Chapter 1
Library

1.1 Introduction

1.1.1 Overview
This user's guide describes the General Digital Filters Library (GDFLIB) for the family of DSP56800E core-based digital signal controllers. This library contains optimized functions.

1.1.2 Data types
GDFLIB supports several data types: (un)signed integer, fractional, and accumulator. The integer data types are useful for general-purpose computation; they are familiar to the MPU and MCU programmers. The fractional data types enable powerful numeric and digital-signal-processing algorithms to be implemented. The accumulator data type is a combination of both; that means it has the integer and fractional portions.

The following list shows the integer types defined in the libraries:

- **Unsigned 16-bit integer** — 
  0 \ldots 65535 > with the minimum resolution of 1
- **Signed 16-bit integer** — 
  -32768 \ldots 32767 > with the minimum resolution of 1
- **Unsigned 32-bit integer** — 
  0 \ldots 4294967295 > with the minimum resolution of 1
- **Signed 32-bit integer** — 
  -2147483648 \ldots 2147483647 > with the minimum resolution of 1

The following list shows the fractional types defined in the libraries:

- **Fixed-point 16-bit fractional** — 
  -1 \ldots 1 - 2^{-15} > with the minimum resolution of 2^{-15}
- **Fixed-point 32-bit fractional** — 
  -1 \ldots 1 - 2^{-31} > with the minimum resolution of 2^{-31}
The following list shows the accumulator types defined in the libraries:

- **Fixed-point 16-bit accumulator** $\langle -256.0 ; 256.0 - 2^{-7} \rangle$ with the minimum resolution of $2^{-7}$
- **Fixed-point 32-bit accumulator** $\langle -65536.0 ; 65536.0 - 2^{-15} \rangle$ with the minimum resolution of $2^{-15}$

### 1.1.3 API definition

GDFLIB uses the types mentioned in the previous section. To enable simple usage of the algorithms, their names use set prefixes and postfixes to distinguish the functions' versions. See the following example:

```
f32Result = MLIB_Mac_F32lss(f32Accum, f16Mult1, f16Mult2);
```

where the function is compiled from four parts:

- **MLIB**—this is the library prefix
- **Mac**—the function name—Multiply-Accumulate
- **F32**—the function output type
- **lss**—the types of the function inputs; if all the inputs have the same type as the output, the inputs are not marked

The input and output types are described in the following table:

<table>
<thead>
<tr>
<th>Type</th>
<th>Output</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>frac16_t</td>
<td>F16</td>
<td>s</td>
</tr>
<tr>
<td>frac32_t</td>
<td>F32</td>
<td>l</td>
</tr>
<tr>
<td>acc32_t</td>
<td>A32</td>
<td>a</td>
</tr>
</tbody>
</table>

### 1.1.4 Supported compilers

GDFLIB for the DSP56800E core is written in assembly language with C-callable interface. The library is built and tested using the following compilers:

- CodeWarrior™ Development Studio

For the CodeWarrior™ Development Studio, the library is delivered in the `gdflib.lib` file.
The interfaces to the algorithms included in this library are combined into a single public interface include file, *gdflib.h*. This is done to lower the number of files required to be included in your application.

### 1.1.5 Special issues

1. The equations describing the algorithms are symbolic. If there is positive 1, the number is the closest number to 1 that the resolution of the used fractional type allows. If there are maximum or minimum values mentioned, check the range allowed by the type of the particular function version.

2. The library functions require the core saturation mode to be turned off, otherwise the results can be incorrect. Several specific library functions are immune to the setting of the saturation mode.

3. The library functions round the result (the API contains Rnd) to the nearest (two's complement rounding) or to the nearest even number (convergent round). The mode used depends on the core option mode register (OMR) setting. See the core manual for details.

4. All non-inline functions are implemented without storing any of the volatile registers (refer to the compiler manual) used by the respective routine. Only the non-volatile registers (C10, D10, R5) are saved by pushing the registers on the stack. Therefore, if the particular registers initialized before the library function call are to be used after the function call, it is necessary to save them manually.

### 1.2 Library integration into project (CodeWarrior™ Development Studio)

This section provides a step-by-step guide to quickly and easily integrate the GDFLIB into an empty project using CodeWarrior™ Development Studio. This example uses the MC56F8257 part, and the default installation path (C:\Freescale\FSLESL \DSP56800E_FSLESL_4.2) is supposed. If you have a different installation path, you must use that path instead.

#### 1.2.1 New project

To start working on an application, create a new project. If the project already exists and is open, skip to the next section. Follow the steps given below to create a new project.

2. Choose File > New > Bareboard Project, so that the "New Bareboard Project" dialog appears.
3. Type a name of the project, for example, MyProject01.
4. If you don't use the default location, untick the “Use default location” checkbox, and type the path where you want to create the project folder; for example, C:\CWProjects\MyProject01, and click Next. See Figure 1-1.

