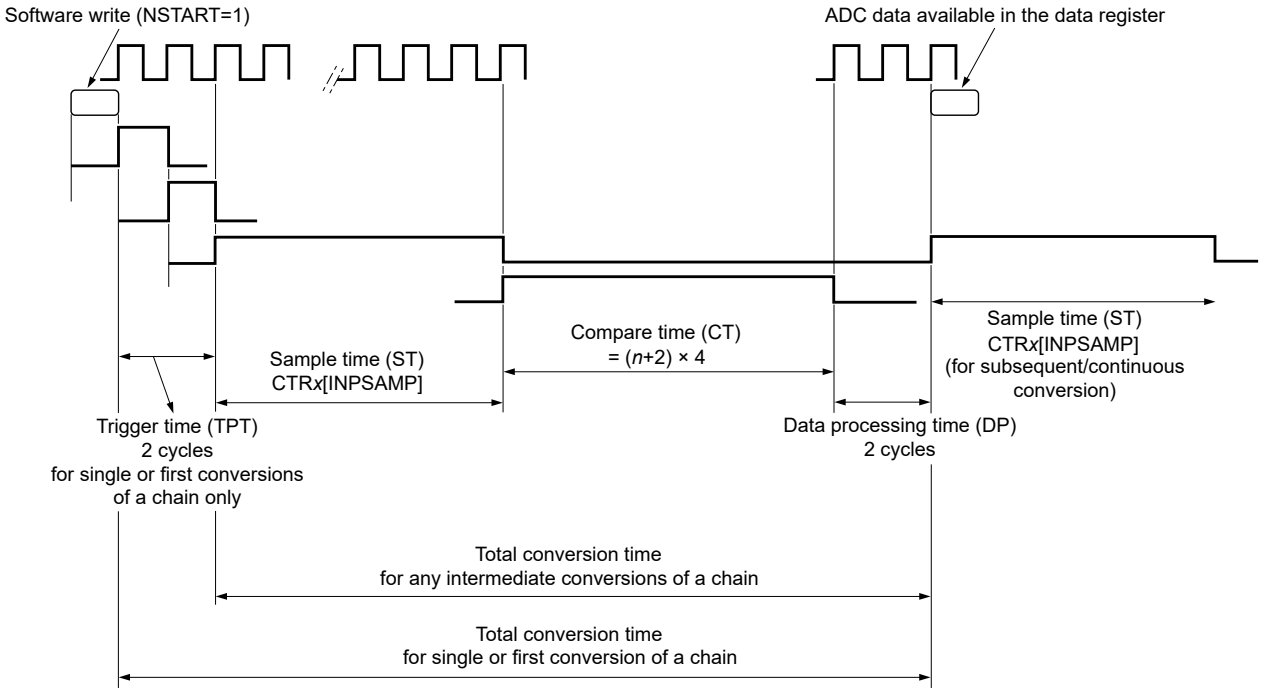

Figure 311. Conversion time

Trigger time (TPT):

To prepare a channel for conversion, two bus clock cycles are required by SAR_ADC for the single conversion and for the first conversion in a chain. For continuous conversions and subsequent conversions in a chain, this time is not required because it is hidden in the pipeline operation.

Sample phase time (ST):

ST duration is controlled by the CTR*n*[INPSAMP[7:0]] configuration. The value in the register field represents units of AD_CLK cycles. The minimum value of sample time is eight AD_CLK cycles. If the value programmed in CTR*n*[INPSAMP[7:0]] is less than eight, it has no effect on sample time duration and will default to eight AD_CLK cycles.

Compare phase time (CT):

CT depends on the resolution of SAR_ADC. The CT is ((x + 2) × 4) cycles of AD_CLK, where x = 4'd12 is the resolution of SAR_ADC.

Data processing time (DP):

DP takes two AD_CLK cycles to post and load data into the data register.

Total conversion time:

The total time required for a single or first conversion is (TPT + ST + CT + DP) AD_CLK cycles. The time for subsequent conversions in a chain or continuous conversions is (ST + CT + DP) AD_CLK cycles.

Examples:

- CTR*n*[INPSAMP] = 20d (software or hardware triggered, MCR[NSTART]):
  - Single or first conversion: 2 + 20 + ((12 + 2) × 4) + 2 = 2 + 20 + 56 +2 = 80 AD_CLK cycles
  - Subsequent or continuous conversions: 20 + ((12 + 2)× 4) + 2 = 20 + 56 + 2 = 78 AD_CLK cycles

Presample phase time (PST):

When presampling is enabled, SAR_ADC presamples prior to starting the actual sampling, as described in Presampling. This phase takes the number of AD_CLK cycles defined in CTR*n*[INPSAMP]. Additionally, to switch from presample phase to actual channel sampling phase, it takes another two AD_CLK cycles. So, the total presampling AD_CLK cycle is CTR*n*[INPSAMP] + 2 additional cycles that are required for a conversion to complete. If presampling is implemented, all equations and examples above are valid only with the additional (CTRN*n*[INPSAMP] + 2) AD_CLK cycles.

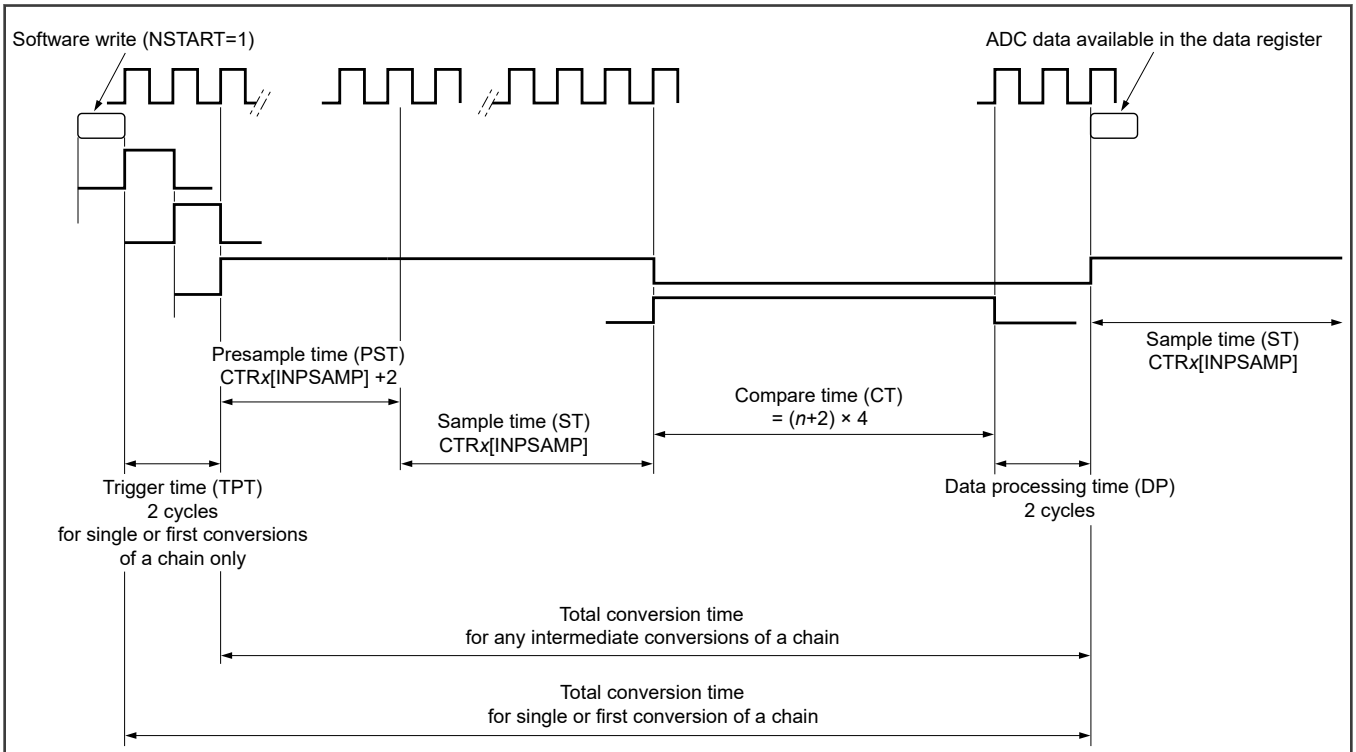

Figure 312. Conversion timing with presampling

Conversion time for calibration:

- Single conversion time = Sample time (MCR[TSAMP]) + CT (11 × 4) + DP (2)
- Interconversion gap = 1 cycle
- Total number of tests = 12
- Averaging = 32

One test duration = (single conversion time + interconversion gap) × averaging samples

Total test duration = (one test duration × total number of tests)

Example: Sample time = 22

Total test time = ((((22 + (11× 4) + 2) + 1) × 32) × 12) = 26496 cycles × 25 ns (40 MHz) = 662.4 µs

Conversion time for self-test conversion:

The time for a self-test conversion is one test period multiplied by the number of consecutive (atomic) steps. For supply self-tests, the atomic step is three and for other tests it is one.

One test period for self-test is:

- For supply tests: (ST + (14 × 4) + 2)
- For other algorithms: (ST + (11 × 4) + 2)

NOTE

Steps (conversions) of the supply algorithm always run in atomic operation, required for algorithmic procedure. So, in Scan Operation mode when all algorithms are selected, three steps (conversions) of supply algorithm run together after end of the chain. Steps (conversions) of algorithm C are not required to be run together, so after every chain one step (conversion) is executed serially. Conversion time in self-test also needs to be calculated accordingly.

Example:

- Channels in chain A→B→C
- Scan Operation mode
- All self-test algorithms selected

The resulting conversion order will be:

[A→B→C→AS_step0→AS_step1→AS_step2→A→B→C→AC_step0→A→B→C→AC_step1→A→B→C→AC_step2→ .....→A→B→C→AC_step11] →[same sequence repeats]

NOTE

AS = Algorithm S (supply self-test)

AC = Algorithm C (capacitive self-test)

57.3.3.5 Conversion data processing

The raw converted data of SAR_ADC contains many types of errors like offset, gain, and so on. In order to reduce or eliminate errors, the raw conversion data is processed inside SAR_ADC controller before sending to result register/output. The process of error correction happens in parallel during bit-by-bit evaluation, with the correction values generated during offset determination and calibration process.

The error correction value is subtracted from the raw conversion result whenever the comparator output for one of the calibrated capacitors evaluates high during the conversion period.

In order to reduce data processing time, the error correction is done in parallel during each bit evaluation of a conversion. All lower-weighted capacitors are not calibrated and no error correction is performed for these capacitors, but they are self-tested to guarantee error contribution is below specified accuracy limits.

The final result is checked for any overflow or underflow. If the processed data is above the maximum value that can be represented by ADC resolution, then the output data is forced to all ones (FFFh for 12-bit resolution). Similarly, if the processed data is negative, then output data is forced to all zeros (000h for 12-bit resolution).

57.3.4 ADC clock prescaler and sample time settings

The AD_CLK frequency can be scaled by programming MCR[ADCLKSE]. If MCR[ADCLKSE] is set, then the AD_CLK frequency is the same as the bus clock. Otherwise, AD_CLK frequency is half of bus clock, MCR[ADCLKSE] bit can be written in power-down only when MCR[PWDN] = 1.

In order to support different sampling times for different type of channels the different conversion timing registers are used (CTR0, CTR1). CTR0 is associated to channels (0 to 31), CTR1 is associated to channels (32 to 63). See the register description for details.

57.3.5 Presampling

The presampling feature allows precharging or discharging SAR_ADC internal sample capacitor node to a defined level before sampling of the selected analog input channel starts. This is useful for resetting information (history effect/offset) regarding the last converted data. During presampling, ADC samples the internally generated voltage, while in the sampling SAR_ADC samples analog input coming from pads.

Presampling can be enabled/disabled on a per-channel basis by setting the corresponding bits in the PSR0, PSR1 registers. PSR0 serves channels 0–31 , PSR1 serves channels 32–63 .

After enabling the presampling for a channel, the normal sequence of operation will be Presampling → Sampling → Evaluation for that channel. Sampling of all channels can be bypassed by setting PSCR[PRECONV]. When sampling of a channel is bypassed, the sampled and stored internal voltage applied during the presampling phase get converted (see Figure 313). See Conversion time for the timing equation for conversion.

Presampling does not apply to self-test channels.

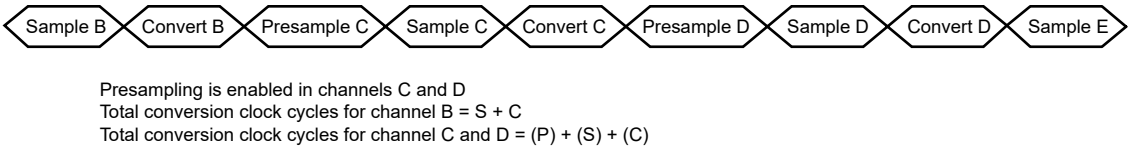

Figure 313. Presampling sequence

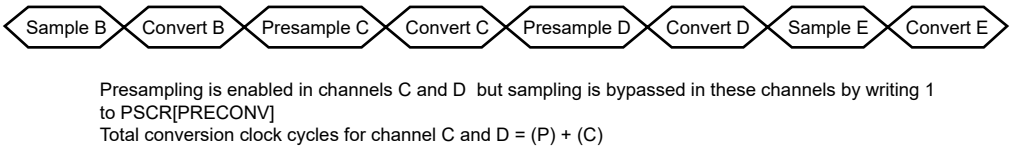

Figure 314. Presampling sequence with PRECONV=1

57.3.5.1 Presampling channel enable

The presampling channels are selected by programming the PSCR. It is possible to select between four internally generated voltages depending on the value of PSCR[PREVAL*n*], as shown in the following table.

Table 522. Presampling voltage selection

PSCR[PREVAL*n*]	Presampling voltage
00	Presample voltage - 1: (DVDD0P8/2)
01	Presample voltage - 2: (AVDD1p8/4)
10	Presample voltage - 3: VREFL_1p8
11	Presample voltage - 4: VREFH_1p8

NOTE

The voltage for presampling is (AVDD1p8/4) when PSCR[PREVAL]=01b. However, when this value is measured in sample bypass mode (PSCR[PRECONV]=1), the raw conversion result is shifted by two bits to the left (multiplied by 4) before error compensation. So the expected value of the final conversion result is AVDD1p8 (deviation may be in the range 0–3 LSB, due to left shift).

The PSCR[PREVAL*n*] fields are associated with SAR_ADC channels as follows:

- PREVAL0 for channels 0–31
- PREVAL1 for channels 32–63

57.3.6 Programmable analog watchdog

The analog watchdogs are used to monitor the conversion result to see if it is within defined limits (as shown in the figure below), specified by an upper and a lower threshold value named THRH and THRL, respectively.

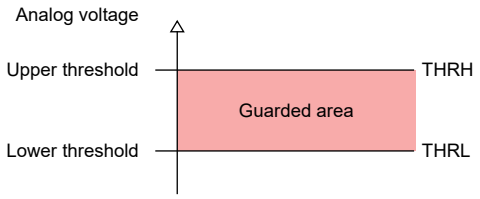

Figure 315. Guarded area

After the conversion of the selected channel, a comparison is performed between the converted value and the threshold values. If the converted value is outside the threshold values, then a corresponding threshold violation interrupt is generated.

The comparison result is stored as WDG*n*H and WDG*n*L fields in WTISR as explained in the following table. Depending on the values of WTIMR[MSKWDG*n*L] and WTIMR[MSKWDG*n*H] mask bits, an interrupt is generated on a threshold violation.

Table 523. Values of WDGxH and WDGxL fields

WDG*n*H	WDG*n*L	Converted data
1	0	Converted data > THRH
0	1	Converted data < THRL
0	0	THRH >= converted data >= THRL

Depending on the device settings, the number of analog watchdogs can vary for each instance of SAR_ADC (see chip-specific SAR_ADC information for details).

Analog watchdog setting

For each watchdog there is one threshold value (low and high) register (THRHLR*n* [*n*=0..15]).

The analog watchdog for each channel can be enabled independently by programming the corresponding CWENR fields.

- CWENR0 for Group0 channels
- CWENR1 for Group32 channels

Watchdog selection of each channel is done by configuring CWSELR*n*[WSEL_CH*m*] (where *n* = CWSELR instance and *m* = channel number).

Each CWSELR*n* holds a selection for a maximum of eight consecutive channels (for example, CWSELR0 holds eight WSEL_CH fields for channels 0–7, CWSELR1 is for channels 8–15, and so on).

If the conversion result of a selected channel is outside the range specified by threshold values, then the corresponding bit is set in the Analog Watchdog Out of Range Register (AWORR) (for example, if channel number 12 is to be monitored with the threshold values in register THRHLR3, then WSEL_CH4 of CWSELR1 is to be programmed with 3). Enabling the watchdog is done by setting the corresponding bit for channel 12 in register CWENR0.

In this setting, a set of threshold values (THRHLR*n*) can be linked to several SAR_ADC channels. The threshold values to be selected for a channel must be programmed only once in CWSELR*n* register.

NOTE

If the higher threshold of the analog watchdog is programmed to be below the lower threshold and the conversion result is below the lower threshold, then the WTISR[WDG*n*L] interrupt for the low threshold violation is set. If the conversion result is greater than the lower threshold (consequently also greater than the higher threshold), then the interrupt WTISR[WDG*n*H] for high threshold violation is set. Thus, you should take care to avoid that situation as it could lead to misinterpretation of the watchdog interrupts.

57.3.7 Clocking

SAR_ADC has only one clock input (bus clock).

This clock is used for accessing registers through the Host Bus and operation of all interfaces.

The conversion clock (AD_CLK), is derived from the bus clock input. The AD_CLK can be equal to, or half of the bus clock frequency based on configuration (see register bit descriptions of MCR[ADCLKSE]).

If MCR[ADCLKSE] = 1, then the AD_CLK is equal to the bus clock. If MCR[ADCLKSE] = 0, then the AD_CLK is half of the bus clock frequency. However, depending on configuration and performance requirements, MCR[ADCLKSE] may always need to be 1.

57.3.8 Reset

SAR_ADC has two resets, Functional (normal) and Calibration. Calibration reset is applied only when calibration is needed along, and is asserted with a functional reset. A functional reset can happen any time without a calibration reset.

Calibration reset is provided to hold internal calibration and status values if a functional reset occurs. The following register and field values are maintained after a functional reset:

- Main Status (MSR)
  - CALIBRTD
  - CALFAIL
- User OFFSET and Gain (USROFSGN) (Full register)
  - GAINUSER
  - OFFSUSER
- Calibration Status (CALSTAT) (Full register)
  - TEST_RESULT
  - STAT[1:14]
- Calibration Configuration 0 (CALCFG0) (Full register) (Also loaded from DCF/fuse bits)
  - BNDFLCNT
  - LDFAIL

57.3.9 Interrupts

SAR_ADC generates the following maskable interrupt signals:

- EOC (End of Conversion) interrupt request
- ECH (End of Chain) interrupt request
- JEOC (End of Injected Conversion mode) interrupt request
- JECH (End of injected Chain) interrupt request
- WDG*n*L and WDG*n*H (watchdog threshold) interrupt requests
- Self-testing Interrupts

Interrupts are generated during the conversion process to signal events such as EOC and so on, as explained in register description for ISR. Two registers named ISR (Interrupt Status Register) and IMR (Interrupt Mask Request Register) are provided in order to check and enable the interrupt request to external interrupt controller.

Interrupts can be individually enabled on a channel-by-channel basis by programming CIMR (Channel Interrupt Mask).

For pending EOC interrupts, registers with one bit per channel are provided to indicate completed conversions on a channel basis (CEOCFR*n*).

Interrupts generated due to the analog watchdogs are handled by two 32-bit registers named WTISR (Watchdog Threshold Interrupt Status Register) and WTIMR (Interrupt Mask for the Watchdog Threshold Register). These registers are used to check and enable an interrupt request . A watchdog interrupt causes two corresponding bits to be set for each channel monitored. One bit is set in the WTISR[WDG*n*H] register and the other bit in the WTISR[WDG*n*L] register.

Generated events are logged into status registers and used to generate an interrupt if enabled in corresponding mask registers.

In the below list, there are different interrupt outputs of ADC. The interrupt structure is shown in Figure 316.

Each interrupt is generated by combining a group of events.

- Interrupts for EOC, ECH, JEOC, JECH , and End of self-test algorithm (WDG_EOA_S and WDG_EOA_C) in STSR1 are combined (logic OR) into one interrupt output. .
- Interrupts of WDG*n*H and WDG*n*L are combined on the second interrupt output.
- Interrupts of all self-test errors (watchdog threshold, sequence, and timer, that is, WDSERR, WDTERR, ERR_S0, ERR_S1, ERR_S2, and ERR_C in STSR1) are combined on the third interrupt output.

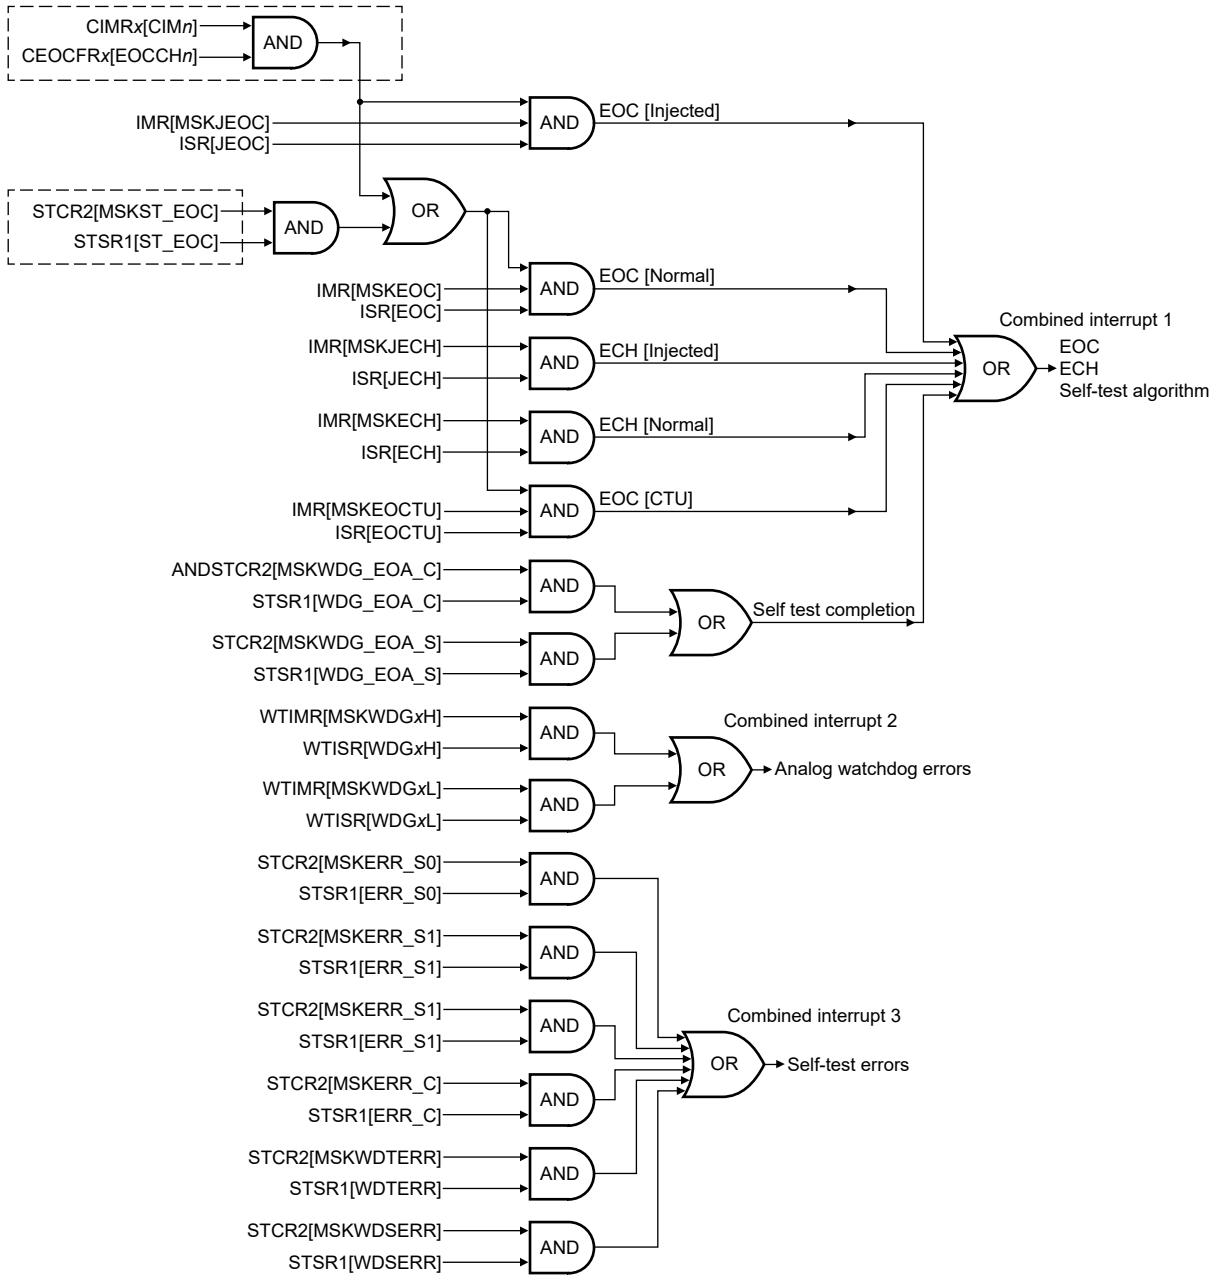

Figure 316. Interrupt structure of SAR_ADC

The ISR register contains the interrupt pending request status. If you want to clear a particular interrupt event status, then writing one to the corresponding status bit clears the pending interrupt flag (during this write operation all other bits of the ISR register must be maintained at zero).

The ISR must check the following for three different types of interrupts.

For interrupt 1:

- Read ISR to determine if the type of event falls in:
  - EOC
  - JEOC
  - ECH

  - JECH
- Read STSR1 to determine the end of self-test algorithm events (WDG_EOA_C / S) (if present).
- If the interrupt is EOC or JEOC:
  - Clear the channel pending bit of respective channel in CEOCFR*n* for EOC or JEOC in ISR.
  - Clear ISR[EOC] or ISR[JEOC].
- If the interrupt is ECH or JECH, clear ISR[ECH] or ISR[JECH].
- If the interrupt is for self-test end of algorithm, clear STSR1[WDG_EOA_C/S].

For interrupt 2:

- Read WTISR to determine which watchdog is giving the interrupt.
- Read AWORR*n* to determine which channel's data is creating the interrupt (if present).
- Clear the respective flag of WTISR [WDG*n*H / WDG*n*L] (*n* = watchdog number).
- Clear the respective flag of AWORR*n*[AWOR_CH*m*] (*n*=register, *m*=channel).

For Interrupt 3:

- Read STSR1 to determine the type of error that has occurred in self-test (ERR_S0/S1/S2/C, WDTERR, WDSERR, and so on) (if present).
- Clear the respective flag in STSR1.

The connectivity of interrupt lines at the chip level (external to SAR_ADC) determines whether software needs to read all the registers for all the interrupts or any one or a combination of any two.

57.3.10 DMA

Conversion data of any channel can be transferred from a register to system memory through Direct Memory Access (DMA). The DMA transfers can be enabled by setting DMAE[DMAEN]. When enabled, the on-chip DMA controller can receive a DMA request after the conversion of every channel by setting the respective masking bit in the DMAR*n* registers. The DMA masking registers must be programmed before starting any conversion.

The DMA request to DMA controller can be cleared at different times in two modes:

MODE 1: Clearing of DMA request on acknowledgment from DMA controller (setting DMAE [DCLR] = 0).

MODE 2: Clearing of DMA request on read to data registers (DMAE[DCLR] = 1).

Figure 317 and Figure 318 show the operation of DMA in two modes (cycle counts are for a typical case).

NOTE

The DMA should complete the read of SAR_ADC data within the throughput rate of SAR_ADC. For example, SAR_ADC can support a maximum throughput rate of 1 MSPS. Thus, DMA should complete a data read within 1 µs after assertion of DMA requests .

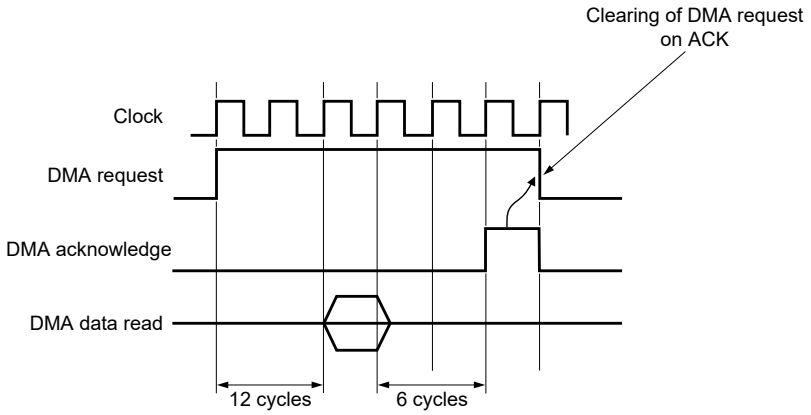

Figure 317. DMA operation MODE 1 (DMAE [DCLR] = 0)

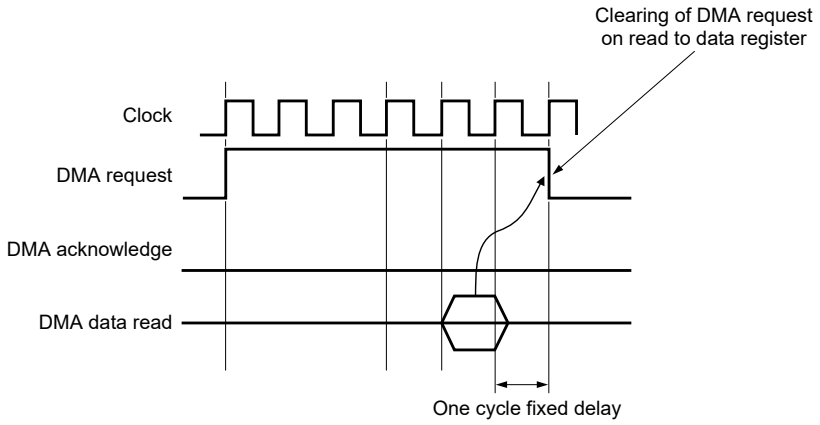

Figure 318. DMA operation MODE 2 (DMAE [DCLR] = 1)

57.3.11 Power-Down mode

The analog part along with SAR controller of the ADC can be put in Power-Down mode by setting MCR[PWDN] to shut down ADC hard macro and to stop the clock to SAR controller. After release of reset MCR[PWDN] remains one, so ADC analog module is kept in Power-Down mode by default. This state must be exited before starting any operation by resetting MCR[PWDN].

In Power-Down mode, no conversion can be started.

MCR[PWDN] can be set anytime. If a conversion is ongoing, the ADC cannot move into Power-down mode immediately. SAR_ADC enters Power-Down mode only after completion of the ongoing conversion. In Scan Operation mode the ongoing operation should be aborted manually by resetting MCR[NSTART] before or after setting MCR[PWDN].

The ADC Power-Down mode status is indicated by MSR[ADCSTATUS] when ADC enters into this mode.

If Power-Down mode is entered by setting MCR[PWDN], the process running before entry into the Power-Down mode must be restarted manually (by setting the appropriate START bit in MCR) after exiting Power-Down mode.

NOTE

Resetting MCR[PWDN] and setting MCR[NSTART] or MCR[JSTART] during the same cycle is forbidden.

57.3.12 Auto-Clock-Off mode

To reduce the power consumption during Idle state (without going into Power-down mode), an 'Auto-Clock-Off' feature can be enabled by setting MCR[ACKO]. When enabled, the internal SAR operating clock (AD_CLK) is automatically switched off during idle periods (for example, you cannot program conversions).

57.3.13 Calibration

The accuracy of ADC depends on the manufacturing precision of the devices used to build the module (for instance, capacitor size matching, amplifier gain, and so on). Due to variations during manufacturing and various runtime environmental influences (like temperature), the conversion result contains errors.

To reduce or eliminate the various error contribution effects, the ADC provides self-test and calibration features.

In the calibration process, a known reference voltage is sampled and converted under controlled conditions to determine the correction values (calibration values) for offset, gain, and capacitor mismatch.

These calibration values (except gain calibration) are used in a result post-processing step to reduce or eliminate the various error contribution effects. The gain calibration is used during sample phase to define the additional charge to be loaded in order to compensate for gain failure.

Calibration must be performed after every power-up reset (check chip-specific reset connectivity for appropriate reset applied) and whenever required in runtime operation. It is also recommended to run calibration if the operating conditions (particularly VrefH) change. Never apply functional reset during the calibration process. If applied, calibration must be rerun after exiting a reset condition; otherwise, the calibration generated values and conversion results may be unspecified.

Configuring and starting of calibration is done by programming the calibration attributes in MCR register. During calibration, the internal hardware averaging function should be enabled. Maximum averaging is recommended for best performance.

Calibration time

Clock 40 MHz. (AD_Clk == (bus_clock / 2)) (MCR[ADCLKSE] = 0)

Average samples (MCR[NRSMPL])

- 16–327 µs
- 32–654 µs
- 128–2.612 ms
- 512–10.446 ms

The calibration status is captured by status flag (MSR[CALFAIL]) to indicate if any fault is detected during calibration execution, or if the calibration has aborted at a premature state (calibration is aborted if any normal conversion is initiated during the execution of calibration, which is called premature termination). MSR[CALFAIL] = 1 means a calibration fail and a determined calibration value is out of internal defined limits. It also means that the ADC health may not be good and may not meet specifications.

The results of individual steps are also updated in CALSTAT register (CALSTAT[STAT_*n*]). The result of the last failed step is dynamically updated in the same register.

To execute the calibration algorithm, perform the following steps:

1. Wait for deassertion of both calibration and functional reset.
2. Configure desired parameters for calibration in MCR:
   - MCR[TSAMP]
   - MCR[NRSMPL]
   - MCR[AVGEN]
   - MCR[ADCLKSE]
3. Set the ADC internal operating clock to 40 MHz (MCR[ADCLKSE] = 0). (This setting assumes that ADC input clock is set to 80 MHz.)

4. Exit power-down state (MCR[PWDN] = 0).
5. Start calibration (MCR[CALSTART] = 1). Calibration starts immediately.
6. Check the status of MSR[CALBUSY] periodically. Wait until it becomes zero (alternatively, MSR[ADCSTATUS] can be monitored until it indicates an idle condition).
7. Check the fail flag (MSR[CALFAIL]) to learn the final status. If it is set to one, then calibration failed.
8. Check the pass/fail status of each calibration step in the CALSTAT register to look for failures.
9. At the end, check the status of MSR[CALIBRTD]. If calibration is successful this bit sets to one.

57.3.14 Self-test

For safety applications, it is important to check at regular intervals whether SAR_ADC is operating correctly. For this purpose, a self-test feature is provided. When self-test is enabled, SAR_ADC automatically checks its components and flags any errors it finds.

The test can be enabled to check the supply voltage (V_{DD}), reference voltage (V_{refH}), and calibrated values.

The following test algorithms have been implemented:

- Supply self-test (algorithm S): It includes the conversion of the band gap, supply, and VREF voltages. It includes a sequence of 3 test conversions (steps). The supply test conversions must be an atomic operation (that is, all supply algorithm conversions must be performed one after another with no functional conversions in between).
- Capacitive self-test (algorithm C): It includes a sequence of test steps per definition of algorithm C (See Table 524) which executes the capacitive matrix of the CDAC used for sampling and conversion.

Individual steps can take up to 1 µs at 80 MHz SAR_ADC clock frequency.

Table 524. Self-test steps

STCR3[ALG]	STCR3 [Step] (per algorithm definition)	Description	Outcome	Comment
'00'(algorithm S)	0	Supply self-test (band gap voltage)	Measures the internal band gap voltage	Band gap is considered as a constant with very little variation across temperature and process.
	1	Supply self-test (analog supply)	Measures the analog supply for SAR_ADC	
	2	Supply self-test (reference voltage high)	Measures the high reference voltage of SAR_ADC	
'01' (Reserved)	Reserved			
'10'(algorithm C)	0–11	Capacitive self-test: One of the calibration steps is being run	The difference/error of individual offset value from the previously calibrated value is being returned as SAR_ADC result that is compared with programmed value in analog watchdog register(s) to detect any fault.	The result value should be compared with analog watchdog values. See Self-test analog watchdog for more detail.

Table continues on the next page...

Table 524. Self-test steps (continued)

STCR3[ALG]	STCR3 [Step] (per algorithm definition)	Description	Outcome	Comment
			The difference or error may be caused by any runtime fault, runtime accuracy shift, or by device noise.	
'11'(algorithm S+C)	0–2 (S) 0–11 (C)	Supply for One-Shot and (Supply + Capacitive) for Scan mode only	Same as above	

In case some failure occurs in any step of the algorithm, ADC: Schedules self-testing algorithms using configuration registers Monitors the conversion result using analog watchdog registers Flags the error to a fault control unit (FCCU), if it exists.

Self-test steps can be activated from software (CPU).

ADC mode	TEST algorithm (CPU)
CPU mode	Yes • one-shot Mode • Scan Mode

NOTE

ADC self-test should be run with MCR[ADCLKSE] bit set to 1. Self-test with ADCLKSE bit set to 0 can give erroneous results.

57.3.14.1 CPU mode

In this case, test conversion works similar to normal conversion. The self-test is enabled by setting STCR2[EN].

The self-test conversions are run with the functional conversions. The sequencing of steps of the selected algorithm depends on the operating mode of normal conversions as selected by MCR[MODE].

In **One-Shot mode**, if self-test is enabled, only one step of the selected self-testing algorithm is executed at the end of the chain. The step number and algorithm to be executed are programmed in STCR3. So, in One-Shot mode the sequence is as follows:

1. Program NCMR*n* to select channels to be converted for normal conversion.
2. Program MCR[MODE] = 0 to select One-Shot mode.
3. Program sampling duration values in STCR1[INPSAMP*n*] field. (x = S,C).
4. Select the self-testing algorithm in STCR3[ALG] and step STCR3[MSTEP]. Default is Algorithm S step 0.
5. Enable self-testing by setting STCR2[EN].
6. Start the normal conversion by setting MCR[NSTART].
7. All normal conversions are executed as usual.
8. At the end of all the normal conversions in the chain, step number programmed in STCR3[MSTEP] field of self-testing algorithm selected by STCR3[ALG] is executed, similar to a normal functional channel.

9. On the receiving end of the conversion for test channel, the result is written in STDR1[TCDATA], and STDR1[VALID] is set. ISR[EOC], ISR[ECH] are set, and so is STSR1[ST_EOC].
10. ADC returns to Idle state.

For example: Channels A-B-C-D-E-F-G-H are present in the device where channels B-D-E are to be converted in One-Shot mode. At the end of conversion for channels B-D-E, self-test conversion is done and ISR[ECH] and ISR[EOC] are set. The sequence is B→D→E→self-test step.

MSR[NSTART] is automatically set when the normal conversion starts and is reset at the end of conversion for test channel.

In **Scan mode**, consecutive steps of the selected self-test algorithm are converted continuously at the end of each chain of normal conversions. The number of channels converted at the end of each chain is one (except for Algorithm S, in which all the steps are performed at once without any functional conversion interleaved). So, in Scan mode the sequence is as follows.

1. Program NCMRx to select channels to be converted for normal conversion.
2. Program MCR[MODE] = 1 to select Scan mode.
3. Select the self-testing algorithm in STCR3[ALG]. By default, all algorithms (supply and capacitive) are selected that is, all algorithms will be executed step-by-step one after the other.
4. Enable self-testing by setting STCR2[EN].
5. Start the normal conversion by setting MCR[NSTART].
6. All normal conversions are executed as usual.
7. At the end of chain of the normal conversions (assuming default value of STCR3[ALG]) all steps of Algorithm S are performed (as Algorithm S is always atomic). MSR[SELF_TEST_S] is set.
8. On receiving end of conversion of test channel for last step of Algorithm S:
   - The result is written in STDR1[TCDATA] and STDR1[VALID] is set.
   - At the same time, MSR[SELF_TEST_S] is reset.
   - For Step 1, the integral part and fractional part are written in STDR2[IDATA] and STDR2[FDATA].
   - Also, EOC and ECH bits are set in ISR register and ST_EOC is set in STSR1.
9. The next chain of normal conversion then starts.
10. At end of the normal conversion chain, Step0 of algorithm C is executed.
11. On the receiving end of conversion of test channel for Step0 of algorithm C:
    - The result is stored in STDR1[TCDATA] and STDR1[VALID] is set (if MCR[OVERWR] is set).
    - Also, EOC and ECH bits are set in ISR register and ST_EOC is set in STSR1.
12. Then the next chain of normal conversion starts.
13. At end of the normal conversion chain, Step1 of algorithm C is executed.
14. This process continues for all the steps of all three algorithms.
15. ADC returns to Idle state when MCR[NSTART] is written to 0.

For example: channels A-B-C-D-E-F-G-H are present in the device where channels B-D-E are to be converted in Scan mode. At the end of every conversion chain for channels B-D-E, one step of self-test conversion is done and ISR[ECH] and ISR[EOC] are set.

The sequence is:

1. B→D→E→ST-S0→ST-S1→ST-S2→B→D→E→ST-C0→B→D→E→ST-C1→B→D→E→ST-C2→ . . . B→D→E→ST-C11→B→D→E→ST-S0 . . .
2. ST-Sx - Self-test supply step x (x = 0,1,2)
3. ST-Cx - Self-test capacitive step x (x = 0 to 11)

MCR[NSTART] is automatically set when the normal conversion starts.

NOTE

The self-test behavior is still the same if normal conversion is started by software (by setting MCR[NSTART]) instead of by external trigger.

In case of Injected Conversion modes, test channel conversion is not performed. It is performed only during normal conversions.

If during a test channel conversion, injection conversion begins, then the test conversion is aborted (as with a normal functional channel) and Injected Conversion modes are completed. After Injected Conversion modes are completed, the test conversion resumes from the step at which it was aborted. In this case, MSR[SELF_TEST_S] remains high during Injected Conversion mode.

For self-testing, the mode bit must be programmed at least one cycle before setting MCR[NSTART], and should not be changed thereafter until the conversion is finished or terminated.

57.3.14.2 Abort and abort chain for self-testing channel

Setting MCR[ABORT] during self-test channel conversion has no effect.

In One-Shot Operation mode, if MCR[ABORTCHAIN] is set when test channel conversion is ongoing, the test channel conversion is aborted and ISR[ECH] is set. In this case, ISR[EOC] for test channel is not generated.

In Scan Operation mode, if MCR[ABORTCHAIN] is set when test channel Step n is ongoing, the test channel Step n is aborted and next the chain conversion starts. At the end of this chain, Step n conversion is performed again. (In the case of Algorithm S, the full algorithm is executed again).

57.3.14.3 Self-test analog watchdog

The ADC digital interface also provides monitors for the conversion data for self-test algorithms. The analog watchdogs are used to determine whether the result of conversion for self-test algorithms is in the range of a particular guard area. For this purpose, separate self-test analog watchdog registers have been provided for each algorithm.

After the conversion of each step of an algorithm, a comparison is performed between the converted value and the threshold values if the analog watchdog feature is enabled by setting STAW*n*R[AWDE]. If the converted value does not lie between the upper and lower threshold values specified by Analog Watchdog Register of the particular algorithm, corresponding error bit STSR1[ERR_S*n*] is set and the step number in which the error occurred is updated in STSR1[STEP_C] (in case of algorithm C). Also, erroneous data is written in the STSR4[DATA*n*] field. The STSR1[ERR_S*n*] fields generate an interrupt if enabled by the corresponding mask bit in STCR2. The fault indication is also given to the fault control unit, if present, through critical and non-critical fault lines, so that necessary action can be taken at the chip level. Configuration in STCR2 register decides the choice between critical and noncritical type.

The analog watchdog feature works differently in algorithm S. As already mentioned, algorithm S is always an atomic operation. So, separate error bits are provided in STSR1 for each Step of algorithm S to avoid overwriting if error occurs in more than one Step. Hence, there are separate mask bits for each step in STCR1. For the same reason, separate fields exist in status registers (STSR2 and STSR3) to store erroneous data for each step.

In step0 of the supply algorithm, ADC measures the band gap voltage (+1.15 V), which is assumed to be stable. The conversion result of Step0 is measured with high (THRH) and low (THRL) thresholds defined in STAW0R if enabled (STAW0R[AWDE] = 1). STSR1[ERR_S0] is set to one if either threshold is violated. After set, it is cleared by writing a one to it.

For algorithm S Step1, a fixed-point division is performed, which takes about 26 cycles after EOC for Step1 to receive the divided value. It is used for analog watchdog checks. So, the value to be compared for Step1 contains the integer as well as fractional part—thus, two registers (STAW1AR and STAW1BR) are provided.

The comparison is done first for the integer part using the threshold values programmed in STAW1AR. If the integer part lies in the range, the fractional part comparison is skipped; otherwise it is compared to the values programmed in STAW1BR. The following table summarizes this feature for Step1.

Table 525. Algorithm S (Step1) threshold comparison

STDR2[IDATA] (integer part)	STDR2[FDATA] (fractional part)	STSR1[ERR_S1]
> STAW1AR[THRH]	Any value	Set
< STAW1AR[THRL]	Any value	Set
== STAW1AR[THRH]	> STAW1BR[THRH]	Set
== STAW1AR[THRL]	< STAW1BR[THRL]	Set

For algorithm S Step2, VREF/VREF is measured in order to check the integrity of the sampling signal. For this particular conversion, no higher threshold value is required, as the ideal value is FFFh. Only the lower threshold value is programmed in STAW2R.

For algorithm C, a separate register is provided for Step0. In Step0, an offset for other steps is measured. The converted data is compared with the threshold values provided by STAW5R if STAW4R[AWDE] is set. For other steps, this offset is subtracted from converted data before performing watchdog checks.

The recommended analog watchdog threshold values are set according to the expected and tested results with a clean environment (noise introduction from external environment minimized) for ADC operation. In a noisier setup, running the self-test with these analog watchdog values may cause failures. To overcome these failures, you can relax the threshold values if the needs of the application can tolerate the existing noise level. The more the threshold values are relaxed, the more the magnitude of true error that can pass. For example, looking at the values for the STAW4R and STAW5R registers, THRH of 010h (16d) and THRL of FF0h (–16d), means that the algorithm C fails for an error of magnitude greater than (16/8 = 2) 2LSB@12b. This is the recommended value for a clean environment.

Similarly, THRH of 020h (32d) and THRL of FE0h (–32d) means that the algorithm C fails for an error of a magnitude greater than 4LSB@12b. Thus to pass the self test in a noisy environment where the application can live with the noise level, the thresholds can be relaxed from ±40 to ±64 or as needed. However, it is preferable that the environment is cleaned up to match the expectation for better operation instead of relaxing the thresholds. Relaxing the thresholds too much (more than ±64) leads to a false pass, and is not recommended for safety applications.

Relaxation of the self-test thresholds due to noise does not directly relate to normal use conversions, and it is not possible to tell what the noise impact to those measurements is with respect to the threshold relaxation. The noise is application-specific and not under control/judgment of the chip. In this scenario, not passing with the default threshold values is caused by external noise and not by the constituent capacitors. Limits are relaxed knowing that there is noise in the system that rides on top of the actual capacitor error, and the magnitude of the noise component is so high that limits should be relaxed as a result. Thus in reality whenever tests are run environment noise will be there, and if there is any true shift of the capacitor error noise it will be added to this environment noise, and should result in a violation of the relaxed threshold limits. The self-test is designed to catch and flag runtime and catastrophic errors. It is not able to, and not meant to, test for specification limits.

57.3.14.4 S1 algorithm: calculated voltage comparison method

The software can implement a method of calculating S1 algorithm STDR2[IDATA], STDR2[FDATA], THRHLRn[THRH] and THRHLRn[THRL] voltage values, then perform a comparison to the calculated THRH and THRL voltages.

The steps involved in this method are as follows:

1. Calculate the high threshold voltage:

   (STAW1AR[THRH] + (STAW1BR[THRH] / 4096)) × $V_{BANDGAP}$

2. Calculate the low threshold voltage:

   (STAW1AR[THRL] + (STAW1BR[THRL] / 4096)) × $V_{BANDGAP}$

3. Calculate the converted results to voltage:

   (STDR2[IDATA] + (STDR2[FDATA] / 4096)) × $V_{BANDGAP}$

4. Compare result from step 3 to THRH and THRL. S1 algorithm passes if low threshold voltage ≤ converted voltage ≤ high threshold voltage.

57.3.14.5 Watchdog timer

The watchdog timer is an additional check which monitors the sequence of the self-testing algorithm implemented. It also verifies that the algorithm is completed within a safe time period. The watchdog timers can be enabled for CPU conversions.

Each algorithm has a different watchdog timer which runs independently of the other. The watchdog timer for a particular algorithm can be enabled by setting STAW*n*R[WDTE]. The safe time value can be programmed in STBRR[WDT] (default value is 10 ms assuming an 80 MHz clock).

The safe time is measured starting from Step0 of the algorithm (including all normal chain conversions in between) to the point where Step0 of the same algorithm starts again.

The programming sequence is as follows:

1. Program NCMR*n* to select the channels on which conversion needs to be performed for normal conversion in Scan Operation mode (MCR[MODE] = 1).
2. Select the self-testing algorithm in STCR3[ALG]. By default, all algorithms (supply and capacitive) are selected, that is, all algorithms will be executed step-by-step one after the other.
3. Enable self-testing channel by setting STCR2[EN].
4. Program safe period value in STBRR[WDT].
5. Enable watchdog timer by setting STAW*n*R[WDTE]. Assume setting of STAW*n*R[WDTE] to be 't0'. It is important to do all the programming first and then enable STAWnR[WDTE], as the safe time check is also performed between setting STAWnR[WDTE] and the start of Step0. This step checks that the algorithm has started within the safe time.
6. Start the normal conversion by setting MCR[NSTART].
7. At the end of the first conversion chain, three steps (Step 0/1/2) of algorithm S are executed in sequence. Let us assume the start of Step0 to be 't1'.
8. After completion of algorithm S, conversion of the next chain is performed.
9. At the end of the conversion chain, the first Step (Step0) of algorithm C is performed.
10. In this way, one Step of algorithm C is performed after completion of one conversion chain until all the steps have been completed. Steps are executed in sequence (Step 0, 1, 2, . . 11).
11. After the last step of algorithm C, another chain conversion is executed. At the end of this chain conversion, Step0 of algorithm S is started again, thus repeating the whole sequence. Let's assume this time (starting of Step0 of Supply algorithm) to be 't2'.
12. For S algorithm, if (t1–t0) > Safe Period or (t2–t1) > Safe Period, the watchdog timer flags an error and STSR1[WDTERR] is set. A fault is asserted on the specified module port as per criticality configuration (Critical or Non-critical), and an interrupt is also generated if enabled by STCR2[MSKWDTERR]. Otherwise, the watchdog timer counter is reset and starts again to monitor the same for the next sequence.
13. A similar sequence is followed for watchdog timers for algorithm C.

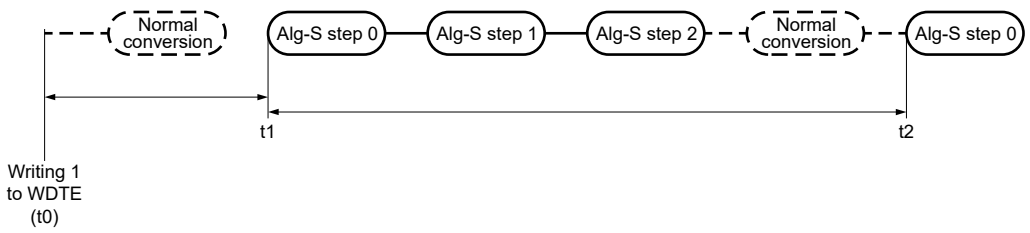

Figure 319. Watchdog timer monitor for Alg-S

NOTE

You must ensure that watchdog timers are disabled for self-test algorithms which are not executed.

57.3.14.5.1 Watchdog sequence checking

The watchdog timer also incorporates sequence checking features that check that the steps of a particular algorithm are in correct order. If steps are not in correct order, an error is flagged by setting STSR1[WDSERR]. A fault is indicated by an interrupt flag if enabled by STCR2[MSKWDSERR]. A fault is also asserted on the specified module port as per criticality configuration (Critical or Non-critical) and an interrupt generated if enabled by STCR2[MSKWDSERR].

A watchdog sequence error is flagged in the following cases:

- If steps of any algorithm are not executed in proper order.
- If abort chain occurs during test channel conversion. That step has to be repeated at the end of the next chain. This gives a sequence error when test channel conversion starts again.
  - Exception: If abort chain occurs during the last step of Algorithm S, then a sequence error is not flagged as the whole algorithm has to be repeated again.

If injected conversion occurs during the test channel conversion, a watchdog sequence error is NOT flagged although the ongoing step number is aborted and is repeated again.

NOTE

Watchdog timer feature is applicable only for Scan Operation mode and not for One-Shot Operation mode.

57.3.14.6 Baud rate control for test channel

Baud rate control defines the scheduling of the test channel between the normal conversion chain. STBRR[BR] specify the scheduling rate.

By default, if a test channel is enabled, one step of the selected algorithm is executed after every chain of normal conversion. The bandwidth consumed by a test channel depends on the number of channels in a normal chain. For example, if we have 50 normal conversions in a chain, then a test channel consumes only 2% of total bandwidth. But if the number decreases to just 3 channels, then the bandwidth consumed by a test channel is 25%, which is significant (and may not be desirable as it slows down the normal conversion rate).

STBRR[BR] provides flexibility by scheduling the test channel conversion to be performed not at the end of every chain, but at the end of BR+1 number of chains. For example, if BR = 5, a single step of the selected algorithm for a test channel is performed after six chain conversions, then the next step is performed at the end of the next six chain conversions, and so on. By default, the value of BR is zero.

NOTE

This feature is applicable only for Scan Operation mode of operation and not for One-Shot Operation mode. STBRR[BR] should be set to zero for One-Shot Operation mode.

To use the baud rate feature in Scan Operation mode, NCMR should have a non-zero value.

57.3.14.6.1 Abort chain when baud rate is non-zero

As already described, for a non-zero value of STBRR[BR], the test channel conversion is performed at the end of (BR+1) number of chains. If an abort chain occurs during the chain in which test conversion is scheduled to be converted, then test conversion is done after the next (BR+1) number of chains.

For example, if STBRR[BR] is programmed to two, the sequence will be two normal chains (without any test channel conversion) followed by a chain with test channel converted at the end. Now, if an abort chain occurs during the first two chains, it is treated as a normal chain abort and test channel is converted at the end of the third chain only (as is the case without any abort chain). But if an abort chain occurs during the third chain in which the test channel is scheduled to be converted, then the test channel is converted after the next three chains, that is at the end of sixth chain (counting from the beginning).

57.3.15 Offset and gain values

Offset and gain errors in ADC are compensated by its calibration mechanism. However, there could be a source of errors outside the ADC module (for example, at system and/or board level). These errors can potentially contribute to ADC static errors and lower the overall TUE observed when an application runs. To compensate for these errors, there is a set of offset and gain values that you can program in User OFFSET and Gain (USROFSGN). By programming this register appropriately, the complete system's TUE can be enhanced (calibrated), when impacted by errors other than ADC itself.

These values (GAIN_USER and OFFSET_USER) must be stored in 2's complement format as described in the register section (see User OFFSET and Gain (USROFSGN)). The values stored here are being considered by SAR_ADC engine and being computed/adjusted for every output. Using this register to compensate offset and gain is described below.

57.3.15.1 Writing for 12-bit ADC

57.3.15.1.1 Gain compensation (GAIN_USER)

The ADC can compensate a maximum of ±63 LSB @12b gain by programming GAIN_USER field in USROFSGN register. The field is in 2's complement format and stored with an 8x multiplication. Thus, if a value of ± Y is stored in this field, it leads to a final result adjusted with ±(Y/8) LSB from its unprogrammed version. It is required to keep the 3-LSBs zero to avoid any fractional subtraction/multiplication related errors.

ADC_OUTPUT_NEW = ADC_OUTPUT_OLD × (1 + (GAIN_USER / (8 × 4096))).

Example:

For GAIN_USER = 0, result is ADC_OUTPUT_NEW = ADC_OUTPUT_OLD = P

For GAIN _USER = +Y, result is ADC_OUTPUT_NEW = P × (1 + (Y / 32768))

For GAIN _USER = −Y, result is ADC_OUTPUT_NEW = P × (1 − (Y / 32768))

57.3.15.1.2 Offset compensation (OFFSET_USER)

The ADC can compensate a maximum of ±15LSB @12b offset by programming OFFSET_USER field in USROFSGN register. The field is in 2's complement format and stored with an 8x multiplication. Thus, if a value of ±X is stored in this field, it leads to a final result adjusted with ±(X/8) from its unprogrammed version. It is required to keep the 3-LSBs zero to avoid any fractional subtraction-related errors.

ADC_OUTPUT_NEW = ADC_OUTPUT_OLD − (OFFSET_USER/8)

Example:

For OFFSET_USER = 0, result is ADC_OUTPUT_NEW = ADC_OUTPUT_OLD = K

For OFFSET_USER = +X, result is ADC_OUTPUT_NEW = K − (X / 8)

For OFFSET_USER = −X, result is ADC_OUTPUT_NEW = K − (−X / 8) = K + (X / 8)

57.3.15.1.3 Using OFFSET_USER and GAIN_USER together

When both the fields are programmed together, gain is computed first and then offset is computed.

ADC_OUTPUT_NEW = (ADC_OUTPUT_OLD × (1 + (GAIN_USER / (8 × 4096)))) − ((OFFSET_USER / 8)).

Example:

For OFFSET_USER = 0 and GAIN_USER = 0, result is ADC_OUTPUT_NEW = ADC_OUTPUT_OLD = M

For OFFSET_USER = X and GAIN_USER = Y, result is ADC_OUTPUT_NEW = (M x (1 + (Y / 32768))) − (X / 8)

NOTE

Negative values are stored in 2's complement in these fields. Example:

GAIN_USER = 1F0h means +496d, and 210h means −496d

OFFSET _USER = 70h means +112d, and 90h means −112d

57.4 External signals

Also see the Block diagram section.

Table 526. External signals

Signal description	Direction	Width	Function
ADC_CH0 – ADC_CH(*n*-1)	Input	*n* (number of channels)	Analog inputs
Injection start trigger	Input	1	Control
Normal start trigger	Input	1	Control

57.5 Initialization

ADC must be programmed properly to function correctly. This section describes the basic programming sequences for applications to use. Application software may use them in combination by sequencing them carefully.

57.5.1 Running calibration

Calibration is the first step that should be run after every power-on reset. ADC has two types of reset:

- Calibration
- Functional

Calibration reset is used for registers that store internal calibration settings and values. This reset is done to store them during functional reset. Functional reset may be applied many times during an application for various reasons and calibration may not be required each time, so storing the settings and values in a higher level of reset avoids recalibration with every functional reset.

1. Wait for deassertion of functional reset.
2. Configure SAR controller operating clock (MCR[ADCLKSE] = 0).
3. Bring ADC out of Power-down state (MCR[PWDN] = 0).
4. Configure desired calibration settings (default values kept for highest accuracy maximum time).
   - MCR[TSAMP]: Sample time for calibration conversion
   - MCR[NRSMPL]: Number of samples in averaging
   - MCR[AVGEN]: Averaging function enable in calibration
5. Run calibration by writing a one to MCR[CALSTART].
6. Check calibration run status in MSR[CALBUSY]—wait until MSR[CALBUSY] = 0; alternatively, MSR[ADCSTAT] can be used to check status.
7. Check calibration pass/fail status in MSR[CALFAIL] field. If MSR[CALFAIL] = 1 then calibration failed. Detailed status can be checked in CALSTAT.

57.5.2 Running normal conversion

Normal conversion mode should usually be used to convert analog samples most of the time in an application, unless there is a special need. There are other modes available for special requirements as described in later sections of this document. Normal conversions can be initiated by software trigger or by hardware trigger. Calibration should be done before running any conversion to ensure an accurate result.

1. Configure channel mask registers NCMR*n*, for different channel groups.
2. Configure desired sample time in CTR*n*, for different channel groups.
3. Configure interrupt mask registers, IMR for global and CIMR*n*, for different channel groups.
4. Configure DMA registers, DMAE, and DMAR*n*, for different channel groups.

5. Configure pre-sampling registers, if needed, PSCR and PSR*n*, for different channel groups (if needed).
6. Configure watchdogs in WTIMR
7. Configure One-Shot or Scan mode in MCR[MODE] and other settings (MCR[WLSIDE], MCR[OWREN], and so on).
8. Start conversion by writing one to MCR[NSTART].
9. Check EOC status in ISR or wait for interrupt.
10. On interrupt read the data register, or DMA will read out data if configured.
11. Status of conversion for individual channel can be seen in CEOCFR*n*.
12. Clear the registers by writing one to the fields.
13. Steps 9 to 12 will continue in loop until conversion finishes or is terminated.

57.5.3 Running injected conversion

Injected conversion has a higher priority than normal conversion and it runs in One-Shot mode only. It can be started in idle condition or when normal conversion is in process. The configuration sequence is almost similar to normal conversion above, except for the registers discussed in the following steps.

1. Channel mask register JCMR*n*, is used for different channel groups.
2. Configure other channel attributes as done in normal conversion.
3. Start conversion by writing 1b to MCR[JSTART].
4. Check status of ISR[JEOC] or wait for interrupt.
5. Read out conversion data and clear interrupts as done in normal conversion.
6. Configure channel mask registers NCMR*n* for different channel groups.
7. Configure desired sample time in CTR*n* for different channel groups.
8. Configure interrupt mask registers, IMR for global and *n*, for different channel groups.
9. Configure DMA registers, DMAE and DMAR*n*, for different channel groups.
10. Configure presampling registers, if needed, PSCR and PSR*n*, for different channel groups (if needed).
11. Configure watchdogs in WTIMR.
12. Configure One-Shot or Scan mode in MCR[MODE] and other settings (MCR[WLSIDE], MCR[OWREN], and so on).
13. Start conversion by writing 1b to MCR[NSTART].
14. Check status of ISR[EOC] or wait for interrupt.
15. On interrupt, read the data register or DMA will read out data if configured.
16. Status of conversion for an individual channel can be seen in CEOCFR*n*.
17. Clear the registers by writing one to the bits.
18. Steps 9 to 12 will continue in loop until conversion finishes or is terminated.

57.5.4 Running self-test

Self-test conversions run after a programmable number of normal conversion chains. To run normal conversions, additional configurations for self-test need to be implemented before starting normal conversion (as shown in Self-test). Also, you may need to configure the self-test watchdog, timer, and baud rate as described in Self-test analog watchdog.

57.6 SAR_ADC register descriptions

Addresses outside the space defined in this section, as well as unused addresses between registers, are reserved. Do not read from or write to reserved spaces.

Fields

Field	Description
31 OWREN	Overwrite Enable Specifies whether the latest conversion overwrites current value in data registers. 0 - Older valid conversion data is not overwritten by newer conversion data 1 - Newer conversion result is always overwritten, irrespective of the validity of older conversion data
30 WLSIDE	Write Left Side Selects whether conversion data is left or right aligned. 0 - Write right-aligned conversion data (from 11 to 0) 1 - Write left-aligned conversion data (from 15 to 4)
29 MODE	Normal Scan Mode Select Selects between One-Shot or Scan Operation modes; MODE must be changed in ADC's Idle condition (check MSR [ADCSTATUS] field). In One-Shot Operation mode, configuration for one chain conversion in Normal Conversion mode takes place. In Scan Operation mode, configuration for continuous chain conversion in Normal Conversion mode takes place. When the chain conversion is finished, a new scan starts immediately. 0 - One-Shot Operation mode 1 - Scan Operation mode
28	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
27 TRGEN	External Trigger Enable Enables external triggers to start conversions. 0 - External trigger is disabled 1 - Enables the external trigger to start a conversion
26 EDGE	Trigger Edge Select Selects which edge of the external trigger starts a conversion. This field is only valid if MCR[TRGEN] = 1b. 0 - Falling edge is trigger 1 - Rising edge is trigger
25 —	Reserved
24 NSTART	Normal Conversion Start Starts normal conversion in One-Shot or Scan Operation mode. In Scan Operation mode, this field remains high after setting. Clearing this field in Scan Operation mode causes the current chain conversion to finish, then stop the scan. In One-shot Operation mode, this field is cleared immediately after the conversion starts. Setting this field during ongoing conversions keeps this field high until the requested conversion is started (or pending during Injected Operation mode).
23 —	Reserved
22 JTRGEN	Injection External Trigger Enable When set, enables the external trigger to start injected conversions. This field must be set if the external trigger feature is needed to start injected conversions. 0 - Injected conversion not started by external trigger 1 - Injected conversion started by external trigger
21 JEDGE	Injection Trigger Edge Selection Selects which edge of the external trigger starts an injected conversion. This field is only valid if MCR[JTRGEN] = 1b. 0 - Falling edge is trigger 1 - Rising edge is trigger
20 JSTART	Start Injection Conversion

Table continues on the next page...

Table continued from the previous page...

Field	Description
	Starts injection conversion for analog channels to be converted. Clearing this field has no effect since the injected chain conversion cannot be interrupted. If this field is set during on ongoing injected conversion, the field will remain set until the new conversion starts.
19-18 —	Reserved
17 —	Reserved
16 —	Reserved
15 STCL	Self-Testing Configuration Lock Locks the self-test configuration registers (write-protected): 1. Self-Test Configuration 1 (STCR1) 2. Self-Test Configuration 2 (STCR2) 3. Self-Test Configuration 3 (STCR3) 4. Self-Test Baud Rate (STBRR) 5. Self-Test Analog Watchdog 0 (STAW0R) 6. Self-Test Analog Watchdog 1A (STAW1AR) 7. Self-Test Analog Watchdog 1B (STAW1BR) 8. Self-Test Analog Watchdog 2 (STAW2R) 9. Self-Test Analog Watchdog 3 (STAW3R) 10. Self-Test Analog Watchdog 4 (STAW4R) 11. Self-Test Analog Watchdog 5 (STAW5R) It can be used only in CPU and Scan operation modes. It is cleared by reset only. 0 - Not locked 1 - Locked
14 CALSTART	Calibration Start Starts calibration. It is self-clearing, and is cleared by hardware when calibration completes or is terminated prematurely. 0 - No effect 1 - Start calibration
13	Average Enable Allows averaging of calibration time.

Table continues on the next page...

Table continued from the previous page...

Field	Description
AVGEN	0 - Disable 1 - Enable (default)
12-11 NRSMPL	Number of Averaging Samples Selects the number of averaging samples to be used during Calibration. 00 - 16 01 - 32 10 - 128 11 - 512
10-9 TSAMP	Sample Time for Calibration Specifies the sample time of calibration conversions. 00 - 22 cycles of AD_CLK (default) 01 - 8 cycles of AD_CLK 10 - 16 cycle of AD_CLK 11 - 32 cycle of AD_CLK
8 ADCLKSE	Analog Clock Frequency Select Selects the clock frequency of the AD_CLK signal. It can be written in Power-down mode only. 0 - AD_CLK frequency is half 1 - AD_CLK frequency is equal to bus clock frequency
7 ABORTCHAIN	Abort Conversion Chain Aborts the chain conversion that is in process. When the chain aborts, this field is reset by hardware. Setting this field in idle state (for example, no normal/injected conversion is in process) has no effect. In this case, the field is reset immediately. During a CTU conversion, this field cannot be programmed. **NOTE** You must not apply Abort and Abort Chain simultaneously in SCAN mode operation. 0 - Chain conversion aborted or is currently not running 1 - Abort current chain conversion
6 ABORT	Abort Conversion Aborts any ongoing conversion and starts the next one. When the ongoing conversion aborts, this field is reset by hardware. This field is not written while the self-test channel conversion is in process. **NOTE** You must not apply Abort and Abort Chain simultaneously in SCAN mode operation.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Channel conversion has been aborted, or channel conversion is not currently running 1 - Abort current channel conversion
5 ACKO	Auto-Clock-Off Mode Enable Enables the auto-clock-off feature. 0 - Auto-Clock-Off feature is disabled 1 - Auto-Clock-Off feature is enabled
4 —	Reserved
3-1 —	Reserved
0 PWDN	Power-Down Enable Enables entry into Power-Down or Idle modes. 0 - When ADC status is in Power-down mode (MSR[ADCSTATUS] = 001b), start ADC transition to IDLE mode 1 - Request to enter Power-down mode

57.6.3 Main Status (MSR)

Contains main status fields.

Fields

Field	Description
31 CALIBRTD	Calibration Status Updates after running high accuracy calibration (see Calibration). 0 - Uncalibrated or calibration unsuccessful 1 - Calibrated or calibration successful
30 CALFAIL	Calibration Failed Indicates the status of calibration. It is set automatically if any of the calibration step fails during the calibration process or calibration is aborted prematurely (by any normal conversion). Cleared by writing one, or on restarting calibration by writing one to MCR[CALSTART]. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Calibration passed (must be checked with CALBUSY = 0b) 1 - Calibration failed When writing 0 - No effect 1 - Clear the flag
29 CALBUSY	Calibration Busy Indicates whether SAR_ADC is executing calibration. Set when MCR[CALSTART] is set. 0 - ADC is ready for use 1 - ADC is busy in a calibration process
28-25 —	Reserved
24 NSTART	Normal Conversion Status Signals whether a normal conversion is in process. 0 - Normal conversion is not in process 1 - Normal conversion is in process
23 JABORT	Injected Conversion Abort Status Signals whether an injected conversion has been aborted. It is reset when a new injected conversion starts. 0 - Injected conversion has not been aborted 1 - Injected conversion has been aborted
22-21	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
—	
20 JSTART	Injected Conversion Status Specifies whether an injected conversion is in process. 0 - Injected conversion is not in process 1 - Injected conversion is in process
19 —	Reserved
18 SELF_TEST_S	Self-Test Status Indicates whether a self-test conversion is in process. 0 - Self-test conversion is not in process 1 - Self-test conversion is in process
17 —	Reserved
16 —	Reserved
15-9 CHADDR	Channel Address Specifies the address of the channel that is currently being converted. 000_0000 - Channel 0 selected 000_0001 - Channel 1 selected 000_0010 - Channel 2 selected 000_0011 - Channel 3 selected 000_0100 - Channel 4 selected 000_0101 - Channel 5 selected 000_0110 - Channel 6 selected 000_0111 - Channel 7 selected 010_0000 - Bandgap input selected 010_0001 - Pre-sample voltage - 1 : DVDD1P0/2 010_0010 - Pre-sample voltage - 2 : AVDD1p8 010_0011 - Pre-sample voltage - 3 : VREFL_1p8 010_0100 - Pre-sample voltage - 4 : VREFH_1p8 All other values are reserved.

Table continues on the next page...

Table continued from the previous page...

Field	Description
8-6 —	Reserved
5 ACKO	Auto-Clock-Off Enable Signals whether the auto-clock-off feature is enabled. 0 - Auto-Clock-Off feature is not enabled 1 - Auto-Clock-Off feature is enabled
4-3 —	Reserved
2-0 ADCSTATUS	ADC Status Represents ADC status. 000 - Idle 001 - Power-down 010 - Wait state (waiting to start conversion after [external trigger]). 011 - Busy in calibration 100 - Sample 110 - Conversion

57.6.4 Interrupt Status (ISR)

Indicates interrupt status.

Offset

Register	Offset
ISR	10h

5 MSKWDG2H	Channel 2 Watchdog High Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being higher than the programmed higher threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled
4 MSKWDG2L	Channel 2 Watchdog Low Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being lower than the programmed lower threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled
3 MSKWDG1H	Channel 1 Watchdog High Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being higher than the programmed higher threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled
2 MSKWDG1L	Channel 1 Watchdog Low Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being lower than the programmed lower threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled
1 MSKWDG0H	Channel 0 Watchdog High Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being higher than the programmed higher threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled
0 MSKWDG0L	Channel 0 Watchdog Low Threshold Interrupt Mask Corresponds to the mask bit for the interrupt generated on the converted value being lower than the programmed lower threshold. When set the interrupt is enabled. 0 - Interrupt is disabled 1 - Interrupt is enabled

57.6.12 DMAE (DMAE)

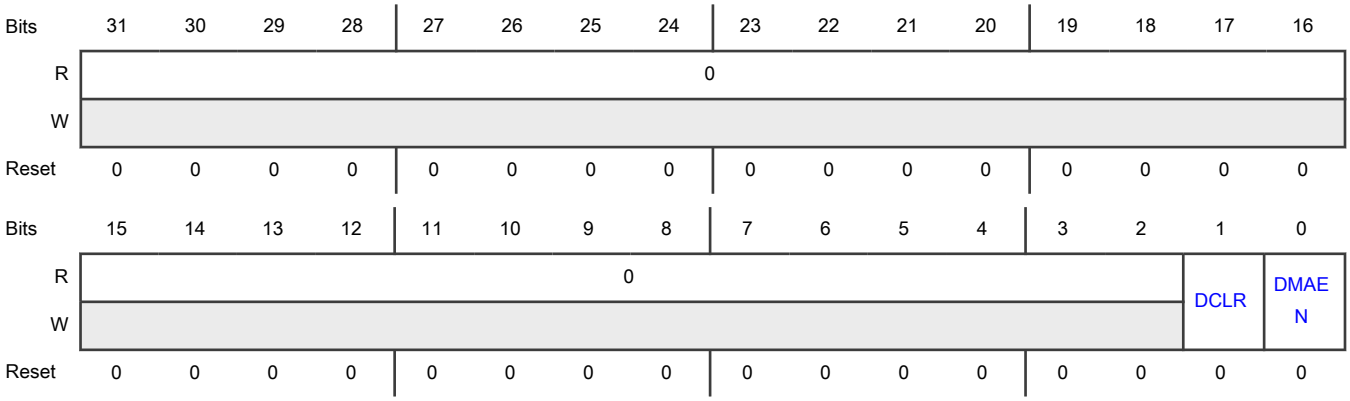
Contains fields for DMA global enable and DMA clear sequence enable.

DMA settings must be changed while ADC is in idle state (MSR[ADCSTATUS] = IDLE).

Offset

Register	Offset
DMAE	40h

Diagram



Fields

Field	Description
31-2 —	Reserved
1 DCLR	DMA Clear Sequence Enable Selects DMA request clear either by acknowledgement from DMA controller or read of data register. 0 - DMA request cleared by acknowledge from DMA controller 1 - DMA request cleared on read of data registers
0 DMAEN	DMA Global Enable Enables DMA feature if set. 0 - DMA feature is disabled 1 - DMA feature is enabled

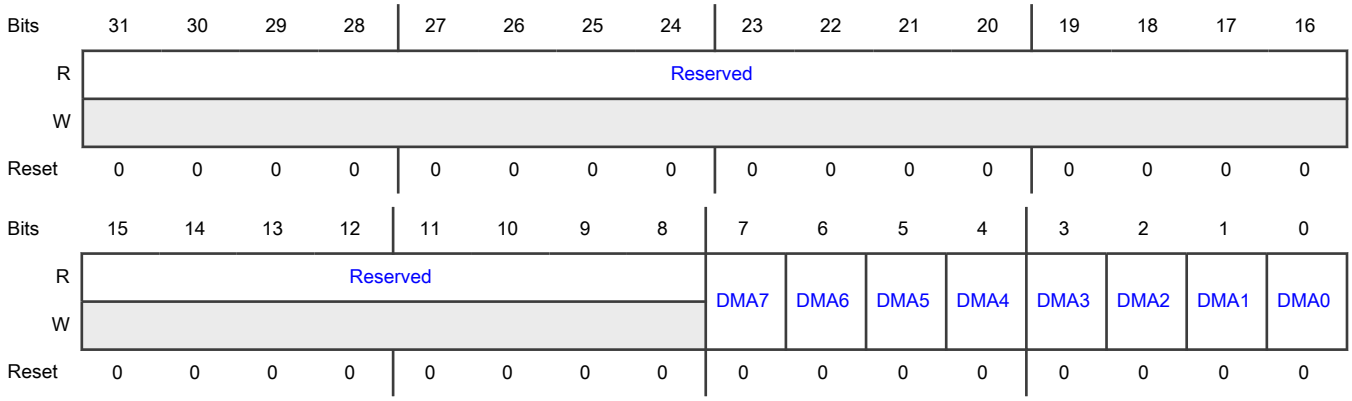
57.6.13 DMA 0 (DMAR0)

Enables transfer of data in DMA mode for Group0.

Offset

Register	Offset
DMAR0	44h

Diagram



Fields

Field	Description
31-8 —	Reserved
7 DMA7	Channel 7 DMA Enable Enables transfer of data in DMA mode for Channel 7 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
6 DMA6	Channel 6 DMA Enable Enables transfer of data in DMA mode for Channel 6 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
5 DMA5	Channel 5 DMA Enable Enables transfer of data in DMA mode for Channel 5 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
4 DMA4	Channel 4 DMA Enable Enables transfer of data in DMA mode for Channel 4 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
3 DMA3	Channel 3 DMA Enable Enables transfer of data in DMA mode for Channel 3 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
2 DMA2	Channel 2 DMA Enable Enables transfer of data in DMA mode for Channel 2 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
1 DMA1	Channel 1 DMA Enable Enables transfer of data in DMA mode for Channel 1 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled
0 DMA0	Channel 0 DMA Enable Enables transfer of data in DMA mode for Channel 0 if set. 0 - Transfer of data in DMA mode is disabled 1 - Transfer of data in DMA mode is enabled

57.6.14 DMA 1 (DMAR1)

Enables transfer of data in DMA mode for Group32.

Table 529. DMA*n* field description

Field	Description
DMA32	DMA enable. When set (DMA32 = 1), channel zero is enabled to transfer data in DMA mode.
DMA *n*	DMA enable. When set (DMA *n* = 1), channel n is enabled to transfer data in DMA mode.

Offset

Register	Offset
DMAR1	48h

15-12 —	Reserved
11-0 THRL	Low Threshold Specifies the low threshold value for channel *n*. Channel *n* is selected by corresponding field in Channel Select Register.

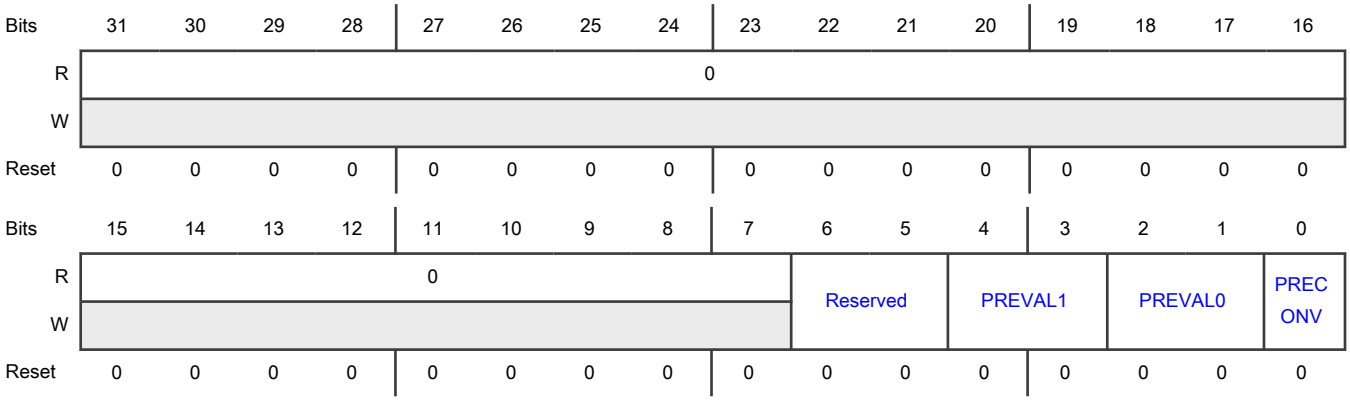
57.6.19 Presampling Control (PSCR)

Contains fields for converting presampled values and selecting analog input voltages for presampling.

Offset

Register	Offset
PSCR	80h

Diagram



Fields

Field	Description
31-7 —	Reserved
6-5 —	Reserved
4-3 PREVAL1	Internal Presampling Voltage Selection. Selects analog input voltages for presampling from four available internal voltages (channels in the range 32 to 63). See Presampling channel enable for details.
2-1 PREVAL0	Internal Presampling Voltage Selection Selects analog input voltages for presampling from four internal available voltages (channels in the range 0 to 31). See Presampling channel enable for details.
0 PRECONV	Convert Presampled Value Converts presampled values. If PRECONV is set, presampling is followed by the conversion. Sampling will be bypassed and conversion of presampled data will be done. 0 - Presampling is followed by sampling then conversion. 1 - Presampling is followed by the conversion.

57.6.20 Presampling 0 (PSR0)

Enables presampling for channel *n*, when set (PRES *n* = 1).

Offset

Register	Offset
PSR0	84h

Diagram

0 PRES32	Presampling Enable for Channel 32 Enables presampling for channel 32, if set. 0 - Presampling is disabled 1 - Presampling is enabled

57.6.22 Conversion Timing 0 (CTR0)

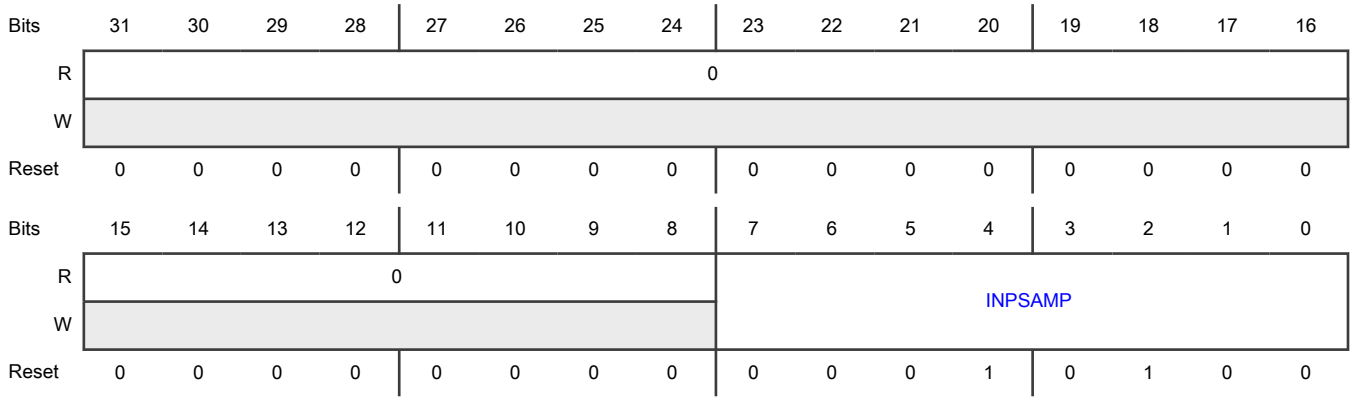
Configures the sample period duration in terms of the SAR controller clock.

This register is associated with channels 0 to 31.

Offset

Register	Offset
CTR0	94h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 INPSAMP	Sampling Phase Duration Configures the sample period duration in terms of the SAR controller clock. The minimum acceptable value is 8. Configuring to a value lower than 8 sets the sample period to 8 cycles.

57.6.23 Conversion Timing 1 (CTR1)

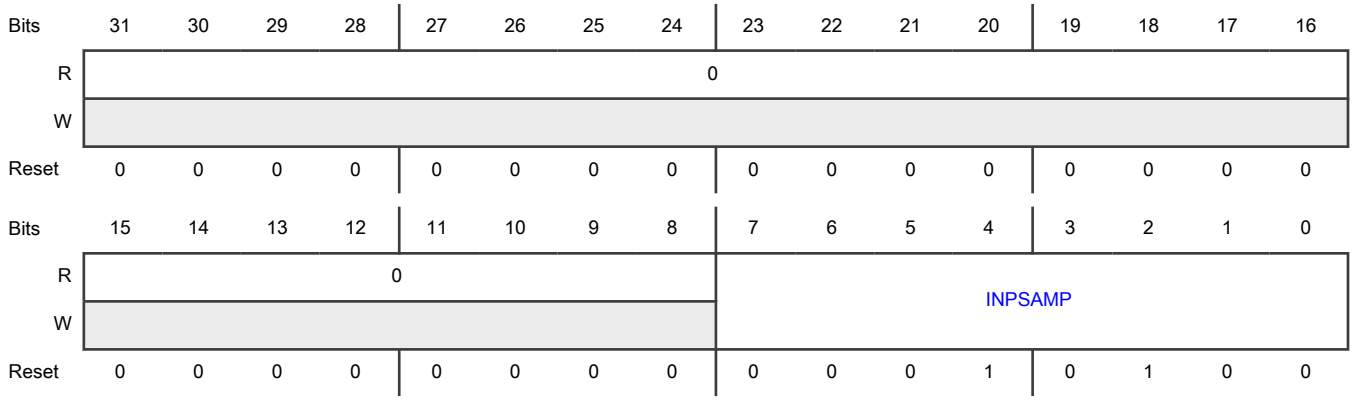
Configures the sample period duration in terms of the SAR controller clock.

This register is associated with channels 32 to 63. An exception exists for the temperature sensor channel, which always uses the CTR1 value.

Offset

Register	Offset
CTR1	98h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 INPSAMP	Sampling Phase Duration Configures the sample period duration in terms of the SAR controller clock. The minimum acceptable value is 8. Configuring to a value lower than 8 sets the sample period to 8 cycles.

57.6.24 Normal Conversion Mask 0 (NCMR0)

Sampling enable for Group0 channel *n* (*n* = Group0 channel number).

Offset

Register	Offset
NCMR0	A4h

Diagram

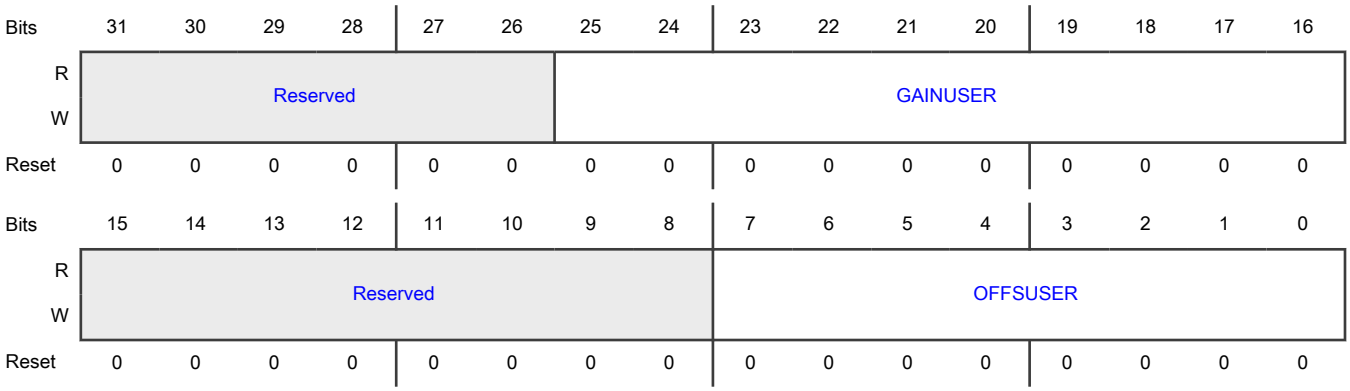
57.6.28 User OFFSET and Gain (USROFSGN)

Specifies additional offset and gain values for data processing.

Offset

Register	Offset
USROFSGN	C0h

Diagram



Fields

Field	Description
31-26 —	Reserved
25-16 GAINUSER	User-Defined Gain Value Specifies additional gain value in two's complement format used by ADC for data processing (for example, values can be either positive or negative; MSB represents sign bit).
15-8 —	Reserved
7-0 OFFSUSER	User Defined Offset Specifies additional offset of ADC in two's complement format used for data processing (values can be either positive or negative; MSB represents sign bit).

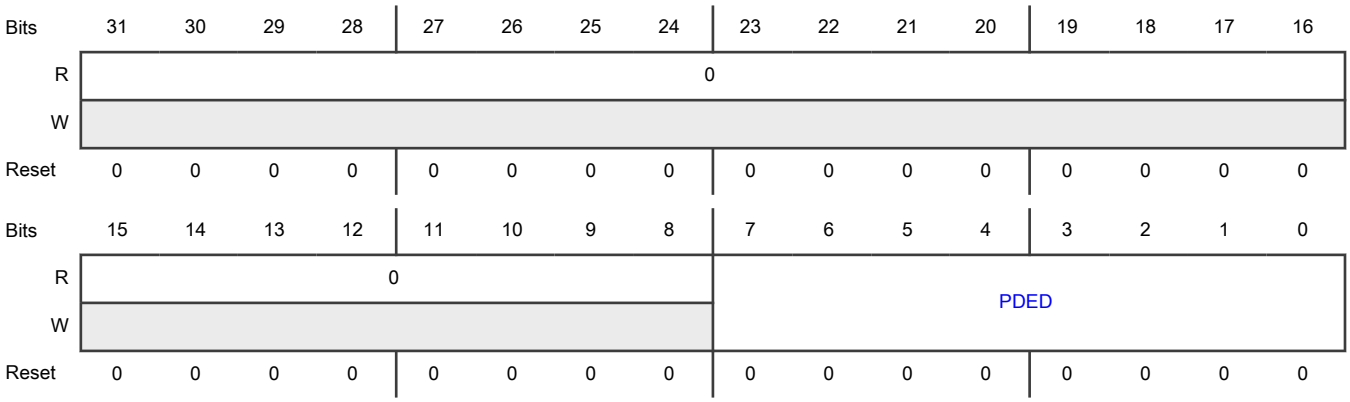
57.6.29 Power Down Exit Delay (PDEDR)

Specifies the delay between the power-down bit reset and the start of conversion.

Offset

Register	Offset
PDEDR	C8h

Diagram



Fields

Field	Description
31-8 —	Reserved
7-0 PDED	Power Down Exist Delay Specifies the delay between the power-down bit reset and the start of conversion. The power-down delay is at least (1/ADC Bus clock) + ((PDED+1) × 1/[ADC_clock_frequency]) where ADC_clock_frequency = frequency of ADC Hard Macro clock(AD_CLK) and ADC Bus clock = module interface clock for register access.

57.6.30 Precision Channel n Data (PCDR0 - PCDR7)

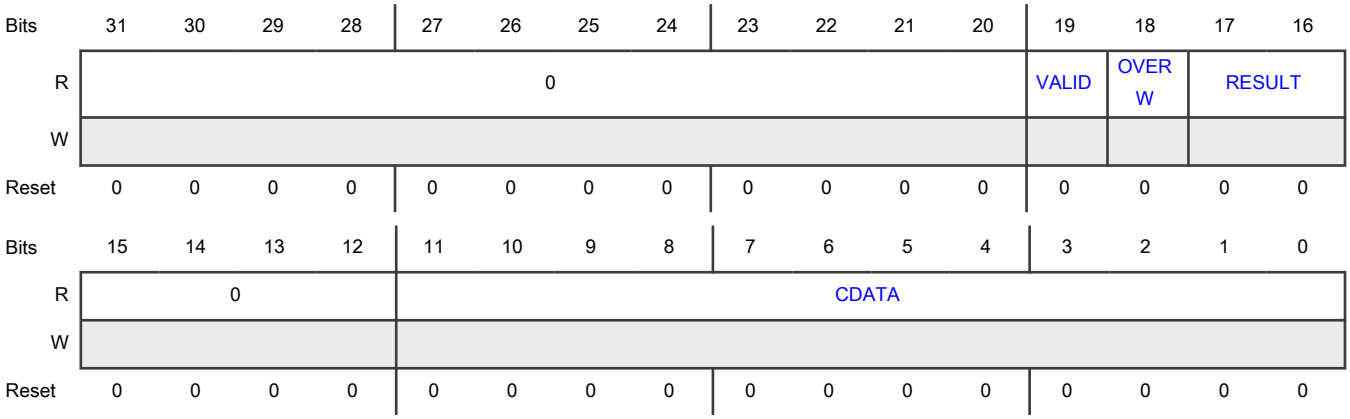
Contains conversion results for the precision channels. Each data register also contains information regarding the result.

Offset

For a = 0 to 7:

Register	Offset
PCDRa	100h + (a × 4h)

Diagram



Fields

Field	Description
31-20 —	Reserved
19 VALID	Conversion Data Valid Indicates when the data is valid (a new value has been written). It is automatically cleared when data is read. 0 - Not valid data 1 - Valid data
18 OVERW	Data Overwrite Indicates when conversion data was overwritten by a newer result. The new data is written or discarded according to MCR[OWREN]. 0 - Data not overwritten 1 - Data overwritten
17-16 RESULT	Mode of Conversion Status Indicates the mode of conversion for the corresponding channel. 00 - Data is a result of Normal conversion mode 01 - Data is a result of Injected conversion mode 10 - Data is a result of CTU conversion mode 11 - Reserved
15-12 —	Reserved
11-0 CDATA	Channel Converted Data Stores the conversion data corresponding to precision channel.

57.6.31 Internal Channel n Data (ICDR32 - ICDR39)

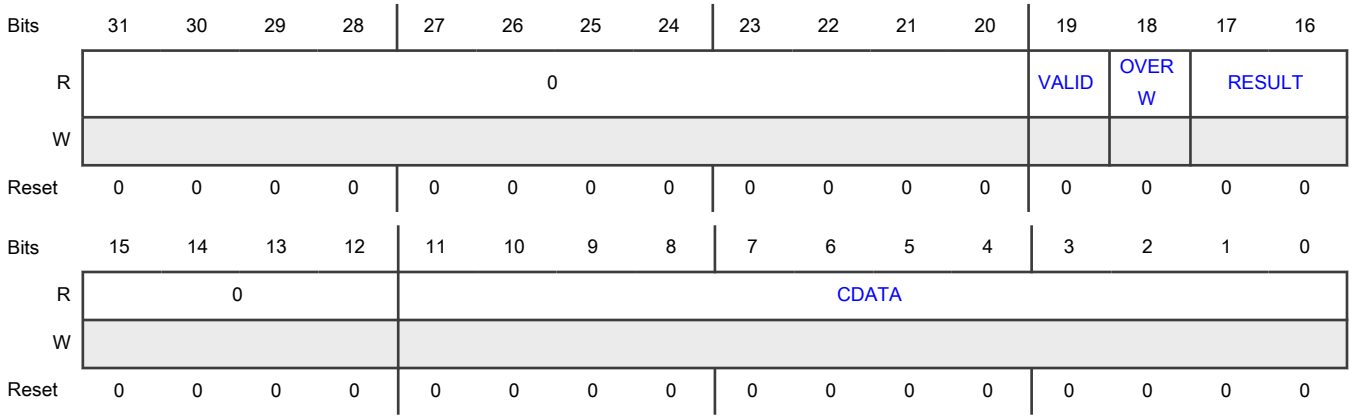
Contains conversion results for the internal channels. Each data register also contains information regarding the result.

Offset

For a = 32 to 39:

Register	Offset
ICDRa	100h + (a × 4h)

Diagram



Fields

Field	Description
31-20 —	Reserved
19 VALID	Conversion Data Valid Notifies when the data is valid (a new value has been written). It is automatically cleared when data is read. 0 - Not valid data 1 - Valid data
18 OVERW	Data Overwrite Indicates when conversion data was overwritten by a newer result. The new data is written or discarded according to MCR[OWREN]. 0 - Data not overwritten 1 - Data overwritten
17-16 RESULT	Mode of Conversion Status Indicates the mode of conversion for the corresponding channel.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	00 - Data is a result of Normal conversion mode 01 - Data is a result of Injected conversion mode 10 - Data is a result of CTU conversion mode 11 - Reserved
15-12 —	Reserved
11-0 CDATA	Channel Converted Data Stores the conversion data corresponding to internal channel.

57.6.32 Analog Watchdog Threshold 4 (THRHLR4)

Specifies high and low threshold 4 values for channel *n*.

Offset

Register	Offset
THRHLR4	280h

Diagram

16 MSKWDG_EOA_S	End of Algorithm S Interrupt Mask Enables the end of Algorithm S interrupt (STSR1[WDG_EOA_S] = 1). 0 - Interrupt disabled 1 - Interrupt enabled
15 MSKERR_C	Error on Algorithm C Channel Interrupt Mask Enables the error on Algorithm C channel interrupt (STSR1[ERR_C] = 1). 0 - Interrupt disabled 1 - Interrupt enabled
14 —	Reserved
13 MSKERR_S2	Error on Algorithm S2 Channel Interrupt Mask Enables the error on Algorithm S2 channel (SUPPLY, step 2) interrupt (STSR1[ERR_S2] = 1). 0 - Interrupt disabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Interrupt enabled
12 MSKERR_S1	Error on Algorithm S1 Channel Interrupt Mask Enables the error on Algorithm S1 channel (SUPPLY, step 1) interrupt (STSR1[ERR_S1] = 1). 0 - Interrupt disabled 1 - Interrupt enabled
11 MSKERR_S0	Error on Algorithm S0 Channel Interrupt Mask Enables the error on Algorithm S0 channel (SUPPLY, step0) interrupt (STSR1[ERR_S0] = 1). 0 - Interrupt disabled 1 - Interrupt enabled
10-8 —	Reserved
7 EN	Self-Testing Channel Enable Enables the TEST channel only in CPU mode. This field must be set before starting normal conversion and should not be changed while the conversion is in process. This field should only be reset after end of conversion of the last self-test channel has been received. 0 - Disable 1 - Enable
6-5 —	Reserved
4 FMA_WDSERR	Fault Mapping for Watchdog Sequence Error Specifies the type of fault mapping (noncritical fault (NCF) or critical fault (CF)) for watchdog sequence error. By default, a failure on the Watchdog Sequence is mapped to drive the NCF line. 0 - NCF mapping 1 - CF mapping
3 FMA_WDTERR	Fault Mapping for Watchdog Timer Error Specifies the type of fault mapping (noncritical fault (NCF) or critical fault (CF)) for watchdog timer error. By default, a failure on the Watchdog Timer is mapped to drive the NCF line. 0 - NCF 1 - CF
2 FMA_C	Fault Mapping for Algorithm C Specifies the type of fault mapping (noncritical fault (NCF) or critical fault (CF)) for algorithm C. By default, a failure during Algorithm C is mapped to drive the CF fault line. 0 - NCF

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - CF
1 —	Reserved
0 FMA_S	Fault Mapping for BGAP Algorithm Specifies the type of fault mapping (noncritical fault (NCF) or critical fault (CF)) for BGAP algorithm. By default, a failure during the supply algorithm is mapped to drive the Critical Fault (CF) line. 0 - NCF 1 - CF

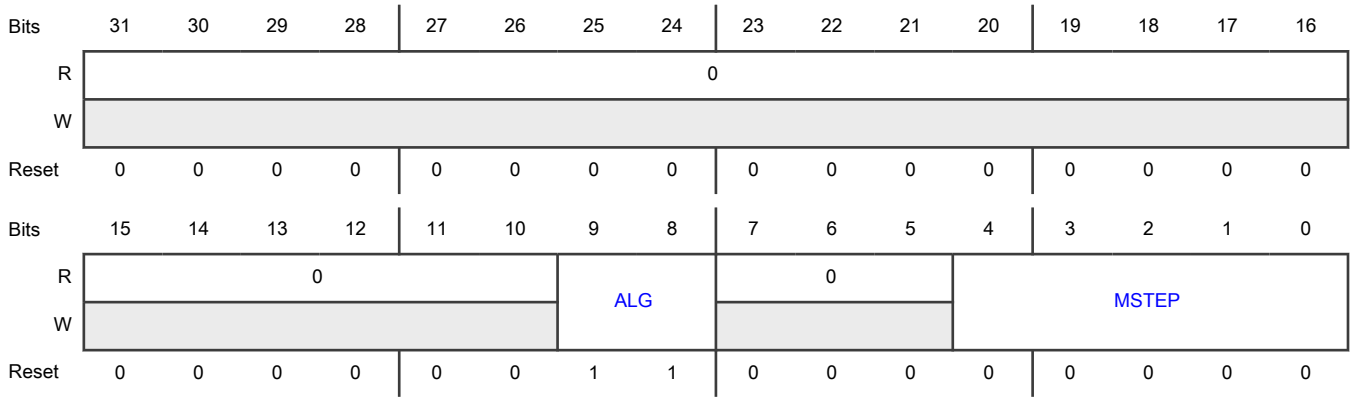
57.6.44 Self-Test Configuration 3 (STCR3)

Defines ADC self-testing capabilities in CPU mode (MCR[CTUEN] = 0). You must program this register before starting the conversion, and must not change the programming while conversion is in process.

Offset

Register	Offset
STCR3	348h

Diagram



Fields

Field	Description
31-10 —	Reserved
9-8	Self-Test Algorithm Select

Table continues on the next page...

Table continued from the previous page...

Field	Description
ALG	Specifies the algorithm for self-test. In One-Shot Operation mode, for test and debug purposes, STCR3[MSTEP] selects the step for self-test. In Scan Operation mode, the step for self-test is automatically selected based on the previous step and the value of this field. The configuration of Self-Test Baud Rate (STBRR) defines the execution baud rate of algorithm C. 00 - Algorithm S 01 - Reserved 10 - Algorithm C 11 - Algorithm S (for One-Shot Operation mode); Algorithm S + C (for Scan Operation mode)
7-5 —	Reserved
4-0 MSTEP	Self-Test Step Select Selects self-test step. For One-Shot Operation mode: Current step for Algorithm S/ C. • MSTEP = 0 to NUM_SUPPLY_STEPS (3) - 1 for Algorithm S • MSTEP = 0 to NUM_C_STEPS (12) - 1 for Algorithm C The unused codes are RESERVED (should not be used). This field is not used in Scan Operation mode as single-step execution (interleaved mode) is always performed. It should be programmed to zero in Scan Operation mode.

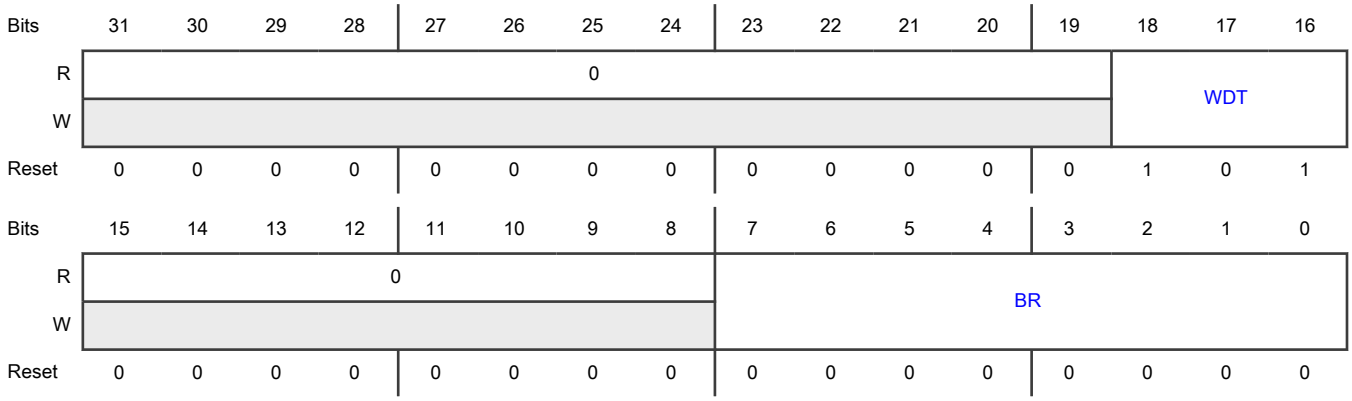
57.6.45 Self-Test Baud Rate (STBRR)

Specifies the self-test baud rate.

Offset

Register	Offset
STBRR	34Ch

Diagram



Fields

Field	Description
31-19 —	Reserved
18-16 WDT	Watchdog Timer Value Specifies the watchdog timer value that is used to monitor the algorithm sequence to verify that it is correctly executing within the safe time period. The self-testing watchdog is enabled by setting STAW *n* R[WDTE]. Default value is 10 ms. A fixed prescaler of 1024 is used to obtain the timer value from the ADCdig clock (80 MHz). Prescaler value is fixed at 1024. 000 - 0.1 ms ((0008h × Prescaler) cycles at 80 MHz) 001 - 0.5 ms ((0027h × Prescaler) cycles at 80 MHz) 010 - 1 ms ((004Eh × Prescaler) cycles at 80 MHz) 011 - 2 ms ((009Ch × Prescaler) cycles at 80 MHz) 100 - 5 ms ((0187h × Prescaler) cycles at 80 MHz) 101 - 10 ms ((030Dh × Prescaler) cycles at 80 MHz) 110 - 20 ms (061Ah × Prescaler) cycles at 80 MHz) 111 - 50 ms (0F42h ×Prescaler) cycles at 80 MHz)
15-8 —	Reserved
7-0 BR	Algorithm Baud Rate Specifies the baud rate for the selected algorithm in Scan Operation mode (MCR[MODE] = 1). 00h ≥ maximum scheduling rate (NOMINAL rate) ... FFh ≥ minimum scheduling rate (NOMINAL rate scaled by 255) You must write to this field before enabling a self-test channel.

57.6.46 Self-Test Status 1 (STSR1)

Indicates self-test status 1.

Offset

Fields

Field	Description
31-28 —	Reserved
27 WDSERR	Watchdog Sequence Errors Indicates whether a watchdog sequence error of the ADC subsystem (check for algorithm step sequence) occurred. If a failure occurs, an interrupt will be generated if enabled (STCR2[MSKWDSERR] = 1). It provides the fault indication to the FCCU, asserting a CF or NCF according to the STCR2[FMA_WDSERR] configuration. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No failure 1 - Failure occurred When writing 0 - No effect 1 - Clear the flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
26 —	Reserved
25 WDTERR	Watchdog Timer Error Indicates whether a watchdog timer error of the ADC subsystem (algorithm check for completion within safe time) occurred. If a failure occurs, an interrupt will be generated if enabled (STCR2[MSKWDTERR] = 1). It provides the fault indication to the FCCU, asserting a CF or NCF according to the STCR2[FMA_WDTERR] configuration. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No failure 1 - Failure occurred When writing 0 - No effect 1 - Clear the flag
24 OVERWR	Overwrite Error Notifies when STSR1[ERR*x*] is overwritten by a new error. The new error status is written or discarded according to the MCR[OWREN] value. To avoid Overwrite Error indication, STSR1[ERR*x*] must be cleared by software. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No overwrite error 1 - Overwrite error occurred When writing 0 - No effect 1 - Clear the flag
23 ST_EOC	Self-Test EOC Indicates whether self-test end of conversion is complete. This field is set along with EOC bit when end of conversion occurs from the analog SAR_ADC for self-test channel. An interrupt is generated if STCR2[MSKST_EOC] = 1, and IMR[MSKEOC] = 1. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Self-test end of conversion is not complete 1 - Self-test end of conversion is complete When writing 0 - No effect 1 - Clear the flag
22-19 —	Reserved
18 WDG_EOA_C	Watchdog End of Algorithm C Indicates that Algorithm C has completed. This field is set after the last STEP of algorithm is executed. An interrupt is generated if STCR2[MSKWDG_EOA_C] = 1. This field will set only if STAW4R[WDTE] = 1. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Self-test end of Algorithm C conversion is not complete 1 - Self-test end of Algorithm C conversion is complete When writing 0 - No effect 1 - Clear the flag
17 —	Reserved
16 WDG_EOA_S	Watchdog End of Algorithm S Indicates whether Algorithm S is complete. This field is set after the last Step of Algorithm S is executed. An interrupt is generated if STCR2[MSKWDG_EOA_S] = 1. This field is set only if STAW0R[WDTE] = 1. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading 0 - Self-test end of Algorithm S conversion is not complete. 1 - Self-test end of Algorithm S conversion is complete. When writing 0 - No effect 1 - Clear the flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
15 ERR_C	Algorithm C Error Indicates an error on the self-testing channel (Algorithm C). An interrupt is generated if STCR2[MSKERR_C] = 1. It provides the fault indication to the FCCU, asserting the programmed fault line (STCR2[FMA_ *x*]). STSR1[ERR_C] can also be set by software (fault injection) by writing 1 to STCR2[SERR]. In this case, a CF or NCF will be asserted according to the STCR2[FMA_ *x*] configuration. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No Algorithm C error 1 - Algorithm C error occurred When writing 0 - No effect 1 - Clear the flag
14 —	Reserved
13 ERR_S2	Algorithm S2 Error Indicates an error on the self-test channel (Algorithm S (SUPPLY), step2). An interrupt is generated if STCR2[MSKERR_S2] = 1. It provides the fault indication to the FCCU, asserting the programmed fault line (STCR2[FMA_ *x*]). STSR1[ERR_S2] can be also set by software (fault injection) by writing 1 to STCR2[SERR]. In this case, a CF or NCF will be asserted according to the STCR2[FMA_ *x*] configuration. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No error occurred on the sampled signal 1 - Error occurred on the sampled signal When writing 0 - No effect 1 - Clear the flag
12 ERR_S1	Algorithm S1 Error Indicates an error on the self-test channel (Algorithm S (SUPPLY), step1). An interrupt is generated if STCR2[MSKERR_S1] = 1. It provides the fault indication to the FCCU, asserting the programmed fault line (STCR2[FMA_ *x*]). STSR1[ERR_S1] can be also set by software (fault injection) by writing 1 to STCR2[SERR]. In this case, a CF or NCF will be asserted according to the STCR2[FMA_ *x*] configuration. Writing 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	NOTE This field behaves differently for register reads and writes. When reading 0 - No VDD ERROR 1 - VDD ERROR occurred When writing 0 - No effect 1 - Clear the flag
11 ERR_S0	Algorithm S0 Error Indicates an error on the self-test channel (Algorithm S (SUPPLY), step0). An interrupt is generated if STCR2[MSKERR_S0] = 1. It provides the fault indication to the FCCU, asserting the programmed fault line (STCR2[FMA_ *x*]). STSR1[ERR_S0] can be also set by software (fault injection) by writing 1 to STCR2[SERR]. In this case, a CF or NCF will be asserted according to the STCR2[FMA_ *x*] configuration. Writing 0 has no effect. **NOTE** This field behaves differently for register reads and writes. When reading 0 - No VREF error 1 - VREF error occurred When writing 0 - No effect 1 - Clear the flag
10 —	Reserved
9-5 STEP_C	Algorithm C Step Number Error Indicates step of the Algorithm C step when an Algorithm C error occurred (as indicated by STSR1[ERR_C]). 0...(NUM_C_STEPS (12)-1) ≥ Algorithm C
4-0 —	Reserved

57.6.47 Self-Test Status 2 (STSR2)

Indicates self-test status 2.

Offset

Register	Offset
STSR2	354h

Fields

Field	Description
31-20 —	Reserved
19 VALID	Valid Data Indicates whether data is valid (a new value is written). The field clears automatically when data is read. 0 - Data not valid 1 - Data valid
18 OWERWR	Overwrite Data Indicates whether conversion data is overwritten by a newer result. The new data is written or discarded according to the MCR[OWREN] value. 0 - Data not overwritten 1 - Data overwritten
17-12 —	Reserved
11-0 TCDATA	Test Channel Converted Data Indicates test channel data that is in 2's complement format.

57.6.51 Self-Test Data 2 (STDR2)

Indicates self-test data 2.

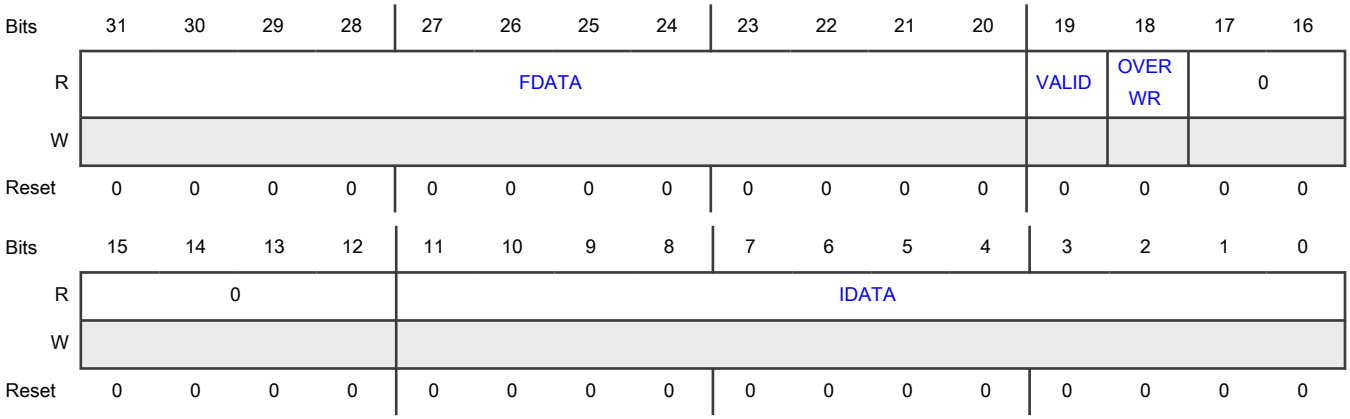
NOTE

If an overflow error occurs for Step1 of Algorithm S, STDR2 is not written.

Offset

Register	Offset
STDR2	374h

Diagram



Fields

Field	Description
31-20 FDATA	Fractional Data Indicates fractional data. The fractional part of the ratio TEST (step1)/TEST (step0) = VDD/VBGAP for Algorithm S.
19 VALID	Valid Data Indicates when data is valid (a new value is written). This field clears automatically when data is read. 0 - Data not valid 1 - Data valid
18 OVERWR	Overwrite Data Indicates when conversion data is overwritten by a newer result. The new data is written or discarded according to the MCR[OWREN] configuration. 0 - Data not overwritten 1 - Data overwritten
17-12 —	Reserved
11-0 IDATA	Integer Data Indicates integer data. The integer part of the ratio TEST (step1)/TEST (step0) = VDD/VBGAP for Algorithm S.

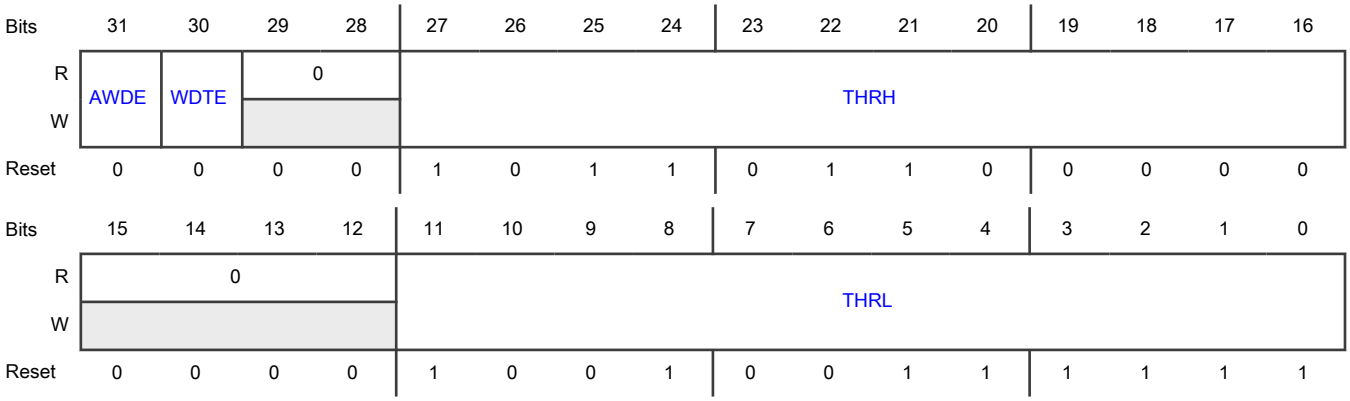
57.6.52 Self-Test Analog Watchdog 0 (STAW0R)

Contains self-test analog watchdog 0 fields.

Offset

Register	Offset
STAW0R	380h

Diagram



Fields

Field	Description
31 AWDE	Analog Watchdog Enable Enables the comparison of the conversion result from the ADC supply self-test step0 to the thresholds contained in this register (THRH and THRL). 0 - Disabled 1 - Enabled
30 WDTE	Watchdog Timer Enable Enables the watchdog timer monitoring function (related to the Algorithm S) for all ADC supply self-test steps. The watchdog timer verifies: • Correct sequence of the algorithm (step sequence) • Execution of the algorithm within the safe time period as defined by STBRR[WDT] As soon as the watchdog timer is enabled the algorithm execution must be detected within the safe time period. The watchdog timer is reset each time the algorithm restarts. Set this field only in Scan mode. 0 - Disabled 1 - Enabled

Table continues on the next page...

Table continued from the previous page...

Field	Description
29-28 —	Reserved
27-16 THRH	High Threshold Value for Algorithm S Step0 Specifies the high threshold value for Algorithm S Step0. If the analog watchdog is enabled, STSR1[ERR_ *x*] is set to 1 if STDR1[TCDATA] > THRH. The reset value of this field is calculated based on a bandgap voltage of 1.15 V. The formula for calculating the higher threshold is (Bandgap_Voltage_Maximum)*4095/(Reference_Voltage_Minimum). **NOTE** The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment (for example, introduction of noise from outside of the device minimized). The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments.
15-12 —	Reserved
11-0 THRL	Low Threshold Value for Algorithm S Step0 Specifies the low threshold value for Algorithm S Step0. If the analog watchdog is enabled, STSR1[ERR_ *x*] is set to 1 if STDR1[TCDATA] < THRL. The reset value of this field is calculated based on a bandgap voltage of 1.15V. The formula for calculating the lower threshold is (Bandgap_Voltage_Minimum)*4095/(Reference_Voltage_Maximum). **NOTE** The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment (for example, introduction of noise from outside of the device minimized). This value may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments.

57.6.53 Self-Test Analog Watchdog 1A (STAW1AR)

Contains self-test analog watchdog 1A fields.

Offset

Fields

Field	Description
31 AWDE	Analog Watchdog Enable Enables the analog watchdog monitoring function (related to Algorithm C) for all ADC capacitive self-test steps. 0 - Disabled 1 - Enabled
30 WDTE	Watchdog Timer Enable Enables the watchdog timer monitoring function (related to Algorithm C) for all ADC capacitive self-test steps. The watchdog timer verifies:

Table continues on the next page...

Table continued from the previous page...

Field	Description
	• Correct sequence of the algorithm (step sequence) • Execution of the algorithm within the safe time period as defined by STBRR[WDT] As soon as the watchdog timer is enabled, execution must be detected within the safe time period. The watchdog timer is reset each time the algorithm restarts. This field should be set only in scan mode. 0 - Disabled 1 - Enabled
29-28 —	Reserved
27-16 THRH	High Threshold Value for Step0 of Algorithm C Specifies the high threshold value for Step0 of Algorithm C. This value is read by the ADC as two's-complement, but should be written positive. If the watchdog is enabled (STAW4R[AWDE] = 1) and STDR1[TCDATA] > STAW4R[THRH], then STSR1[ERR_C] is set. **NOTE** The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment (for example, introduction of noise from outside of the device minimized). The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments.
15-12 —	Reserved
11-0 THRL	Low Threshold Value for Step0 of Algorithm C Specifies the low threshold value for Step0 of Algorithm C. This value is read by the ADC as two's-complement, and it should be the inverse of STAW4R[THRH]. If the watchdog is enabled (STAW4R[AWDE] = 1) and STDR1[TCDATA] < STAW4R[THRL], then STSR1[ERR_C] is set. The settings in this register are applicable only to step0 of the ADC's capacitive self-test. Refer to the STAW5R register for settings applicable to other capacitive self-test steps. The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment (for example, introduction of noise from outside of the device minimized). The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments.

Field	Description
STAT_3	Indicates status of test *n* (where *n* = 1...12). This field is cleared when MCR[CALSTART] = 1, which initiates the test. This field updates automatically as the test progresses. Bit for each test is updated dynamically during test and the test number field reflects the last failing test. 0 - Test passed 1 - Test failed
1 STAT_2	Status of Calibration Step 2 Indicates status of test *n* (where *n* = 1...12). This field is cleared when MCR[CALSTART] = 1, which initiates the test. This field updates automatically as the test progresses. Bit for each test is updated dynamically during test and the test number field reflects the last failing test. 0 - Test passed 1 - Test failed
0 STAT_1	Status of Calibration Step 1 Indicates status of test *n* (where *n* = 1...12). This field is cleared when MCR[CALSTART] = 1, which initiates the test. This field updates automatically as the test progresses. Bit for each test is updated dynamically during test and the test number field reflects the last failing test. 0 - Test passed 1 - Test failed

57.6.60 Calibration Configuration 0 (CALCFG0)

This register defines settings for calibration (RW, Reserved, non_cust, fuse bit).

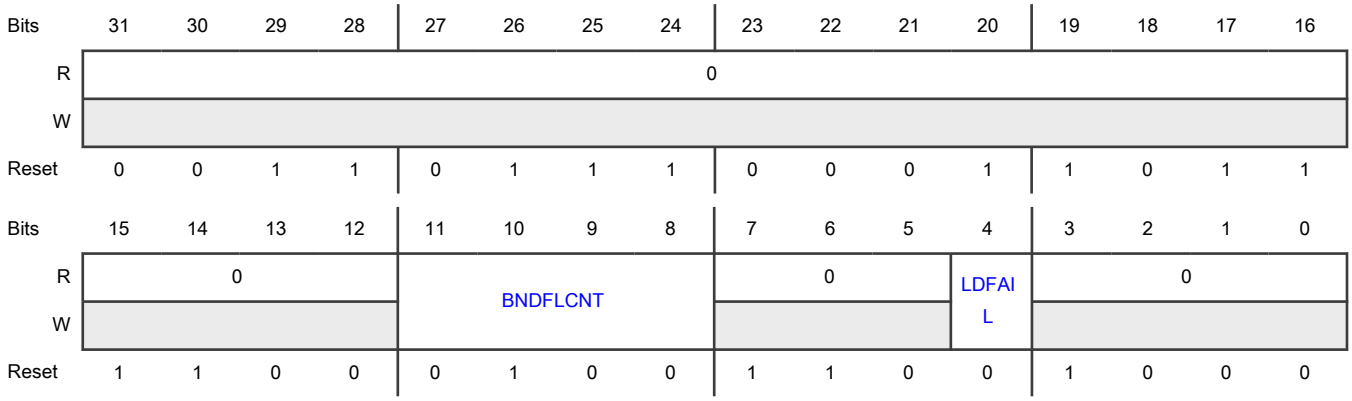
NOTE

LDFAIL and BNDFLCNT bits can be used if DC-to-DC converter is used as a source of ADC supply (reference) and calibration fails. For more details, contact the NXP representative."

Offset

Register	Offset
CALCFG0	3A0h

Diagram



Fields

Field	Description
31-12 —	Reserved
11-8 BNDFLCNT	Boundary condition fail count Boundary condition is checked in all individual conversions of calibration. The condition is (2^BNDFLCNT). 0000 - Single occurrence 0001 - Double occurrence 0010 - Four occurrence
7-5 —	Reserved
4 LDFAIL	Load calibrated values in fail condition 0 - Load calibrated values only if the calibration step passes (retain existing values in case of fail) (default) 1 - Enable loading of calibrated values in fail condition also
3-0 —	Reserved

Temperature Sensor (TEMPSENSOR)

58.1 Chip-specific TEMPSENSOR information

Table 532. Reference links to related information

Topic	Related module	Reference
A55	Arm Cortex CA55 Platform (CA55)	CA55 Platform
System memory map		System memory map
Clocking		Clock generation
Signal multiplexing	Port control	External signals and pin multiplexing
System Debug		System Debug Overview

This chip has one temperature monitoring site in the ANAMIX, next to the temperature diode. It allows software to enable/disable it and read the temperature. This sensor is:

Self contained with no provision for remote sensing

Calibrates relative to an applied voltage

58.1.1 Module instances

This device has one instance of the TEMPSENSOR module.

58.1.2 TEMPSENSOR range and error

Refer the table below for details about TEMPSENSOR's monitoring and error range.

Table 533. TEMPSENSOR range and error

Description	Min	Typ	Max	Units
Temperature monitoring range	-40	-	105	°C
Temperature sensor error	-2.5	-	2.5	°C

NOTE

- Accuracy specified is based on design and validation under controlled conditions.
- Accuracy outside of operating range (-40 to 105°C) is not guaranteed.

58.2 Overview

TEMPSENSE is a high-accuracy temperature sensor. It provides control for the following modes along with the temperature threshold comparison:

- Single One-Shot Measurement
- Periodic One-Shot Measurement

58.2.1 Block diagram

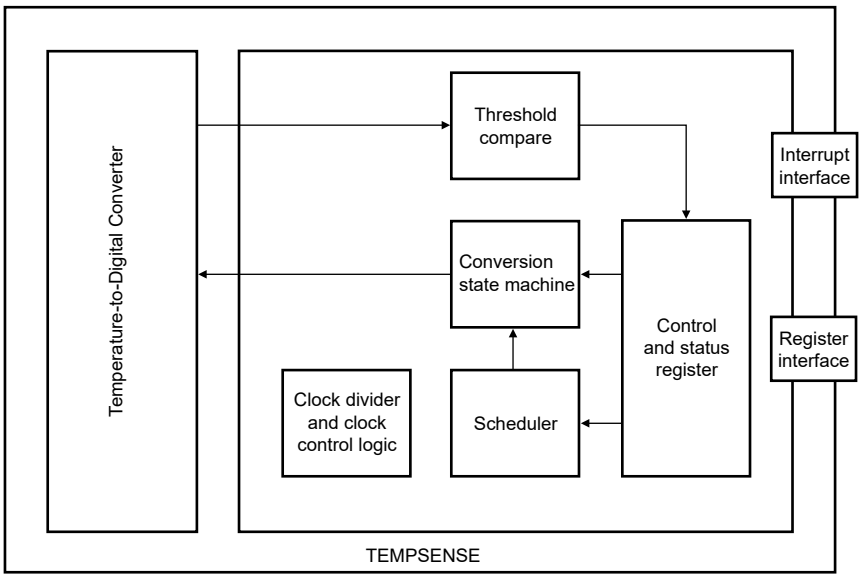

Figure 320. Block diagram

58.2.2 Features

- Enables a programmable start and stop measurement
- Contains temperature threshold comparators, in normal and secure address space, with direction and threshold programmability
- Supports measurement modes (see Operating modes)
- Supports a temperature measurement data register in normal address space and also in secure address space
- Provides an interrupt for end of measurement and threshold violation
- Provides status registers for end of measurement and threshold violation
- Allows a programmable measurement frequency for Periodic One-Shot Measurement mode
- Provides a programmable resolution

58.3 Functional description

58.3.1 Subblocks

58.3.1.1 xTDC

TEMPSENSE includes a BJT-based temperature sensor. A sigma-delta ADC converts the raw output from the sensor to a digital value, and a decimation filter processes this digital value. This block also has a calibration engine.

58.3.1.2 Threshold comparator

TEMPSENSE includes comparators. Each of them compares the temperature value (from the sensor) against the programmable threshold values. You can also program the direction of comparison (greater than or less than), for each comparator, through registers.

58.3.1.3 Control and status registers

TEMPSENSE includes several control and status registers. These allow you to configure multiple TEMPSENSE functions and examine various TEMPSENSE outputs, respectively.

58.3.1.4 Scheduler

The scheduler is responsible for scheduling TEMPSENSE conversions in different modes.

58.3.2 Operating modes

Table 534. Operating modes

Mode	Description	See section
Single One-Shot Measurement	Measures single temperature data after you start a measurement	Single One-Shot Measurement mode
Periodic One-Shot Measurement	Measures temperature data repeatedly at a periodic interval of time	Periodic One-Shot Measurement mode
Low-Power	Operates in a low-power state	Low-Power mode

58.3.2.1 Single One-Shot Measurement mode

In this mode, TEMPSENSE measures single temperature data after you start a measurement (if CTRL1[START] = 1). TEMPSENSE changes CTRL1[START] to 0 automatically. After the end of measurement, TEMPSENSE enters the Idle state. You must write 1 to CTRL1[START] again for the next measurement. CTRL1[STOP] does not impact anything in this mode.

58.3.2.2 Periodic One-Shot Measurement mode

In this mode, TEMPSENSE keeps measuring temperature data repeatedly at a periodic interval of time (t_{MEAS_FREQ}), as specified in PERIOD_CTRL[MEAS_FREQ]. TEMPSENSE keeps triggering the conversion by itself, in periodic intervals, after you write 1 to CTRL1[START].

TEMPSENSE changes CTRL1[START] to 0 automatically. Writing 1 to CTRL1[START] again does not impact ongoing measurements until you write 1 to CTRL1[STOP] to stop TEMPSENSE. Writing 1 to CTRL1[STOP] stops further measurements after completing the ongoing conversion. When measurement stops, you must write 1 to CTRL1[START] to start periodic one-shot conversions again. In this mode, TEMPSENSE completes a conversion (t_{CONV}) as specified in CTRL1[RESOLUTION]. For the remainder of the period ($t_{MEAS_FREQ} - t_{CONV}$), TEMPSENSE is either in Idle state or powering up. This mode is useful for conversion in Low-Power mode, during which the periodic interval is higher than the conversion time ($t_{MEAS_FREQ} >> t_{CONV}$). Writing 1 to CTRL1[STOP] stops further measurements after completing the ongoing conversion.

58.3.2.3 Low-Power mode

You can use either of the following methods to operate TEMPSENSE in a low-power state:

- Disable TEMPSENSE. No conversion takes place until it wakes up again.
- Operate TEMPSENSE in Periodic One-Shot mode. In this mode, TEMPSENSE goes into the sleep state in between consecutive conversions, and you can program the time gap between these conversions.

58.3.3 Digital word representation

The digital part of TEMPSENSE includes a calculation engine, where the input and output values, along with the fitting parameters, are mapped to a fixed-point representation. In the following table:

- The "Range" column shows the range of real values for representation.
- The "Representation" column lists the representation of the parameters, where "u" indicates an unsigned number and "s" indicates a signed number (in two's-complement form). The first number that follows indicates the total number of bits used to

represent the parameter and the second number shows the number of bits used to represent the fractional part. For example, DATA*n*[DATA_VAL] is a 16-bit signed value, with the last 6 LSBs representing the fractional part. Therefore:

- DATA*n*[DATA_VAL] = 0000_0110_0101_0000 = 25.25 ℃
- DATA*n*[DATA_VAL] = 1111_1001_1011_0000 = -25.25 ℃ (represented in two's-complement form)

Table 535. Digital word representation

Parameter	Range	Representation
DATA0[DATA_VAL]	−512 to 511.98	s (16, 6)
DATA1[DATA_VAL]	−512 to 511.98	s (16, 6)
THR_CTRL*m*[TEMPERATURE_THRESHOLD*n*]	−512 to 511.98	s (16, 6)

58.3.4 Clocking

Table 536. TEMPSENSE clocks

Clock	Description
MODULE_CLK	Intended for the IPS interface register programming This clock generates CONV_CLK. The clock should be non-FM and meet the criteria for analog TEMPSENSE.
CONV_CLK	Internally generated clock divided from MODULE_CLK You must use REF_DIV[DIV] to program the division factor. Additionally, use it for the analog block, and for running the conversion state machine and scheduler. The range for this clock is 3.6 MHz to 4.4 MHz.

58.3.5 Reset

Table 537. TEMPSENSE reset sources

Reset source	Description
Functional reset	Hardware reset for all registers

58.3.6 Interrupts

TEMPSENSE includes the following interrupts.

Table 538. Interrupts

Interrupt	Description
DRDY0_IF	Data-ready interrupt that indicates the arrival of a new temperature data value at DATA0[DATA_VAL]: • Read DATA0[DATA_VAL] to clear the interrupt. • Use CTRL0[DRDY0_IE] to enable this interrupt.
DRDY1_IF	Data-ready interrupt that indicates the arrival of a new temperature data value at DATA1[DATA_VAL]:

Table continues on the next page...

Table 538. Interrupts (continued)

Interrupt	Description
	• Read DATA1[DATA_VAL] to clear the interrupt. • Use CTRL1[DRDY1_IE] to enable this interrupt.
THR0_IF	Indicates the threshold violation at comparator0: • Clear it after acknowledging via W1C in STAT0[THR0_IF]. • Use CTRL0[THR0_IE] to enable this interrupt.
THR1_IF	Indicates the threshold violation at comparator1: • Clear it after acknowledging via W1C in STAT0[THR1_IF]. • Use CTRL0[THR1_IE] to enable this interrupt.
THR2_IF	Indicates the threshold violation at comparator2: • Clear it after acknowledging via W1C in STAT0[THR2_IF]. • Use CTRL0[THR2_IE] to enable this interrupt.
THR4_IF	Indicates the threshold violation at comparator4: • Clear it after acknowledging via W1C in STAT1[THR4_IF]. • Use CTRL1[THR4_IE] to enable this interrupt.
THR5_IF	Indicates the threshold violation at comparator5: • Clear it after acknowledging via W1C in STAT1[THR5_IF]. • Use CTRL1[THR5_IE] to enable this interrupt.

58.4 External signals

This module has no external signals.

58.5 Initialization

Follow the procedures listed in Configure Periodic One-Shot Measurement mode, and Configure Single One-Shot Measurement mode to use TEMPSENSE in different modes.

58.5.1 Configure Periodic One-Shot Measurement mode

Perform the following procedure for periodic one-shot measurement:

1. Configure REF_DIV[DIV] to divide MODULE_CLK to generate CONV_CLK. See Clocking to check the MODULE_CLK and CONV_CLK specifications.
2. Write 1b to REF_DIV[DE].
3. Configure PUD_ST_CTRL[PUD] to set the PUD. The default value corresponds to 25 µs with CONV_CLK = 4 MHz.
4. Configure CTRL1[RESOLUTION] according to the required conversion time. The default value corresponds to 1.10525 ms with CONV_CLK = 4 MHz.
5. Configure PERIOD_CTRL[MEAS_FREQ] according to the required periodic measurement interval time, which is PERIOD_CTRL[MEAS_FREQ] × t_{CONV_CLK}.
6. Write 10b to CTRL1[MEAS_MODE].
7. Write 1b to CTRL1[ENABLE].

8. Write 1b to CTRL0[DRDY0_IE] or CTRL1[DRDY1_IE] to enable the corresponding interrupt output.
9. Configure Threshold Control 01 (THR_CTRL01), Threshold Control 23 (THR_CTRL23), and Threshold Control 45 (THR_CTRL45) to set the corresponding thresholds for each comparator.
10. Configure CTRL*m*[THR*n*_MODE] for the required behavior of the corresponding threshold comparator.
11. Write 1b to CTRL1*m*[THR*n*_IE] for the corresponding interrupt output for comparator threshold violation.
12. Configure CTRL0[N_FILT_0] and CTRL1[N_FILT_1] for corresponding comparators.
13. Write 1b to CTRL1[START]. Wait until STAT*m*[DRDY*n*] becomes 1.
14. Read DATA*n*[DATA_VAL]. It clears the corresponding STAT*m*[DRDY*n*].

    DATA*n*[DATA_VAL] and STAT*m*[DRDY*n*_IF] keep refreshing at a periodic interval of time, corresponding to PERIOD_CTRL[MEAS_FREQ].
15. Configure CTRL1[STOP] to stop the measurements.

See Application information for the intended application use cases for threshold comparator and interrupt.

58.5.2 Configure Single One-Shot Measurement mode

Perform the following procedure for single one-shot measurement:

1. Configure REF_DIV[DIV] to divide MODULE_CLK to generate CONV_CLK. See Clocking to check the MODULE_CLK and CONV_CLK specifications.
2. Write 1b to REF_DIV[DE].
3. Configure PUD_ST_CTRL[PUD] to set the PUD. The default value corresponds to 25 µs with CONV_CLK = 4 MHz.
4. Configure CTRL1[RESOLUTION] according to the required conversion time. The default value corresponds to 1.10525 ms with CONV_CLK = 4 MHz.
5. Write 00b to CTRL1[MEAS_MODE].
6. Write 1b to CTRL1[ENABLE].
7. Write 1b to CTRL0[DRDY0_IE] or CTRL1[DRDY1_IE] to enable the corresponding interrupt output.
8. Write 1b to CTRL1[START]. Wait until STAT*m*[DRDY*n*] becomes 1.
9. Read DATA*n*[DATA_VAL]. It clears the corresponding STAT*m*[DRDY*n*].

58.5.3 Clearing threshold violation counter

If the IP is doing conversions, it keeps on internally counting the no. of consecutive threshold violations based on the Threshold and THR*_MODE settings of the comparators. So If the user wants to change the CTRLn[THRm_MODE] or THR_CTRLxy[TEMPERATURE_THRESHOLDz] in between the conversions (that is, without the module being reset). Then it is advised to clear these internal counters else it may lead to false flag/false interrupt generation using the following steps:

1. Program CTRL1[START] = 1'b1 . This step should be skipped if IP is running in periodic oneshot mode.
2. Program the respective CTRLn[FILTm_CNT_CLR] = 1'b1.
3. Wait for clearing of the field CTRLn[FILTm_CNT_CLR] , which was asserted in previous step. This is an acknowledgement that the respective internal counter is cleared.
4. Change the respective CTRLn[THRm_MODE].

58.6 Application information

This section discusses use models of the temperature threshold comparators and a few corner cases after startup, such as changing the configuration of a comparator or the threshold level. It does not discuss setup of the sensor or security aspects.

58.6.1 Normal and secure space accesses

The secure case requires TEMPSENSE to check the possible temperature side-channel attacks. Thermal management requires understanding the temperature in this application. The proposal is a compromise that requires secure space access to set up the sensor. A normal access can:

- Set the threshold of comparators, each associated with an interrupt.
- Read the last measured temperature.
- Write the data value for debug purposes.

You must use secure space access to setup, start, or stop conversions, and for other features. Address bit 9 = 1 differentiates between secure and normal accesses. The 1 KB address space is split into two halves—the upper half (200–3FFh) has secure access and the lower half (0–1FFh) has normal access.

58.6.2 Description of the comparator

TEMPSENSE includes independent comparators, each having the same features and set of control and status fields. The following fields describe the modes of the corresponding comparators:

- CTRL0[THR0_MODE]
- CTRL0[THR1_MODE]
- CTRL0[THR2_MODE]
- CTRL1[THR4_MODE]
- CTRL1[THR5_MODE]

For each new conversion event, the value register stores the data and the comparators compare the data with the threshold and filter the output signal. TEMPSENSE sets the thermal flag (THR*n*_IF), and the thermal status (THR*n*_STAT) changes if the consecutive number of threshold violations is greater than the corresponding filter length, CTRL*m*[N_FILT_*n*].

You can write the comparators at any time. The status field remains unchanged until the new filtered values arrive. For example, if you raise the threshold and the corresponding status is 1 (temperature is above the previous value), it takes conversions (specified by CTRL*m*[N_FILT_*n*]) to reflect that the temperature is not below the new threshold value. Having the flag set by level or by edge supports two use models (see the following table).

Table 539. Use models

Use model	Description	Advantages or disadvantages
State-based	Notifies when the temperature exceeds the threshold (see State-based use model)	You must use both interrupt and polling modes.
Event-based	Notifies when the temperature exceeds the threshold in the opposite direction (see Event-based use model)	You may not require polling, but you may miss an event.

58.6.2.1 State-based use model

When using this model, you receive a notification (interrupt) when the temperature exceeds the threshold. You must disable the interrupt to avoid a lock in the interrupt loop because it is not easy to influence the temperature. Then, poll the status to check whether the temperature is back to normal. If the temperature is within the threshold, the respective flag can be cleared via W1C; otherwise, TEMPSENSE sets the flag. You can change the threshold value to set the hysteresis, but it also takes *n* measurement periods to become effective. The following diagram corresponds to a case model in which CTRL*m*[THR*n*_MODE] equals 0b or 1b.

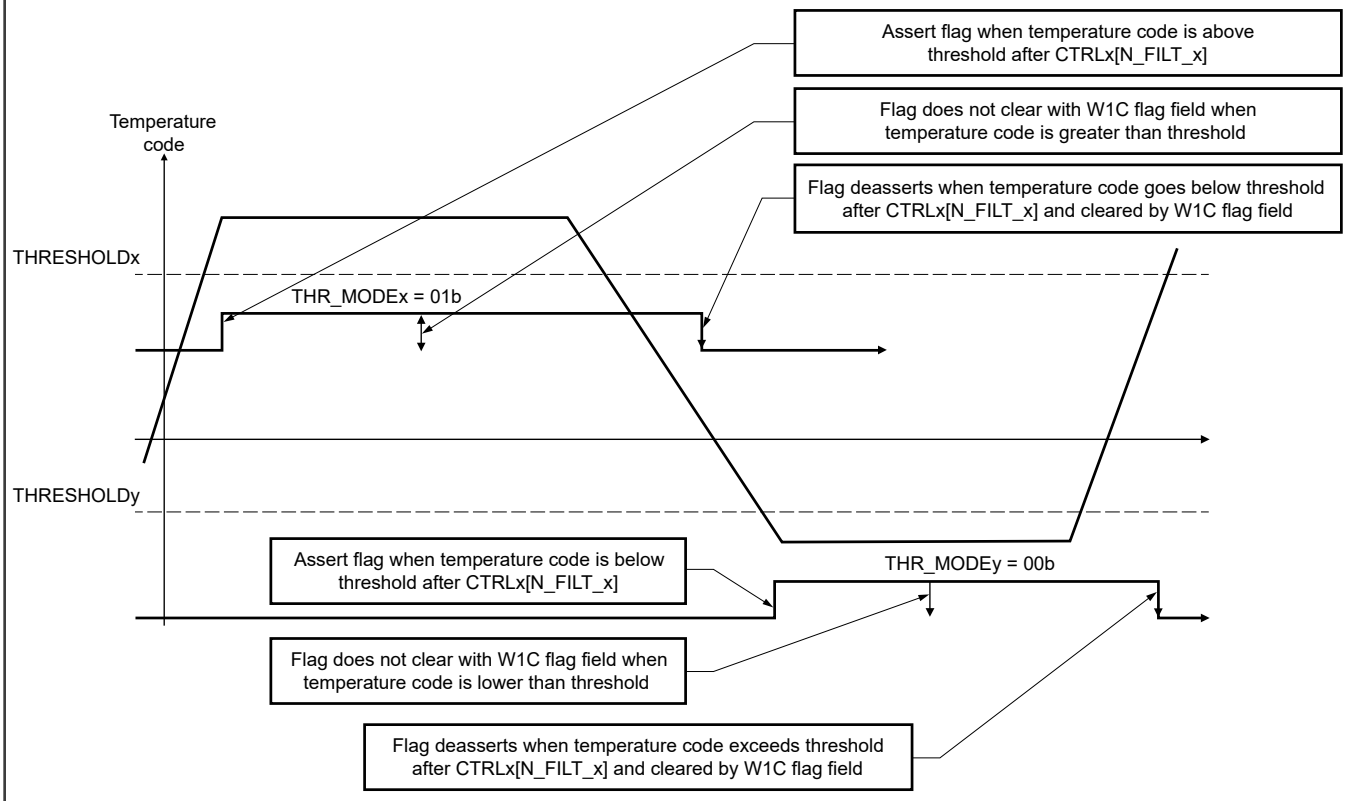

Figure 321. State-based model

58.6.2.2 Event-based use model

When using this model, similar to the state-based use model, you receive a notification when the temperature exceeds (for example, rising) the threshold, but you can clear the flag by writing 1 to it. Then, you can reconfigure the edge type (for example, falling) to receive a notification when the temperature exceeds the threshold in the opposite direction. The following diagram corresponds to a case model where CTRL*m*[THR*n*_MODE] equals 10b or 11b.

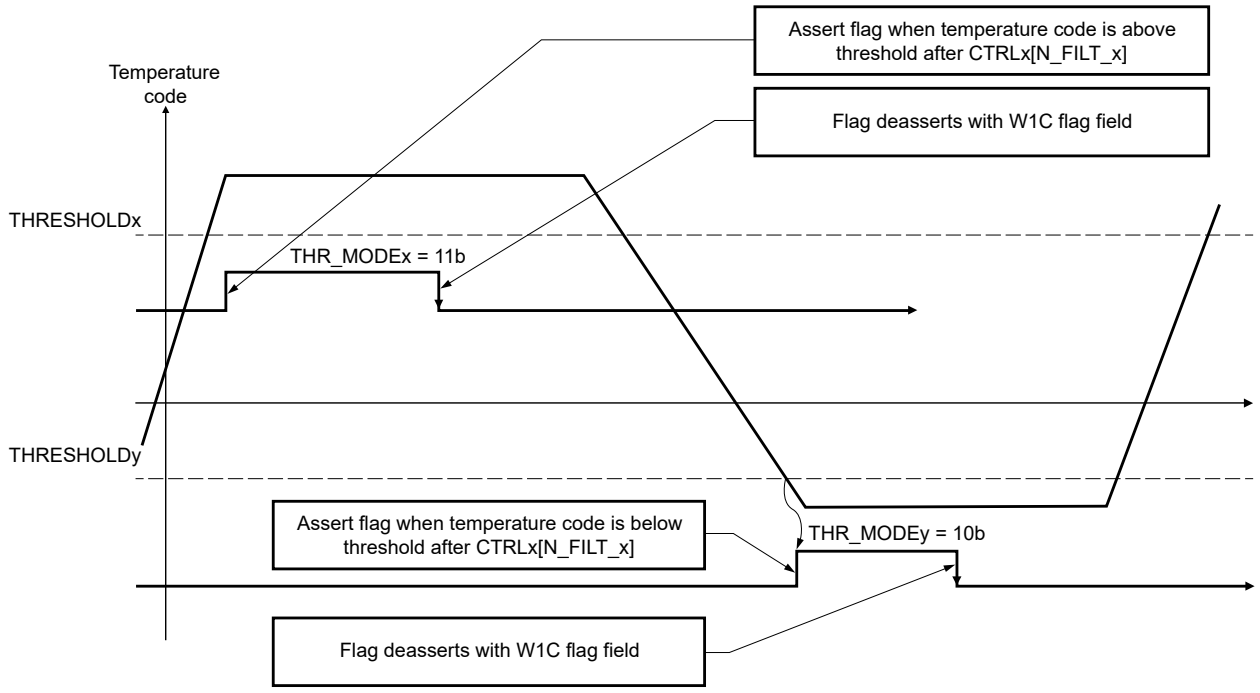

Figure 322. Event-based model

58.6.3 Use cases for configuring each comparator flag for event-based use model

Programming guidelines for threshold comparator0, Programming guidelines for threshold comparator1, and Programming guidelines for threshold comparator2 depict use cases for comparator0, comparator1, and comparator2, respectively, for the event-based use model. Similar use cases are also possible for comparator4 and comparator5. Event-based use case model: diagram presents a diagram of the event-based use case model.

In this use case, configure comparator0 for panic high-temperature threshold, comparator1 for high-temperature threshold, and comparator2 for low-temperature threshold.

Perform the following procedure to configure each comparator flag for event-based use model:

1. Configure REF_DIV[DIV] to divide MODULE_CLK to generate CONV_CLK. See Clocking to check the MODULE_CLK and CONV_CLK specifications.
2. Write 1b to REF_DIV[DE].
3. Configure PUD_ST_CTRL[PUD] to set the PUD. The default value corresponds to 25 µs with CONV_CLK = 4 MHz.
4. Configure CTRL1[RESOLUTION] according to the required conversion time. The default value corresponds to 1.10525 ms with CONV_CLK = 4 MHz.
5. Configure PERIOD_CTRL[MEAS_FREQ] to set the conversion interval. e.g 24'd8000 for 2ms conversion rate.
6. Write 10b to CTRL1[MEAS_MODE].
7. Write 1b to CTRL1[ENABLE].
8. Write 1b to CTRL1[START] to start the measurements.
9. Write 1b to CTRL0[DRDY0_IE].
10. Write 0011b to CTRL0[N_FILT_0] and 0011b to CTRL1[N_FILT_1].

58.6.3.1 Programming guidelines for threshold comparator0

Perform the following procedure to configure threshold comparator0:

1. Write 11b to CTRL0[THR0_MODE].
2. Write the panic high-temperature threshold to THR_CTRL01[TEMPERATURE_THRESHOLD0].
3. When STAT0[THR0_IF] is set (indicating that comparator0 detected panic high-temperature violation):
    a. Clear STAT0[THR0_IF].
    b. Write 10b to CTRL0[THR0_MODE].
    c. Write 1b to CTRL0[FILT0_CNT_CLR].
    d. Write the panic high-temperature threshold hysteresis to Threshold Control 01 (THR_CTRL01).
4. When STAT0[THR0_IF] is set again, repeat the aforementioned steps.

58.6.3.2 Programming guidelines for threshold comparator1

Perform the following procedure to configure threshold comparator1:

1. Write 11b to CTRL0[THR1_MODE].
2. Write the high-temperature threshold to THR_CTRL01[TEMPERATURE_THRESHOLD1].
3. When STAT0[THR1_IF] is set (indicating that comparator1 detected panic high-temperature violation):
    a. Clear STAT0[THR1_IF].
    b. Write 10b to CTRL0[THR1_MODE].
    c. Write 1b to CTRL0[FILT1_CNT_CLR].
    d. Write the high-temperature threshold hysteresis to Threshold Control 01 (THR_CTRL01).
4. When STAT0[THR1_IF] is set again, repeat the aforementioned steps.

58.6.3.3 Programming guidelines for threshold comparator2

Perform the following procedure to configure threshold comparator2:

1. Write 10b to CTRL0[THR2_MODE].
2. Write the low-temperature threshold to THR_CTRL23[TEMPERATURE_THRESHOLD2].
3. When STAT0[THR2_IF] is set (indicating that comparator2 detected panic high-temperature violation):
    a. Clear STAT0[THR2_IF].
    b. Write 11b to CTRL0[THR2_MODE].
    c. Write 1b to CTRL0[FILT2_CNT_CLR].
    d. Write the low-temperature threshold hysteresis to Threshold Control 23 (THR_CTRL23).
4. When STAT0[THR2_IF] is set again, repeat the aforementioned steps.
5. Write 1b to CTRL1[STOP] to stop further measurements.

58.6.3.4 Event-based use case model: diagram

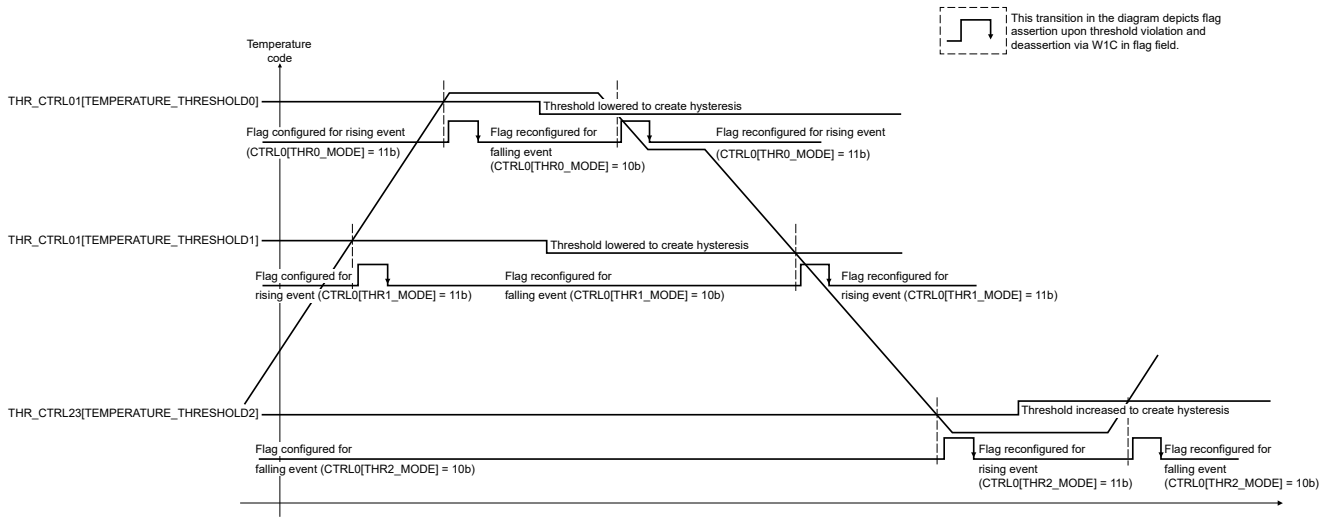

Figure 323. Event-based use case model for comparators 0, 1, and 2

58.6.4 Use cases for configuring each comparator flag for state-based use model

Programming guidelines for threshold comparator0, Programming guidelines for threshold comparator1, and Programming guidelines for threshold comparator2 depict use cases for comparator0, comparator1, and comparator2, respectively, for the state-based use model. Similar use cases are also possible for comparator4 and comparator5. State-based use case model: diagram presents a diagram of the state-based use case model.

In this use case, configure comparator0 for panic high-temperature threshold, comparator1 for high-temperature threshold, and comparator2 for low-temperature threshold.

Perform the following procedure to configure each comparator flag for state-based use model:

1. Configure REF_DIV[DIV] to divide MODULE_CLK to generate CONV_CLK. See Clocking to check the MODULE_CLK and CONV_CLK specifications.
2. Write 1b to REF_DIV[DE].
3. Configure PUD_ST_CTRL[PUD] to set the PUD. The default value corresponds to 25 µs with CONV_CLK = 4 MHz.
4. Configure CTRL1[RESOLUTION] according to the required conversion time. The default value corresponds to 1.10525 ms with CONV_CLK = 4 MHz.
5. Configure PERIOD_CTRL[MEAS_FREQ] to set the conversion interval. e.g 24'd8000 for 2ms conversion rate.
6. Write 10b to CTRL1[MEAS_MODE].
7. Write 1b to CTRL1[ENABLE].
8. Write 1b to CTRL1[START] to start the measurements.
9. Write 1b to CTRL0[DRDY0_IE].
10. Write 0011b to CTRL0[N_FILT_0] and 0011b to CTRL1[N_FILT_1].

58.6.4.1 Programming guidelines for threshold comparator0

Perform the following procedure to configure threshold comparator0:

1. Write 01b to CTRL0[THR0_MODE].
2. Write the panic high-temperature threshold to THR_CTRL01[TEMPERATURE_THRESHOLD0].

3. When STAT0[THR0_IF] is set (indicating that comparator0 detected panic high-temperature violation):
    a. Clear STAT0[THR0_IF].
    b. Write 01b to CTRL0[THR0_MODE].
    c. Write 1b to CTRL0[FILT0_CNT_CLR].
    d. Write the panic high-temperature threshold hysteresis to Threshold Control 01 (THR_CTRL01).
4. When STAT0[THR0_IF] is set again, repeat all the aforementioned steps.

58.6.4.2 Programming guidelines for threshold comparator1

Perform the following procedure to configure threshold comparator1:

1. Write 01b to CTRL0[THR1_MODE].
2. Write the high-temperature threshold to THR_CTRL01[TEMPERATURE_THRESHOLD1].
3. When STAT0[THR1_IF] is set (indicating that comparator1 detected panic high-temperature violation):
    a. Clear STAT0[THR1_IF].
    b. Write 01b to CTRL0[THR1_MODE].
    c. Write 1b to CTRL0[FILT1_CNT_CLR].
    d. Write the high-temperature threshold hysteresis to Threshold Control 01 (THR_CTRL01).
4. When STAT0[THR1_IF] is set again, repeat all the aforementioned steps.

58.6.4.3 Programming guidelines for threshold comparator2

Perform the following procedure to configure threshold comparator2:

1. Write 00b to CTRL0[THR2_MODE].
2. Write the low-temperature threshold to THR_CTRL23[TEMPERATURE_THRESHOLD2].
3. When STAT0[THR2_IF] is set (indicating that comparator2 detected panic high-temperature violation):
    a. Clear STAT0[THR2_IF].
    b. Write 00b to CTRL0[THR2_MODE].
    c. Write 1b to CTRL0[FILT2_CNT_CLR].
    d. Write the low-temperature threshold hysteresis to Threshold Control 23 (THR_CTRL23).
4. When STAT0[THR2_IF] is set again, repeat all the aforementioned steps.

58.6.4.4 State-based use case model: diagram

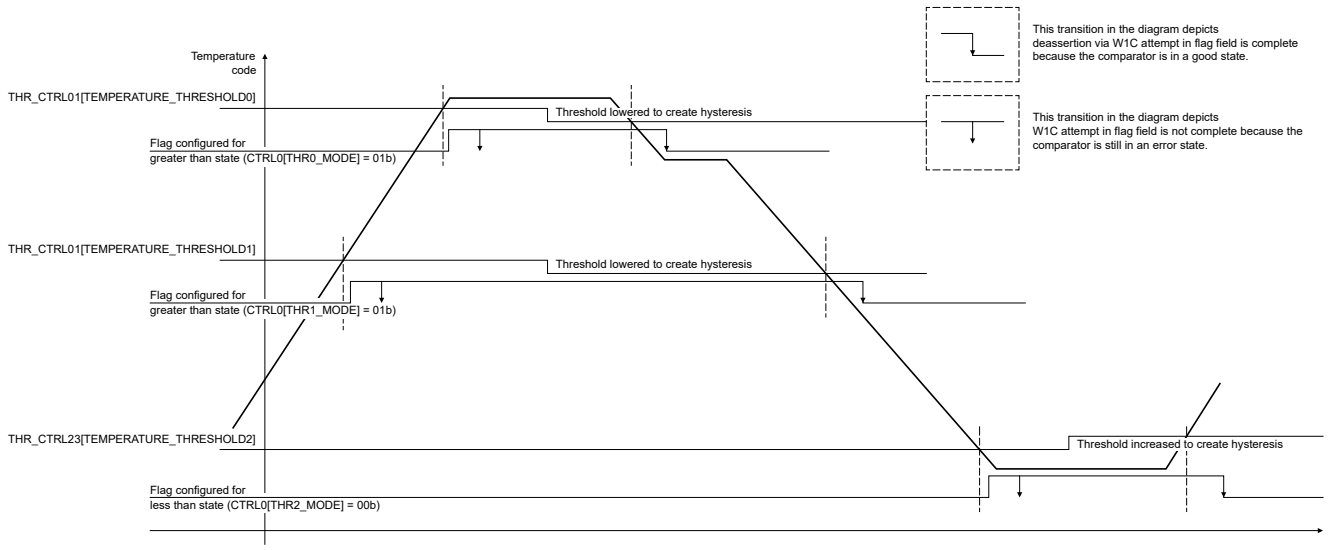

Figure 324. State-based use case model for comparators 0, 1, and 2

58.7 Memory map and registers

58.7.1 TEMPSENSE register descriptions

This section includes TEMPSENSE module memory map and detailed descriptions of all registers. All the registers support byte-enabled access and half word access along with full word access. Also, "ips_xfr_err" is generated if an out-of-range register address is accessed.

58.7.1.1 TEMPSENSE memory map

58.7.1.2 Control 0 (CTRL0)

Provides controls to:

- Configure comparator modes.
- Enable interrupt output events.
- Program the filter length.
- Clear internal counters.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
CTRL0	0h	Control 0
CTRL0_SET	4h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL0 is 1
CTRL0_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL0 is 0
CTRL0_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL0

Fields

Field	Description
31-23 —	Reserved
22 FILT2_CNT_CLR	Filter 2 Counter Clear Clears the internal counter that counts the number of threshold violations corresponding to THR_CTRL23[TEMPERATURE_THRESHOLD2]. You must clear this filter counter before changing THR_CTRL23[TEMPERATURE_THRESHOLD2] or THR2_MODE. Otherwise, the filter may give a false-flag warning. See the section Clearing threshold violation counter for more details. 0 - Settle to 0 after clearing the counter 1 - Clear the internal counter
21 FILT1_CNT_CLR	Filter 1 Counter Clear Clears the internal counter that counts the number of threshold violations corresponding to THR_CTRL01[TEMPERATURE_THRESHOLD1]. You must clear this filter counter before changing THR_CTRL01[TEMPERATURE_THRESHOLD1] or THR1_MODE. Otherwise, the filter may give a false-flag warning. See the section Clearing threshold violation counter for more details. 0 - Settle to 0 after clearing the counter 1 - Clear the internal counter
20 FILT0_CNT_CLR	Filter 0 Counter Clear Clears the internal counter that counts the number of threshold violations corresponding to THR_CTRL01[TEMPERATURE_THRESHOLD0]. You must clear this filter counter before changing THR_CTRL01[TEMPERATURE_THRESHOLD0] or THR0_MODE. Otherwise, the filter may give a false-flag warning. See the section Clearing threshold violation counter for more details. 0 - Settle to 0 after clearing the counter 1 - Clear the internal counter
19-17 —	Reserved
16 DRDY0_IE	Data-Ready Interrupt Enable Enables the interrupt output event when output data is ready after measurement completion. When this field is 0, the interrupt output is 0, and when this field is 1, the interrupt output follows STAT0[DRDY0_IF]. 0 - Disable 1 - Enable
15-12 N_FILT_0	Filter Length for Threshold Flag Allows you to program the filter length. You must implement a filter on the output of the thermal comparators at the cost of adding latency to the setting of the flag. This helps in limiting the false-positive thermal threshold setting of the flag. The thermal

Table continues on the next page...

Table continued from the previous page...

Field	Description
	flag asserts only if the consecutive number of threshold violations is greater than the value defined by this flag. Therefore, the setting of this flag is delayed by N_FILT_0+1 conversions.
11 —	Reserved for comparator3
10 THR2_IE	Threshold2 Comparator Interrupt Enable Enables interrupt output event for the threshold2 comparator event. If this field is 0, the interrupt output is 0, and if this field is 1, the interrupt output follows STAT0[THR2_IF]. 0 - Disable 1 - Enable
9 THR1_IE	Threshold1 Comparator Interrupt Enable Enables interrupt output event for the threshold1 comparator event. If this field is 0, the interrupt output is 0, and if this field is 1, the interrupt output follows STAT0[THR1_IF]. 0 - Disable 1 - Enable
8 THR0_IE	Threshold0 Comparator Interrupt Enable Enables interrupt output event for the threshold0 comparator event. If this field is 0, the interrupt output is 0, and if this field is 1, the interrupt output follows STAT0[THR0_IF]. 0 - Disable 1 - Enable
7-6 —	Reserved for comparator3
5-4 THR2_MODE	Threshold2 Comparator Mode Configures comparator modes for temperature threshold2. A comparator detects events by comparing the temperature data with a threshold. See the section Clearing threshold violation counter if changing THR2_MODE between conversions without IP reset. 00 - Less than or equal to threshold 01 - Greater than threshold 10 - High to low temperature data transition at threshold 11 - Low to high temperature data transition at threshold
3-2 THR1_MODE	Threshold1 Comparator Mode Configures comparator modes for temperature threshold1. A comparator detects events by comparing the temperature data with a threshold. See the section Clearing threshold violation counter if changing THR1_MODE between conversions without IP reset.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	00 - Less than or equal to threshold 01 - Greater than threshold 10 - High to low temperature data transition at threshold 11 - Low to high temperature data transition at threshold
1-0 THR0_MODE	Threshold0 Comparator Mode Configures comparator modes for temperature threshold0. A comparator detects events by comparing the temperature data with a threshold. See the section Clearing threshold violation counter if changing THR0_MODE between conversions without IP reset. 00 - Less than or equal to threshold 01 - Greater than threshold 10 - High to low temperature data transition at threshold 11 - Low to high temperature data transition at threshold

58.7.1.3 Status 0 (STAT0)

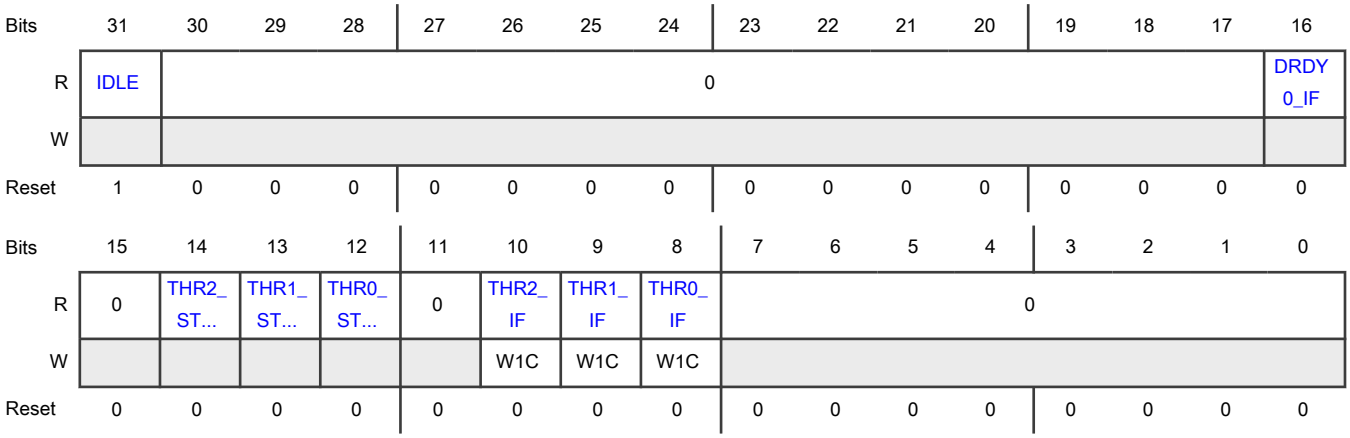
Provides the threshold comparator status, flag, and finish status.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
STAT0	10h	Status 0
STAT0_SET	14h	Writing 1 to a bit in this register ensures that the corresponding bit in STAT0 is 1
STAT0_CLR	18h	Writing 1 to a bit in this register ensures that the corresponding bit in STAT0 is 0
STAT0_TOG	1Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in STAT0

Diagram



Fields

Field	Description
31 IDLE	Idle State Indicates whether TEMPSENSE is in Idle state or undergoing conversion. 0 - Conversion 1 - Idle
30-17 —	Reserved
16 DRDY0_IF	Data Ready Flag Indicates whether new data is available on DATA0[DATA_VAL]. TEMPSENSE sets this flag for data ready after measurement completion. Read DATA0[DATA_VAL] to clear this flag. 0 - No new data available 1 - New data available
15 —	Reserved for comparator3
14 THR2_STAT	Threshold2 State Indicates the state of the threshold2 comparator. If bit 0 of CTRL0[THR2_MODE] is 0, this field becomes 0 when DATA0[DATA_VAL] is above threshold2. This field becomes 1 when DATA0[DATA_VAL] is less than or equal to threshold2. If bit 0 of CTRL0[THR2_MODE] is 1, this field becomes 0 when DATA0[DATA_VAL] is less than or equal to threshold2. This field becomes 1 when DATA0[DATA_VAL] is above threshold2. **NOTE** This field becomes 1 or 0, considering the value of CTRL0[N_FILT_0].
13	Threshold1 State

Table continues on the next page...

Table continued from the previous page...

Field	Description
THR1_STAT	Indicates the state of the threshold1 comparator. If bit 0 of CTRL0[THR1_MODE] is 0, this field becomes 0 when DATA0[DATA_VAL] is above threshold1. This field becomes 1 when DATA0[DATA_VAL] is less than or equal to threshold1. If bit 0 of CTRL0[THR1_MODE] is 1, this field becomes 0 when DATA0[DATA_VAL] is less than or equal to threshold1. This field becomes 1 when DATA0[DATA_VAL] is above threshold1. **NOTE** This field becomes 1 or 0, considering the value of CTRL0[N_FILT_0].
12 THR0_STAT	Threshold0 State Indicates the state of the threshold0 comparator. If bit 0 of CTRL0[THR0_MODE] is 0, this field becomes 0 when DATA0[DATA_VAL] is above threshold0. This field becomes 1 when DATA0[DATA_VAL] is less than or equal to threshold0. If bit 0 of CTRL0[THR0_MODE] is 1, this field becomes 0 when DATA0[DATA_VAL] is less than or equal to threshold0. This field becomes 1 when DATA0[DATA_VAL] is above threshold0. **NOTE** This field becomes 0 or 1, considering the value of CTRL0[N_FILT_0].
11 —	Reserved for comparator3
10 THR2_IF	Threshold2 Status Flag Indicates whether a threshold2 comparator event occured (that is, threshold2 violation happens). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Event did not occur 1 - Event occurred When writing 0 - No effect 1 - Clear the flag
9 THR1_IF	Threshold1 Status Flag Indicates whether a threshold1 comparator event occured (that is, threshold1 violation happens). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Event did not occur

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Event occurred When writing 0 - No effect 1 - Clear the flag
8 THR0_IF	Threshold0 Status Flag Indicates whether a threshold0 comparator event occured (that is, threshold0 violation happens). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Event did not occur 1 - Event occurred When writing 0 - No effect 1 - Clear the flag
7-0 —	Reserved

58.7.1.4 Data 0 (DATA0)

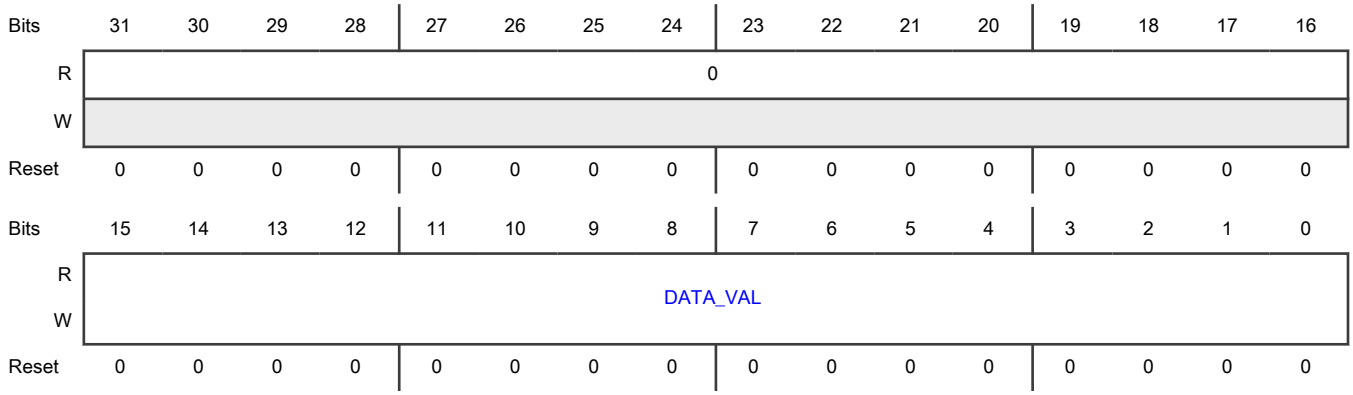
Captures temperature data value from TEMPSENSE.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DATA0	20h	Data 0
DATA0_SET	24h	Writing 1 to a bit in this register ensures that the corresponding bit in DATA0 is 1
DATA0_CLR	28h	Writing 1 to a bit in this register ensures that the corresponding bit in DATA0 is 0
DATA0_TOG	2Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DATA0

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 DATA_VAL	Temperature Data Value Captures data from TEMPSENSE at the end of measurement. To convert the binary value of this field to temperature, in ℃, see Digital word representation .

58.7.1.5 Threshold Control 01 (THR_CTRL01)

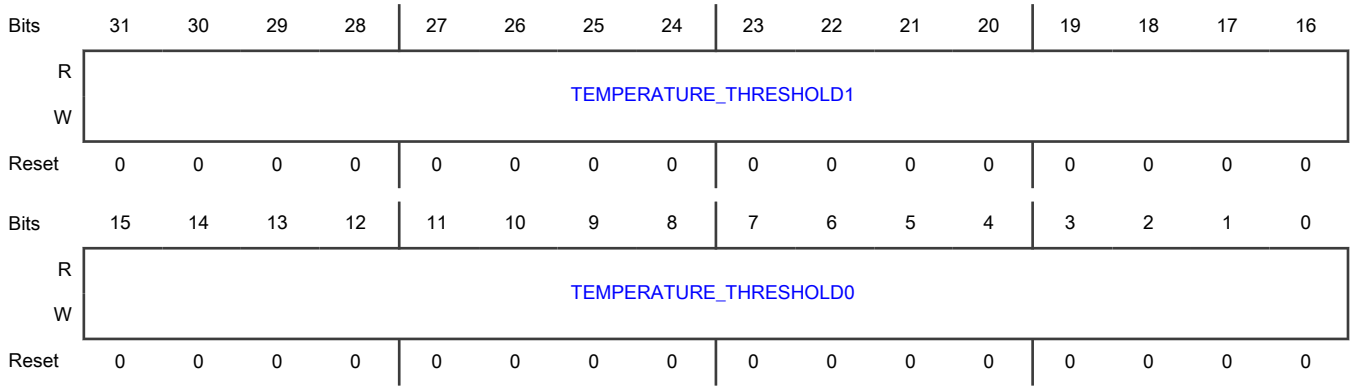
Provides threshold control for comparator0 and comparator1.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
THR_CTRL01	30h	Threshold Control 01
THR_CTRL01_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL01 is 1
THR_CTRL01_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL01 is 0
THR_CTRL01_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in THR_CTRL01

Diagram



Fields

Field	Description
31-16 TEMPERATURE_THRESHOLD1	Temperature Threshold1 Provides the threshold for temperature comparator1 to detect whether DATA0[DATA_VAL] is within the range. CTRL0[THR1_MODE] selects the modes of comparator1, and CTRL0[N_FILT_0] filters the temperature comparator1 result to avoid a false flag. To configure the binary value of this field to temperature, in ℃, see Digital word representation .
15-0 TEMPERATURE_THRESHOLD0	Temperature Threshold0 Provides the threshold for temperature comparator0 to detect whether DATA0[DATA_VAL] is within the range. CTRL0[THR0_MODE] selects the modes of comparator0, and CTRL0[N_FILT_0] filters temperature comparator0 to avoid a false flag. To configure the binary value of this field to temperature, in ℃, see Digital word representation .

58.7.1.6 Threshold Control 23 (THR_CTRL23)

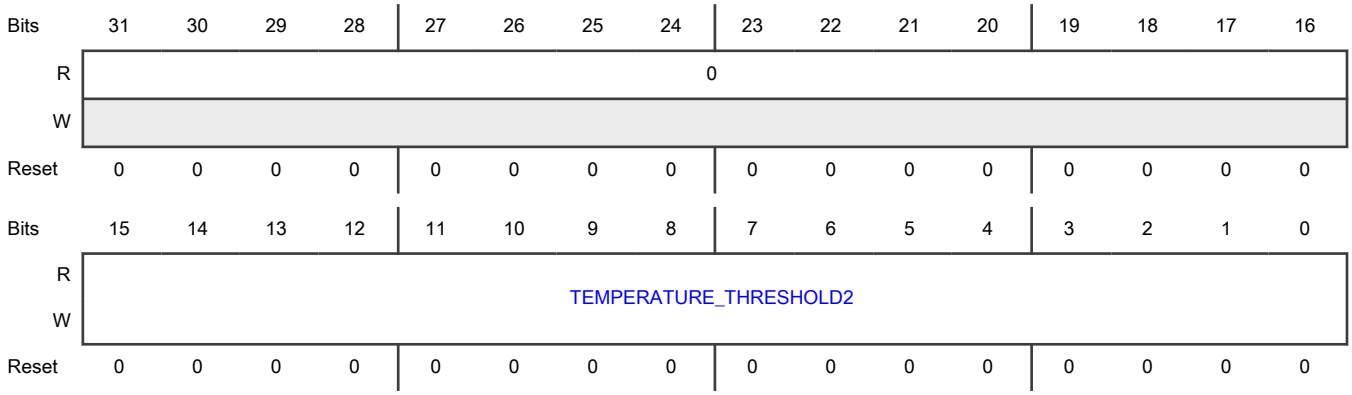
Provides threshold control for comparator2.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
THR_CTRL23	40h	Threshold Control 23
THR_CTRL23_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL23 is 1
THR_CTRL23_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL23 is 0
THR_CTRL23_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in THR_CTRL23

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 TEMPERATURE_THRESHOLD2	Temperature Threshold2 Provides the threshold for temperature comparator2 to detect whether DATA0[DATA_VAL] is within the range. CTRL0[THR2_MODE] selects the modes of comparator2, and CTRL0[N_FILT_0] filters the temperature comparator2 result to avoid a false flag. To configure the binary value of this field to temperature, in ℃, see Digital word representation .

58.7.1.7 Control 1 (CTRL1)

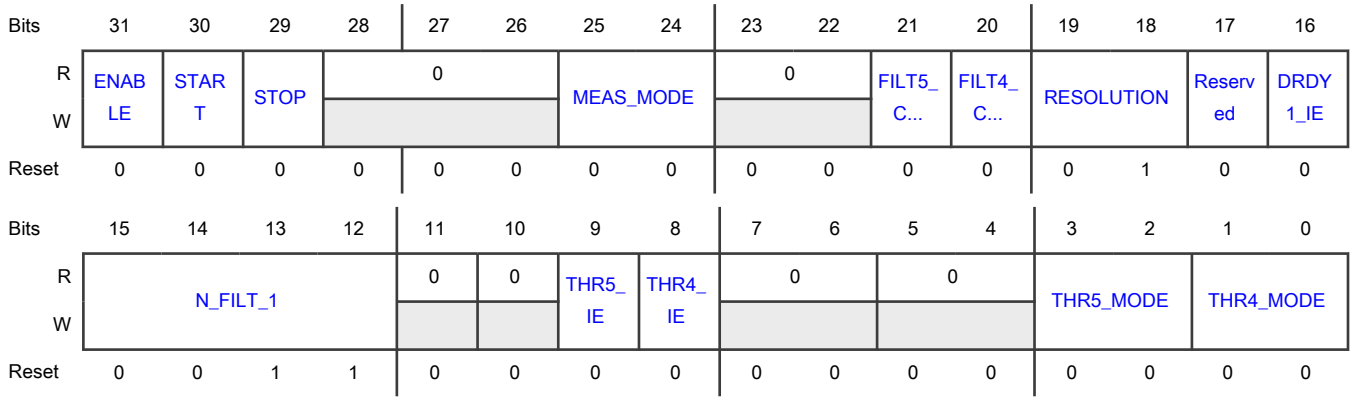
Allows mode and interrupt control for comparator4 and comparator5.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
CTRL1	200h	Control 1
CTRL1_SET	204h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL1 is 1
CTRL1_CLR	208h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL1 is 0
CTRL1_TOG	20Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL1

Diagram



Fields

Field	Description
31 ENABLE	TEMPSENSE Enable Enables TEMPSENSE. 0 - Disable 1 - Enable
30 START	Start Measurement Starts the temperature measurement. After you write 1 to this field, TEMPSENSE automatically changes this field to 0. 0 - No effect 1 - Start the measurement
29 STOP	Stop Measurement Stops the temperature measurement. For Single or Periodic One-Shot Measurement mode, it waits for the ongoing conversion to end. 0 - Clear after conversion is over 1 - Stop the conversion
28-26 —	Reserved
25-24 MEAS_MODE	Measurement Mode Selects the measurement mode (Single One-Shot, or Periodic One-Shot) for TEMPSENSE. You must change this field only when TEMPSENSE is not measuring, that is, when STAT*n*[IDLE] = 1. 00 - Single One-Shot Measurement 01 - Reserved 10 - Periodic One-Shot Measurement 11 - Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
23-22 —	Reserved
21 FILT5_CNT_CLR	Filter 5 Counter Clear Clear the internal counter that counts the number of threshold violations corresponding to THR_CTRL45[TEMPERATURE_THRESHOLD5]. You must clear this filter counter before changing THR_CTRL45[TEMPERATURE_THRESHOLD5] or THR5_MODE. Otherwise, the filter may give a false-flag warning. See the section Clearing threshold violation counter for more details. 0 - Settle to 0 after clearing the counter 1 - Clear the internal counter
20 FILT4_CNT_CLR	Filter 4 Counter Clear Clears the internal counter that counts the number of threshold violations corresponding to THR_CTRL45[TEMPERATURE_THRESHOLD4]. You must clear this filter counter before changing THR_CTRL45[TEMPERATURE_THRESHOLD4] or THR4_MODE. Otherwise, the filter may give a false-flag warning. See the section Clearing threshold violation counter for more details. 0 - Settle to 0 after clearing the counter 1 - Clear the internal counter
19-18 RESOLUTION	Resolution Mode Specifies the conversion time for different resolution modes. This field helps you configure the length of the conversion time. Longer conversion time translates into higher resolution. 00 - 0.59325 ms 01 - 1.10525 ms 10 - 2.12925 ms 11 - 4.17725 ms
17 —	Reserved
16 DRDY1_IE	Data-Ready Interrupt Enable Enables interrupt output event for measurement completion. When this field is 0, the interrupt output is 0, and when this field is 1, the interrupt output follows STAT1[DRDY1_IF]. 0 - Disable 1 - Enable
15-12 N_FILT_1	Filter Length for Threshold Flag Programs the filter length. You must implement a filter on the output of the thermal comparators at the cost of adding latency to the setting of the flag. This helps in limiting the false-positive thermal threshold setting of the flag. The thermal

Field	Description
	flag asserts only if the consecutive number of threshold violations is greater than the value defined by this flag. Therefore, setting of this flag is delayed by N_FILT_1+1 conversions.
11 —	Reserved
10 —	Reserved
9 THR5_IE	Threshold Comparator5 Interrupt Enable Enables interrupt output event for the threshold5 comparator event. When this field is 0, the interrupt output is 0, and when this field is 1, the interrupt output follows STAT1[THR5_IF]. 0 - Disable 1 - Enable
8 THR4_IE	Threshold Comparator4 Interrupt Enable Enables interrupt output event for the threshold4 comparator event. When this field is 0, the interrupt output is 0, and when this field is 1, the interrupt output follows STAT1[THR4_IF]. 0 - Disable 1 - Enable
7-6 —	Reserved
5-4 —	Reserved
3-2 THR5_MODE	Threshold5 Comparator Mode Configures the comparator modes for temperature threshold5. A comparator detects events by comparing the temperature data with a threshold. See the section Clearing threshold violation counter if changing THR5_MODE between conversions without IP reset. 00 - Less than or equal to threshold 01 - Greater than threshold 10 - High to low temperature data transition at threshold 11 - Low to high temperature data transition at threshold
1-0 THR4_MODE	Threshold4 Comparator Mode Configures the comparator modes for temperature threshold4. A comparator detects events by comparing the temperature data with a threshold. See the section Clearing threshold violation counter if changing THR4_MODE between conversions without IP reset. 00 - Less than or equal to threshold

Table continues on the next page...

Table continued from the previous page...

Field	Description
	01 - Greater than threshold 10 - High to low temperature data transition at threshold 11 - Low to high temperature data transition at threshold

58.7.1.8 Status 1 (STAT1)

Provides the comparator threshold state and flag status.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
STAT1	210h	Status 1
STAT1_SET	214h	Writing 1 to a bit in this register ensures that the corresponding bit in STAT1 is 1
STAT1_CLR	218h	Writing 1 to a bit in this register ensures that the corresponding bit in STAT1 is 0
STAT1_TOG	21Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in STAT1

Diagram

Fields

Field	Description
31 IDLE	Idle State Indicates whether TEMPSENSE is in Idle state or undergoing conversion.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	0 - Conversion 1 - Idle
30-18 —	Reserved
17 —	Reserved
16 DRDY1_IF	Data Ready Flag Indicates whether new data is available on DATA1[DATA_VAL]. TEMPSENSE sets this flag for measurement completion. Read DATA1[DATA_VAL] to clear this flag. 0 - No new data 1 - New data
15-14 —	Reserved
13 THR5_STAT	Threshold5 State Indicates the state of the threshold5 comparator. If bit 0 of CTRL1[THR5_MODE] is 0, this field becomes 0 when DATA1[DATA_VAL] is above threshold5. This field becomes 1 when DATA1[DATA_VAL] is less than or equal to threshold5. If bit 0 of CTRL1[THR5_MODE] is 1, this field becomes 0 when DATA1[DATA_VAL] is less than or equal to threshold5. This field becomes 1 when DATA1[DATA_VAL] is above threshold5. **NOTE** This field becomes 1 or 0, considering the value of CTRL1[N_FILT_1].
12 THR4_STAT	Threshold4 State Indicates the state of the threshold4 comparator. If bit 0 of CTRL1[THR4_MODE] is 0, this field becomes 0 when DATA1[DATA_VAL] is above threshold4. This field becomes 1 when DATA1[DATA_VAL] is less than or equal to threshold4. If bit 0 of CTRL1[THR4_MODE] is 1, this field becomes 0 when DATA1[DATA_VAL] is less than or equal to threshold4. This field becomes 1 when DATA1[DATA_VAL] is above threshold4. **NOTE** This field becomes 1 or 0, considering the value of CTRL1[N_FILT_1].
11-10 —	Reserved
9	Threshold5 Status Flag

Table continues on the next page...

Table continued from the previous page...

Field	Description
THR5_IF	Indicates whether a threshold5 comparator event occured (that is, threshold5 violation happens). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Event did not occur 1 - Event occurred When writing 0 - No effect 1 - Clear the flag
8 THR4_IF	Threshold4 Status Flag Indicates whether a threshold4 comparator event occured (that is, threshold4 violation happens). **NOTE** This field behaves differently for register reads and writes. When reading 0 - Event did not occur 1 - Event occurred When writing 0 - No effect 1 - Clear the flag
7-0 —	Reserved

58.7.1.9 Data 1 (DATA1)

Captures data from the temperature sensor.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

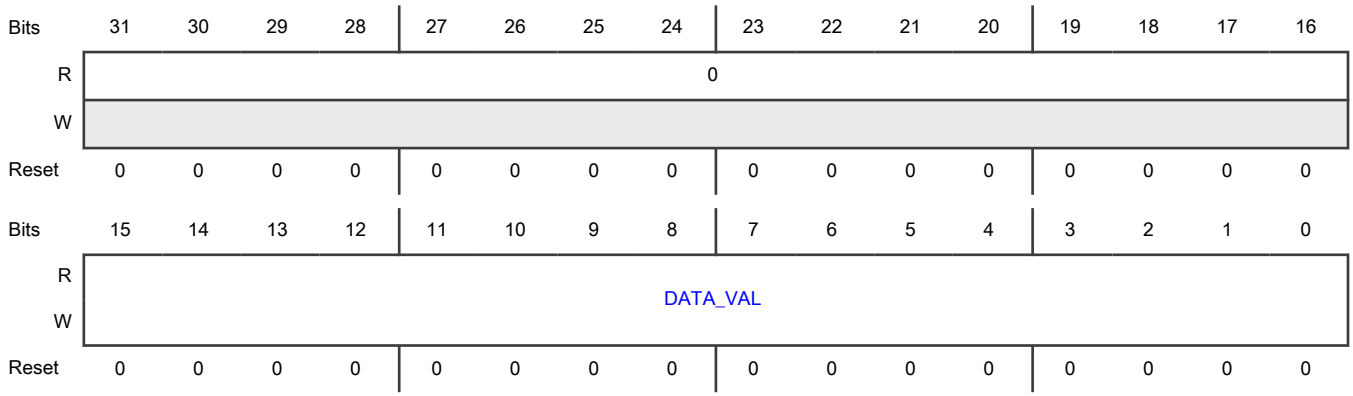
Register	Offset	Description
DATA1	220h	Data 1
DATA1_SET	224h	Writing 1 to a bit in this register ensures that the corresponding bit in DATA1 is 1
DATA1_CLR	228h	Writing 1 to a bit in this register ensures that the corresponding bit in DATA1 is 0

Table continues on the next page...

Table continued from the previous page...

Register	Offset	Description
DATA1_TOG	22Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DATA1

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 DATA_VAL	Temperature Data Value Captures data from the temperature sensor at the end of measurement. To convert the binary value of this field to temperature, in ℃, see Digital word representation .

58.7.1.10 Threshold Control 45 (THR_CTRL45)

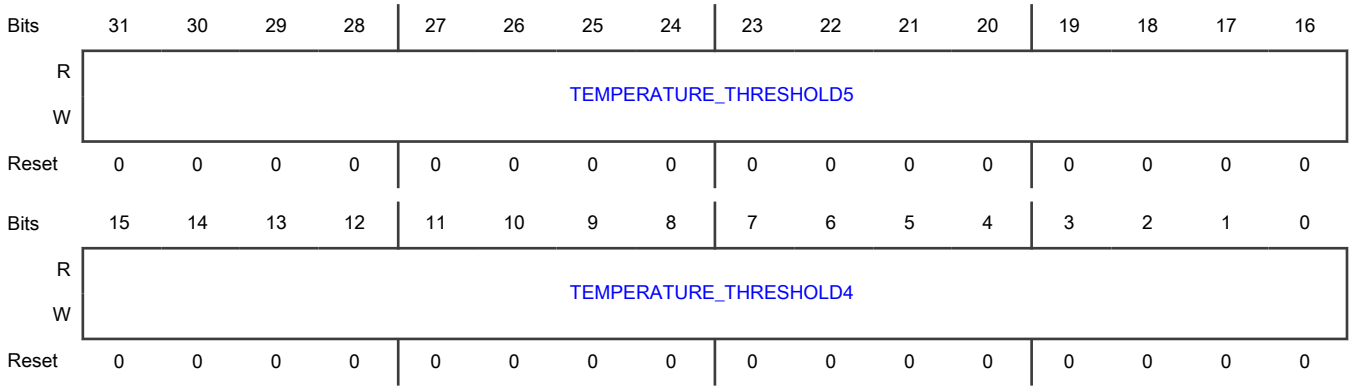
Specifies the threshold for comparator4 and comparator5.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
THR_CTRL45	250h	Threshold Control 45
THR_CTRL45_SET	254h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL45 is 1
THR_CTRL45_CLR	258h	Writing 1 to a bit in this register ensures that the corresponding bit in THR_CTRL45 is 0
THR_CTRL45_TOG	25Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in THR_CTRL45

Diagram



Fields

Field	Description
31-16 TEMPERATURE_THRESHOLD5	Temperature Threshold5 Specifies the threshold for temperature comparator5 to detect whether DATA1[DATA_VAL] is within the range. CTRL1[THR5_MODE] selects the modes of comparator5, and CTRL1[N_FILT_1] filters the temperature comparator5 result to avoid a false flag. To configure the binary value of this field to temperature, in ℃, see Digital word representation .
15-0 TEMPERATURE_THRESHOLD4	Temperature Threshold4 Specifies the threshold for temperature comparator4 to detect whether DATA1[DATA_VAL] is within the range. CTRL1[THR4_MODE] selects the modes of comparator4, and CTRL1[N_FILT_1] filters the temperature comparator4 result to avoid a false flag. To configure the binary value of this field to temperature, in ℃, see Digital word representation .

58.7.1.11 Measurement Period Control (PERIOD_CTRL)

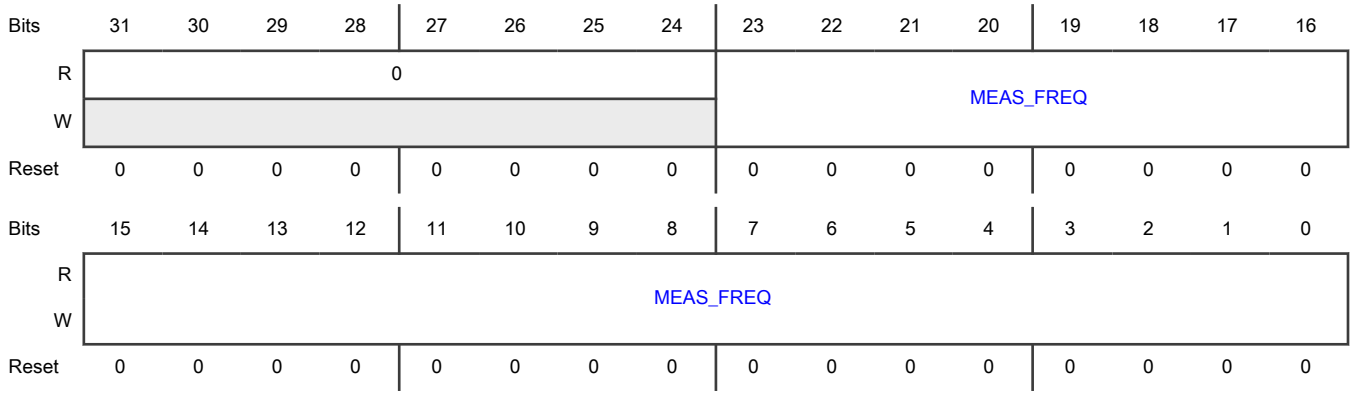
Controls the measurement period for Periodic One-Shot Conversion.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
PERIOD_CTRL	270h	Measurement Period Control
PERIOD_CTRL_SET	274h	Writing 1 to a bit in this register ensures that the corresponding bit in PERIOD_CTRL is 1
PERIOD_CTRL_CLR	278h	Writing 1 to a bit in this register ensures that the corresponding bit in PERIOD_CTRL is 0
PERIOD_CTRL_TOG	27Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in PERIOD_CTRL

Diagram



Fields

Field	Description
31-24 —	Reserved
23-0 MEAS_FREQ	TEMPSENSE Periodic Measurement Frequency Sets the target count (measurement period) on CONV_CLK for periodic trigger in Periodic One-Shot Conversion mode: (t_{MEAS_FREQ} = t_{CONV_CLK} × MEAS_FREQ, where t_{MEAS_FREQ} = Measurement period and t_{CONV_CLK} = 1/f_{CONV_CLK}). For example, measurement period = 1 s. f_{CONV_CLK} = 4 MHz. MEAS_FREQ = 4000000d. This field must be greater than count corresponding to time greater than summation of conversion time, PUD, and six times of conversion clock time: t_{MEAS_FREQ} > (t_{CONV} + t_{PUD} + 6 × t_{CONV_CLK}). t_{CONV} is the conversion time determined by CTRL1[RESOLUTION]. For example, t_{CONV} = 1.10525 ms (For RESOLUTION=2'b01) and f_{CONV_CLK} = 4 MHz. Then program MEAS_FREQ greater than 4427d.

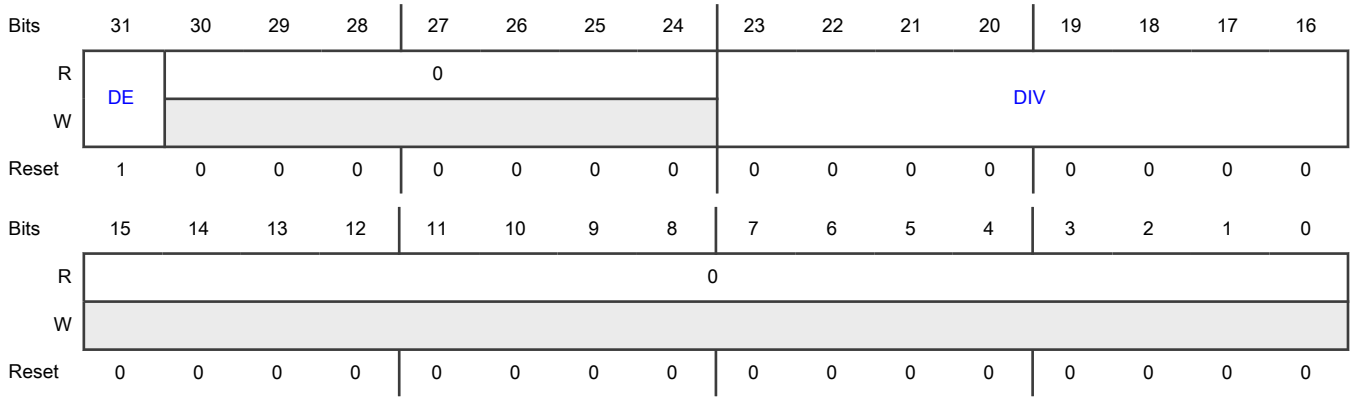
58.7.1.12 Reference Clock Divider Control (REF_DIV)

Specifies the divider value for reference clock generation.

Offset

Register	Offset
REF_DIV	280h

Diagram



Fields

Field	Description
31 DE	Divider Enable Enables the divider. 0 - Disable 1 - Enable
30-24 —	Reserved
23-16 DIV	Divider Value Specifies the divider value for generating CONV_CLK from MODULE_CLK. The output clock frequency = input clock frequency ÷ (DIV+1). 0000_0000 - Output clock frequency = input clock frequency 0000_0001 - Output clock frequency = input clock frequency ÷ 2 0000_0010 - Output clock frequency = input clock frequency ÷ 3 0000_0011 - ... 1111_1111 - Output clock frequency = input clock frequency ÷ 256
15-0 —	Reserved

58.7.1.13 Power-Up Delay Control (PUD_ST_CTRL)

Controls PUD and Self-Test mode of the analog block.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
PUD_ST_CTRL	2B0h	Power-Up Delay Control
PUD_ST_CTRL_SET	2B4h	Writing 1 to a bit in this register ensures that the corresponding bit in PUD_ST_CTRL is 1
PUD_ST_CTRL_CLR	2B8h	Writing 1 to a bit in this register ensures that the corresponding bit in PUD_ST_CTRL is 0
PUD_ST_CTRL_TOG	2BCh	Writing 1 to a bit in this register inverts the value of the corresponding bit in PUD_ST_CTRL

Diagram

PUD	Power-up delay

Chapter 59
PLLs

59.1 Overview

PLL (as a fractional-N synthesizer) supports a 30-bit numerator and denominator. Numerator is a signed number that you can use to adjust the fractional portion of the feedback divider dynamically.

The PLL digital control unit provides a user interface and control of the PLL system, which consists of the following:

- A single PLL analog block
- A digital interface
- DFS blocks with a dedicated output divided by two dividers for fractional division with different output clocks and status signals

59.1.1 Block diagram

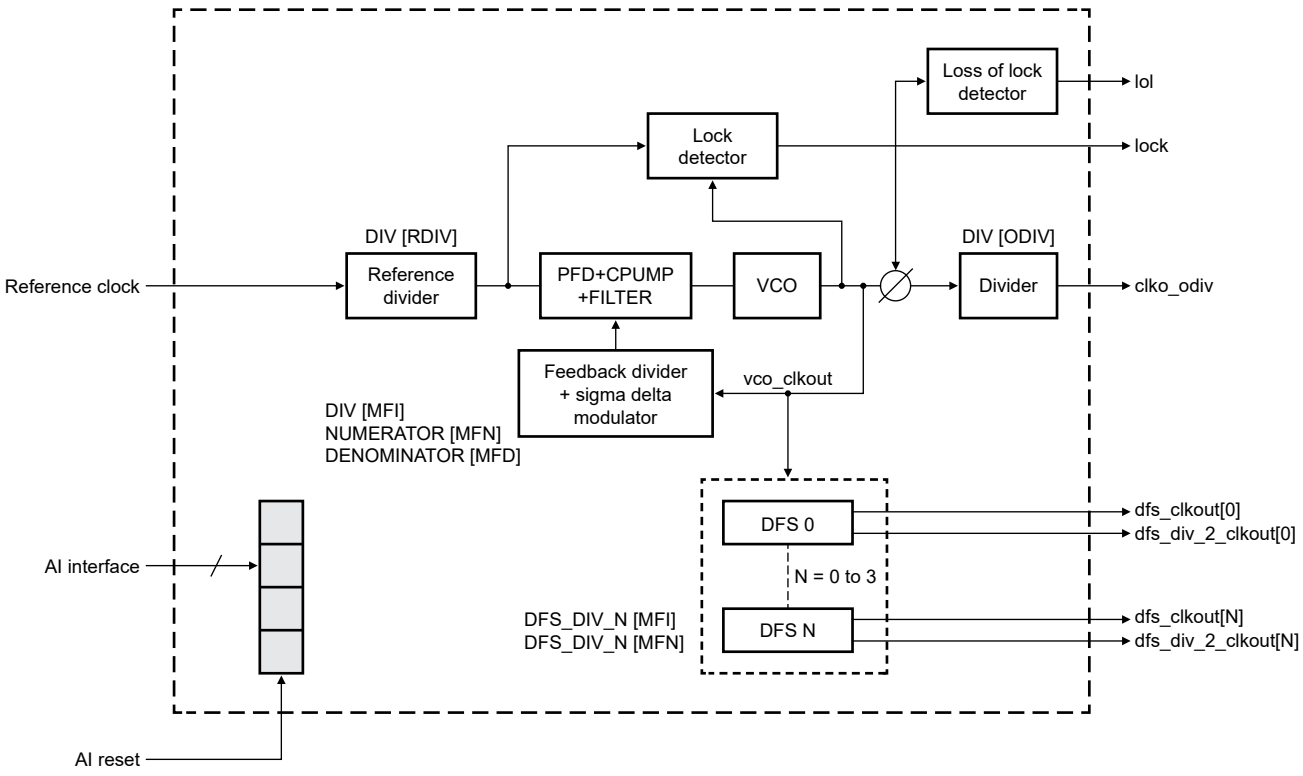

Figure 325. Block diagram

59.1.2 Features

- Programmable frequency modulation
- Programmable output dividers
- Capability to change runtime programmable fractional portion of feedback divider
- Programmable clock bypass feature
- Integer and fractional loop dividers

- Spread spectrum feature
- Support for DFS blocks
- DFS block has dedicated output divided by 2 dividers with different output clocks and status signals

59.2 Functional description

This section describes the operation and configuration of PLL.

59.2.1 PLL settings for operation in different modes

CTRL[POWERUP] and SPREAD_SPECTRUM[ENABLE] work together to enable or disable PLL in different modes. The following table lists the value settings of these fields.

Table 540. PLL settings for operation in different modes

CTRL[POWERUP]	SPREAD_SPECTRUM[ENABLE]	Functionality
0	0/1	PLL is disabled.
1	0	PLL is operational in both Integer and Fractional modes.
1	1	PLL is operational in SSCG mode.

59.2.2 Frequency range

PLL supports a reference clock frequency (F_{ref} ÷ DIV[RDIV]) in the range of 20−40 MHz, and VCO clock frequency (F_{vco_clk}) in the range of 2.5−5 GHz.

59.2.3 Clock configuration

59.2.3.1 PLL output clock frequency

$$F_{clko_odiv} = \frac{F_{vco_clk}}{DIV[ODIV]}$$

Equation 50. PLL output clock frequency

59.2.3.2 DFS output clock frequency

$$F_{dfs_clkout_N} = \frac{F_{vco_clk}}{DFS_DIV_N[MFI] + \left(\frac{DFS_DIV_N[MFN]}{5}\right)} \quad N = 0 \text{ to } 3$$

Equation 51. DFS output clock frequency

59.2.3.3 PLL VCO clock frequency in Integer mode

$$F_{vco_clk} = \frac{F_{ref}}{DIV[RDIV]} \times DIV[MFI]$$

Equation 52. PLL VCO clock frequency in Integer mode

59.2.3.4 PLL VCO clock frequency in Fractional mode

$$F_{vco_clk} = \frac{F_{ref}}{DIV[RDIV]} \times \left(DIV[MFI] + \frac{NUMERATOR[MFN]}{DENOMINATOR[MFD]} \right)$$

$$where \ \frac{NUMERATOR[MFN]}{DENOMINATOR[MFD]}$$

must be in the range of −2 to +2 when spread spectrum is disabled
must be in the range of 0 to 1 when spread spectrum is enabled

Equation 53. PLL VCO clock frequency in Fractional mode

59.2.4 Spread spectrum

This section describes the types of spread depending on the spread spectrum frequency, and the spread spectrum configuration along with a sample calculation.

59.2.4.1 Types of spreads

In Spread Spectrum mode, you must modulate the frequency of the output clock to lower the Electromagnetic interference (EMI) (for some specific applications). The frequency varies with time in a triangular fashion as shown in Figure 326 and Figure 327.

The time taken by the peak frequency to repeat itself is the modulation time and its inverse is called modulation frequency. The difference between high and low peak frequency is called spread frequency or modulation depth.

The spreads can be of the following two types:

- Center spread: The high peak frequency is above the base frequency by (spread_frequency ÷ 2) and low peak frequency is below the base frequency by (spread_frequency ÷ 2).
- Down spread: The high peak frequency is the base frequency itself, and low peak frequency is (base_frequency - spread_frequency).

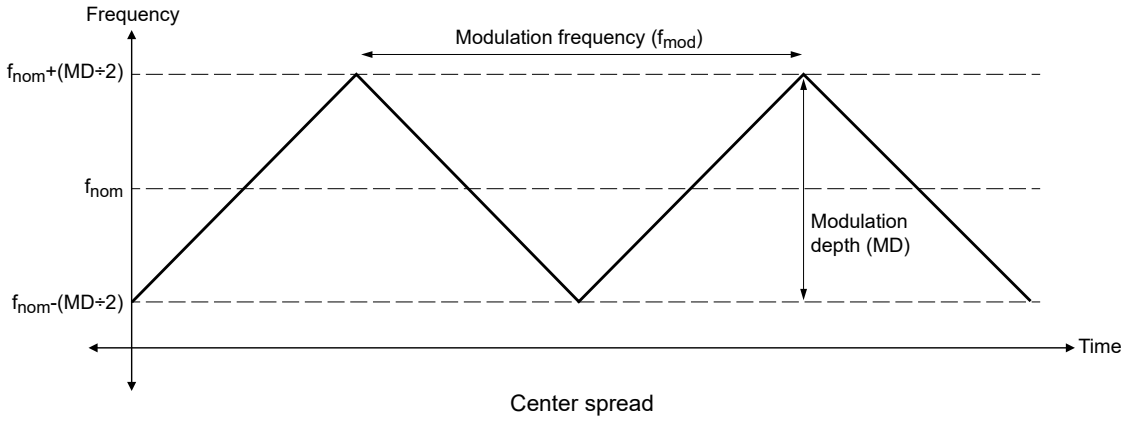

Figure 326. Spread spectrum frequency change vs time plot (center spread)

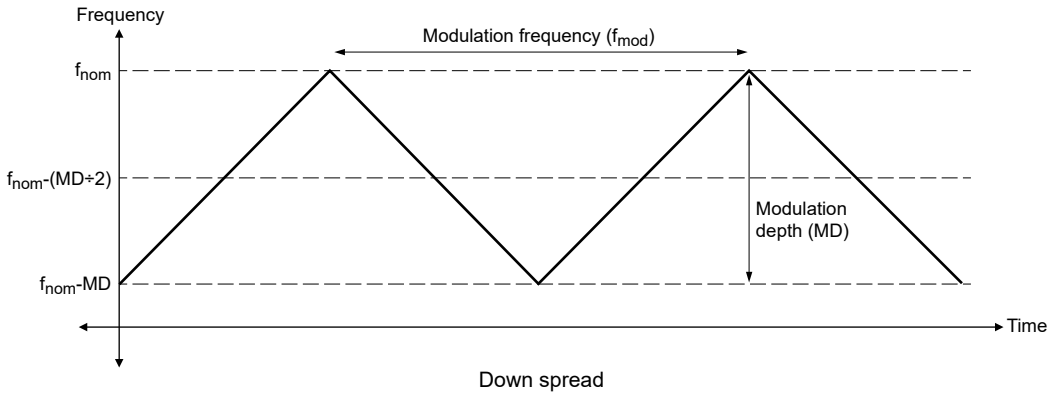

Figure 327. Spread spectrum frequency change vs time plot (down spread)

59.2.4.2 Spread spectrum configuration

You can configure Spread Spectrum mode using the following register fields:

- SPREAD_SPECTRUM[ENABLE]: Enables or disables spread spectrum.
- CTRL[SPREADCTL]: Selects between center spread and down spread.
- SPREAD_SPECTRUM[STEP] and SPREAD_SPECTRUM[STOP]: Helps program the modulation and spread frequency.

Prior to enabling the spread spectrum, you must configure the base frequency in either Integer mode or Fractional mode.

Use Equation 54 to calculate spread frequency.

$$spread_{freq} = \frac{SPREAD_SPECTRUM[STOP]}{DENOMINATOR[MFD]} \times \frac{F_{ref}}{DIV[RDIV]}$$

Equation 54. Spread frequency

Ensure that the following conditions are fulfilled for spread spectrum configuration:

- The value of SPREAD_SPECTRUM[STOP] must be less than four times the value of DENOMINATOR[MFD].
- The calculated spread frequency must not exceed the value of 4 × (F_{ref} ÷ DIV[RDIV]). For example, if (F_{ref} ÷ DIV[RDIV]) is 20 MHz, then spread frequency must be within 4 × 20 MHz, which means 80 MHz.

Use Equation 55 to calculate modulation frequency.

$$Modulation_{freq} = \frac{F_{ref}}{DIV[RDIV] \times 2} \times \frac{SPREAD_SPECTRUM[STEP]}{SPREAD_SPECTRUM[STOP]}$$

Equation 55. Modulation frequency

If (F_{ref} ÷ DIV[RDIV]) = 40 MHz, then modulation frequency must lie between 30 KHz and 128 KHz, and if (F_{ref} ÷ DIV[RDIV])) is less than 40 MHz, then modulation frequency must lie between 30 KHz and 64 KHz.

Use Equation 56 to calculate the step by which the frequency increases or decreases.

$$Step_{freq}change = \frac{SPREAD_SPECTRUM[STEP]}{DENOMINATOR[MFD]} \times \frac{F_{ref}}{DIV[RDIV]}$$

Equation 56. Step frequency change

The range in which the frequency varies during spread spectrum depends on the type of spread you program:

- For center spread, the range is from (F_{vco_clk} - (spread_frequency ÷ 2)) to (F_{vco_clk} + (spread_frequency ÷ 2)).
- For down spread, the range is from (F_{vco_clk} - spread_frequency) to F_{vco_clk}.

59.2.4.3 Sample calculations

Table 541. Calculations for SPREAD_SPECTRUM[STOP] and SPREAD_SPECTRUM[STEP]

Assumed parameters	SPREAD_SPECTRUM[STOP]	SPREAD_SPECTRUM[STEP]
• F_{ref} = 40 MHz • DIV[RDIV] = 1 • DENOMINATOR[MFD] = 10000 • NUMERATOR[MFN] = 9000 • Spread frequency = 32 MHz • Modulation frequency = 50 KHz	Formula: SPREAD_SPECTRUM[STOP] = (spread frequency × DENOMINATOR[MFD]) ÷ (F_{ref} ÷ DIV[RDIV])	Formula: SPREAD_SPECTRUM[STEP] = (modulation frequency × SPREAD_SPECTRUM[STOP]) ÷ (F_{ref} ÷ (DIV[RDIV] × 2))
	Calculation: SPREAD_SPECTRUM[STOP] = (32 MHz × 10000) ÷ (40 MHz ÷ 1) Therefore, SPREAD_SPECTRUM[STOP] = (32 × 10000) ÷ (40) = 8000	Calculation: SPREAD_SPECTRUM[STEP] = (50 KHz × 8000) ÷ (40 MHz ÷ (1 × 2)) Therefore,SPREAD_SPECTRUM[STEP] = (50 × 8) ÷ (40 × 2) = 20

59.2.5 Dynamic MFN update in PLL

In PLL, NUMERATOR[MFN] can be updated dynamically.

You cannot dynamically change the value of NUMERATOR[MFN] when CTRL[HW_CTRL_SEL] is 1. In this scenario, for dynamically changing the value of NUMERATOR[MFN], perform the following steps:

1. Write 1 to CTRL[POWERUP].
2. Write 0 to CTRL[HW_CTRL_SEL] (this switches the PLL control to software mode).
3. Configure the needed value to NUMERATOR[MFN].
4. Switch back to hardware control mode by writing 1 to CTRL[HW_CTRL_SEL].

NOTE

If NUMERATOR[MFN] is to be updated dynamically, it is essential to ensure that the resulting frequency change does not exceed 1%. Otherwise, the PLL may lose its lock, leading to a loss of signal assertion.

59.2.6 Dynamic MFN update in DFS

In DFS, DFS_DIV_N[MFN] and DFS_DIV_N[MFI] can be updated dynamically.

59.2.7 Interrupts

This module has no interrupts.

59.3 External signals

This module has no external signals.

59.4 Initialization

59.4.1 Integer mode

Table 542. Initialization in Integer mode

Step	Purpose	Programming	Notes
1	Specify the divider value according to Integer mode.	Configure the following fields: • DIV[ODIV] • DIV[RDIV] • DIV[MFI]	—
2	—	Wait for 5 µs.	—
3	Enable the PLL block.	Configure CTRL[POWERUP].	—
4	Wait for lock.	Poll PLL_STATUS[PLL_LOCK] and wait until it becomes 1 and the pll_lock output signal is asserted.	The maximum wait time is 100 µs.
5	Enable the PLL output clock.	Write 1 to CTRL[CLKMUX_EN].	—
6	Specify the DFS division integer and fraction according to Integer mode.	Write appropriate values to DFS_DIV_N[MFN] and DFS_DIV_N[MFI].	N ranges from 0–3 and is calculated as NO_OF_DFS - 1.
7	Enable DFS.	Write 1 to DFS_CTRL_N[ENABLE].	N ranges from 0–3 and is calculated as NO_OF_DFS - 1.
8	Enable the PLL DFS clock.	Write 1 to DFS_CTRL_N[CLKOUT_EN] and/or DFS_CTRL_N[CLKOUT_DIVBY2_EN].	—
9	Wait for the DFS output clock to become valid.	Poll DFS_STATUS[DFS_OK] and wait until it becomes 1 and the dfs_ok[N-1] output signal is asserted.	—

NOTE

To change the value of DFS_DIV_N[MFI] or DFS_DIV_N[MFN] after DFS_STATUS[DFS_OK] becomes 1, configure DFS_DIV_N[MFI] or DFS_DIV_N[MFN] and check the DFS output clock.

59.4.2 Fractional mode

Table 543. Initialization in Fractional mode

Steps	Purpose	Programming	Notes
1	Specify the divider values according to Fractional mode.	Configure the following fields: • DIV[ODIV]	—

Table continues on the next page...

Table 543. Initialization in Fractional mode (continued)

Steps	Purpose	Programming	Notes
		• DIV[RDIV] • DIV[MFI]	
2	Disable Spread-Spectrum mode.	Write 0 to SPREAD_SPECTRUM[ENABLE].	—
3	Specify the numerator and denominator of the fraction according to Fractional mode.	Configure NUMERATOR[MFN] and DENOMINATOR[MFD].	—
4	—	Wait for 5 µs.	—
5	Enable the PLL block.	Configure CTRL[POWERUP].	—
6	Wait for lock.	Poll PLL_STATUS[PLL_LOCK] and wait until it becomes 1 and the pll_lock output signal is asserted.	The maximum wait time is 100 µs.
7	Enable the PLL output clock.	Write 1 to CTRL[CLKMUX_EN].	—
8	Verify that the value of PLL_STATUS[ANA_MFN] matches the configured value of NUMERATOR[MFN].	Read PLL_STATUS[ANA_MFN].	—
9	To change the value of NUMERATOR[MFN] after PLL_STATUS[PLL_LOCK] becomes 1 (if needed).	Configure NUMERATOR[MFN] and check the PLL output clock.	—
10	Verify that the value of PLL_STATUS[ANA_MFN] matches the configured value of NUMERATOR[MFN].	Read PLL_STATUS[ANA_MFN].	—
11	Specify the DFS division integer and fraction according to Integer mode.	Write appropriate values to DFS_DIV_N[MFN] and DFS_DIV_N[MFI].	• N ranges from 0–3 and is calculated as NO_OF_DFS - 1. • The range for DFS_DIV_N[MFI] is 2–255 and for DFS_DIV_N[MFN] is 0–4.
12	Enable DFS.	Write 1 to DFS_CTRL_N[ENABLE].	N ranges from 0–3 and is calculated as NO_OF_DFS - 1.
13	Enable the PLL DFS clock.	Write 1 to DFS_CTRL_N[CLKOUT_EN] and/or DFS_CTRL_N[CLKOUT_DIVBY2_EN].	
14	Wait for the DFS output clock to become valid.	Poll DFS_STATUS[DFS_OK] and wait until it becomes 1 and the dfs_ok[N-1] output signal is asserted.	—

NOTE

To change the value of DFS_DIV_N[MFI] or DFS_DIV_N[MFN] after DFS_STATUS[DFS_OK] becomes 1, configure DFS_DIV_N[MFI] or DFS_DIV_N[MFN] and check the DFS output clock.

59.4.3 Spread-Spectrum mode

Table 544. Initialization in Spread-Spectrum mode

Steps	Purpose	Programming	Notes
1	Specify the divider values according to Fractional mode.	Configure the following fields: • DIV[ODIV] • DIV[RDIV] • DIV[MFI]	—
2	Enable Spread-Spectrum mode.	Write 1 to SPREAD_SPECTRUM[ENABLE].	—
3	Specify the step and stop values according to Spread spectrum.	Configure SPREAD_SPECTRUM[STEP] and SPREAD_SPECTRUM[STOP].	—
4	Specify the numerator and denominator of the fraction according to Fractional mode.	Configure NUMERATOR[MFN] and DENOMINATOR[MFD].	Ratio of MFN and MFD should be between 0 and 1.
5	—	Wait for 5 µs.	—
6	Enable the PLL block.	Configure CTRL[POWERUP].	—
7	Wait for lock.	Poll PLL_STATUS[PLL_LOCK] and wait until it becomes 1 and the pll_lock output signal is asserted.	The maximum wait time is 100 µs.
8	Enable the PLL output clock.	Write 1 to CTRL[CLKMUX_EN].	—
9	Verify that the value of PLL_STATUS[ANA_MFN] matches the configured value of NUMERATOR[MFN].	Read PLL_STATUS[ANA_MFN].	—
10	To change the value of NUMERATOR[MFN] after PLL_STATUS[PLL_LOCK] becomes 1 (if needed).	Configure NUMERATOR[MFN] and check the PLL output clock.	—
11	Verify that the value of PLL_STATUS[ANA_MFN] matches the configured value of NUMERATOR[MFN].	Read PLL_STATUS[ANA_MFN].	—
12	Specify the DFS division integer and fraction according to Integer mode.	Write appropriate values to DFS_DIV_N[MFN] and DFS_DIV_N[MFI].	• N ranges from 0–3 and is calculated as NO_OF_DFS - 1. • The range for DFS_DIV_N[MFI] is 2–255 and for DFS_DIV_N[MFN] is 0–4.

Table continues on the next page...

Table 544. Initialization in Spread-Spectrum mode (continued)

Steps	Purpose	Programming	Notes
13	Enable DFS.	Write 1 to DFS_CTRL_N[ENABLE].	N ranges from 0–3 and is calculated as NO_OF_DFS - 1.
14	Enable the PLL DFS clock.	Write 1 to DFS_CTRL_N[CLKOUT_EN] and/or DFS_CTRL_N[CLKOUT_DIVBY2_EN].	—
15	Wait for the DFS output clock to become valid.	Poll DFS_STATUS[DFS_OK] and wait until it becomes 1 and the dfs_ok[N-1] output signal is asserted.	—

NOTE

To change the value of DFS_DIV_N[MFI] or DFS_DIV_N[MFN] after DFS_STATUS[DFS_OK] becomes 1, configure DFS_DIV_N[MFI] or DFS_DIV_N[MFN] and check the DFS output clock.

59.4.4 Powering down the module

Table 545. Settings for powering down the module

Steps	Purpose	Programming	Notes
1	Gate the DFS clock output.	Write 0 to DFS_CTRL_N[CLKOUT_EN].	N = 0–3 and is calculated as NO_OF_DFS - 1.
2	—	Wait for one AI clock cycle.	—
3	Disable DFS.	Write 0 to DFS_CTRL_N[ENABLE].	N = 0–3 and is calculated as NO_OF_DFS - 1.
4	Verify whether DFS is disabled.	Poll DFS_STATUS[DFS_OK].	—
5	—	Wait for three AI clock cycles.	—
6	Gate the PLL clock output.	Write 0 to CTRL[CLKMUX_EN].	—
7	—	Wait for one AI clock cycle.	—
8	Disable PLL.	Write 0 to CTRL[POWERUP].	—
9	Verify whether PLL is disabled.	Poll PLL_STATUS[PLL_LOCK].	—
10	Reset the module properly.	Prior to enabling PLL again, wait for 5 µs.	—

59.5 Memory map and register definitions

This section includes the PLL module memory map and detailed descriptions of all registers.

59.5.1 PLL register descriptions

59.5.1.1 PLL memory map

59.5.1.2 PLL Control (CTRL)

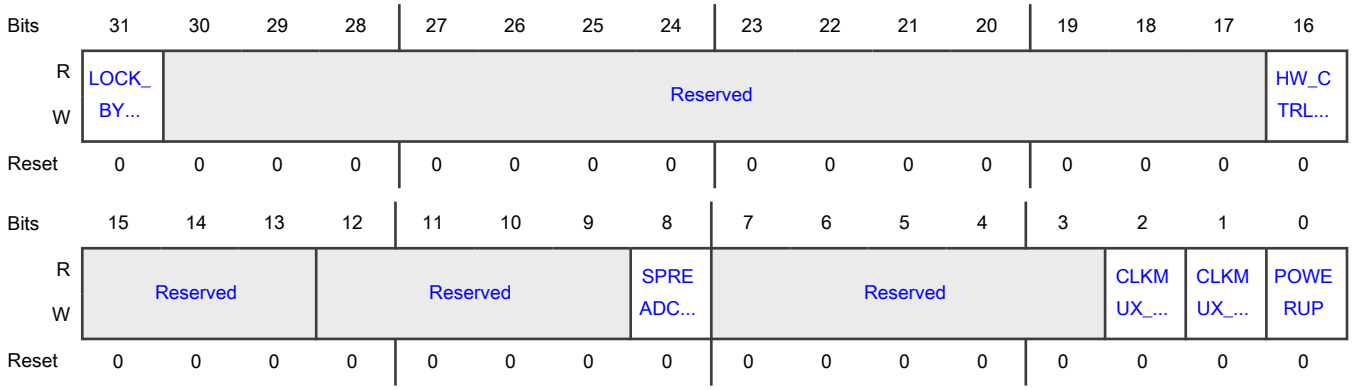
Enables PLL control and contains fractional PLL control registers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
CTRL	0h	PLL Control
CTRL_SET	4h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 1
CTRL_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 0
CTRL_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL

Diagram



Fields

Field	Description
31 LOCK_BYPASS	Lock Bypass Enables bypass for the lock detector. 0 - Disable 1 - Enable
30-17 —	Reserved
16 HW_CTRL_SEL	Hardware Control Select Controls PLL through hardware. If this field is disabled, PLL is controlled by register. If this field is enabled, PLL is controlled by hardware inputs and you cannot change NUMERATOR[MFN] dynamically. 0 - Disable 1 - Enable
15-13 —	Reserved
12-9 —	Reserved
8 SPREADCTL	Modulation Type Select Selects whether modulation is centered around, or spread below the nominal frequency. 0 - Centered around nominal frequency 1 - Spread below nominal frequency
7-3 —	Reserved
2	CLKMUX_Bypass

Table continues on the next page...

Table continued from the previous page...

Field	Description
CLKMUX_BYPASS	Bypasses PLL. The output clock is the PLL reference clock source. 0 - Normal mode 1 - PLL Bypass mode
1 CLKMUX_EN	CLKMUX Enable Enables output clock mux. 0 - Disable 1 - Enable
0 POWERUP	Power Up Enables PLL. 0 - Disable 1 - Enable

59.5.1.3 Spread Spectrum (SPREAD_SPECTRUM)

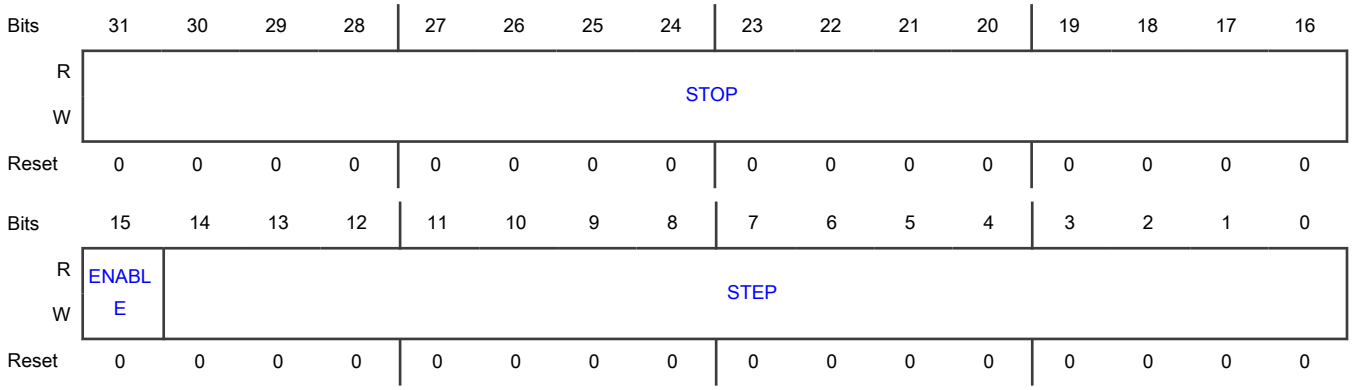
Sets spread spectrum control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
SPREAD_SPECTRUM	30h	Spread Spectrum
SPREAD_SPECTRUM_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 1
SPREAD_SPECTRUM_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 0
SPREAD_SPECTRUM_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in SPREAD_SPECTRUM

Diagram



Fields

Field	Description
31-16 STOP	Stop Sets spread spectrum stop.
15 ENABLE	Enable Enables or disables the spread spectrum modulation. 0 - Disable 1 - Enable
14-0 STEP	Step Sets spread spectrum step.

59.5.1.4 Numerator (NUMERATOR)

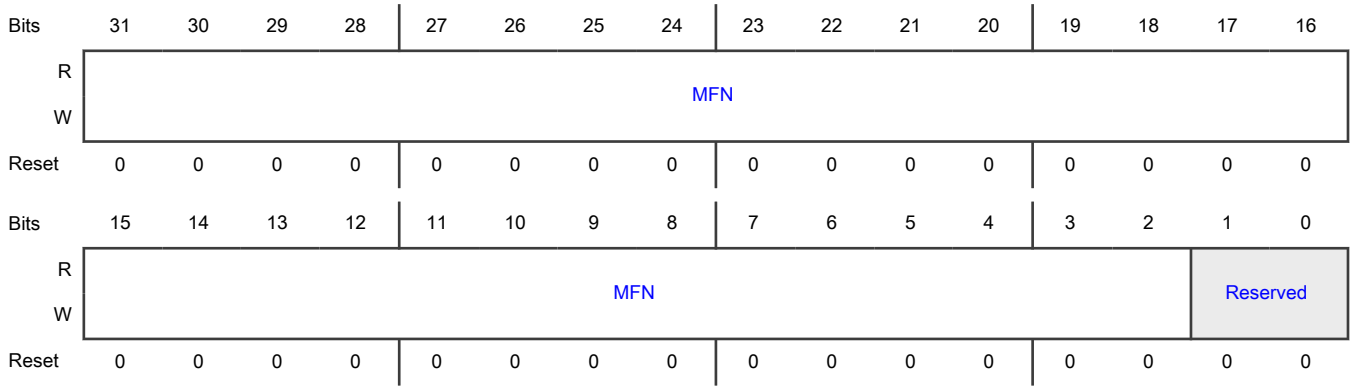
Sets numerator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
NUMERATOR	40h	Numerator
NUMERATOR_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 1
NUMERATOR_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 0
NUMERATOR_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in NUMERATOR

Diagram



Fields

Field	Description
31-2 MFN	Numerator Sets the numerator of the fractional PLL loop divider (signed number). You can configure this field dynamically when PLL is enabled, except when CTRL[HW_CTRL_SEL] is 1.
1-0 —	Reserved

59.5.1.5 Denominator (DENOMINATOR)

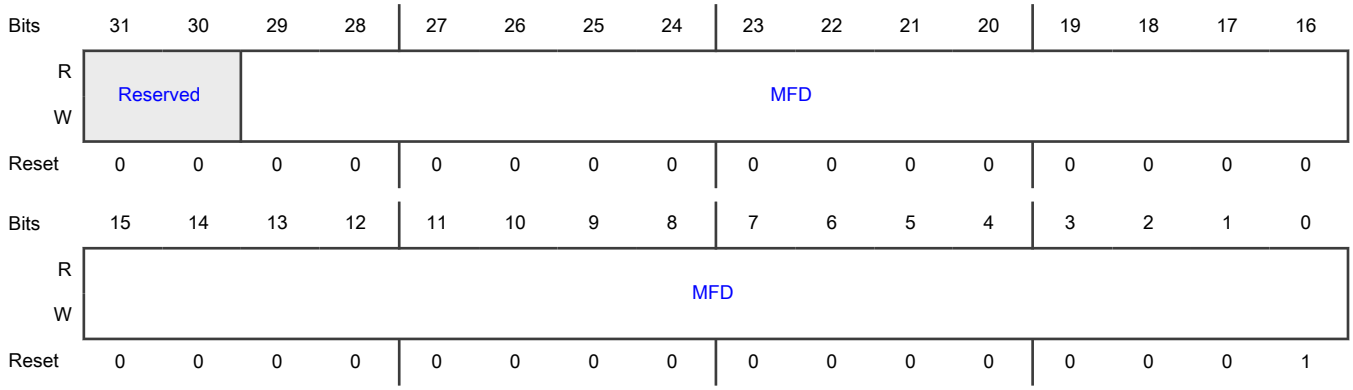
Sets denominator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DENOMINATOR	50h	Denominator
DENOMINATOR_SET	54h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 1
DENOMINATOR_CLR	58h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 0
DENOMINATOR_TOG	5Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DENOMINATOR

Diagram



Fields

Field	Description
31-30 —	Reserved
29-0 MFD	Denominator Sets the denominator of the fractional loop divider (unsigned number). **NOTE** You are not allowed to write 0 to this field.

59.5.1.6 PLL Dividers (DIV)

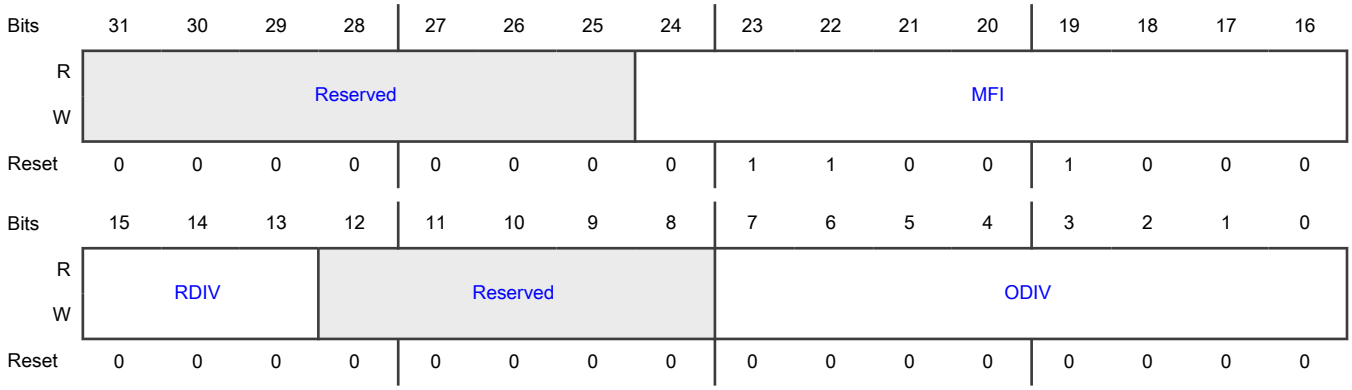
Controls PLL's digital and post dividers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DIV	60h	PLL Dividers
DIV_SET	64h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 1
DIV_CLR	68h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 0
DIV_TOG	6Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DIV

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 MFI	Integer Portion of Loop Divider Sets the value of the divider in the PLL feedback loop. The value specified establishes the multiplication factor applied to the reference frequency. Divider value = MFI, where the chosen MFI does not violate VCO frequency specifications.
15-13 RDIV	Input Clock Predivider Sets the input clock divider. The output of the predivider circuit generates the PLL analog loop reference clock. 000 - Divide by 1 001 - Divide by 1 010 - Divide by 2 011 - Divide by 3 100 - Divide by 4 101 - Divide by 5 110 - Divide by 6 111 - Divide by 7
12-8 —	Reserved
7-0 ODIV	Output Frequency Divider for Clock Output Determines the VCO clock post divider for driving the final output clock. The value can be configured in the range of 0 to 255. If value is programmed as 0 or 1, output frequency will be F_{vco_clk}÷2. For all other values, output frequency will be as described in PLL output clock frequency.

59.5.1.7 DFS Control (DFS_CTRL_0 - DFS_CTRL_2)

Configures the DFS block.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

For a = 0 to 2:

Register	Offset	Description
DFS_CTRL_a	70h + (a × 20h)	DFS Control
DFS_CTRL_a_SET	74h + (a × 20h)	Writing 1 to a bit in this register ensures that the corresponding bit in DFS_CTRL_a is 1
DFS_CTRL_a_CLR	78h + (a × 20h)	Writing 1 to a bit in this register ensures that the corresponding bit in DFS_CTRL_a is 0
DFS_CTRL_a_TOG	7Ch + (a × 20h)	Writing 1 to a bit in this register inverts the value of the corresponding bit in DFS_CTRL_a

Fields

Field	Description
31 ENABLE	DFS Block Enable Enables the DFS block. 0 - Disable 1 - Enable
30 CLKOUT_EN	DFS Clock Output Enable Enables the DFS clock output. 0 - Disable 1 - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
29 CLKOUT_DIVBY2_EN	DFS Clock Output Divide by 2 Enable Enables DFS divide by 2 clock output. 0 - Disable 1 - Enable
28-24 —	Reserved
23 BYPASS_EN	Bypass Enable Enables bypass for DFS. The DFS clock output is the bypass clock source. 0 - Disable 1 - Enable
22-17 —	Reserved
16 HW_CTRL_SEL	Hardware Control Select Controls DFS through hardware. 0 - Controlled by register 1 - Controlled by hardware inputs
15-0 —	Reserved

59.5.1.8 DFS Division_N (DFS_DIV_0 - DFS_DIV_2)

Specifies the values for MFN and MFI in the DFS block.

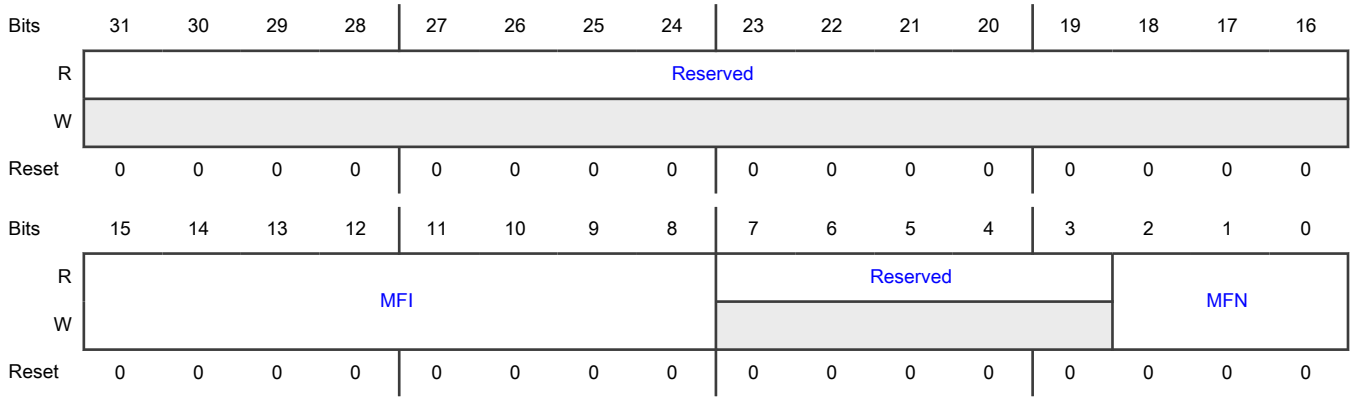
Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

For a = 0 to 2:

Register	Offset	Description
DFS_DIV_a	80h + (a × 20h)	DFS Division_N
DFS_DIV_a_SET	84h + (a × 20h)	Writing 1 to a bit in this register ensures that the corresponding bit in DFS_DIV_a is 1
DFS_DIV_a_CLR	88h + (a × 20h)	Writing 1 to a bit in this register ensures that the corresponding bit in DFS_DIV_a is 0
DFS_DIV_a_TOG	8Ch + (a × 20h)	Writing 1 to a bit in this register inverts the value of the corresponding bit in DFS_DIV_a

Diagram



Fields

Field	Description
31-16 —	Reserved
15-8 MFI	MFI Sets the integer part of the division factor for port *n*.
7-3 —	Reserved
2-0 MFN	MFN Sets the numerator of the fractional part of the division factor for port *n*.

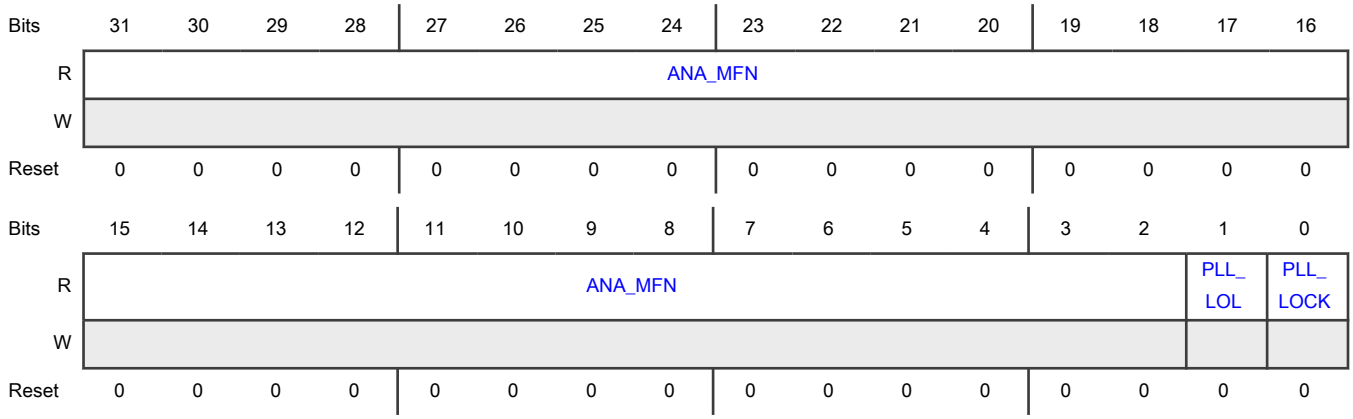
59.5.1.9 PLL Status (PLL_STATUS)

Indicates analog capture MNN values for debug purposes and PLL_LOCK status.

Offset

Register	Offset
PLL_STATUS	F0h

Diagram



Fields

Field	Description
31-2 ANA_MFN	ANA_MFN Stores analog block capture MFN value for debug purposes.
1 PLL_LOL	PLL_LOL Captures the loss of lock (LoL) signal when you write 0 to PLL_LOCK.
0 PLL_LOCK	PLL_LOCK Captures the lock signal to confirm whether the PLL clock is stable after you write 1 to PLL_LOCK.

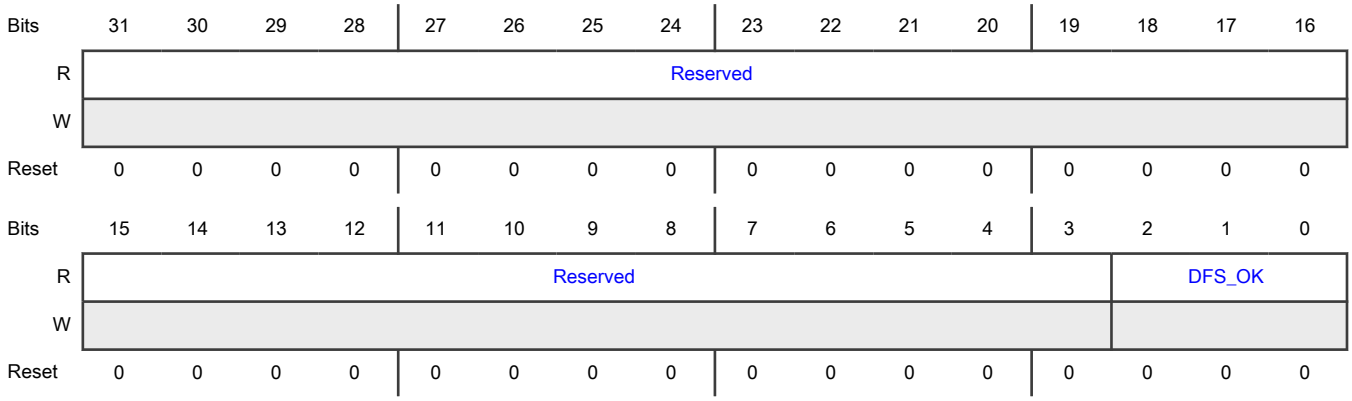
59.5.1.10 DFS Status (DFS_STATUS)

Indicates the status of clock out OK signals for DFS blocks.

Offset

Register	Offset
DFS_STATUS	F4h

Diagram



Fields

Field	Description
31-3 —	Reserved
2-0 DFS_OK	DFS OK Indicates the status of the DFS output clock. 000 - Invalid 001 - Valid

59.5.2 PLL register descriptions

59.5.2.1 PLL memory map

ARMPLL base address: 4448_1000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	PLL Control (CTRL)	32	RW	0000_0000
4	PLL Control (CTRL_SET)	32	RW	0000_0000
8	PLL Control (CTRL_CLR)	32	RW	0000_0000
C	PLL Control (CTRL_TOG)	32	RW	0000_0000
60	PLL Dividers (DIV)	32	RW	00C8_0000
64	PLL Dividers (DIV_SET)	32	RW	00C8_0000
68	PLL Dividers (DIV_CLR)	32	RW	00C8_0000
6C	PLL Dividers (DIV_TOG)	32	RW	00C8_0000
F0	PLL Status (PLL_STATUS)	32	R	0000_0000

59.5.2.2 PLL Control (CTRL)

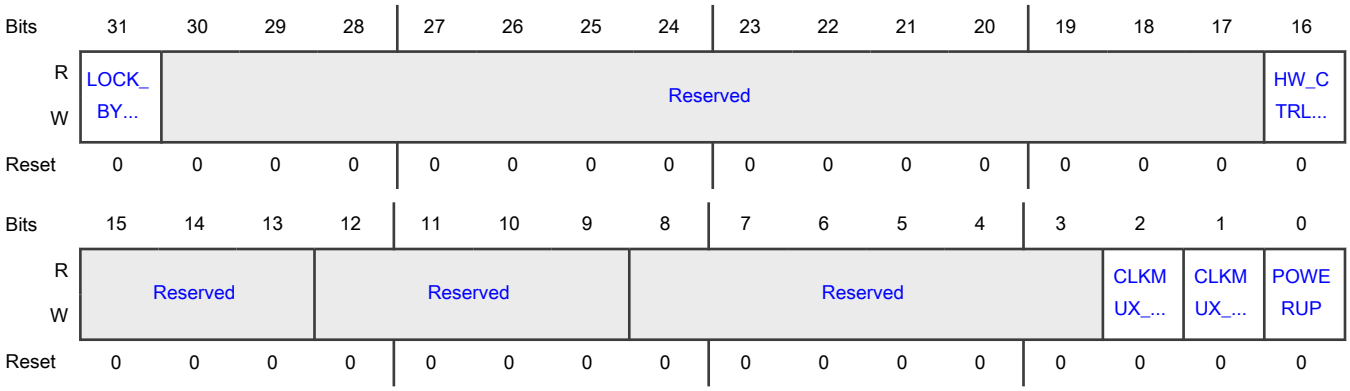
Enables PLL control and contains fractional PLL control registers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
CTRL	0h	PLL Control
CTRL_SET	4h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 1
CTRL_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 0
CTRL_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL

Diagram



Fields

Field	Description
31 LOCK_BYPASS	Lock Bypass Enables bypass for the lock detector. 0 - Disable 1 - Enable
30-17 —	Reserved
16 HW_CTRL_SEL	Hardware Control Select Controls PLL through hardware. If this field is disabled, PLL is controlled by register. If this field is enabled, PLL is controlled by hardware inputs and you cannot change dynamically. 0 - Disable

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Enable
15-13 —	Reserved
12-9 —	Reserved
8-3 —	Reserved
2 CLKMUX_BYPASS	CLKMUX_Bypass Bypasses PLL. The output clock is the PLL reference clock source. 0 - Normal mode 1 - PLL Bypass mode
1 CLKMUX_EN	CLKMUX Enable Enables output clock mux. 0 - Disable 1 - Enable
0 POWERUP	Power Up Enables PLL. 0 - Disable 1 - Enable

59.5.2.3 PLL Dividers (DIV)

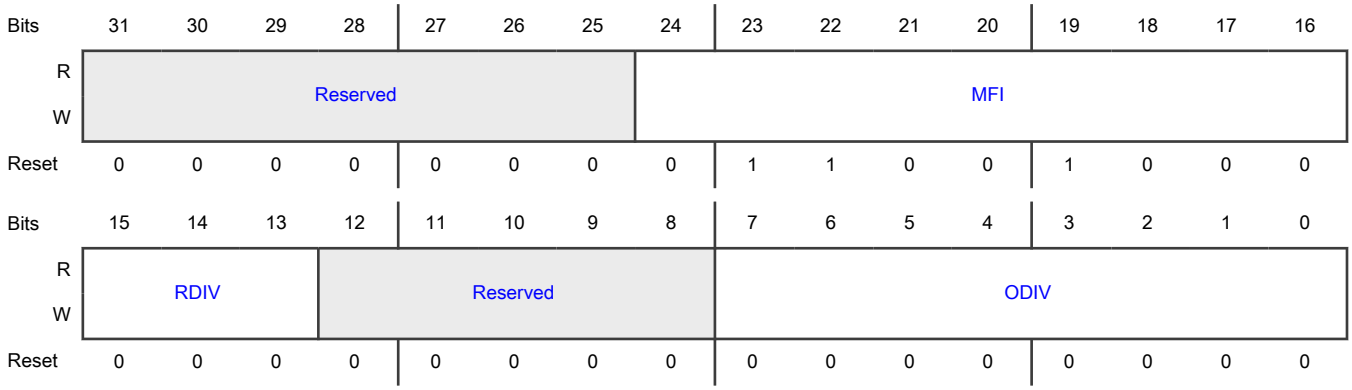
Controls PLL's digital and post dividers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DIV	60h	PLL Dividers
DIV_SET	64h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 1
DIV_CLR	68h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 0
DIV_TOG	6Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DIV

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 MFI	Integer Portion of Loop Divider Sets the value of the divider in the PLL feedback loop. The value specified establishes the multiplication factor applied to the reference frequency. Divider value = MFI, where the chosen MFI does not violate VCO frequency specifications.
15-13 RDIV	Input Clock Predivider Sets the input clock divider. The output of the predivider circuit generates the PLL analog loop reference clock. 000 - Divide by 1 001 - Divide by 1 010 - Divide by 2 011 - Divide by 3 100 - Divide by 4 101 - Divide by 5 110 - Divide by 6 111 - Divide by 7
12-8 —	Reserved
7-0 ODIV	Output Frequency Divider for Clock Output Determines the VCO clock post divider for driving the final output clock. The value can be configured in the range of 0 to 255. If value is programmed as 0 or 1, output frequency will be F_{vco_clk}÷2. For all other values, output frequency will be as described in PLL output clock frequency.

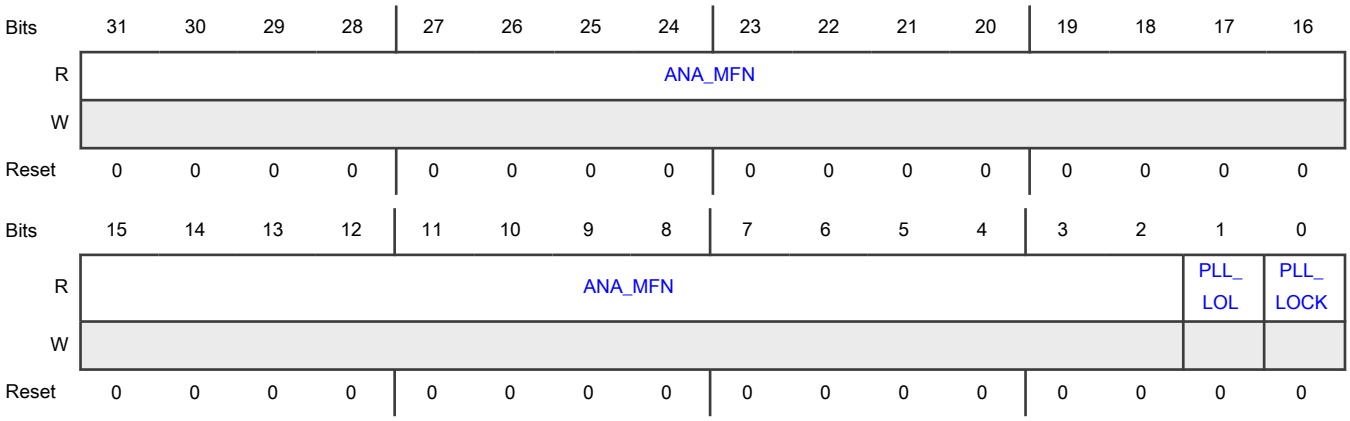
59.5.2.4 PLL Status (PLL_STATUS)

Indicates analog capture MNN values for debug purposes and PLL_LOCK status.

Offset

Register	Offset
PLL_STATUS	F0h

Diagram



Fields

Field	Description
31-2 ANA_MFN	ANA_MFN Stores analog block capture MFN value for debug purposes.
1 PLL_LOL	PLL_LOL Captures the loss of lock (LoL) signal when you write 0 to PLL_LOCK.
0 PLL_LOCK	PLL_LOCK Captures the lock signal to confirm whether the PLL clock is stable after you write 1 to PLL_LOCK.

F0	PLL Status (PLL_STATUS)	32	R	0000_0000

59.5.3.2 PLL Control (CTRL)

Enables PLL control and contains fractional PLL control registers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

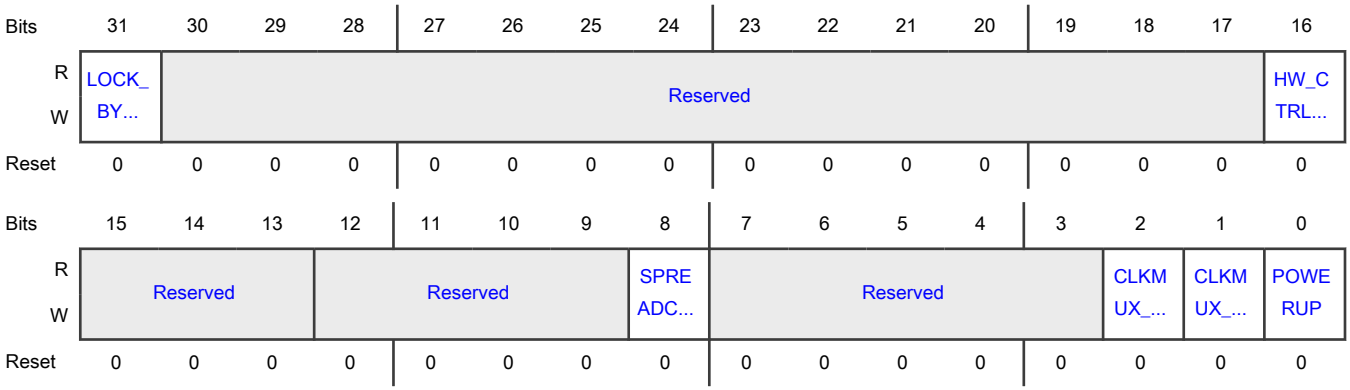
Register	Offset	Description
CTRL	0h	PLL Control
CTRL_SET	4h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 1

Table continues on the next page...

Table continued from the previous page...

Register	Offset	Description
CTRL_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 0
CTRL_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL

Diagram



Fields

Field	Description
31 LOCK_BYPASS	Lock Bypass Enables bypass for the lock detector. 0 - Disable 1 - Enable
30-17 —	Reserved
16 HW_CTRL_SEL	Hardware Control Select Controls PLL through hardware. If this field is disabled, PLL is controlled by register. If this field is enabled, PLL is controlled by hardware inputs and you cannot change NUMERATOR[MFN] dynamically. 0 - Disable 1 - Enable
15-13 —	Reserved
12-9 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
8 SPREADCTL	Modulation Type Select Selects whether modulation is centered around, or spread below the nominal frequency. 0 - Centered around nominal frequency 1 - Spread below nominal frequency
7-3 —	Reserved
2 CLKMUX_BYPASS	CLKMUX_Bypass Bypasses PLL. The output clock is the PLL reference clock source. 0 - Normal mode 1 - PLL Bypass mode
1 CLKMUX_EN	CLKMUX Enable Enables output clock mux. 0 - Disable 1 - Enable
0 POWERUP	Power Up Enables PLL. 0 - Disable 1 - Enable

59.5.3.3 Spread Spectrum (SPREAD_SPECTRUM)

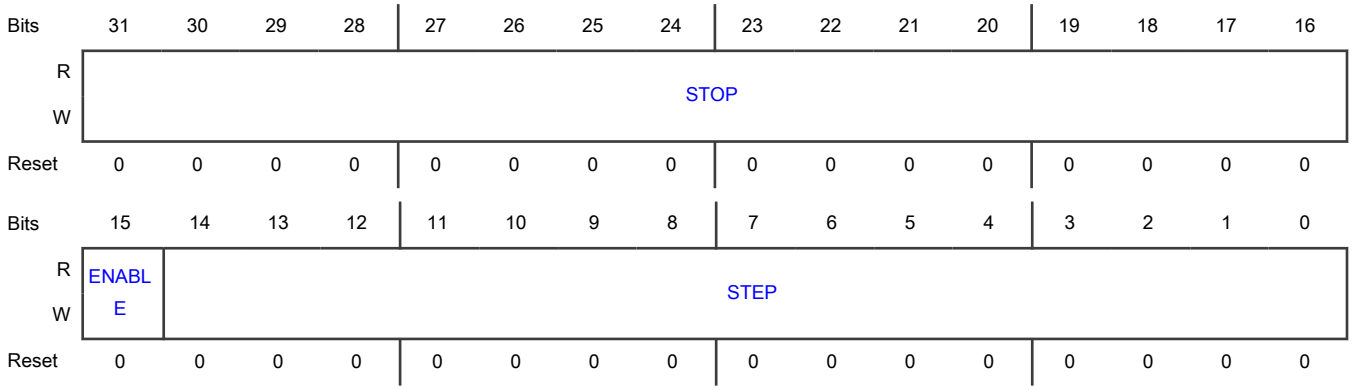
Sets spread spectrum control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
SPREAD_SPECTRUM	30h	Spread Spectrum
SPREAD_SPECTRUM_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 1
SPREAD_SPECTRUM_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 0
SPREAD_SPECTRUM_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in SPREAD_SPECTRUM

Diagram



Fields

Field	Description
31-16 STOP	Stop Sets spread spectrum stop.
15 ENABLE	Enable Enables or disables the spread spectrum modulation. 0 - Disable 1 - Enable
14-0 STEP	Step Sets spread spectrum step.

59.5.3.4 Numerator (NUMERATOR)

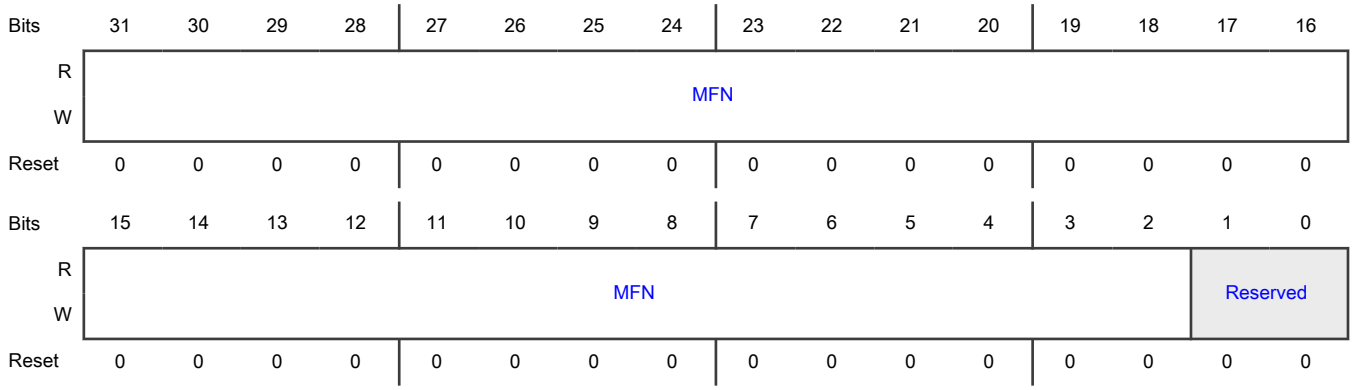
Sets numerator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
NUMERATOR	40h	Numerator
NUMERATOR_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 1
NUMERATOR_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 0
NUMERATOR_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in NUMERATOR

Diagram



Fields

Field	Description
31-2 MFN	Numerator Sets the numerator of the fractional PLL loop divider (signed number). You can configure this field dynamically when PLL is enabled, except when CTRL[HW_CTRL_SEL] is 1.
1-0 —	Reserved

59.5.3.5 Denominator (DENOMINATOR)

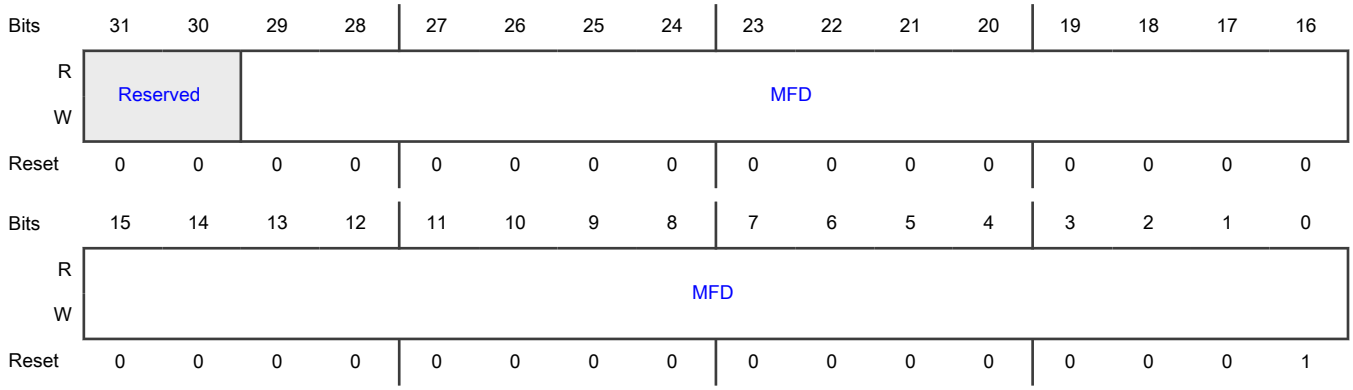
Sets denominator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DENOMINATOR	50h	Denominator
DENOMINATOR_SET	54h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 1
DENOMINATOR_CLR	58h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 0
DENOMINATOR_TOG	5Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DENOMINATOR

Diagram



Fields

Field	Description
31-30 —	Reserved
29-0 MFD	Denominator Sets the denominator of the fractional loop divider (unsigned number). **NOTE** You are not allowed to write 0 to this field.

59.5.3.6 PLL Dividers (DIV)

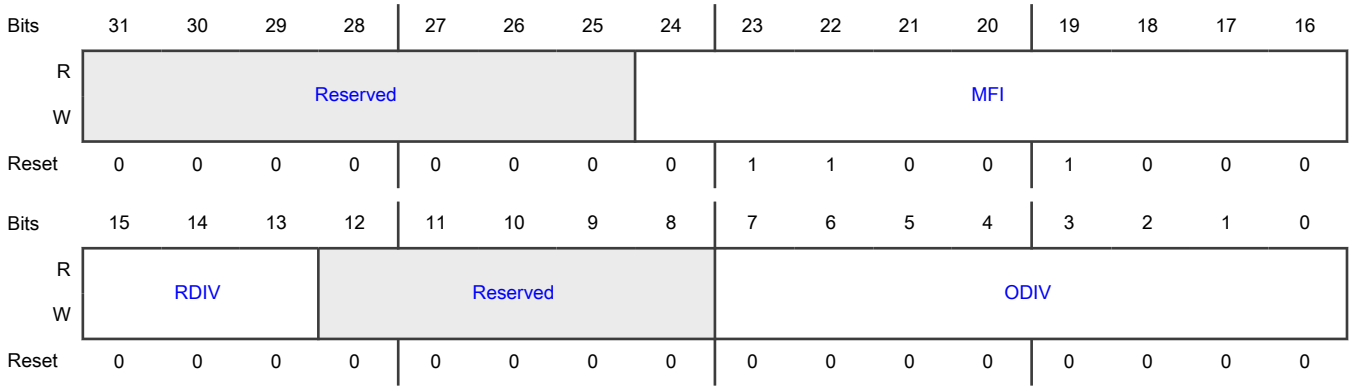
Controls PLL's digital and post dividers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DIV	60h	PLL Dividers
DIV_SET	64h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 1
DIV_CLR	68h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 0
DIV_TOG	6Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DIV

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 MFI	Integer Portion of Loop Divider Sets the value of the divider in the PLL feedback loop. The value specified establishes the multiplication factor applied to the reference frequency. Divider value = MFI, where the chosen MFI does not violate VCO frequency specifications.
15-13 RDIV	Input Clock Predivider Sets the input clock divider. The output of the predivider circuit generates the PLL analog loop reference clock. 000 - Divide by 1 001 - Divide by 1 010 - Divide by 2 011 - Divide by 3 100 - Divide by 4 101 - Divide by 5 110 - Divide by 6 111 - Divide by 7
12-8 —	Reserved
7-0 ODIV	Output Frequency Divider for Clock Output Determines the VCO clock post divider for driving the final output clock. The value can be configured in the range of 0 to 255. If value is programmed as 0 or 1, output frequency will be F_{vco_clk}÷2. For all other values, output frequency will be as described in PLL output clock frequency.

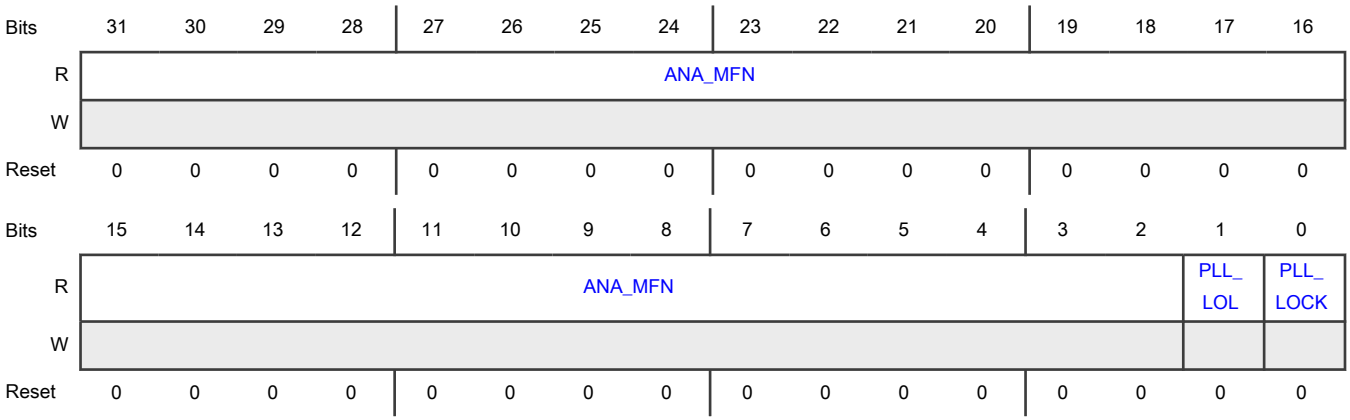
59.5.3.7 PLL Status (PLL_STATUS)

Indicates analog capture MNN values for debug purposes and PLL_LOCK status.

Offset

Register	Offset
PLL_STATUS	F0h

Diagram



Fields

Field	Description
31-2 ANA_MFN	ANA_MFN Stores analog block capture MFN value for debug purposes.
1 PLL_LOL	PLL_LOL Captures the loss of lock (LoL) signal when you write 0 to PLL_LOCK.
0 PLL_LOCK	PLL_LOCK Captures the lock signal to confirm whether the PLL clock is stable after you write 1 to PLL_LOCK.

2 CLKMUX_BYPASS	CLKMUX_Bypass Bypasses PLL. The output clock is the PLL reference clock source. 0 - Normal mode 1 - PLL Bypass mode
1 CLKMUX_EN	CLKMUX Enable Enables output clock mux. 0 - Disable 1 - Enable
0 POWERUP	Power Up Enables PLL. 0 - Disable 1 - Enable

59.5.4.3 Spread Spectrum (SPREAD_SPECTRUM)

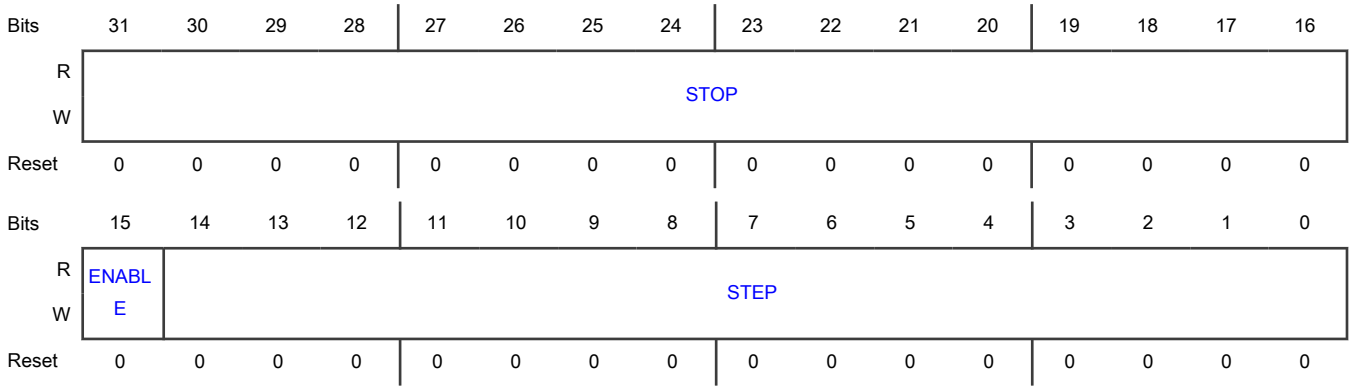
Sets spread spectrum control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
SPREAD_SPECTRUM	30h	Spread Spectrum
SPREAD_SPECTRUM_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 1
SPREAD_SPECTRUM_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 0
SPREAD_SPECTRUM_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in SPREAD_SPECTRUM

Diagram



Fields

Field	Description
31-16 STOP	Stop Sets spread spectrum stop.
15 ENABLE	Enable Enables or disables the spread spectrum modulation. 0 - Disable 1 - Enable
14-0 STEP	Step Sets spread spectrum step.

59.5.4.4 Numerator (NUMERATOR)

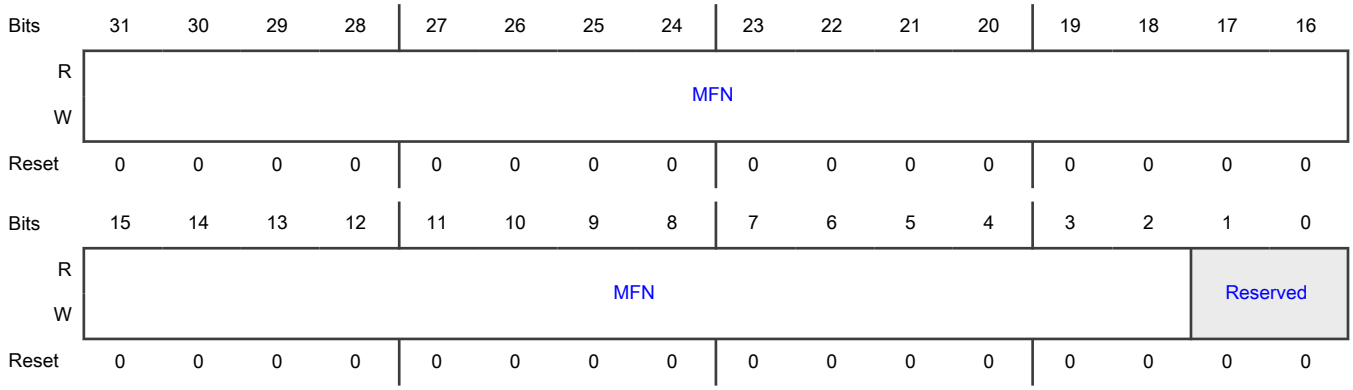
Sets numerator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
NUMERATOR	40h	Numerator
NUMERATOR_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 1
NUMERATOR_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 0
NUMERATOR_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in NUMERATOR

Diagram



Fields

Field	Description
31-2 MFN	Numerator Sets the numerator of the fractional PLL loop divider (signed number). You can configure this field dynamically when PLL is enabled, except when CTRL[HW_CTRL_SEL] is 1.
1-0 —	Reserved

59.5.4.5 Denominator (DENOMINATOR)

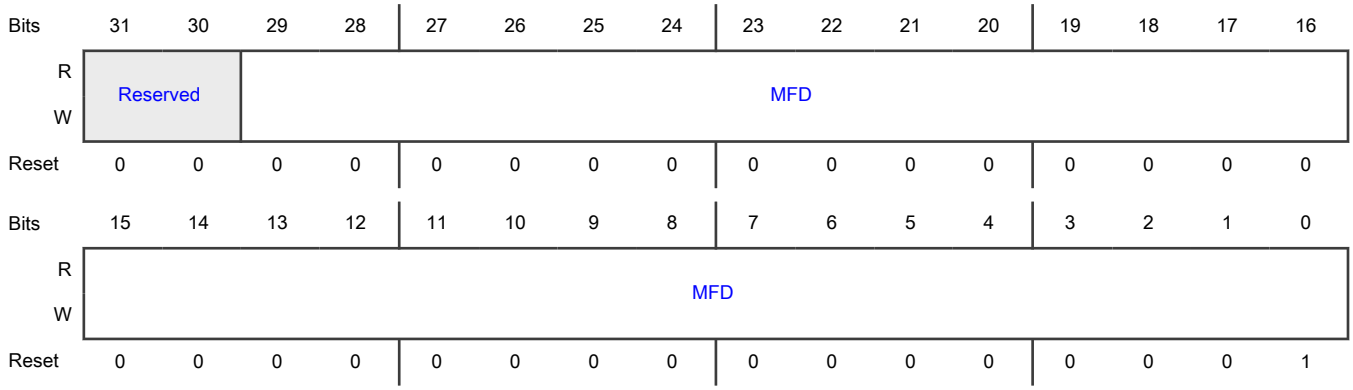
Sets denominator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DENOMINATOR	50h	Denominator
DENOMINATOR_SET	54h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 1
DENOMINATOR_CLR	58h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 0
DENOMINATOR_TOG	5Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DENOMINATOR

Diagram



Fields

Field	Description
31-30 —	Reserved
29-0 MFD	Denominator Sets the denominator of the fractional loop divider (unsigned number). **NOTE** You are not allowed to write 0 to this field.

59.5.4.6 PLL Dividers (DIV)

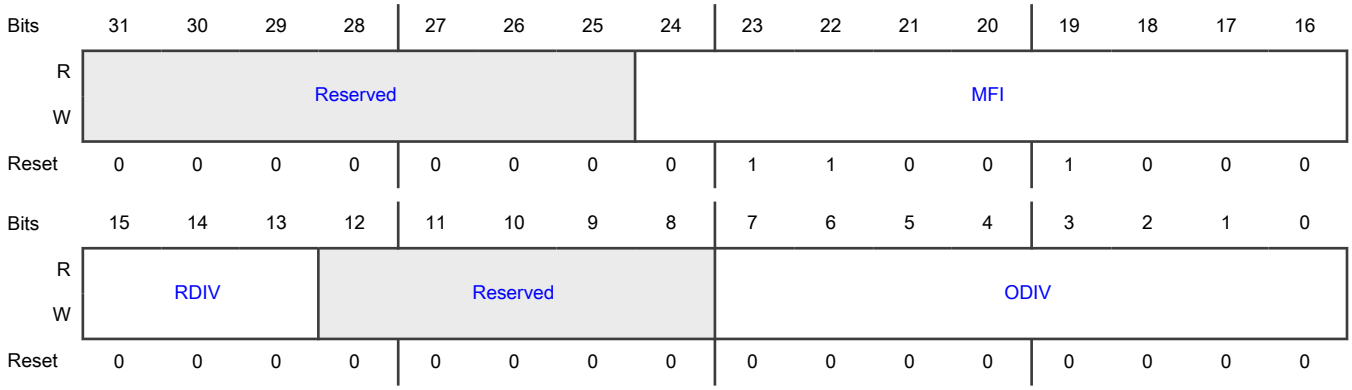
Controls PLL's digital and post dividers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DIV	60h	PLL Dividers
DIV_SET	64h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 1
DIV_CLR	68h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 0
DIV_TOG	6Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DIV

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 MFI	Integer Portion of Loop Divider Sets the value of the divider in the PLL feedback loop. The value specified establishes the multiplication factor applied to the reference frequency. Divider value = MFI, where the chosen MFI does not violate VCO frequency specifications.
15-13 RDIV	Input Clock Predivider Sets the input clock divider. The output of the predivider circuit generates the PLL analog loop reference clock. 000 - Divide by 1 001 - Divide by 1 010 - Divide by 2 011 - Divide by 3 100 - Divide by 4 101 - Divide by 5 110 - Divide by 6 111 - Divide by 7
12-8 —	Reserved
7-0 ODIV	Output Frequency Divider for Clock Output Determines the VCO clock post divider for driving the final output clock. The value can be configured in the range of 0 to 255. If value is programmed as 0 or 1, output frequency will be F_{vco_clk}÷2. For all other values, output frequency will be as described in PLL output clock frequency.

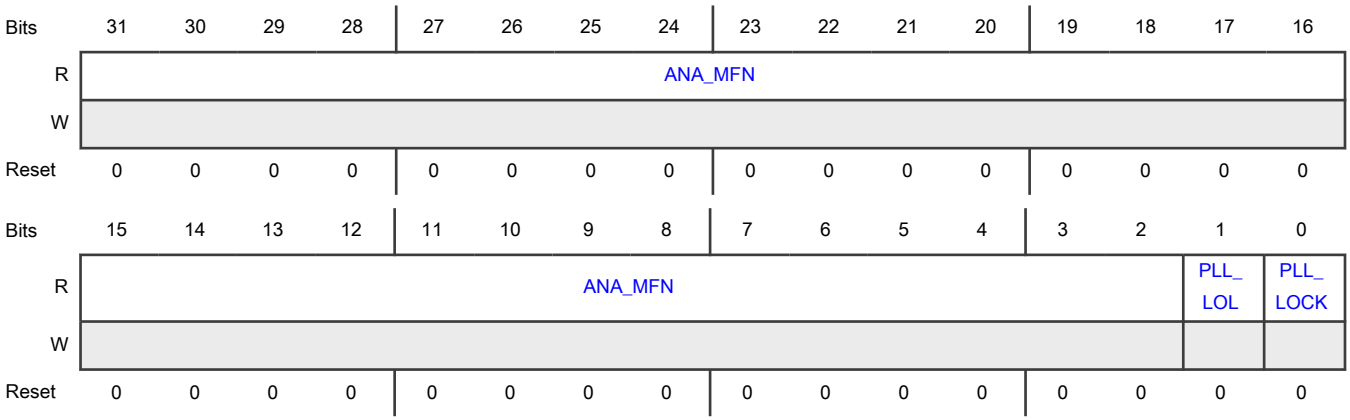
59.5.4.7 PLL Status (PLL_STATUS)

Indicates analog capture MNN values for debug purposes and PLL_LOCK status.

Offset

Register	Offset
PLL_STATUS	F0h

Diagram



Fields

Field	Description
31-2 ANA_MFN	ANA_MFN Stores analog block capture MFN value for debug purposes.
1 PLL_LOL	PLL_LOL Captures the loss of lock (LoL) signal when you write 0 to PLL_LOCK.
0 PLL_LOCK	PLL_LOCK Captures the lock signal to confirm whether the PLL clock is stable after you write 1 to PLL_LOCK.

Table continued from the previous page...

Register	Offset	Description
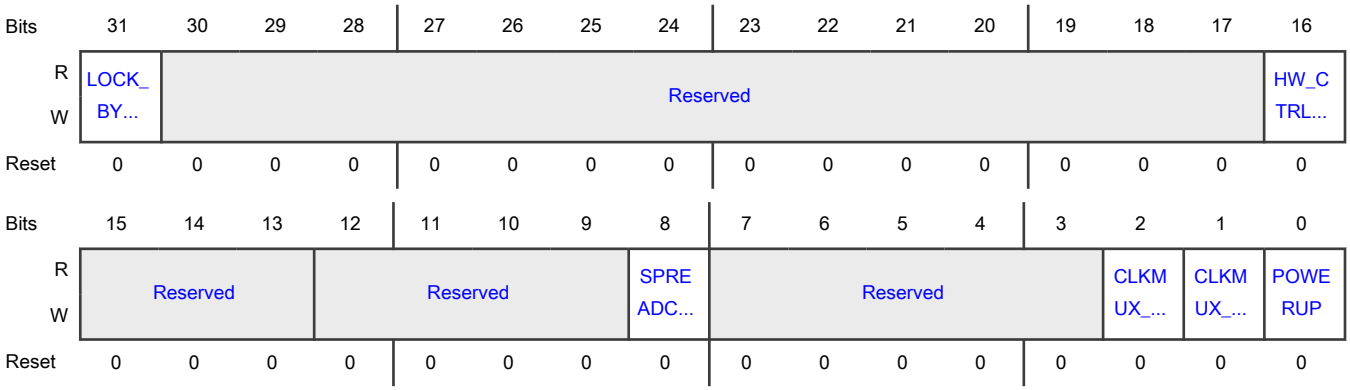
CTRL_CLR	8h	Writing 1 to a bit in this register ensures that the corresponding bit in CTRL is 0
CTRL_TOG	Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in CTRL

Diagram



Fields

Field	Description
31 LOCK_BYPASS	Lock Bypass Enables bypass for the lock detector. 0 - Disable 1 - Enable
30-17 —	Reserved
16 HW_CTRL_SEL	Hardware Control Select Controls PLL through hardware. If this field is disabled, PLL is controlled by register. If this field is enabled, PLL is controlled by hardware inputs and you cannot change NUMERATOR[MFN] dynamically. 0 - Disable 1 - Enable
15-13 —	Reserved
12-9 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Description
8 SPREADCTL	Modulation Type Select Selects whether modulation is centered around, or spread below the nominal frequency. 0 - Centered around nominal frequency 1 - Spread below nominal frequency
7-3 —	Reserved
2 CLKMUX_BYPASS	CLKMUX_Bypass Bypasses PLL. The output clock is the PLL reference clock source. 0 - Normal mode 1 - PLL Bypass mode
1 CLKMUX_EN	CLKMUX Enable Enables output clock mux. 0 - Disable 1 - Enable
0 POWERUP	Power Up Enables PLL. 0 - Disable 1 - Enable

59.5.5.3 Spread Spectrum (SPREAD_SPECTRUM)

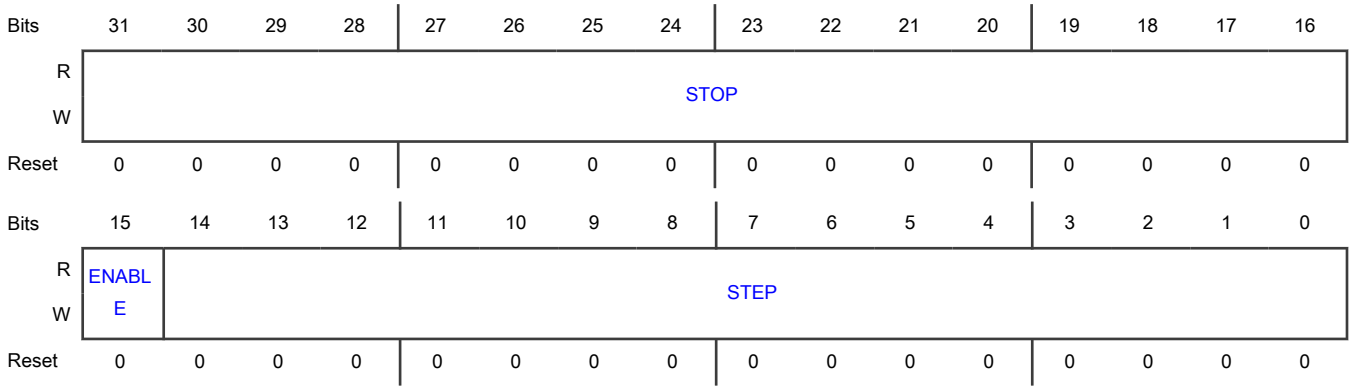
Sets spread spectrum control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
SPREAD_SPECTRUM	30h	Spread Spectrum
SPREAD_SPECTRUM_SET	34h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 1
SPREAD_SPECTRUM_CLR	38h	Writing 1 to a bit in this register ensures that the corresponding bit in SPREAD_SPECTRUM is 0
SPREAD_SPECTRUM_TOG	3Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in SPREAD_SPECTRUM

Diagram



Fields

Field	Description
31-16 STOP	Stop Sets spread spectrum stop.
15 ENABLE	Enable Enables or disables the spread spectrum modulation. 0 - Disable 1 - Enable
14-0 STEP	Step Sets spread spectrum step.

59.5.5.4 Numerator (NUMERATOR)

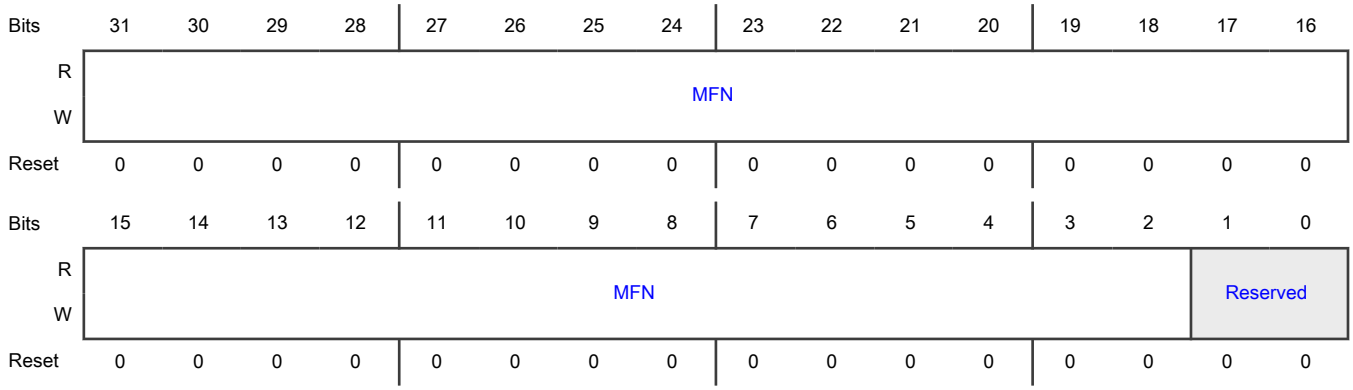
Sets numerator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
NUMERATOR	40h	Numerator
NUMERATOR_SET	44h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 1
NUMERATOR_CLR	48h	Writing 1 to a bit in this register ensures that the corresponding bit in NUMERATOR is 0
NUMERATOR_TOG	4Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in NUMERATOR

Diagram



Fields

Field	Description
31-2 MFN	Numerator Sets the numerator of the fractional PLL loop divider (signed number). You can configure this field dynamically when PLL is enabled, except when CTRL[HW_CTRL_SEL] is 1.
1-0 —	Reserved

59.5.5.5 Denominator (DENOMINATOR)

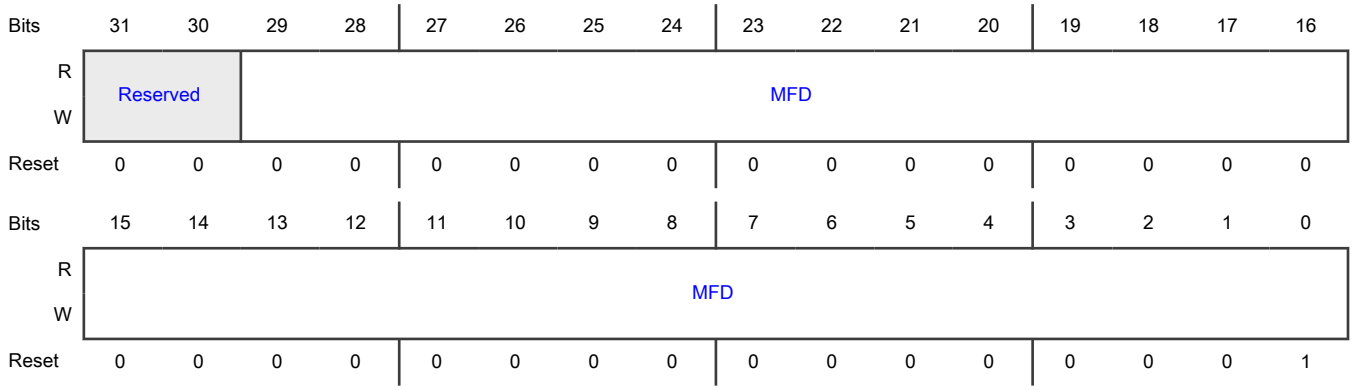
Sets denominator control.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DENOMINATOR	50h	Denominator
DENOMINATOR_SET	54h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 1
DENOMINATOR_CLR	58h	Writing 1 to a bit in this register ensures that the corresponding bit in DENOMINATOR is 0
DENOMINATOR_TOG	5Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DENOMINATOR

Diagram



Fields

Field	Description
31-30 —	Reserved
29-0 MFD	Denominator Sets the denominator of the fractional loop divider (unsigned number). **NOTE** You are not allowed to write 0 to this field.

59.5.5.6 PLL Dividers (DIV)

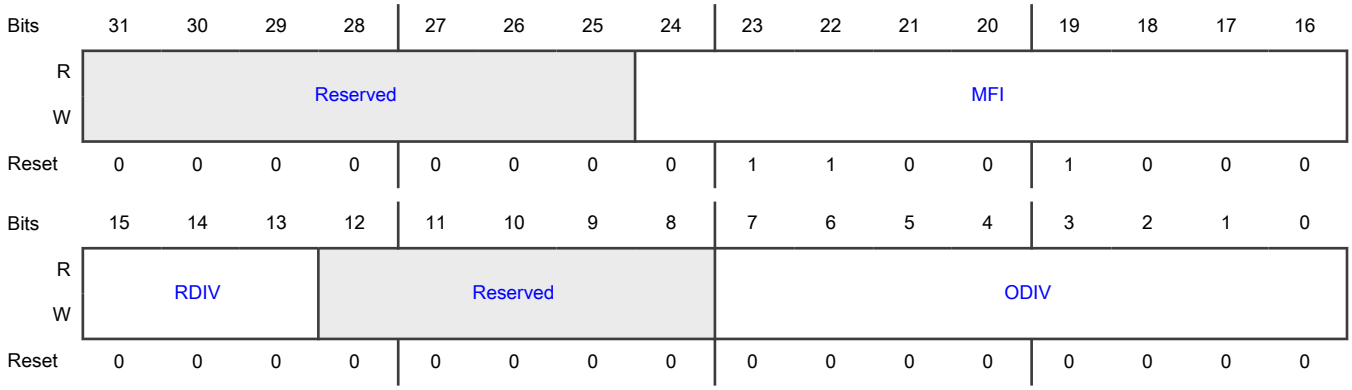
Controls PLL's digital and post dividers.

Offset

This type of register has supplemental _SET, _CLR, and _TOG registers at adjacent offsets.

Register	Offset	Description
DIV	60h	PLL Dividers
DIV_SET	64h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 1
DIV_CLR	68h	Writing 1 to a bit in this register ensures that the corresponding bit in DIV is 0
DIV_TOG	6Ch	Writing 1 to a bit in this register inverts the value of the corresponding bit in DIV

Diagram



Fields

Field	Description
31-25 —	Reserved
24-16 MFI	Integer Portion of Loop Divider Sets the value of the divider in the PLL feedback loop. The value specified establishes the multiplication factor applied to the reference frequency. Divider value = MFI, where the chosen MFI does not violate VCO frequency specifications.
15-13 RDIV	Input Clock Predivider Sets the input clock divider. The output of the predivider circuit generates the PLL analog loop reference clock. 000 - Divide by 1 001 - Divide by 1 010 - Divide by 2 011 - Divide by 3 100 - Divide by 4 101 - Divide by 5 110 - Divide by 6 111 - Divide by 7
12-8 —	Reserved
7-0 ODIV	Output Frequency Divider for Clock Output Determines the VCO clock post divider for driving the final output clock. The value can be configured in the range of 0 to 255. If value is programmed as 0 or 1, output frequency will be F_{vco_clk}÷2. For all other values, output frequency will be as described in PLL output clock frequency.

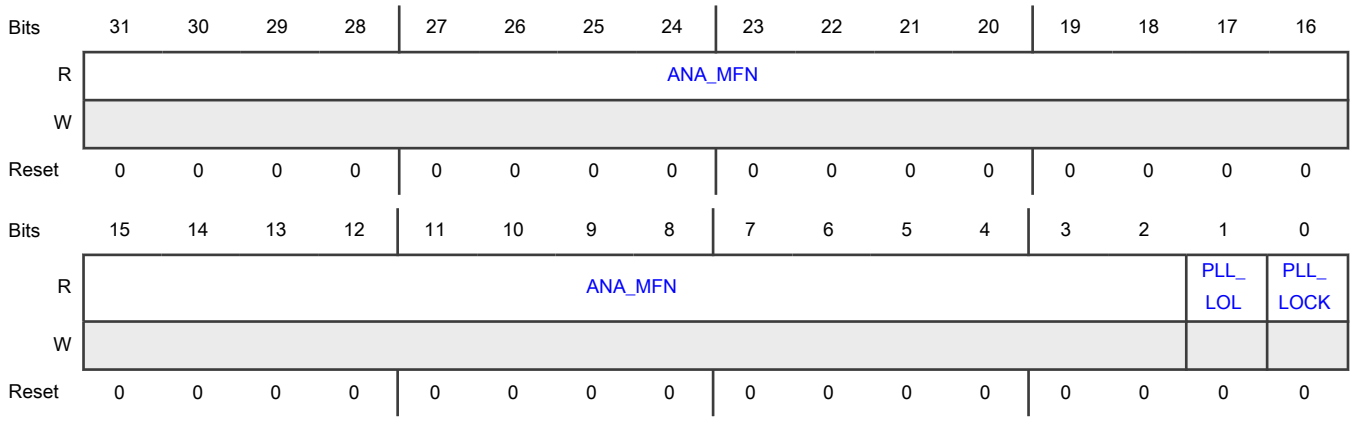
59.5.5.7 PLL Status (PLL_STATUS)

Indicates analog capture MNN values for debug purposes and PLL_LOCK status.

Offset

Register	Offset
PLL_STATUS	F0h

Diagram



Fields

Field	Description
31-2 ANA_MFN	ANA_MFN Stores analog block capture MFN value for debug purposes.
1 PLL_LOL	PLL_LOL Captures the loss of lock (LoL) signal when you write 0 to PLL_LOCK.
0 PLL_LOCK	PLL_LOCK Captures the lock signal to confirm whether the PLL clock is stable after you write 1 to PLL_LOCK.

Chapter 60
OSC

60.1 Overview

The OSC module includes the DIGPROG Device ID register for the chip.

60.2 Memory map and register definition

The OSC Memory map includes the DIGPROG Device ID register for the chip. This register allows software to identify the silicon version it is running on.

60.2.1 OSC register descriptions

60.2.1.1 OSC_REGS memory map

ANA_OSC base address: 4448_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
800	Device ID (DIGPROG_DEVICE_ID)	32	R	0090_1010

60.2.1.2 Device ID (DIGPROG_DEVICE_ID)

This allows software to identify the silicon version.

Offset

Register	Offset
DIGPROG_DEVICE_ID	800h

Diagram

Reset	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

Fields

Field	Description
31-24 —	Reserved
23-16 DIGPROG_MAJOR_UPPER	DIGPROG_MAJOR_UPPER Bit[7:4] is 0x9. Bit[3:0] is 0x0, Reserved.
15-8 DIGPROG_MAJOR_LOWER	DIGPROG_MAJOR_LOWER Bit[7:4] is the number of Cortex-A cores physically implemented on the chip. Bit[3:0] is 0x20.
7-0 DIGPROG_MINOR	Bit[3:0] is the metal layer revision. Bit[7:4] is the base layer revision. DIGPROG_MINOR[3:0] is programmable by VIA0 change.

Chapter 61
Always-on Domain, Non-secure Block Control (blk_ctrl_ns_aonmix)

61.1 Introduction

The blk_ctrl_ns_aonmix contains control and status registers in the AONMIX domain, that can be accessed by both secure and non-secure processors. These registers include core sleep control, ipg debug mask, upper address extention, OCOTP fuse data and control, and some control bits for modules in the AONMIX domain.

61.2 Features

Block Control Non-Secure AON Domain has the following features:

- Sleeping or deep sleeping selection for low power mode entry
- Debug halt mask bits for peripherals in AON Domain
- AON Domain SSI master block low power bits
- SAI1 MCLK direction control
- MQS settings
- OCOTP fuse register
- OCOTP Status register
- I3C1 asynchronous interrupt enable
- Fastboot enable bits
- I3C1 IO on chip strong pull enable bit
- QCHANNEL disable bits for modules.

61.3 Block diagram

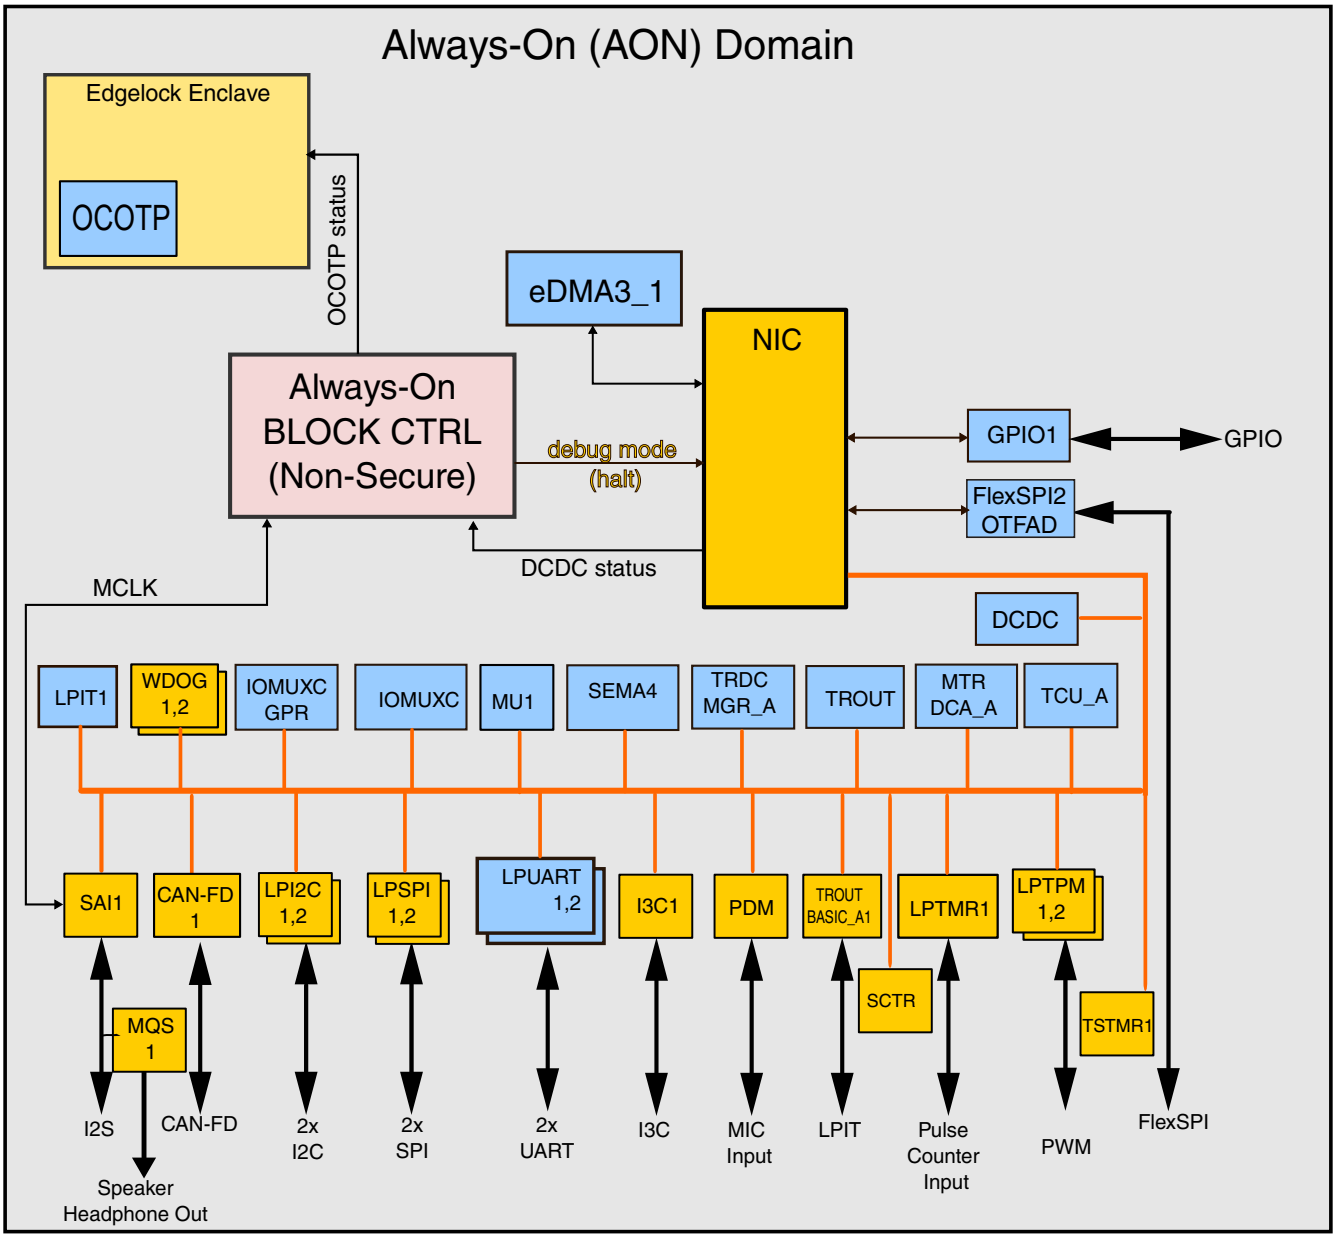

Figure 328. AONMIX block diagram

61.4 Functional description

This block is a register container and doesn't have any function itself. The regisers it contained cover:

- Sleeping or deep sleeping selection for low power mode entry
- Debug halt mask bits for peripherals in AON Domain
- AON Domain SSI master block low power bits
- SAI1 MCLK direction control
- DCDC status bit and exception bits read and clear

- OCOTP miscellaneous status bits
- I3C1 asynchronous interrupt clear bit
- I3C1 IO on chip strong pull enable bit
- GPIO_AON bank voltage range control

61.4.1 Clocks

The table found here describes the clock sources for BLK_CTRL_NS_AON. Please see the Clock Control chapter for clock setting, configuration, and gating information.

Table 546. Clocks

Clock Name	Description
bus_aon_clk	AON bus clock for register access.

61.4.2 Reset

The AON NS BLK_CTRL resets with the AON Domain.

61.5 Initialization

There are no initialization steps required.

61.6 Memory Map and register definition

This section includes the blk_ctrl_ns_aonmix module memory map and detailed descriptions of all registers.

61.6.1 BLK_CTRL_NS_AONMIX register descriptions

61.6.1.1 AONMIX Non-Secure Block Control memory map

BLK_CTRL_NS_AONMIX1 base address: 4421_0000h

Fields

Field	Description
31-1 —	Reserved
0 BUSY	OCOTP controller busy bit Indicates OTP controller is busy 0 - Idle 1 - OCOTP is Busy

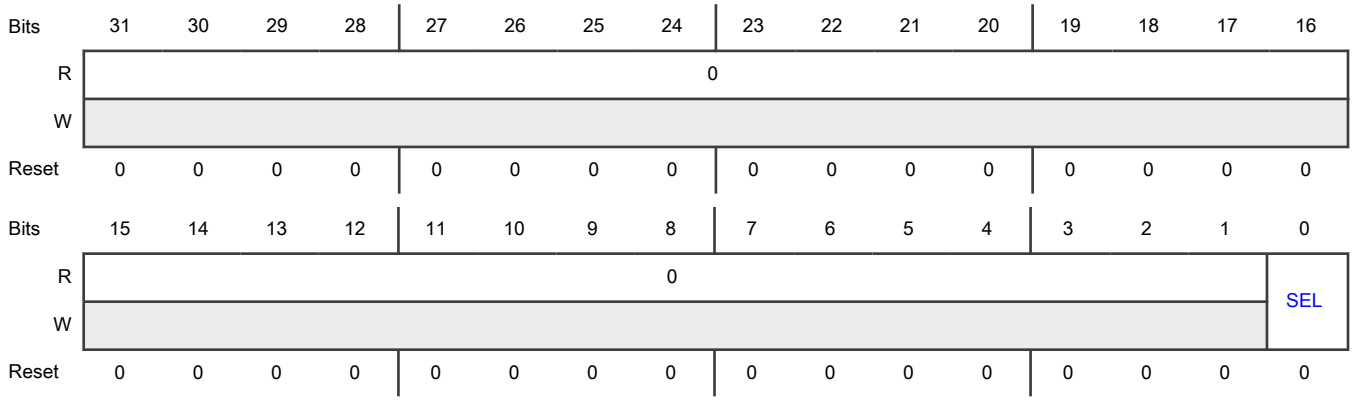
61.6.1.24 PDM clock selection register (PDM_CLK_SEL)

select source of PDM clock

Offset

Register	Offset
PDM_CLK_SEL	78h

Diagram



Fields

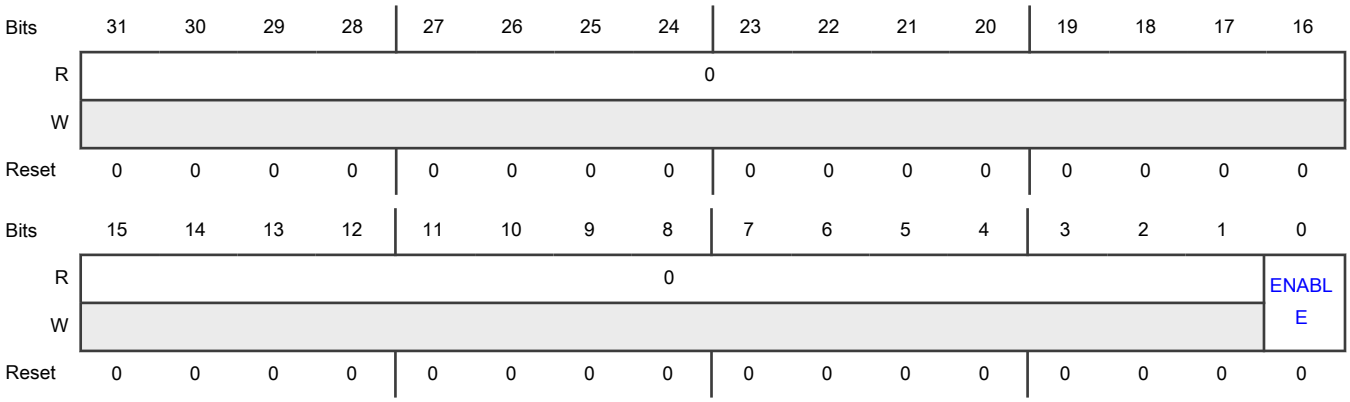
Field	Description
31-1 —	Reserved
0 SEL	Select source for PDM clock This bit enables source clock selection for PDM clock. 0 - PDM root clock 1 - SAI1_MCLK

61.6.1.25 I3C1 SDA IRQ CONTROL (I3C1_SDA_IRQ)

Offset

Register	Offset
I3C1_SDA_IRQ	7Ch

Diagram



Fields

Field	Description
31-1 —	Reserved
0 ENABLE	IRQ enable bit 0 - I3C1 SDA IRQ disable 1 - I3C1 SDA IRQ enable

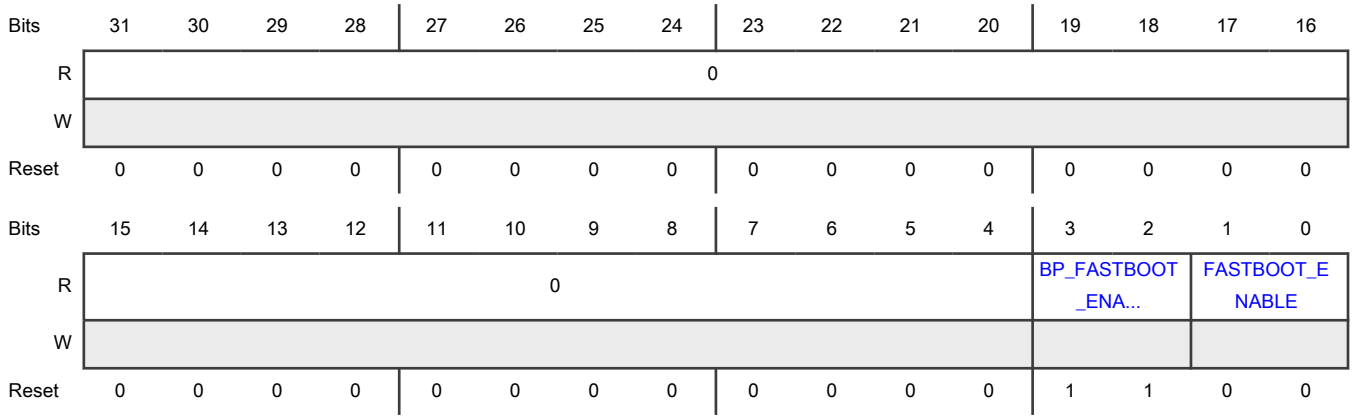
61.6.1.26 Fastboot enable (FASTBOOT_ENABLE)

This register includes read-only fastboot enable bits.

Offset

Register	Offset
FASTBOOT_ENABLE	80h

Diagram



Fields

Field	Description
31-4 —	Reserved
3-2 BP_FASTBOOT_ENABLE	BP_FASTBOOT_ENABLE
1-0 FASTBOOT_ENABLE	FASTBOOT_ENABLE bits Read value will be inverted of FASTBOOT_ENABLE & BP_FASTBOOT_ENABLE , As if FASTBOOT_ENABLE will "00" then BP_FASTBOOT_ENABLE will be "11"

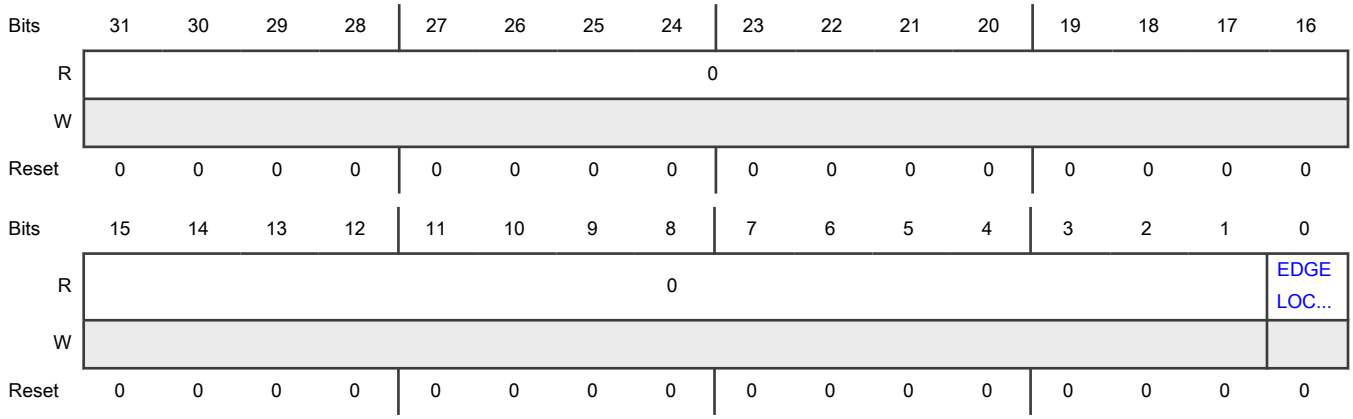
61.6.1.27 Read only Edgelock fuse (EDGELOCK_FW_PRESENT)

If/when programmed, this bit will indicate to Edgelock ROM that is *must* load Edgelock FW (NXP signed/encrypted), *before* any other system image. It is there to allow enforcing Edgelock ROM patching (for example if we hit ROM issues that might represent system level vulnerabilities). This bit can be set in NXP manufacturing and/or in field.

Offset

Register	Offset
EDGELOCK_FW_PRESENT	84h

Diagram



Fields

Field	Description
31-1 —	Reserved
0 EDGELOCK_FW_PRESENT	Read only bit for Edgelock fuse

61.6.1.28 low power control for SSI_MASTER_AON2WKUP (SSI_MASTER_AON2WKUP)

Chapter 62
Always-on Domain, Secure Block Control (blk_ctrl_s_aonmix)

62.1 Introduction

The BLK_CTRL_S_AONMIX contains control and status registers, that can be accessed only by secure processors. These registers include IRQ mask bits, low power control bits, WDOG output mask bits, CA55 start address, and some other core-related control bits.

62.1.1 Block diagram

A block diagram of the AONMIX implementation is shown below.

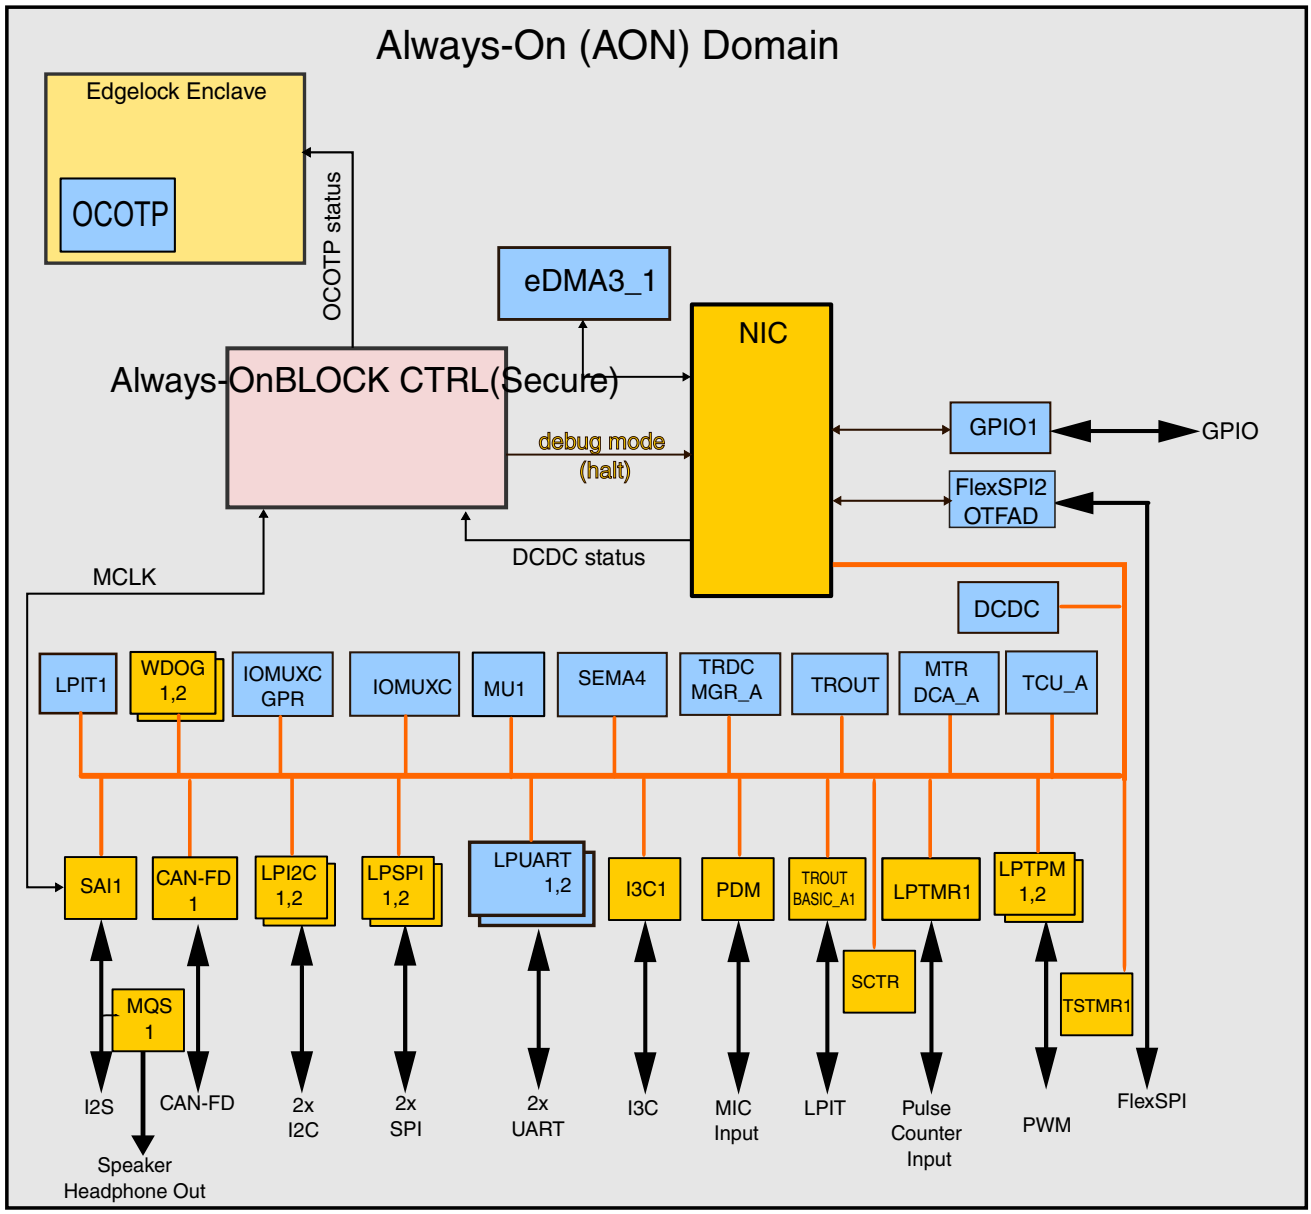

Figure 329. AONMIX Block Diagram

62.2 Functional description

Please refer to RM for detailed function description.

62.2.1 Clocks

The table found here describes the clock sources for BLK_CTRL_S_AON. Please see the Clock Control chapter for clock setting, configuration, and gating information.

Clock Name	Description

Table continues on the next page...

Table continued from the previous page...

edgelock_clk	Edgelock Trust

62.2.2 Reset

BLK CTRL S AONMIX resets with the AONMIX domain.

62.3 Initialization

There are no initialization steps required.

62.4 Memory Map and register definition

This section includes the S_AONMIX module memory map and detailed descriptions of all registers.

62.4.1 blk_ctrl_s_aonmix register descriptions

62.4.1.1 AONMIX Block Control For Secure World memory map

BLK_CTRL_S_AONMIX2 base address: 444F_0000h

Chapter 63
Wake-up Domain Block Control (blk_ctrl_wakeupmix)

63.1 Introduction

The WAKEUPMIX domain contains control and status registers. These registers include upper address extension, debug mask bits, pad voltage status bits, and control registers for the modules in the WAKEUPMIX domain. These registers provide chip-level control outside the peripherals.

63.1.1 Block diagram

A block diagram of the Wakeup BLK_CTRL implementation is shown below.

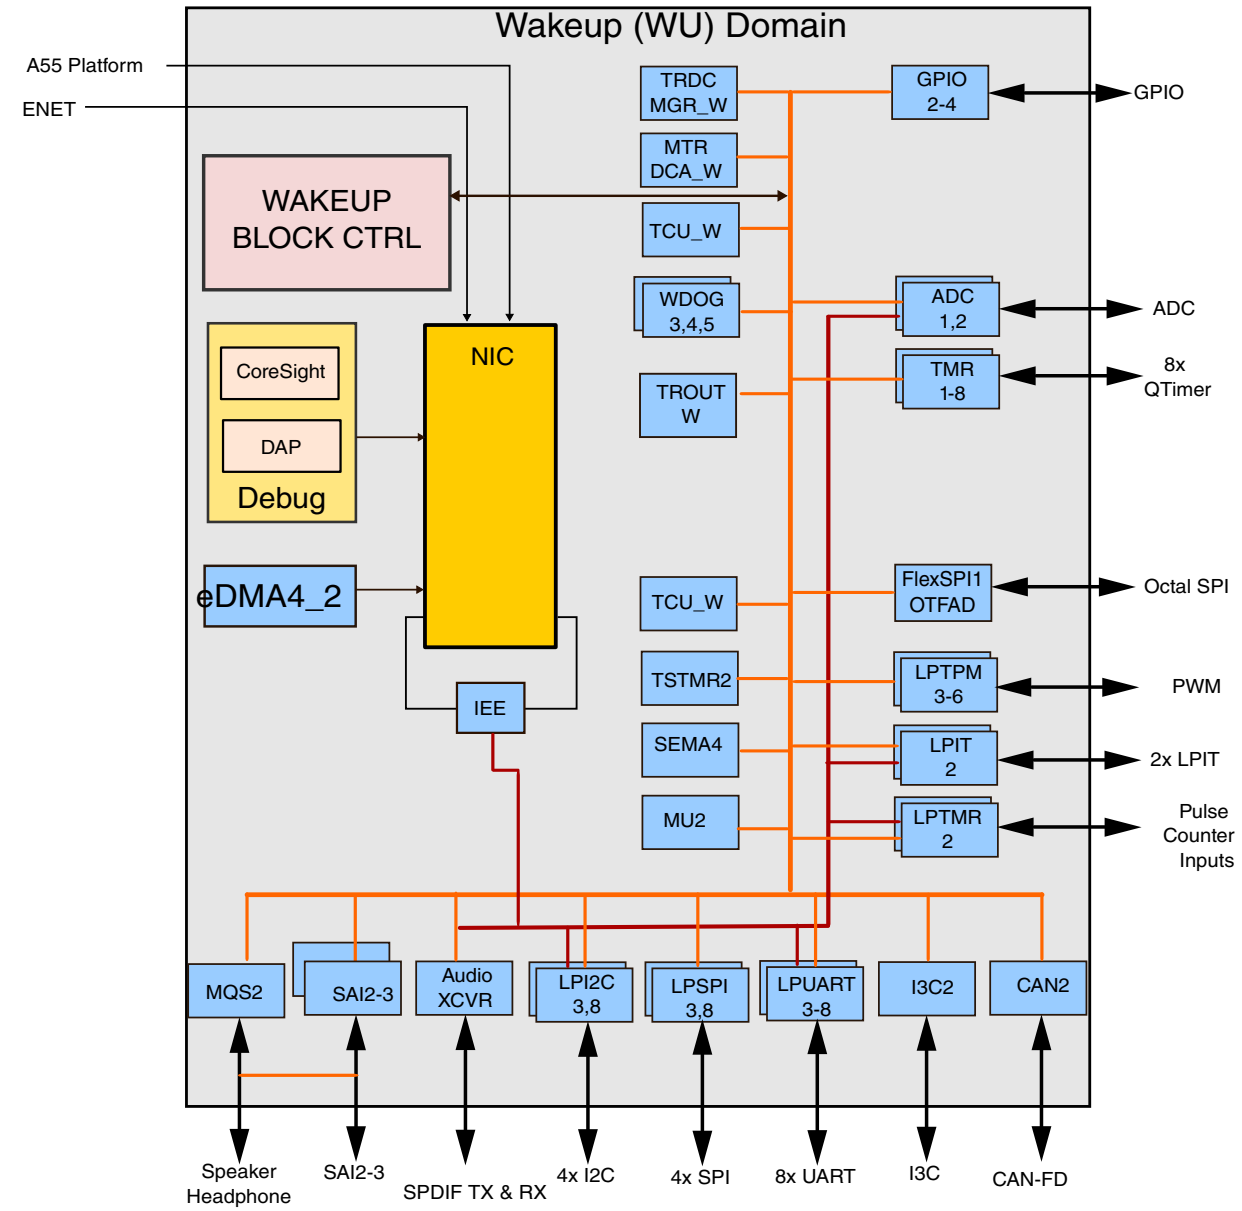

Figure 330. Wakeup BLK_CTRL Block Diagram

63.1.2 Features

The WAKEUP BLK_CTRL has the following features:

- Debug halt mask bits for peripherals in WAKEUP Domain
- WAKEUP SSI master block low power bits
- SAI2/3 MCLK direction control and MCLK source selection
- USBPHY asynchronous interrupt clear bit
- I3C2 wakeup clear bit
- I3C2 IO on-chip strong pull enable bit
- MQS settings
- Voltage detector output

63.2 Functional description

This block is a register container and doesn't have any function itself. The registers included are as below:

- Debug halt mask bits for peripherals in WAKEUP Domain
- WAKEUP SSI master block low power bits
- SAI2/3 MCLK direction control and MCLK source selection
- USBPHY asynchronous interrupt clear bit
- I3C2 wakeup clear bit
- I3C2 IO on-chip strong pull enable bit
- MQS settings
- Voltage detector output

63.2.1 Clocks

The table below describes the clock sources for Wakeup BLK_CTRL. Please see the Clock Control chapter for clock setting, configuration, and gating information.

Table 547. WAKEUPMIX clocks

Clock name	Description
wakeup_axi_clk_root	uSDHC1,2,3 NIC_mega NIC_main EDMA4_2 (AXI) FlexSPI1 (both its AHB and APB buses) SAI2, SAI3
bus_wakeup_clk_root	AIPS2 and its peripherals AIPS3 and its peripherals GPIO2, 3

63.2.2 Reset

The Wakeup BLK_CTRL resets with the Wakeup Domain.

63.2.3 Interrupts

Please refer to the individual peripheral chapters for detailed interrupt information.

63.3 Initialization

There are no initialization steps required.

63.4 Memory Map and register definition

This section includes the blk_ctrl_wakeupmix module memory map and detailed descriptions of all registers.

63.4.1 BLK_CTRL_WAKEUPMIX register descriptions

63.4.1.1 WAKEUPMIX Block Control memory map

BLK_CTRL_WAKEUPMIX1 base address: 4242_0000h

Chapter 64
NIC Mix Block Control (blk_ctrl_nicmmix)

64.1 Introduction

The NICMIX domain includes configuration registers for DEXSC error response, QoS value from A55, AXI limit and HSIOMIX.

64.1.1 Block diagram

The figure below shows NICMIX.

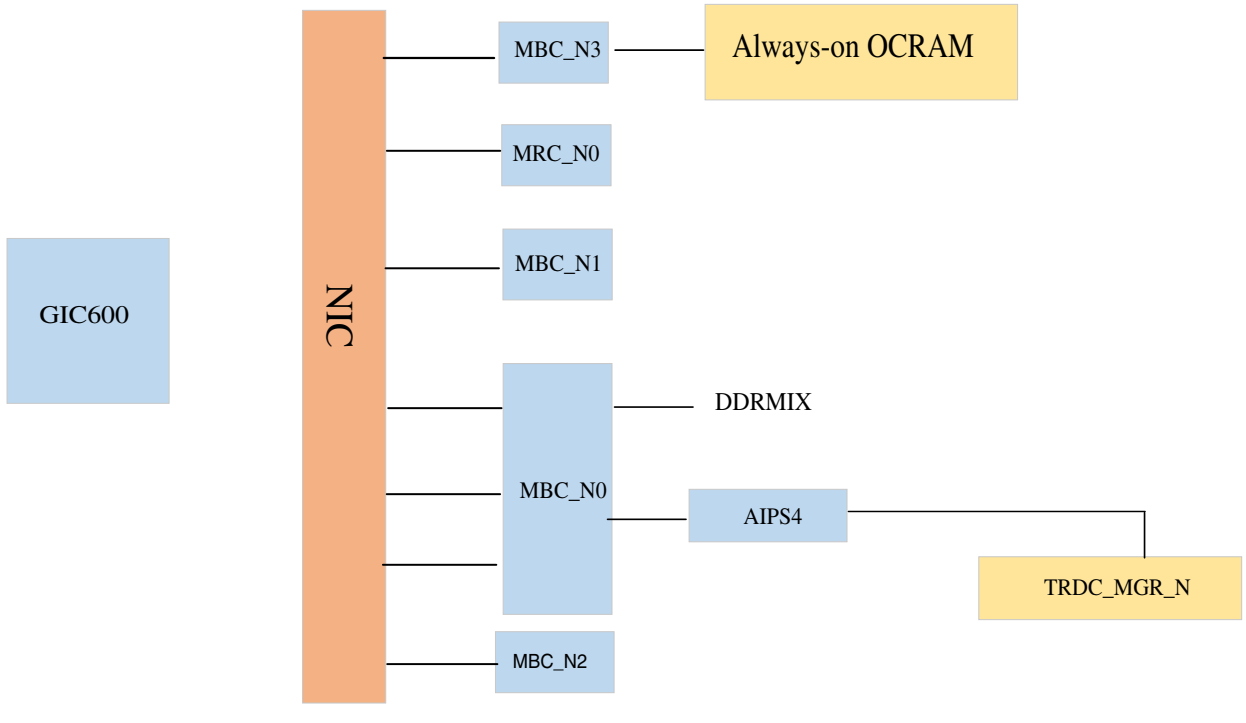

Figure 331. NICMIX block diagram

64.1.2 Features

- Configuration of DEXSC error response
- OCRAM RMW configuration
- WAKEUPMIX AXI limit configuration
- QoS Configuration from A55, HSIOMIX
- AxCACHE and AXI limit configuration

64.2 Functional description

The following sections describe functional details of the BLK CTRL NICMIX.

64.2.1 Clocks

The table found here describes the clock sources for BLK_CTRL_NS_AON. Please see the Clock Control chapter for clock setting, configuration, and gating information.

Clock Name	Description
nic_clk	NIC_Central GIC600 OCRAM
nic_apb_clk	AIPS4 Peripherals

64.2.2 Reset

BLK CTRL NICMIX resets with the NICMIX domain.

64.3 Initialization

There are no initialization steps required.

64.4 Memory Map and register definition

This section includes the BLK CTRL NICMIX module memory map and detailed descriptions of all registers.

NOTE

Write/Read to the Reserved locations will not generate a transfer error.

64.4.1 BLK CTRL NICMIX register descriptions

64.4.1.1 NICMIX Block Control memory map

These registers are GPRs(General Purpose Registers) of NICMIX. Please note that xfr_err cannot be generated for the module's illegal/Reserved accesses.

BLK_CTRL_NIC_WRAPPER1 base address: 4900_0000h

Chapter 65
DDR Mix Domain Block Control (blk_ctrl_ddrmix)

65.1 Overview

The DDRMIX contains DDR Controller, LPDDR4 PHY and DRAM PLL.

It also contains control and status registers, that can be accessed by both secure and non-secure processors, known as blk_ctrl_ddrmix. These registers include Hardware Fast Frequency Change(HWFFC) control and DDRC stop signal control. There is also a register for PLL test observability. Please refer to the register description below for more information.

65.1.1 Block Diagram

This section includes the DDRMIX block diagram.

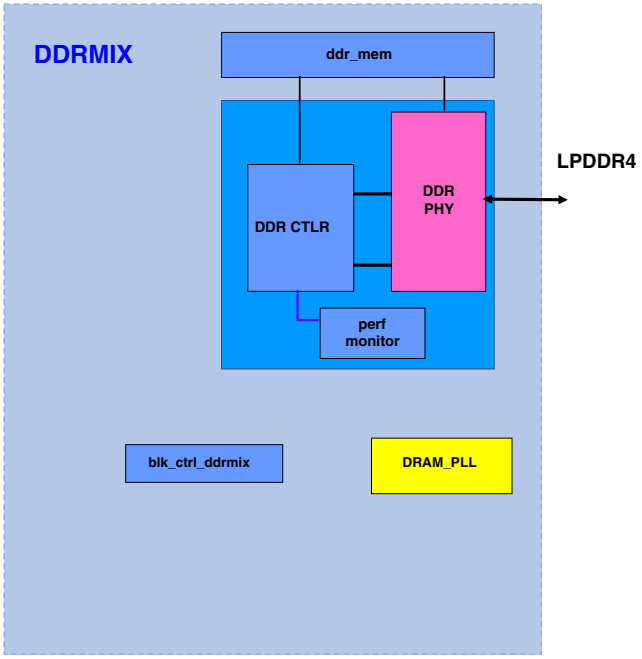

Figure 332. Block diagram

65.1.2 Features

Please refer to DDR Memory Controller for more details.

65.2 Functional Description

This section describes the functional details of DDRMIX.

65.2.1 Clocks

DRAM CLK is the source for DDRMIX.

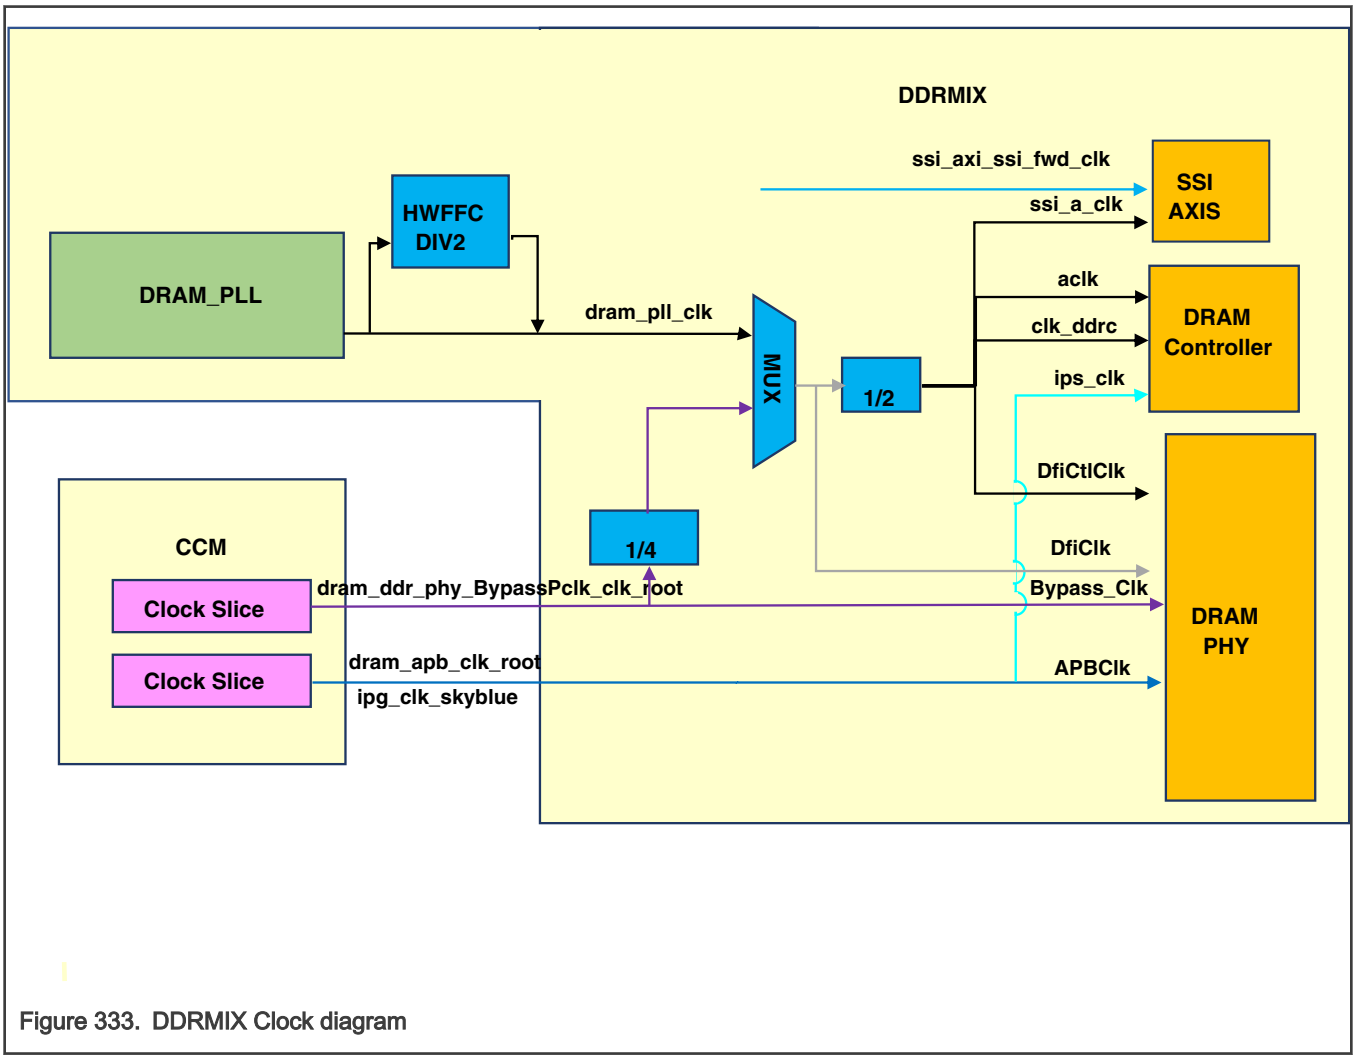

Figure 333. DDRMIX Clock diagram

65.2.2 Interrupts

Please refer to Interrupts and DMA Assignments Chapter.

65.3 HWFCC and SWFFC Procedure

The DDR Mix Domain and DDR Memory Controller (DDRC) allow for dynamic frequency scaling of the DDR frequency to save power during use cases where higher DDR performance is not required. There are two methods which can be utilized: Hardware Fast Frequency Change (HWFFC) and Software Fast Frequency Change (SWFFC).

HWFFC is utilized when switching from the maximum DDR frequency setpoint (full-speed mode) to half of the maximum frequency setpoint (half-speed mode). As the name implies, it uses the DDR Mix hardware mechanism to change DDR frequencies (between full-speed and half-speed mode) in a relatively short amount of time.

SWFFC is utilized when switching between frequencies that do not meet the half-frequency guideline used for HWFFC. SWFFC is especially useful when switching to very low DDR frequencies where minimum DDR performance is needed (for example, in an audio playback use case).

Both HWFFC and SWFFC can be used together when configuring the system for up to three frequency setpoints (also known as Frequency states). In this case, it is assumed that Frequency State 0 is configured for full-speed mode, Frequency State 1 for

half-speed mode, and Frequency State 2 configured for a frequency much less than half the full-speed mode, for example 100 MT/s (50 MHz). In this scenario, HWFFC is used for switching between Frequency State 0 and Frequency State 1 and SWFCC used for switching between Frequency State 0 and Frequency State 2.

The following sections describe the flow for HWFCC and SWFFC. It is the responsibility of the user to decide which method is used and when to employ each method. In addition, the code location for implementing these procedures should reside in a memory other than the DRAM and in this case it is recommended to use the On Chip SRAM (OCRAM).

65.3.1 HWFFC Procedure

The following section describes the HWFFC flow. Before performing HWFFC, an initial setup is required during DRAM initialization and is outlined first. This is followed by the actual implementation of the HWFFC flow.

The following figure illustrates the HWFFC flow:

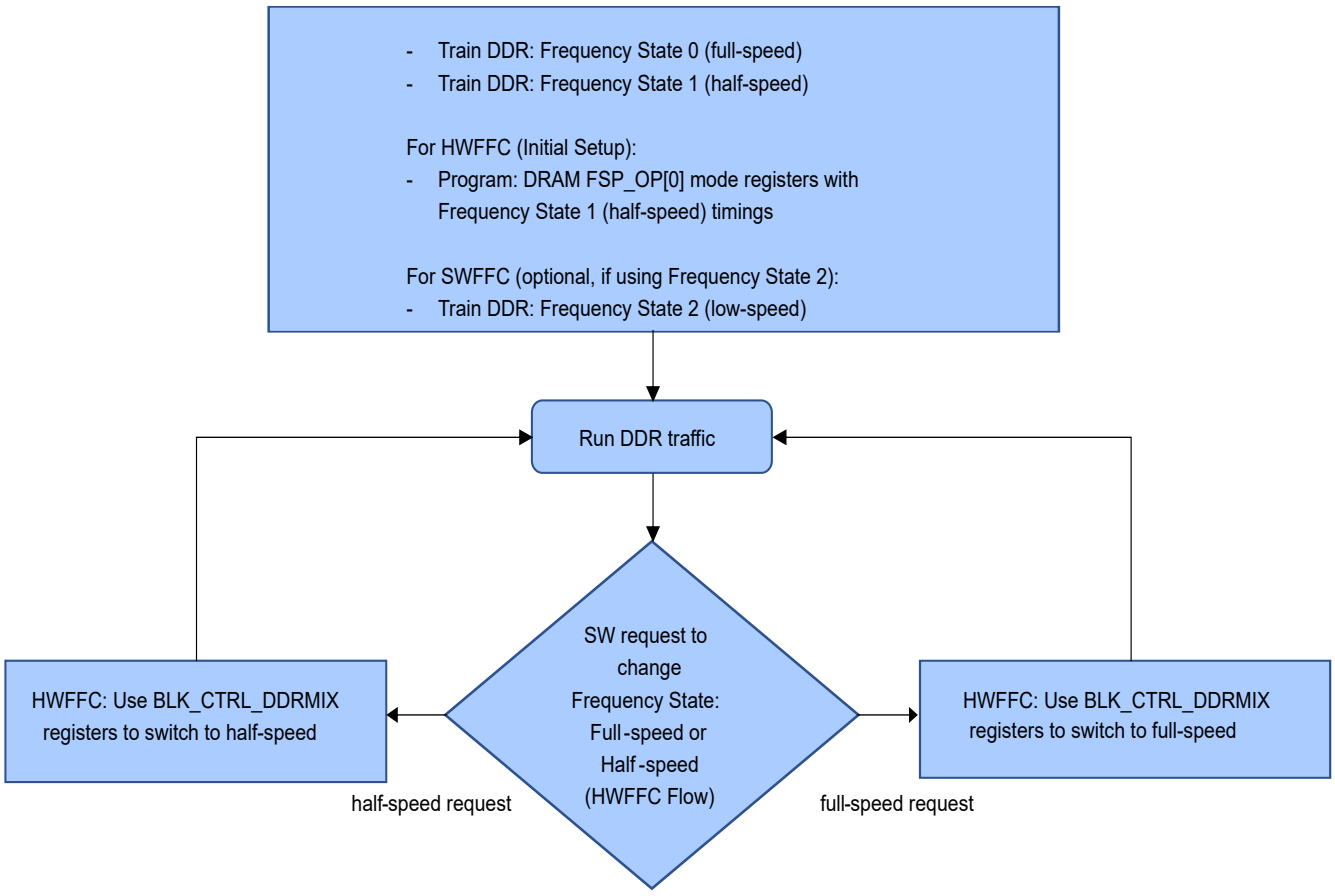

Figure 334. HWFFC Procedure

HWFFC Initial Setup:

1. HWFFC is supported between the full frequency (full-speed mode) and half frequency (half-speed mode) only. Note, not all the DDRC TIMING_CFG_12/13/14 registers for half-speed configurations can be programmed to the half-speed values. Instead, these should be programmed based on the guidelines below:
    a. Match the corresponding full-speed values for the TIMING_CFG_12[PRETOACT_HS], TIMING_CFG_12[ACTTOPRE_HS], TIMING_CFG_12[ACTTORW_HS], TIMING_CFG_13[WRREC_HS], TIMING_CFG_13[ACTTOACT_HS], TIMING_CFG_14[RD_TO_PRE_HS] register bits in DDRC. See DDR Memory Controller (DDRC) for more information.

NOTE

These bits are automatically configured by the NXP's DDR Config tool.

b. Program per the desired half-speed values for the DDRC TIMING_CFG_12[CASLAT_HS], TIMING_CFG_13[REFREC_HS], TIMING_CFG_14[WRLAT_HS], TIMING_CFG_14[REFINT_HS] register bits in DDRC. See DDR Memory Controller (DDRC) for more information.

NOTE

These bits are automatically configured by the NXP's DDR Config tool.

c. Note that the DDRC registers should not be accessed while operating at half-speed. A switch to full-speed is first required (for example, if an error register needs to be read).

2. When HWFFC is to be used, then train Frequency State 0 of the DDR PHY to full frequency (full-speed mode) and then train Frequency State 1 of the DDR PHY to half frequency (half-speed mode).
3. After 2D training is run, the DDR PHY will leave the DRAM in FSP-OP[1], and the PHY will be in Frequency State 0 (full frequency). At this point, the DDRC DDR_SDRAM_MD_CNTL can be used to perform mode register writes to program the FSP-OP[0] registers of the LPDDR4 DRAM to match the half-speed requirements (the DDR PHY does not do this automatically).
4. The following LPDDR4 registers have shadow copies for different frequency setpoints (FSPs): MR1, MR2, MR3, MR11, MR12, MR14, MR22.
5. After programming the DRAM's FSP-OP[0] registers, the DDRC is now ready for operation.

HWFFC Implementation (used when switching between full-speed and half-speed mode):

1. AUTO_CG_CTRL[AUTO_CG_ENA] bit in BLK_CTRL_DDRMIX should be cleared to disable DDR Controller automatic clock gating.
2. Set AUTO_CG_CTRL[HWFFC_ACG_FORCE_B] bit in BLK_CTRL_DDRMIX to 1. This bit will allow HWFFC sequence to launch ipg_stop to DDR Controller, which is necessary for HWFFC.
3. DDR_SDRAM_CFG[SREN] in DDRC should be set to 1 to enable self-refresh during sleep.
    a. This step should be performed in the DDR initialization by setting DDR_SDRAM_CFG[MEM_EN]
4. Set HWFFC_CTRL[HWFFC_EN] in BLK_CTRL_DDRMIX to 1 to enable DDR HWFFC. This step can be done together with Step 5.
5. Configure HWFFC_CTRL[HWFFC_SEL] to select the option of switching to full-speed or half-speed. HWFFC_CTRL[HWFFC_SEL]=0 configures switching to full speed and HWFFC_CTRL[HWFFC_SEL]=1 for half speed. This can be done together with Step 4.
6. Poll DDRC_STOP_CTRL[DDRC_STOP_ACK] bit in BLK_CTRL_DDRMIX until is returns 0.
7. Set DDRC_STOP_CTRL[DDRC_STOP] to 1.
8. Poll DDRC_STOP_CTRL[DDRC_STOP_ACK] until is returns 1.
9. Clear DDRC_STOP_CTRL[DDRC_STOP] to 0.
10. Additional steps when switching from half-speed to full-speed:
    a. If the DDRC DDR_SDRAM_CFG_3[DYN_REF_RATE_EN] = 1, then save this state into a variable and clear this bit.
    b. Perform a DDR mode register write to MR13 to 0xC0 to set the FSP-WR and FSP-OP to frequency setpoint 1.
    c. If the DDR_SDRAM_CFG_3[DYN_REF_RATE_EN] was previously set above, restore the state of this bit.
11. The AUTO_CG_CTRL[AUTO_CG_ENA] in BLK_CTRL_DDRMIX can be set to re-enable DDR Controller automatic clock gating.

The following steps needed to take the full system from a high performance mode to a low performance mode :

- SW detects event to switch from high to low perf/power mode (UD Mode).

- Enter low perf/power use case.
- Clock frequency reduction sequence
    1. Reduce all system clock (GPU, USB, and so on) frequencies except for DRAM, NoC, CPU clock frequency. This should take these components into low performance mode while DDR is still in high performance run.
    2. Reduce CPU clock frequency only IF needed. This is after #1, so CPU can still function at high performance while other components are reduced to UDM first.
    3. Reduce DRAM clock frequency to /2 using HWFFC. This is last so that DDR is still running at high performance during the switch to avoid BW issues.
    4. Reduce NOC clock frequency. Final step to complete LD mode entry, again to avoid any internal BW limitation that might cause an issue.
- Reduce voltage level to UD mode voltage specification for power savings.
- Commence with UD mode operation.

The following steps needed to take the full system from a low performance mode to a high performance mode :

- SW detects event to switch from low to high perf/power mode.
- 1. Increase NOC clock frequency.
    2. Increase DRAM clock frequency using PLL post divider /1 and HWFFC.
    3. Increase the CPU clock frequency.
    4. Increase all remaining system clock frequencies (GPU, etc). Enter high perf/power use case. Commence with high performance use case.

65.3.2 SWFFC Procedure

The following section describes the SWFFC flow. The following figure illustrates the SWFFC flow:

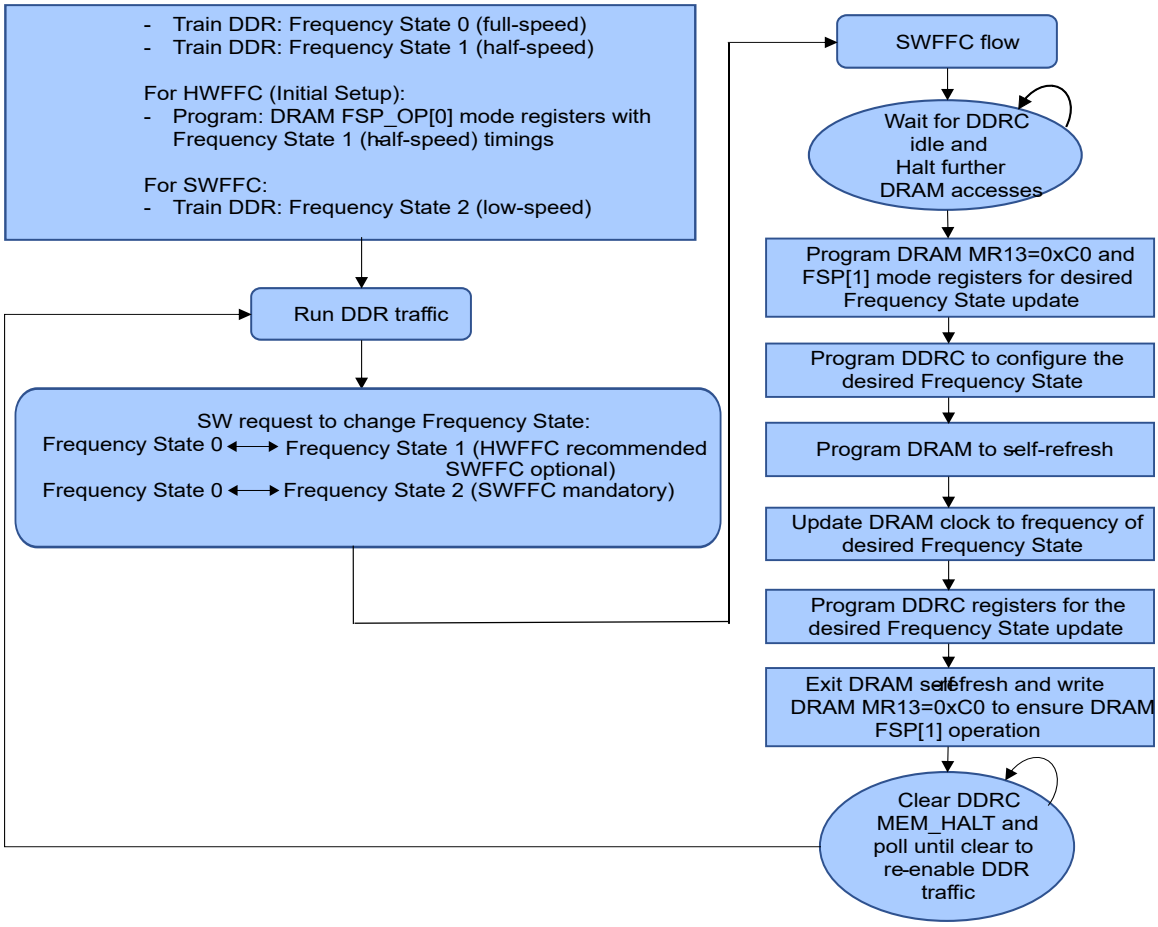

Figure 335. SWFFC Procedure

The following are the detailed steps for the SWFFC flow:

1. Prior to implementing the SWFFC procedure, if both HWFFC and SWFFC are used, then train Frequency State 2 (the third and lowest frequency setpoint) of the DDR PHY to the SWFFC Frequency State 2 frequency (Frequency State 1 can also be used for SWFFC for half-frequency switching, even though it meets the requirements for HWFFC).
2. In the DDRC, the register bit settings for DDR_SDRAM_CFG_3[SR_FAST_WK_EN] and [DYN_REF_RATE_EN] should be cleared. In BLK_CTRL_DDRMIX, AUTO_CG_CTRL[AUTO_CG_ENA] should be cleared to disable auto clock gating (this step can be moved to step 1 if desired).
    a. If inline ECC is enabled (global or per region), then ensure that the DDRC DDR_TX_CFG_1 bit[3:0] is cleared to 0000.
3. Halt further DDRC transfers by setting DDR_SDRAM_CFG[MEM_HALT] and poll for [MEM_HALT] to be set.
4. In the DDRC, poll for the DDRDSR_2[IDLE] to be set. If inline ECC is enabled, also poll for DDRDSR_2[NML] to be set.
5. Use the DDRC DDR_SDRAM_MD_CNTL register to issue a DRAM mode register write to MR13 in order to set FSP-WP and FSP-OP to 1 (MR13 value of 0xC0) for frequency setpoint1 operation. As the DRAM and its mode registers are now configured for frequency setpoint1 operation, issue a series of mode register writes to configure the DRAM mode registers to operate at the newly desired Frequency State ’s DDR frequency (for example, update MR2 for the desired frequency’s WL/RL setting, and so on). However it is recommended to leave VRef(CA) as it should be for the higher of the all frequencies.
    a. These series of mode registers are configured for each Frequency State (frequency setpoint) using NXP’s DDR Config tool.

6. Write the DDRC DDR_SDRAM_CFG_4[FRQCH_RET] to the desired Frequency State value (0x0 for Frequency State 0, 0x1 for Frequency State 1, 0x2 for Frequency State 2) then poll DDR_SDRAM_CFG_4[FRQCH_RET] to ensure desired Frequency State value configuration has completed.
7. If the desired Frequency State data rate <=533MT/s, then the following sequence should be followed:
    a. Wait 2 micro-seconds.
    b. Reset the DDRC by setting DDR_SDRAM_CFG_3[DDRC_RST]=1 and then poll this bit to ensure it is set.
    c. Wait 5 micro-seconds before proceeding to the next step.
8. Set the DDRC DDR_SDRAM_CFG_2 [FRC_SR] to place the DRAM in self-refresh and wait sometime to ensure DRAM in self-refresh. The following wait times are recommended based on the DRAM data rate of the current Frequency State :

Data rate of current Frequency State	Wait time after self-refresh entry
Greater than or equal to 625MT/s	7 micro-seconds
Less than 625MT/s	70 micro-seconds

9. Switch the DDR clock (frequency) by programming the DRAM PLL to match the new frequency of the desired Frequency State or switch to the CCM DRAM root clock in bypass mode.
10. Update the following DDRC registers to align with the timings for the desired Frequency State : TIMING_CFG_{0, 1, 2, 3, 4, 7, 8, 9, 10, 11}, DDR_SDRAM_INTERVAL, and DDR_ZQ_CNTL.
    a. These registers are configured for each Frequency State (frequency setpoint) using NXP’s DDR Config Tool.
11. Clear the DDRC DDR_SDRAM_CFG_2 [FRC_SR] to force the DRAM to exit self-refresh.
    a. If the desired Frequency State data rate <=533MT/s, then wait 5 micro-seconds before proceeding to the next step.
12. Use the DDRC DDR_SDRAM_MD_CNTL register to issue a DRAM mode register write to MR13 in order to set FSP-WP and FSP-OP to 1 (MR13 value of 0xC0) for frequency setpoint1 operation. This ensures that the DRAM is configured for frequency setpoint1 operation in case this may have been inadvertently re-configured.
13. Restore the previous state of the DDRC DDR_SDRAM_CFG_3[SR_FAST_WK_EN] and [DYN_REF_RATE_EN] which were previously disabled in Step 2. Also, re-enable auto clock gating be setting the DDR Mix AUTO_CG_CTRL[AUTO_CG_ENA] = 1.
14. Clear the DDRC DDR_SDRAM_CFG [MEM_HALT] and poll for [MEM_HALT] to be cleared.

65.4 DDR IO Retention Enter/Exit Procedure

The DDR IO Retention standby power state is a non-operational low power state. It is the lowest possible power state for the DDR Controller and PHY. In this state, the DRAM is in self refresh to maintain its data contents, while the DDR Controller and PHY are powered down.

The prerequisite prior to entering and exiting DDR retention is to save the DDR controller and DDR PHY configuration data (address and data pairs) and store this data to a non-DRAM location; in this case it is recommended to use the On-Chip SRAM (OCRAM). This step is necessary as this configuration data must be restored when exiting DDR retention. It is recommended to save the DDR controller and DDR PHY configuration data during the system initialization process after DRAM initialization and data training have completed.

The DDR controller and DDR PHY address/data pair configuration structures can be found in the file lpddr4_timing.c. This file, generically named henceforth as timing.c, is generated using NXP’s DDR Config Tool (available at nxp.com). Refer to the NXP DDR Config Tool’s User Guide for more information on the tool and its usage.

The DDR controller and DDR PHY configuration data can be found in the timing.c file structure called:

```
struct dram_timing_info dram_timing
```

Specifically, the user will need to save the address/data pairs of the following dram_timing members to a designated area in the OCRAM:

```
.ddrc_cfg – DDR Controller (DDRC) configuration data
.ddrc_cfg_num – size of the ddrc_cfg data structure
.ddrphy_cfg – DDR PHY configuration data
.ddrphy_cfg_num – size of the ddrphy_cfg data structure
.ddrphy_trained_csr – DDR PHY trained values configuration data (initialize after data
      training)
.ddrphy_trained_csr_num – size of the ddrphy_trained_csr data structure
.ddrphy_pie – DDR PHY configuration data
.ddrphy_pie_num – size of the ddrphy_pie data structure
.fsp_cfg – DDRC timing registers and DRAM mode registers for each Frequency State
.fsp_cfg_num – size of the fsp_cfg data structure
```

For the data structure ddr_ddrphy_trained_csr, the data values are initialized to zero. The data for the structure will need to be obtained and saved after performing DRAM initialization, specifically after data training. This data consists of trained values specific for the DDR PHY and hence why they can only be saved after performing DRAM data training. The following section outlines how to save this trained data into the data structure ddr_ddrphy_trained_csr.

65.4.1 Procedure on how to save the DDR PHY trained data

The DDR PHY configuration data structure is defined in the timing.c file and consists of the following structures:

```
.ddrphy_cfg – DDR PHY configuration data
.ddrphy_trained_csr – DDR PHY trained values configuration data (initialize after data
      training)
.ddrphy_pie – DDR PHY configuration data
```

Most of these can simply be saved using the data provided in the timing.c file. However, in the case of ddrphy_trained_csr, this consists of trained data values which can only be obtained after data training has been completed.

The following describes the steps necessary to save the DDR PHY trained data.

- First, ensure DDR data training has completed, then proceed with the following
- Write 0x0 to address 0x4E2B8000
- Write 0x3 to address 0x4E2B4200
- In a for-loop, perform the following:
    1. Read from the address in the structure
        a. You will need to covert this address to the AXI address equivalent – refer Procedure on translating the DDR PHY address to the equivalent AXI address
    2. Store the read value into the associated data of the address/data pair of the structure
    3. Increment to the next structure member address
    4. Continue these steps until the end of the data structure size
- Write 0x2 to address 0x4E2B4200
- Write 0x1 to address 0x4E2B8000

65.4.2 DDR IO Retention Enter Procedure

The figure below illustrates the flow for entering DDR IO Retention:

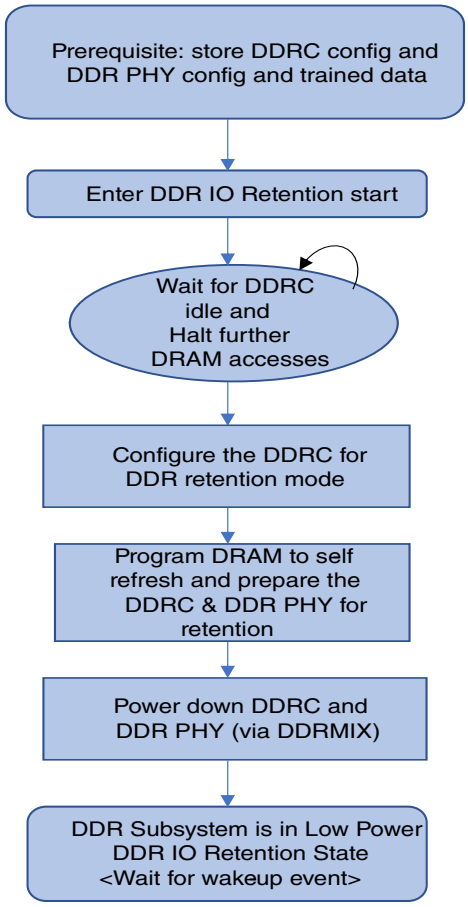

Figure 336. DDR IO Retention Enter Procedure

The following are the detailed steps for entering DDR IO Retention:

1. Poll for the DDRC DDRDSR_2[IDLE] to be set to 1 and then halt further DDRC transfers by setting DDRC DDR_SDRAM_CFG[MEM_HALT] to 1
2. Set DDRC DDR_SDRAM_CFG_3[SR_FAST_WK_EN] to 1 then poll to ensure this is set to 1
3. Program DDR_SDRAM_CFG_4[FRQCH_RET] to 1_1111 (0x1F) then poll to ensure this is configured correctly to 0x1F
4. Clear the DDRC DDR_ZQ_CNTL register to 0
5. Force the DDRC to enter self-refresh by setting DDRC DDR_SDRAM_CFG_2[FRC_SR] to 1 then perform the following tasks:
    a. Set BLK_CTRL_DDRMIX AUTO_CG_CTRL[HWFFC_ACG_FORCE_B] to 1 to allow the auto clock gate to send ipg_stop
    b. Set DDRC DDR_SDRAM_CFG[SREN] to 1 to enable self-refresh during sleep
    c. Set DDRC DDR_SDRAM_CFG_3[DRAIN_FOR_SR] to 1 to force the DDRC to drain its main command queue before servicing a self-refresh request
6. Set the BLK_CTRL_DDRMIX DDR Controller ipg_stop signal and wait for DDR Controller ipg_stop_ack signal acknowledge as follows:
    a. Poll BLK_CTRL_DDRMIX DDRC_STOP_CTRL[DDRC_STOP_ACK] bit until it returns 0

b. Set DDRC_STOP_CTRL[DDRC_STOP] to 1

c. Poll DDRC_STOP_CTRL[DDRC_STOP_ACK] bit until it returns 1

7. Disable auto refresh by clearing DDRC DDR_INTERVAL to 0
8. Set DDRC DDR_SDRAM_MD_CNTL to 0x00100000 which forces CKE to remain low
9. Clear DDRC_STOP_CTRL[DDRC_STOP] to 0, then perform the following tasks:
    a. Poll DDRC DDRDSR_2[PHY_INIT_CMPLT] until it returns 1
    b. Now set DDRDSR_2[PHY_INIT_CMPLT] to 1 to clear this bit
10. Clear DDRC DDR_SDRAM_CFG[SREN] to 0
11. Clear DDRC DDR_SDRAM_CFG_3[SR_FAST_WK_EN] to 0
12. Set the BLK_CTRL_DDRMIX DDR Controller ipg_stop signal and wait for DDR Controller ipg_stop_ack signal acknowledge as follows:
    a. Poll BLK_CTRL_DDRMIX DDRC_STOP_CTRL[DDRC_STOP_ACK] bit until it returns 0
    b. Set DDRC_STOP_CTRL[DDRC_STOP] to 1
    c. Poll DDRC_STOP_CTRL[DDRC_STOP_ACK] bit until it returns 1
13. Clear DDRC_STOP_CTRL[DDRC_STOP] to 0
14. Check the status of the internal DDR PHY to ensure it has entered low power (DDR Retention) mode
    a. Write 0x0 to address 0x4E2B8000
    b. Read from address 0x4E2A40A0 and ensure it returns 1
        - If it doesn’t return 1, re-visit the steps above to ensure they’ve been implemented correctly
    c. Write 0x1 to address 0x4E2B8000
15. Clear DDR PHY PwrOkIn via System Reset Controller (SRC) src_dphy_slice SINGLE_RESET_SW_CTRL [RST_CTRL_SOFT_0] (address 0x44461424, bit[0] = 0)
16. Power off the DDR subsystem by setting SRC src_ddr_slice SLICE_SW_CTRL[PDN_SOFT] = 1 (address 0x44461020, bit [31] = 1)

65.4.3 DDR IO Retention Exit Procedure

The figure below illustrates the flow for exiting DDR IO Retention:

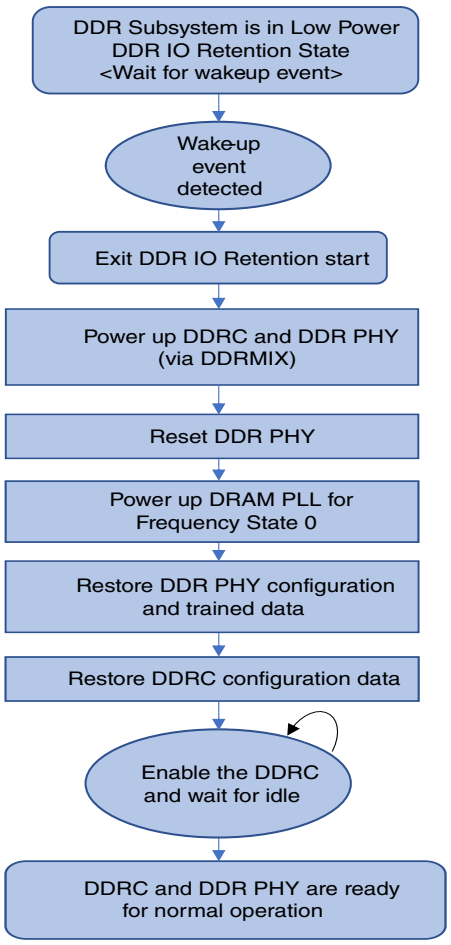

Figure 337. DDR IO Retention Exit Procedure

The following are the detailed steps for exiting DDR IO Retention:

1. First, power up and reset the DDRMIX subsystem by
    a. Power up the DDRMIX: Clear System Reset Controller (SRC) src_ddr_slice SLICE_SW_CTRL[PDN_SOFT] = 0 (address 0x44461020, bit [31] = 0)
    b. Reset to the DDRMIX subsystem as follows:
        i. Set SRC src_ddr_slice SLICE_SW_CTRL[RST_CTRL_SOFT_0] = 1 (address 0x44461020, bit [0] = 1)
        ii. Wait for a minimum of 10 milli-seconds
        iii. Clear SRC src_ddr_slice SLICE_SW_CTRL[RST_CTRL_SOFT_0] = 0 (address 0x44461020, bit [0] = 0)
        iv. Wait for a minimum of 10 milli-seconds
2. Reset the DDR PHY as follows:
    a. Clear SRC src_dphy_slice SLICE_SW_CTRL[RST_CTRL_SOFT] = 0 (address 0x44461420, bit[0] = 0)
    b. Clear SRC src_dphy_slice SINGLE_RESET_SW_CTRL[RST_CTRL_SOFT_1] = 0 (address 0x44461424, bit[2] = 0)
    c. Set SRC src_dphy_slice SINGLE_RESET_SW_CTRL [RST_CTRL_SOFT_0] = 1 (address 0x44461424, bit[0] = 1)
    d. Wait a minimum of 10 micro-seconds

e. Set SRC src_dphy_slice SLICE_SW_CTRL[RST_CTRL_SOFT] = 1 (address 0x44461420, bit[0] = 1)

f. Set SRC src_dphy_slice SINGLE_RESET_SW_CTRL[RST_CTRL_SOFT_1] = 1 (address 0x44461424, bit[2] = 1)

g. Wait a minimum of 10 micro-seconds

h. Clear SRC src_dphy_slice SINGLE_RESET_SW_CTRL [RST_CTRL_SOFT_0] = 0 (address 0x44461424, bit[0] = 0)

i. Wait a minimum of 10 micro-seconds

j. Clear SRC src_dphy_slice SLICE_SW_CTRL[RST_CTRL_SOFT] = 0 (address 0x44461420, bit[0] = 0)

k. Clear SRC src_dphy_slice SINGLE_RESET_SW_CTRL[RST_CTRL_SOFT_1] = 0 (address 0x44461424, bit[2] = 0)

3. Configure the DRAM PLL for Frequency State 0 as follows:

   a. Set DRAM PLL Control (CTRL_SET) to 1 (address 0x44481304 = 0x1) to power up and enable the DRAM PLL

   b. Wait for PLL lock by polling DRAM PLL PLL_STATUS[PLL_LOCK] until it becomes set to 1 (poll address 0x444813F0, bit[0] until it becomes a 1)

   c. Write 0x4 to DRAM PLL CTRL_CLR (write 0x4 to address 0x44481308)

   d. Write 0x2 to DRAM PLL CTRL_SET (write 0x2 to address 0x44481304)

   e. Perform the following to disable the DDR clock bypass

      i. Configure the DRAM APB to 133MHz: Write 0x202 to bits[9:0] of the DRAM_APB_CLK (slice 77, dram_apb_clk_root, CLOCK_ROOT77_CONTROL) register (address 0x44452680, bits[9:0] = 0x202).

      ii. Wait (poll) to ensure the setting was updated: Read bit[28] of address 0x444526A0 until it returns 0 (slice 77, dram_apb_clk_root, Clock root working status register (CLOCK_ROOT77_STATUS0)).

      iii. Switch from DRAM clock root from CCM to PLL: Write 1 to DRAM_PLL_BYPASS bit[0] of the CCM_GPR2 (GPR_SHARED2) register (address 0x44454840, bit[0] = 1).

4. Restore the DDR PHY configuration as follows. Note, when writing back the address/data pairs, the address portion will need to be re-mapped to the AXI address. Refer Procedure on how to save the DDR PHY trained data .

   a. Restore the ddrphy_cfg data (previously saved from the timing.c file). As noted above, when writing the values back to the DDR PHY registers, these register addresses will need to be translated to the equivalent AXI address.

   b. Restore the ddr_ddrphy_trained_csr data (mentioned previously, where this data should have been saved following DRAM initialization). The restore process for ddr_ddrphy_trained_csr data is as follows:

      i. Write 0x0 to address 0x4E2B8000

      ii. Write 0x3 to address 0x4E2B4200

      iii. In a for-loop, perform the following:

         i. Restore (write) the saved data of the associated address/data pair to the (translated AXI) address

         ii. Increment to the next structure member address

         iii. Continue these steps until the end of the data structure size

      iv. Write 0x2 to address 0x4E2B4200

      v. Write 0x1 to address 0x4E2B8000

   c. Restore the ddr_phy_pie data (previously saved from the timing.c file). As noted above, when writing the values back to the DDR PHY registers, these register addresses will need to be translated to the equivalent AXI address.

5. Restore the DDR Controller configuration data ddr_ddrc_cfg (previously saved from the timing.c file) as follows:

   a. Restore the ddrc_cfg data

- When writing back address 0x4e300114 (DDR_SDRAM_CFG_2), clear bit[4] (D_INIT)

b. Next, restore the Frequency Setpoint 0 (FSP[0]) DDRC timing registers. This is data structure fsp_cfg[0] found in timing.c (and should've been previously saved). Only restore the DDRC registers in this structure's FSP[0] data and not the DRAM mode registers.

c. Poll DDRC DDRDSR_2[PHY_INIT_CMPLT] until it returns 1

d. Now set DDRDSR_2[PHY_INIT_CMPLT] to 1 to clear this bit

e. Enable the DDRC by writing MEM_EN (bit[31] = 1) in DDR_SDRAM_CFG

f. Wait until the DDRC is idle: Read IDLE bit[31] in DDRDSR_2 until it is set to 1

The DDR Controller and PHY should now have exited DDR IO Retention mode and is ready for normal operation.

65.4.4 Procedure on translating the DDR PHY address to the equivalent AXI address

The various DDR PHY data structures contain configuration data for the DDR PHY in address/data pairs and are defined in the timing.c file. However, these addresses are defined from the perspective of the internal PHY module.

Whenever reading configuration data from or writing configuration data to the DDR PHY, the user will need to convert the PHY-based address to the equivalent AXI address. The following describes how to perform this address translation. It is recommended to implement the following steps into a function where the user passes in the DDR PHY address (DDR_PHY_ADDR) and returns the equivalent AXI address:

1. Function parameter input: DDR_PHY_ADDR
2. Create variable "X1" and configure as follows:
   - X1 = (DDR_PHY_ADDR >> 12) & 0x3FF
3. Create variable "X2" and configure as follows:
   - X2= DDR_PHY_ADDR & 0xFFF
4. Create variable "Y1" and configure this based "X1" in the lookup table below
5. Create variable "Y2" and configure as follows:
   - Y2=((Y1<<13) | (X2<<1)) << 1
6. Finally add "Y2" with 0x4E100000 and return the resultant value – this is the AXI address

Table 548. DDR PHY Address to AXI address lookup table

"X1"	"Y1"	"X1"	"Y1"	"X1"	"Y1"	"X1"	"Y1"

65.5 Memory Map and register definition

This section includes the blk_ctrl_ddrmix module memory map and detailed descriptions of all registers.

65.5.1 blk_ctrl_ddrmix register descriptions

65.5.1.1 DDRMIX Block Control memory map

BLK_CTRL_DDRMIX1 base address: 4E01_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	DDRPHY DfiClk, DfiCtlClk HWFFC Control (HWFFC_CTRL)	32	RW	0000_0000
4	CA55 Arm PLL, Anamix PLL Observe Select (CA55_SEL_CTRL)	32	RW	0000_0000
8	DRAM_VREF power switch (VREF_PSW_CTRL)	32	RW	0000_0000
C	DDR Controller ipg_stop SW control (DDRC_STOP_CTRL)	32	RW	0000_0000
10	DDR Controller automatic clock gating (AUTO_CG_CTRL)	32	RW	0000_0000
14	DDRMIX SSI Slave low power signal control (SSI_LP_CTRL)	32	RW	0000_0002

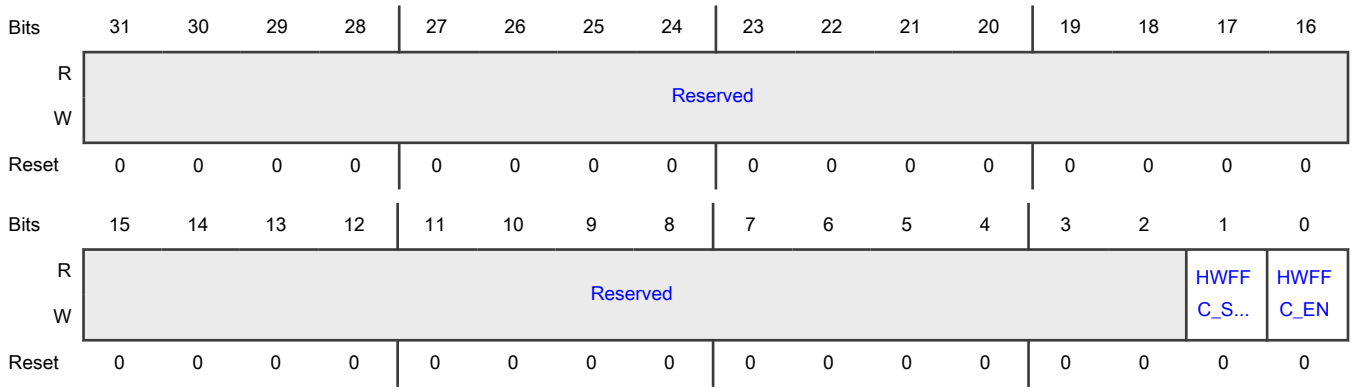
65.5.1.2 DDRPHY DfiClk, DfiCtlClk HWFFC Control (HWFFC_CTRL)

DDRPHY DfiClk, DfiCtlClk HWFFC functionality, select normal clock or div2 frequency clock.

Offset

Register	Offset
HWFFC_CTRL	0h

Diagram



Fields

Field	Description
31-2 —	Reserved
1 HWFFC_SEL	DDRPHY DfiClk, DfiCtlClk HWFFC Select This field select normal clock or div2 clock. 0 - Normal clock is selected 1 - Div2 frequency clock is selected
0 HWFFC_EN	DDRPHY DfiClk, DfiCtlClk HWFFC Enable This field enables DDRPHY HWFFC functionality. 0 - DDRPHY HWFFC is disabled 1 - DDRPHY HWFFC is enabled

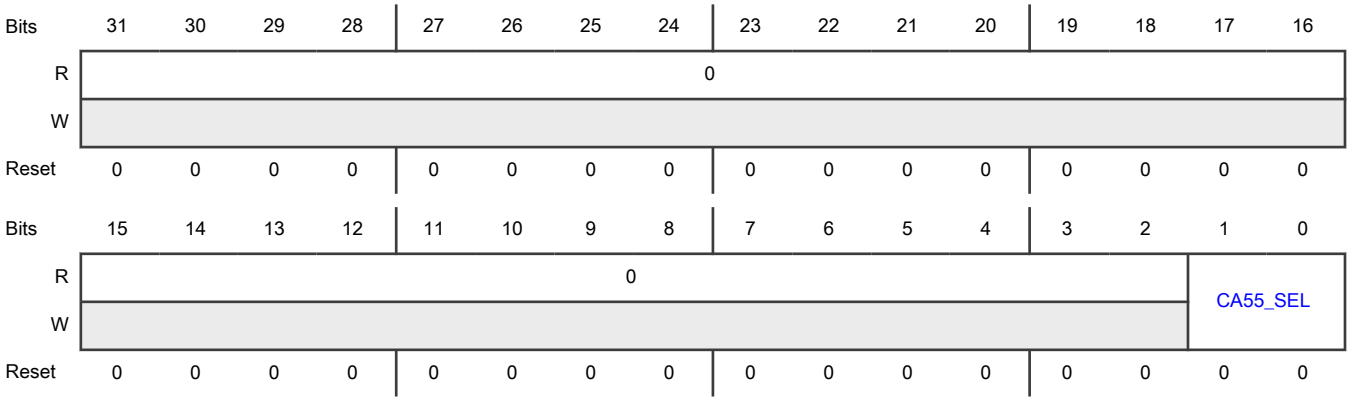
65.5.1.3 CA55 Arm PLL, Anamix PLL Observe Select (CA55_SEL_CTRL)

CA55mix Arm PLL/Anamix PLL output clock need observability support from DDRPHY.

Offset

Register	Offset
CA55_SEL_CTRL	4h

Diagram



Fields

Field	Description
31-2 —	Reserved
1-0 CA55_SEL	CA55 Arm PLL/Anamix PLL output select into DDRPHY This field select CA55MIX Arm PLL or ANAMIX source output clock into DDRPHY DfiClk. This shows the Arm PLL/ANAMIX source output clock from DDRPHY digital observe bump DRAM_MALERT_B. 00 - Normal DfiClk from DRAM PLL is selected 01 - Anamix PLL output is selected 10 - Normal DfiClk from DRAM PLL is selected 11 - CA55 mix Arm PLL is selected

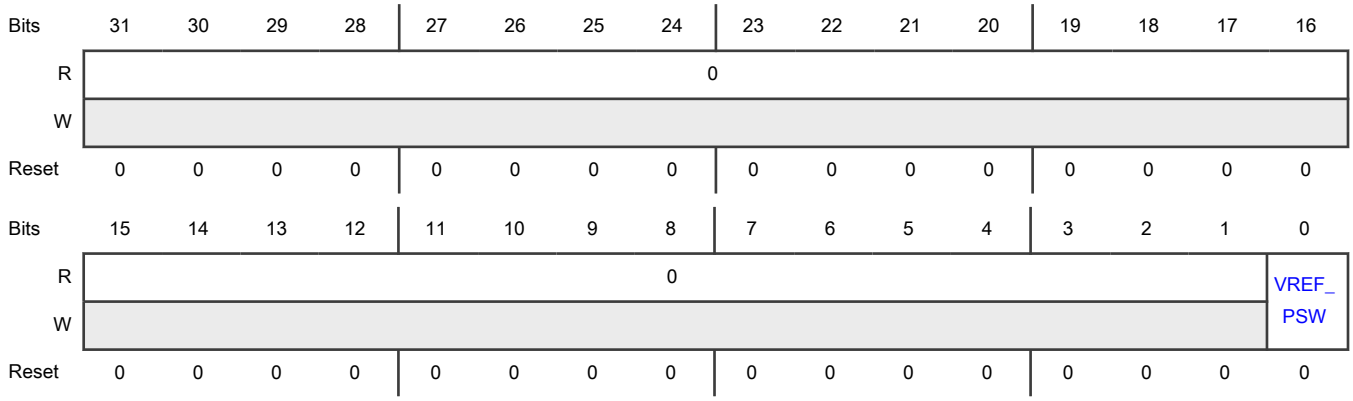
65.5.1.4 DRAM_VREF power switch (VREF_PSW_CTRL)

DDRPHY DRAM_VREF connected to ADC 1.8V rather than a bump, need power switch to prevent leakage.

Offset

Register	Offset
VREF_PSW_CTRL	8h

Diagram



Fields

Field	Description
31-1 —	Reserved
0 VREF_PSW	DDRPHY DRAM_VREF Power Switch This field shows 1.1V to ADC 1.8V power switch. DDRPHY DRAM_VREF is connected to ADC rather than BUMP. ADC supply is 1.8V versus DDRPHY supply 1.1V. A power switch is needed to prevent leakage when DRAM_VREF is not used for analog observability. 0 - Power switch is closed to prevent leakage 1 - Power switch is opened and is set together with DDRPHY[VrefInGlobal]

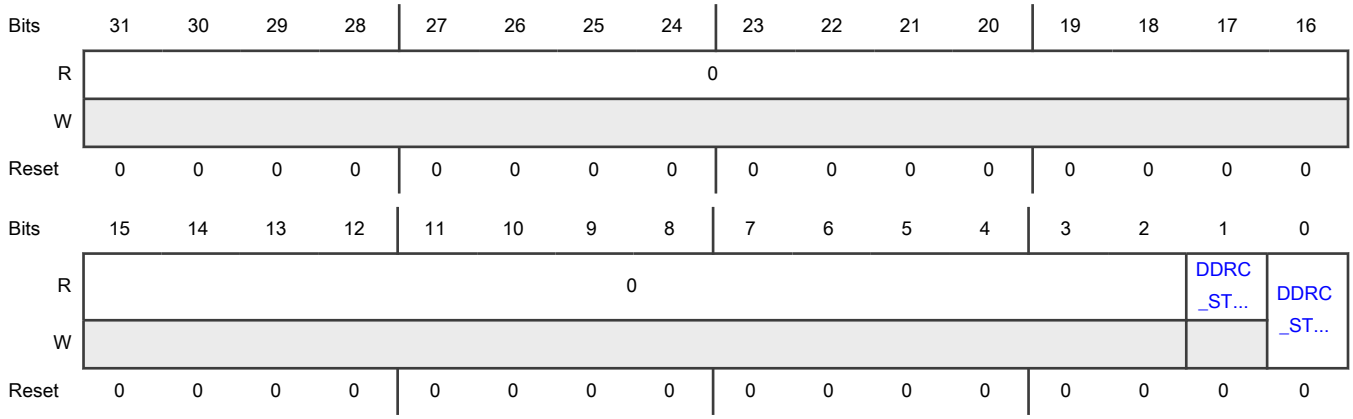
65.5.1.5 DDR Controller ipg_stop SW control (DDRC_STOP_CTRL)

Allow software control on DDR Controller ipg_stop signal, mainly used for HWFFC.

Offset

Register	Offset
DDRC_STOP_CTRL	Ch

Diagram



Fields

Field	Description
31-2 —	Reserved
1 DDRC_STOP_ACK	DDR Controller ipg_stop_ack This field is DDR Controller ipg_stop_ack signal. DDR Controller ipg_stop_ack is read only. This field should be polled before setting or clearing DDRC_STOP field. 0 - DDR Controller ipg_stop_ack is a 0 1 - DDR Controller ipg_stop_ack is a 1
0 DDRC_STOP	DDR Controller ipg_stop DDR Controller ipg_stop signal can be launched by this bit field. This bit is mainly used for HWFFC. The DDRC_STOP_ACK field should be 0 before setting this bit, and it should be a 1 before clearing this bit. 0 - Clear DDR Controller ipg_stop signal 1 - Set DDR Controller ipg_stop signal

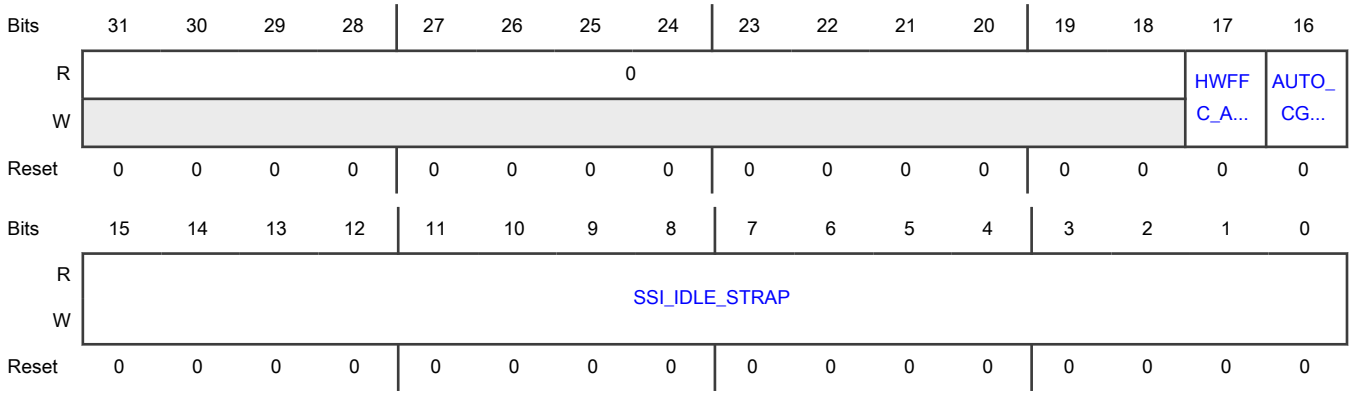
65.5.1.6 DDR Controller automatic clock gating (AUTO_CG_CTRL)

DDR Controller automatic clock gating when no AXI transmit(SSI idle and DDRC idle).

Offset

Register	Offset
AUTO_CG_CTRL	10h

Diagram



Fields

Field	Description
31-18 —	Reserved
17 HWFFC_ACG_FORCE_B	DDR Controller hwffc and auto CG send ipg_stop allow This field can be only programmed once. Please note that once programmed to 1, this bit cannot be cleared until next reset. 0 - DDR Controller hwffc and auto CG cannot send ipg_stop 1 - DDR Controller hwffc and auto CG can send ipg_stop
16 AUTO_CG_ENA	DDR Controller automatic clock gating enable 0 - DDR Controller automatic clock gating is disabled 1 - DDR Controller automatic clock gating is enabled
15-0 SSI_IDLE_STRAP	SSI Idle Strap This field is the number of cycles for SSI being idle before DDRC automaic clock gating. SSI slave module clk_wake_glitch signal needs to be 0 during this period. SSI prim channel needs to be idle, ddrc ipg_idle_ddrc need to be 1. All values: Clock cycles before DDRC automatic clock gating.

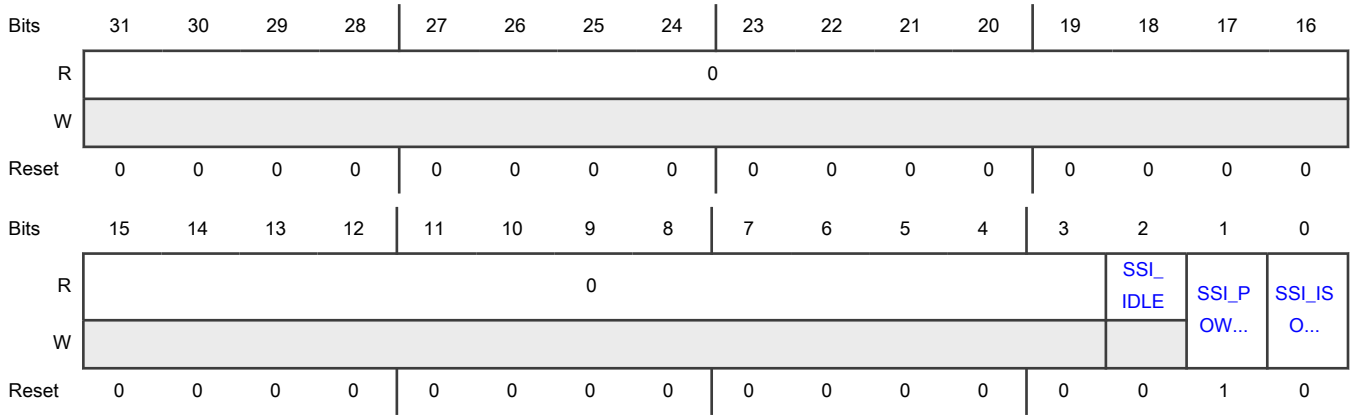
65.5.1.7 DDRMIX SSI Slave low power signal control (SSI_LP_CTRL)

Allow software control on DDRMIX SSI Slave low power signal, and can get the idle status.

Offset

Register	Offset
SSI_LP_CTRL	14h

Diagram



Fields

Field	Description
31-3 —	Reserved
2 SSI_IDLE	DDRMIX SSI idle signal DDRMIX SSI idle signal can be launched by this bit field. This SSI idle signal is read only. When the bit is 1 means SSI is idle and no transaction, 0 means there transactions for SSI 0 - means SSI is not idle 1 - means SSI is idle
1 SSI_POW_CTRL	DDRMIX SSI power control DDRMIX SSI power_control signal can be launched by this bit field. This field is SSI power_control signal SW source. The field will connect to ssi_slave_power_down[1] in SSI, when the bit is 0 means no power, enter BHM and generate SLVERR for new transactions. 0 - enter no power mode for SSI 1 - power mode for SSI
0 SSI_ISO_CTRL	DDRMIX SSI isolation mode control DDRMIX SSI iso_control signal can be launched by this bit field. This field is SSI iso_control signal SW source. The field will connect to ssi_slave_power_down[0] in SSI, when the bit is 1 means entering pause mode, and 0 means no isolation and in normal mode. 0 - in normal mode 1 - enter pause mode

Chapter 66
Media Mix Domain Block Control (blk_ctrl_mediamix)

66.1 Overview

The MEDIAMIX domain contains control and status registers known as MEDIAMIX Block Control (MEDIAMIX BLK_CTRL). These registers include clocking, reset, and miscellaneous top-level controls for peripherals within the MEDIAMIX domain. Please see the clock control chapter and reset chapters for additional information.

66.1.1 Block diagram

The MEDIA BLK_CTRL interface connects to the MEDIAMIX domain peripherals. A block diagram illustrating the MEDIAMIX domain is shown below.

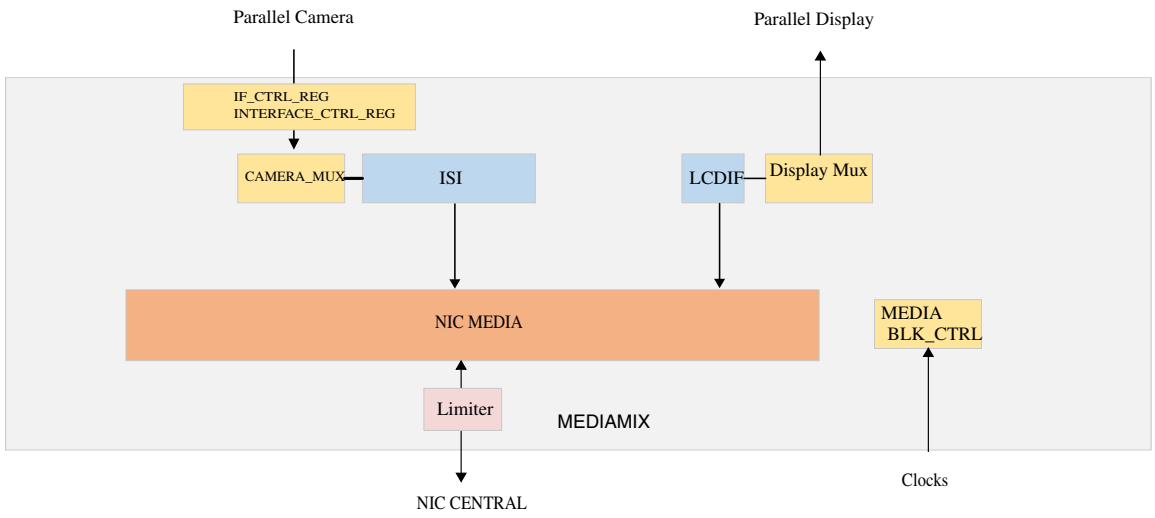


Figure 338. MEDIAMIX block diagram

66.1.2 Features

The MEDIA BLK_CTRL features include:

- Resets for each MEDIAMIX peripheral's clock related logic
- Clock gating of each MEDIAMIX peripheral's clock
- Top-level control and status registers for the MEDIAMIX peripherals

— LCDIF

— Image Sensor Interface (ISI)

66.2 Functional description

The following sections describe functional details of the MEDIAMIX BLK_CTRL module.

66.2.1 Clocks

The MEDIA BLK_CTRL contains clock distribution and gating controls, as well as reset handling to several MEDIAMIX peripherals. The RESET Control Register and the CLK Control Register provide reset and clock gating of the MEDIAMIX peripherals as shown below. Please see related clock and reset controls in the BLK_CTRL register description.

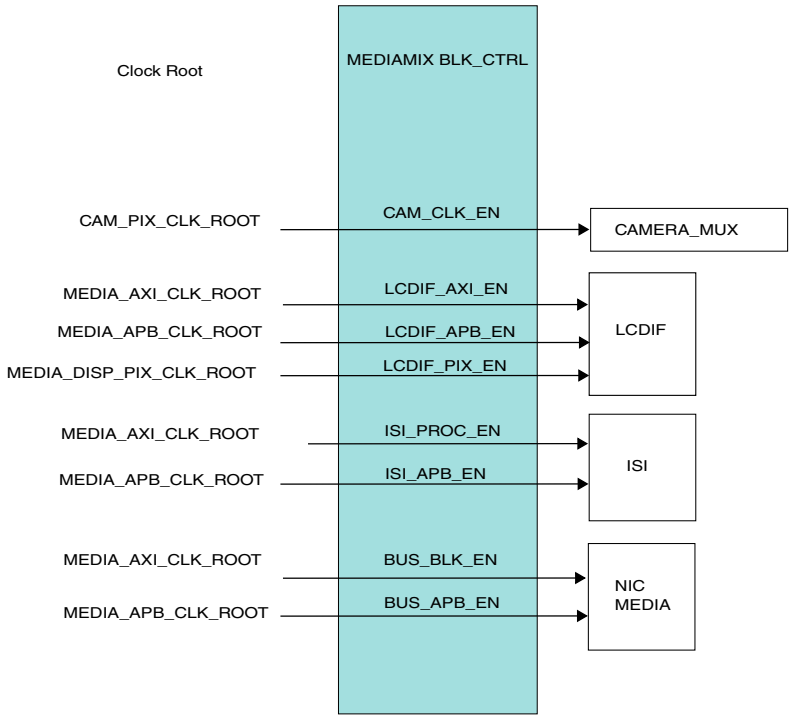

Figure 339. MEDIAMIX clock structure

66.2.2 Interrupts

Refer to the individual display, imaging, and camera peripherals chapters for interrupt signal details.

66.3 External signals

There are no external signals pinned out for the MEDIAMIX Blk_Ctrl.

66.4 Initialization

This section describes initialization of the MEDIAMIX BLK_CTRL module.

66.5 Memory map and register definition

This section includes the MEDIAMIX_GPR_CTRL module memory map and detailed descriptions of all registers.

66.5.1 BLK CTRL MEDIAMIX register descriptions

The mediamix_blk_ctrl provides the following registers for controlling MEDIAMIX operation.

66.5.1.1 mediamix_GPR_ctrl memory map

BLK_CTRL_MEDIAMIX1 base address: 4AC1_0000h

Offset (hex)	Register	Width (In bits)	Access	Reset value (hex)
0	RESET Control Register (RESET)	32	RW	0000_047F
4	CLK Control Register (CLK)	32	RW	0000_0000
C	QOS and cache of LCDIF (LCDIF)	32	RW	0000_0012
14	Cache of ISI (ISI0)	32	RW	000F_2222
1C	QoS of ISI (ISI1)	32	RW	0000_0000
3C	Read Pixel Control Register (PIXEL_CTRL)	32	R	0000_0403
60	Display Mux Control Register (DISPLAY_MUX)	32	RW	0000_0000
70	Parallel Camera Interface Register (IF_CTRL_REG)	32	RW	0000_0000
74	Interface Status Register (INTERFACE_STATUS)	32	R	0000_0000
78	Interface Control Register (INTERFACE_CTRL_REG)	32	RW	8000_0000
7C	Interface Control Register 1 (INTERFACE_CTRL_REG1)	32	RW	0000_0000

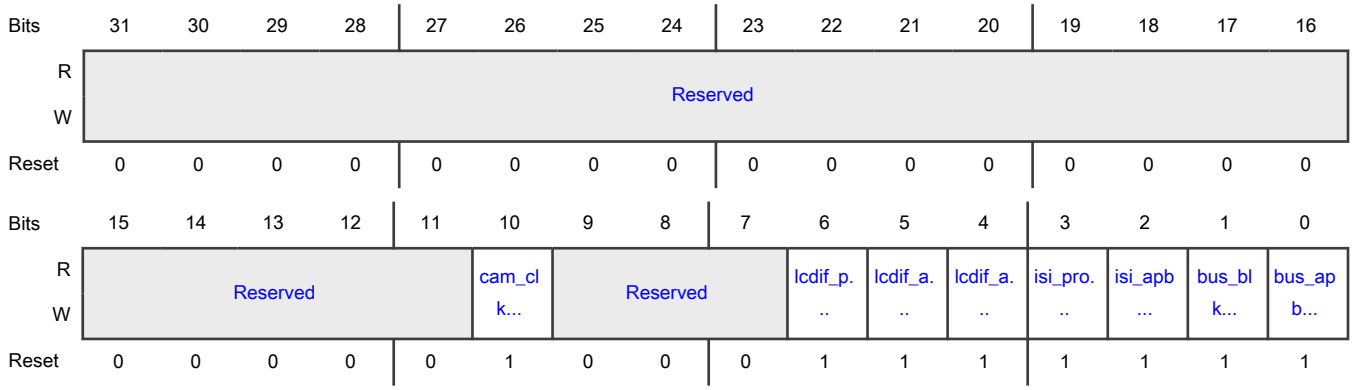
66.5.1.2 RESET Control Register (RESET)

Provides software reset control to the MEDIAMIX peripherals.

Offset

Register	Offset
RESET	0h

Diagram



Fields

Field	Description
31-11 —	Reserved
10 cam_clk_en	Camera clock reset Reset camera clock related logic 0 - Reset camera related logic 1 - Do not reset camera clock related logic
9-7 —	Reserved
6 lcdif_pix_en	LCDIF pix_clk reset Reset LCDIF pix_clk related logic 0 - Reset LCDIF pix_clk related logic 1 - Do not reset LCDIF pix_clk related logic
5 lcdif_axi_en	LCDIF axi_clk reset Reset LCDIF axi_clk related logic 0 - Reset LCDIF axi_clk related logic 1 - Do not reset LCDIF axi_clk related logic
4 lcdif_apb_en	LCDIF apb_clk reset Reset LCDIF apb_clk related logic 0 - Reset LCDIF apb_clk related logic 1 - Do not reset LCDIF apb_clk related logic
3	ISI axi_clk reset Reset ISI axi_clk related logic

Table continues on the next page...

Table continued from the previous page...

Field	Description
isi_proc_en	0 - Reset ISI axi_clk related logic 1 - Do not reset ISI axi_clk related logic
2 isi_apb_en	ISI apb_clk reset Reset ISI apb_clk related logic 0 - Reset ISI apb_clk related logic 1 - Do not reset ISI apb_clk related logic
1 bus_blk_en	Bus axi_clk reset Reset bus axi_clk related logic 0 - Reset bus axi_clk related logic 1 - Do not reset bus axi_clk related logic
0 bus_apb_en	Bus apb_clk reset Reset bus apb_clk related logic 0 - Reset bus apb_clk related logic 1 - Do not reset bus apb_clk related logic

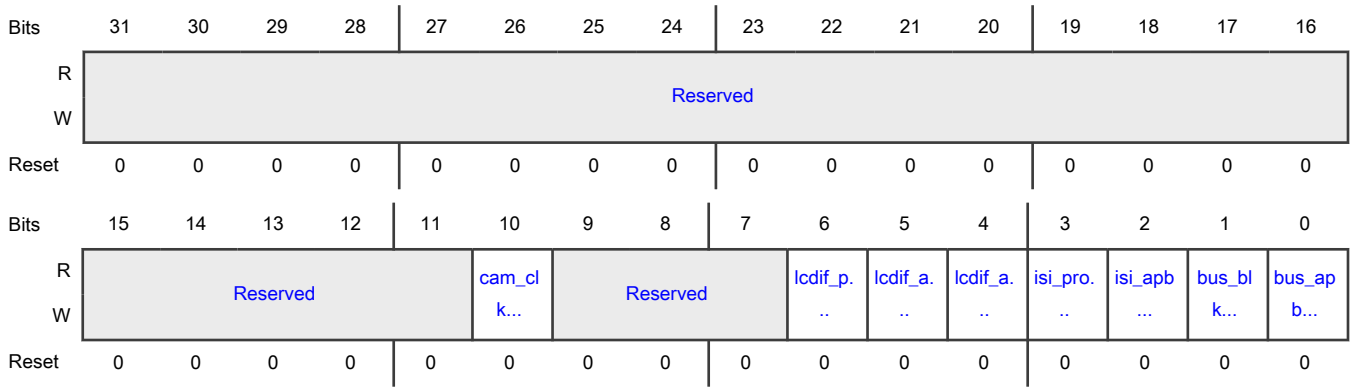
66.5.1.3 CLK Control Register (CLK)

Provides software clock gating control to the MEDIAMIX peripherals.

Offset

Register	Offset
CLK	4h

Diagram



Fields

Field	Description
31-11 —	Reserved
10 cam_clk_en	cam_clk gate enable Gate cam_clk root 0 - Do not gate cam_clk root 1 - Gate cam_clk root
9-7 —	Reserved
6 lcdif_pix_en	LCDIF pix_clk gate enable Gate LCDIF pix_clk root 0 - Do not gate LCDIF pix_clk root 1 - Gate LCDIF pix_clk root
5 lcdif_axi_en	LCDIF axi_clk gate enable Gate LCDIF axi_clk root 0 - Do not gate LCDIF axi_clk root 1 - Gate LCDIF axi_clk root
4 lcdif_apb_en	LCDIF apb_clk gate enable Gate LCDIF apb_clk root 0 - Do not gate LCDIF apb_clk root 1 - Gate LCDIF apb_clk root
3 isi_proc_en	ISI axi_clk gate enable Gate ISI axi_clk root 0 - Do not gate ISI axi_clk root 1 - Gate ISI axi_clk root
2 isi_apb_en	ISI apb_clk gate enable Gate ISI apb_clk root 0 - Do not gate ISI apb_clk root 1 - Gate ISI apb_clk root
1 bus_blk_en	Bus axi_clk gate enable Gate bus axi_clk root 0 - Do not gate bus axi_clk root

Table continues on the next page...

Table continued from the previous page...

Field	Description
	1 - Gate bus axi_clk root
0 bus_apb_en	Bus apb_clk gate enable Gate bus apb_clk root 0 - Do not gate bus apb_clk root 1 - Gate bus apb_clk root

66.5.1.4 QOS and cache of LCDIF (LCDIF)

Provides controls for the LCDIF QoS and cache

Offset

Register	Offset
LCDIF	Ch

Diagram

R W	DEFAULT_QOS_Y_R				CFG_QOS_Y_R				DEFAULT_QOS_Y_W				CFG_QOS_Y_W			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Description
31-28 DEFAULT_QOS_V	Default QOS_V value of ISI
27-24 CFG_QOS_V	CFG_QOS_V value of ISI
23-20 DEFAULT_QOS_U	Default QoS value of ISI
19-16 CFG_QOS_U	cfg_qos_u value of ISI
15-12 DEFAULT_QOS_Y_R	Default QOS_Y_R value of ISI A low priority MEDIAMIX request, either LCDIF or ISI, may be blocked behind medium QoS transactions from other masters. However, when panic goes high, the LCDIF/ISI request QOS can go high, but these medium QoS transactions are blocked behind previous low priority LCDIF/ISI requests. In this case they can be blocked for a long time. This is the reason for panic to also go to the other master to control their default/panic QoS value. When panic goes high, the other masters will be set to a lower priority, lower than LCDIF/ISI (default), and thus the system will flush and allow the LCDIF/ISI requests to go through. In this case, the ISI CFG_QOS_Y_R should be lower than the DEFAULT_QOS.
11-8 CFG_QOS_Y_R	CFG_QOS_Y_R value of ISI A low priority MEDIAMIX request, either LCDIF or ISI, may be blocked behind medium QoS transactions from other masters. However, when panic goes high, the LCDIF/ISI request QOS can go high, but these medium QoS transactions are blocked behind previous low priority LCDIF/ISI requests. In this case they can be blocked for a long time. This is the reason for panic to also go to the other master to control their default/panic QoS value. When panic goes high, the other masters will be set to a lower priority, lower than LCDIF/ISI (default), and thus the system will flush and allow the LCDIF/ISI requests to go through.

Table continues on the next page...

Table continued from the previous page...

Field	Description
	In this case, the ISI CFG_QOS_Y_R should be lower than the DEFAULT_QOS.
7-4 DEFAULT_QOS_Y_W	Default QOS_Y_W value of ISI
3-0 CFG_QOS_Y_W	cfg_qos_y_w value of ISI

66.5.1.7 Read Pixel Control Register (PIXEL_CTRL)

Read pixel control information status.

Offset

Register	Offset
PIXEL_CTRL	3Ch

Field	Description
31-12 —	Reserved
11-0 PIXEL_CTRL	Read pixel control information status

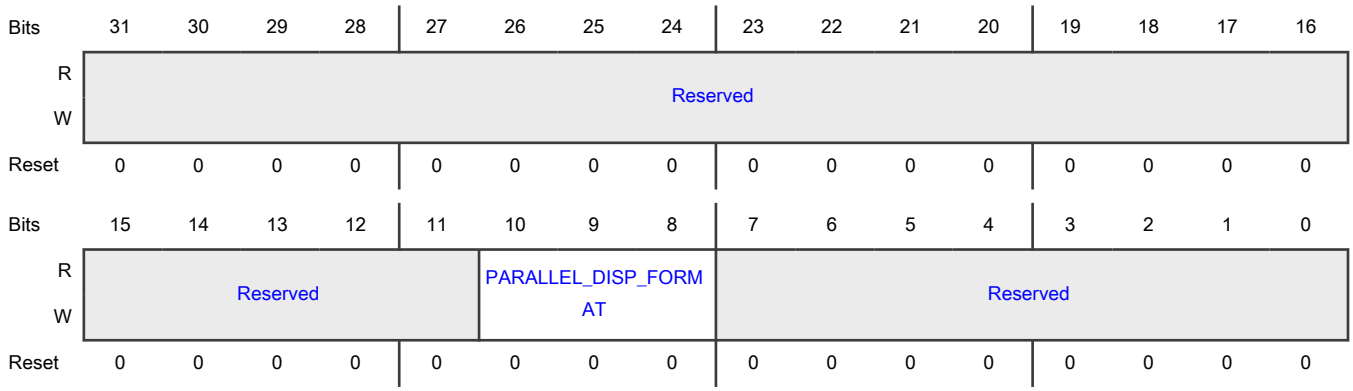
66.5.1.8 Display Mux Control Register (DISPLAY_MUX)

Display parameters

Offset

Register	Offset
DISPLAY_MUX	60h

Diagram



Fields

Field	Description
31-11 —	Reserved
10-8 PARALLEL_DISP_FORMAT	Parallel display format configuration 000 - RGB888 -> RGB888 001 - RGB888 -> RGB666. Truncate the two least significant bits of each color component (pass through the 6 most significant bits of each color component.) 010 - RGB565 -> RGB565 011 - RGB555 -> RGB555 100 - YUV -> YCbCr 24 bits 101 - YUV -> YUV444
7-0 —	Reserved

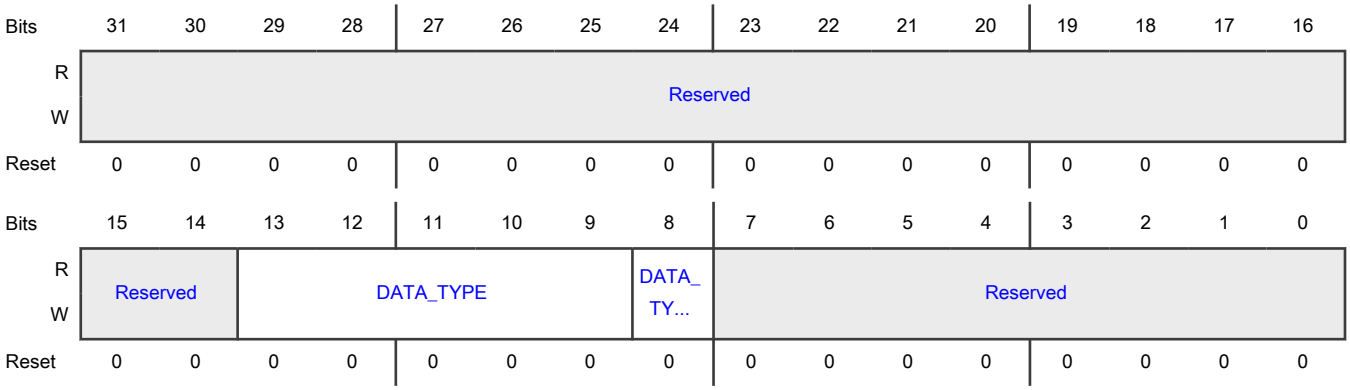
66.5.1.9 Parallel Camera Interface Register (IF_CTRL_REG)

Control parameters for the parallel camera interface.

Offset

Register	Offset
IF_CTRL_REG	70h

Diagram



Fields

Field	Description
31-14 —	Reserved
13-9 DATA_TYPE	Date type to ISI control bus [11:7] 0_0000 - Null data 0_0100 - RGB format 0_1000 - YUV444 format 1_0000 - YYU420 type(a) odd line (not supported) 1_0010 - YYU420 type(a) even line (not supported) 1_1000 - YYU420 type(a) YYY odd line (not supported) 1_1010 - YYU420 type(b) UYVY even line (not supported) 1_1100 - RAW
8 DATA_TYPE_SEL	Pixel link data type select 0 - Reserved 1 - Pixel Link data type comes from IF_CTRL_REG DATA_TYPE[4:0]
7-0 —	Reserved

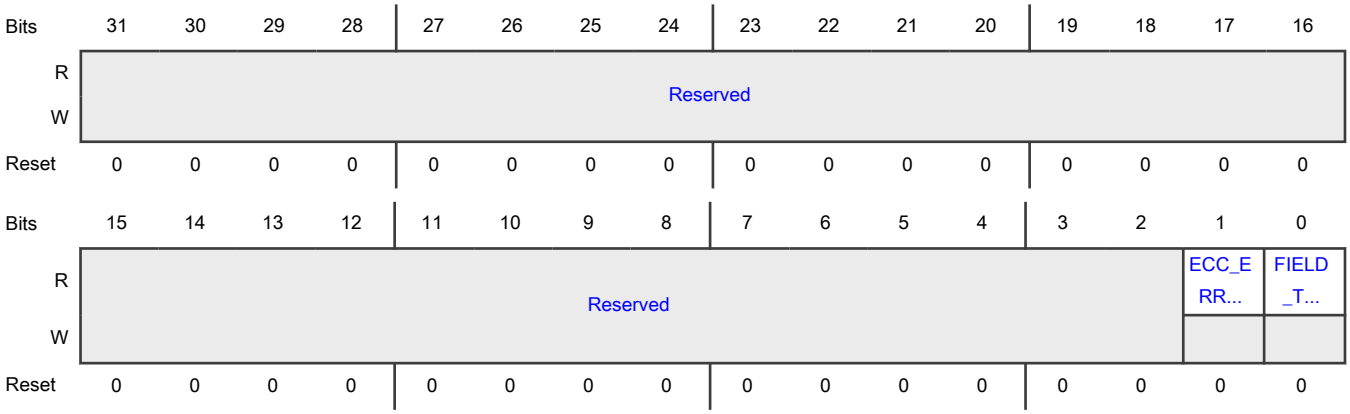
66.5.1.10 Interface Status Register (INTERFACE_STATUS)

Provides ECC error status and field toggle status information.

Offset

Register	Offset
INTERFACE_STATUS	74h

Diagram



Fields

Field	Description
31-2 —	Reserved
1 ECC_ERROR_STATUS	ECC error status 0 - No ECC error detected 1 - ECC error detected
0 FIELD_TOGGLE_STATUS	Field toggle status 0 - VSYNC field toggle mode disabled 1 - VSYNC field toggle mode enabled

66.5.1.11 Interface Control Register (INTERFACE_CTRL_REG)

Controls for HSNC, VSYNC, DE, and CCIR error correction.

Offset

Register	Offset
INTERFACE_CTRL_REG	78h

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Description
31 —	Reserved
30-29 —	Reserved
28-27 —	Reserved
26-23 —	Reserved
22 UV_SWAP_EN	UV swap enable 0 - UV swap disable 1 - UV swap enable
21-19 HSYNC_PULSE	HSYNC_PULSE HSYNC Pulse width
18 —	Reserved
17 HSYNC_OUT_SEL	HSYNC output select 0 - HYSNC output level 1 - HYSNC output pulse
16	RAW output select 0 - Right justified output

Table continues on the next page...

Table continued from the previous page...

Field	Description
RAW_OUT_SEL	1 - Left justified to 14-bit output
15 VALID_SEL	Data valid select 0 - HSYNC data valid. 1 - Data enable valid. Not supported.
14 GCLK_MODE_EN	Gate clock mode enable 0 - Disable 1 - Enable
13 VSYNC_FORCE_EN	VSYNC force enable 0 - Do not override VSYNC. 1 - Override VSYNC.
12 HSYNC_FORCE_EN	HSYNC force enable 0 - Do not override HSYNC. 1 - Override HSYNC.
11 CCIR_ECC_CORR_EN	CCIR error correction enable This bit enables and disables the ECC error correction. If single-bit ECC error occurs and this bit is disabled, only ECC_INT will be generated without error correction. If single-bit ECC error occurs and this bit is enabled, the ECC error will be corrected and ECC_INT will not be generated. 0 - ECC error correction is disabled. 1 - ECC error correction is enabled.
10 CCIR_VSYNC_RST_EN	CCIR_VSYNC_RESET_EN If this bit is set, the CCIR Decoder FSM will be reset by VSYNC signal in every frame starting.
9 CCIR_NTSC_EN	CCIR NTSC enable 0 - PAL 1 - NTSC
8 CCIR_VIDEO_MODE	CCIR video mode 0 - Progressive mode 1 - Interlace
7 CCIR_EN	CCIR mode enable 0 - CCIR mode disable 1 - CCIR mode enable
6	External VSYNC enable

Table continues on the next page...

Table continued from the previous page...

Field	Description
CCIR_EXT_VSYNC_EN	When CCIR_EN bit is enabled and this bit is set to 1, the external VSYNC signal will be used
5 PIXEL_DATA_POL	PIXEL_DATA polarity control 0 - PIXEL_DATA output to Pixel Link is not inverted. 1 - PIXEL_DATA output to Pixel Link is inverted.
4 DE_POL	DE polarity control 0 - DE output to Pixel Link is not inverted. 1 - DE output to Pixcel Link is inverted.
3 VSYNC_POL	VSYNC polarity control 0 - VSYNC output to Pixel Link is not inverted. 1 - VSYNC output to Pixel Link is inverted.
2 HSYNC_POL	HSYNC polarity control 0 - HSYNC output to Pixel Link is not inverted. 1 - HSYNC output to Pixel Link is inverted.
1 PIXEL_CLK_POL	Pixel clock polarity control 0 - Pixel clcok is not inverted. 1 - Pixel clock input is inverted.
0 —	Reserved

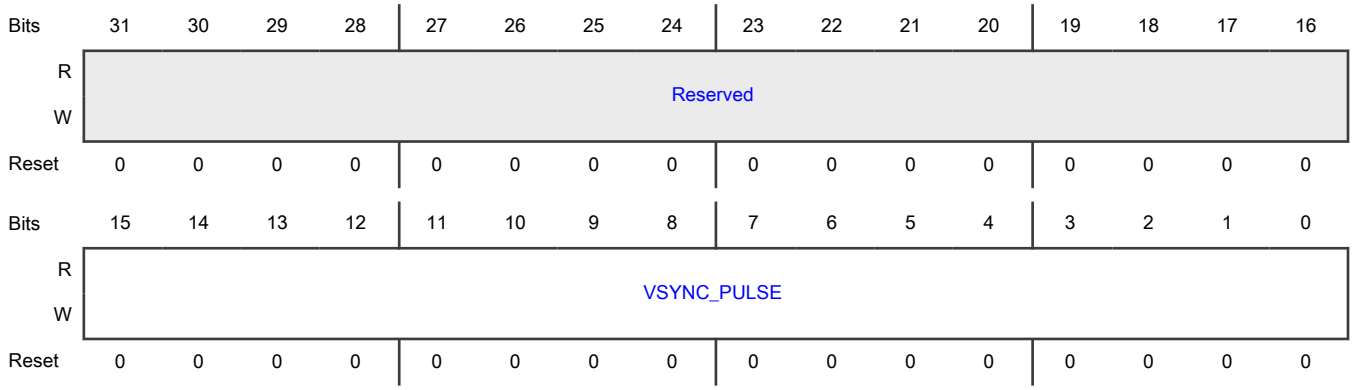
66.5.1.12 Interface Control Register 1 (INTERFACE_CTRL_REG1)

Controls for VSYNC pulse and pixel widths.

Offset

Register	Offset
INTERFACE_CTRL_REG1	7Ch

Diagram



Fields

Field	Description
31-16 —	Reserved
15-0 VSYNC_PULSE	VSYNC pulse width

Appendix A
Release notes

A.1 About_this_manual changes

No substantial content changes.

A.2 Introduction changes

No substantial content changes.

A.3 Memory Map changes

No substantial content changes.

A.4 IRQ and DMA assignment changes

No substantial content changes.

A.5 Enhanced Direct Memory Access (eDMA3)

A.5.1 Chip-specific eDMA3 changes

No substantial content changes.

A.5.2 eDMA3 module changes

No substantial content changes.

A.6 Enhanced Direct Memory Access (eDMA4)

A.6.1 Chip-specific eDMA4 changes

No substantial content changes.

A.6.2 eDMA4 module changes

No substantial content changes.

A.7 Security Overview changes

No substantial content changes.

A.8 Fusemap changes

- Updated watchdog timeout select options in Boot Fusemap.

A.9 FSB module changes

No substantial content changes.

A.10 System Boot changes

- Updated watchdog timeout select options in Watchdog.

A.11 IOMUXC GPR module changes

No substantial content changes.

A.12 Arm Modules Overview changes

No substantial content changes.

A.13 A55 Platform Overview changes

No substantial content changes.

A.14 SRAMCTL module changes

No substantial content changes.

A.15 SEMA42 module changes

No substantial content changes.

A.16 Trusted Resource Domain Controller (TRDC)

A.16.1 Chip-specific TRDC changes

No substantial content changes.

A.16.2 TRDC module changes

No substantial content changes.

A.17 System Counter (SYS_CTR)

A.17.1 Chip-specific SYS_CTR changes

No substantial content changes.

A.17.2 SYS_CTR module changes

No substantial content changes.

A.18 System Debug changes

No substantial content changes.

A.19 JTAG Controller (JTAGC)

A.19.1 Chip-specific JTAG changes

No substantial content changes.

A.19.2 JTAGC module changes

No substantial content changes.

A.20 External Signals changes

No substantial content changes.

A.21 IOMUXC module changes

- Updated description of all FSEL1 and DSE bits.

A.22 General-Purpose Input/Output (GPIO)

A.22.1 Chip-specific GPIO changes

- In Chip-specific GPIO information, updated GPIO4 bits.

A.22.2 GPIO module changes

No substantial content changes.

A.23 Clocks and Power Overview changes

No substantial content changes.

A.24 CCM module changes

No substantial content changes.

A.25 GPC changes

No substantial content changes.

A.26 SRC module changes

No substantial content changes.

A.27 Battery-Backed Non-Secure Module (BBNSM)

A.27.1 Chip-specific BBNSM changes

No substantial content changes.

A.27.2 BBNSM module changes

No substantial content changes.

A.28 External_memory controllers

No substantial content changes.

A.29 DDR Memory Controller (DDRC)

A.29.1 Chip-specific DDR changes

No substantial content changes.

A.29.2 DDRC module changes

No substantial content changes.

A.30 Flexible Serial Peripheral Interface (FlexSPI)

A.30.1 Chip-specific FLEXSPI changes

No substantial content changes.

A.30.2 FlexSPI module changes

No substantial content changes.

A.31 Ultra Secured Digital Host Controller (uSDHC)

A.31.1 Chip-specific USDHC changes

No substantial content changes.

A.31.2 uSDHC module changes

No substantial content changes.

A.32 CAN (FlexCAN)

A.32.1 Chip-specific FLEXCAN changes

No substantial content changes.

A.32.2 FlexCAN module changes

No substantial content changes.

A.33 Universal Serial Bus Controller (USB)

A.33.1 Chip-specific USB changes

No substantial content changes.

A.33.2 USB CTRL module changes

No substantial content changes.

A.34 fusemap changes

No substantial content changes.

A.35 Ethernet Controller with TSN (ENET_QoS)

A.35.1 Chip-specific ENET changes

No substantial content changes.

A.35.2 ENET_QOS Controller module changes

No substantial content changes.

A.36 ENET module changes

No substantial content changes.

A.37 Audio Overview changes

- In Table 426, updated TX and RX lanes for SAI1:
  - It supports two lanes in TX
  - It supports one lane in RX

A.38 PDM Microphone Interface (PDM)

A.38.1 Chip-specific PDM changes

No substantial content changes.

A.38.2 MICFIL module changes

No substantial content changes.

A.39 Synchronous Audio Interface (SAI)

A.39.1 Chip-specific SAI changes

- In Chip-specific SAI information, added "SAI1 supports two lanes TX and one lane RX."

A.39.2 SAI module changes

No substantial content changes.

A.40 AUDIO_XCVR module changes

No substantial content changes.

A.41 Medium Quality Sound (MQS)

A.41.1 Chip-specific MQS changes

No substantial content changes.

A.41.2 MQS module changes

No substantial content changes.

A.42 Audio Overview changes

No substantial content changes.

A.43 LCD Interface (LCDIF)

A.43.1 Chip-specific LCDIF changes

No substantial content changes.

A.43.2 LCDIF changes

No substantial content changes.

A.44 Image Sensing Interface (ISI)

A.44.1 Chip-specific ISI changes

No substantial content changes.

A.44.2 ISI module changes

No substantial content changes.

A.45 Parallel Camera Interface changes

No substantial content changes.

A.46 Low Power Inter-Integrated Circuit (LPI2C)

A.46.1 Chip-specific LPI2C changes

No substantial content changes.

A.46.2 LPI2C module changes

No substantial content changes.

A.47 Low Power Serial Peripheral Interface (LPSPI)

A.47.1 Chip-specific LPSPI changes

No substantial content changes.

A.47.2 LPSPI module changes

No substantial content changes.

A.48 Low Power Universal Asynchronous Receiver/Transmitter (LPUART)

A.48.1 Chip-specific LPUART changes

No substantial content changes.

A.48.2 LPUART module changes

No substantial content changes.

A.49 Improved Inter-Integrated Circuit (I3C)

A.49.1 Chip-specific I3C changes

No substantial content changes.

A.49.2 I3C module changes

No substantial content changes.

A.50 Timers Overview changes

No substantial content changes.

A.51 Low-Power Timer (LPTMR)

A.51.1 Chip-specific LPTMR changes

No substantial content changes.

A.51.2 LPTMR module changes

No substantial content changes.

A.52 Low Power Periodic Interrupt Timer (LPIT)

A.52.1 Chip-specific LPIT changes

No substantial content changes.

A.52.2 LPIT module changes

No substantial content changes.

A.53 Timer/PWM Module (TPM)

A.53.1 Chip-specific TPM changes

No substantial content changes.

A.53.2 TPM module changes

No substantial content changes.

A.54 Timer (TSTMR)

A.54.1 Chip-specific TSTMR changes

No substantial content changes.

A.54.2 TSTMR module changes

No substantial content changes.

A.55 Watchdog timer (WDOG)

A.55.1 Chip-specific WDOG changes

No substantial content changes.

A.55.2 WDOG module changes

No substantial content changes.

A.56 Analog Overview changes

No substantial content changes.

A.57 Trigger Mux (TRGMUX)

A.57.1 Chip-specific TRGMUX changes

No substantial content changes.

A.57.2 TRGMUX module changes

No substantial content changes.

A.58 Analog-to-Digital Converter (SAR_ADC)

A.58.1 Chip-specific ADC changes

No substantial content changes.

A.58.2 SAR_ADC module changes

No substantial content changes.

A.59 Temperature Sensor (TEMPSENSOR)

A.59.1 Chip-specific TEMPSENSOR changes

- Added TEMPSENSOR range and error section.
- From Chip-specific TEMPSENSOR information, removed "TEMPSENSE is supported over the full temperature range of the chip (-40°C to +125°C)".

A.59.2 TEMPSENSE module changes

No substantial content changes.

A.60 PLL module changes

No substantial content changes.

A.61 OSC changes

No substantial content changes.

A.62 BLK CTRL NS AONMIX

No substantial content changes.

A.63 BLK_CTRL_S_AONMIX module changes

No substantial content changes.

A.64 BLK CTRL WAKEUPMIX changes (showing internal content)

No substantial content changes.

A.65 BLK CTRL NICMIX module changes

No substantial content changes.

A.66 BLK_CTRL_DDRMIX module changes

No substantial content changes.

A.67 BLK_CTRL_MEDIAMIX module changes

No substantial content changes.

NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at https://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

HTML publications — An HTML version, if available, of this document is provided as a courtesy. Definitive information is contained in the applicable document in PDF format. If there is a discrepancy between the HTML document and the PDF document, the PDF document has priority.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