![Figure 1-1. Project name and location](image)

5. Expand the tree by clicking the 56800/E (DSC) and MC56F8257. Select the Application option and click Next. See Figure 1-2.

![Figure 1-2. Processor selection](image)

6. Now select the connection that will be used to download and debug the application. In this case, select the option P&E USB MultiLink Universal[FX] / USB MultiLink and Freescale USB TAP, and click Next. See Figure 1-3.
7. From the options given, select the Simple Mixed Assembly and C language, and click Finish. See Figure 1-4.

The new project is now visible in the left-hand part of CodeWarrior™ Development Studio. See Figure 1-5.

1.2.2 Library path variable

To make the library integration easier, create a variable that will hold the information about the library path.

1. Right-click the MyProject01 node in the left-hand part and click Properties, or select Project > Properties from the menu. The project properties dialog appears.
2. Expand the Resource node and click Linked Resources. See Figure 1-6.

3. Click the 'New...' button on the right-hand side.
4. In the dialog that appears (see Figure 1-7), type this variable name into the Name box: FSLESL_LOC
5. Select the library parent folder by clicking 'Folder...' or just typing the following path into the Location box: C:\Freescale\FSLESL\DSP56800E_FSLESL_4.2_CW and click OK.
6. Click OK in the previous dialog.
1.2.3 Library folder addition

To use the library, add it into the CodeWarrior Project tree dialog.

1. Right-click the MyProject01 node in the left-hand part and click New > Folder, or select File > New > Folder from the menu. A dialog appears.
2. Click Advanced to show the advanced options.
3. To link the library source, select the third option—Link to alternate location (Linked Folder).
4. Click Variables…, and select the FSLESL_LOC variable in the dialog that appears, click OK, and/or type the variable name into the box. See Figure 1-8.
5. Click Finish, and you will see the library folder linked in the project. See Figure 1-9.
1.2.4 Library path setup

GDFLIB requires MLIB to be included too. Therefore, the following steps show the inclusion of all dependent modules.

1. Right-click the MyProject01 node in the left-hand part and click Properties, or select Project > Properties from the menu. A dialog with the project properties appears.
2. Expand the C/C++ Build node, and click Settings.
3. In the right-hand tree, expand the DSC Linker node, and click Input. See Figure 1-11.
4. In the third dialog Additional Libraries, click the 'Add…' icon, and a dialog appears.
5. Look for the FSLESL_LOC variable by clicking Variables…, and then finish the path in the box by adding one of the following:
   - `${FSLESL_LOC}\MLIB\mlib_SDM.lib` for small data model projects
   - `${FSLESL_LOC}\MLIB\mlib_LDM.lib` for large data model projects
6. Tick the box Relative To, and select FSLESL_LOC next to the box. See Figure 1-9. Click OK.
7. Click the 'Add…' icon in the third dialog Additional Libraries.
8. Look for the FSLESL_LOC variable by clicking Variables…, and then finish the path in the box by adding one of the following:
   - `${FSLESL_LOC}\GDFLIB\gdflib_SDM.lib` for small data model projects
   - `${FSLESL_LOC}\GDFLIB\gdflib_LDM.lib` for large data model projects
9. Tick the box Relative To, and select FSLESL_LOC next to the box. Click OK.
10. Now, you will see the libraries added in the box. See Figure 1-11.

![Figure 1-10. Library file inclusion](image)
11. In the tree under the DSC Compiler node, click Access Paths.
12. In the Search User Paths dialog (#include “…”), click the 'Add…' icon, and a dialog will appear.
13. Look for the FSLESL_LOC variable by clicking Variables…, and then finish the path in the box to be: ${FSLESL_LOC}\MLIB\include.
14. Tick the box Relative To, and select FSLESL_LOC next to the box. See Figure 1-12. Click OK.
15. Click the 'Add…' icon in the Search User Paths dialog (#include “…”).
16. Look for the FSLESL_LOC variable by clicking Variables…, and then finish the path in the box to be: ${FSLESL_LOC}\GDFLIB\include.
17. Tick the box Relative To, and select FSLESL_LOC next to the box. Click OK.
18. Now you will see the paths added in the box. See Figure 1-13. Click OK.
The final step is typing the `#include` syntax into the code. Include the library into the `main.c` file. In the left-hand dialog, open the Sources folder of the project, and double-click the `main.c` file. After the `main.c` file opens up, include the following lines into the `#include` section:

```
#include "mlib.h"
#include "gdflib.h"
```

When you click the Build icon (hammer), the project will be compiled without errors.
Chapter 2
Algorithms in detail

2.1 GDFLIB_FilterIIR1

This function calculates the first-order direct form 1 IIR filter.

For a proper use, it is recommended that the algorithm is initialized by the GDFLIB_FilterIIR1Init function, before using the GDFLIB_FilterIIR1 function. The GDFLIB_FilterIIR1Init function initializes the buffer and coefficients of the first-order IIR filter.

The GDFLIB_FilterIIR1 function calculates the first-order infinite impulse response (IIR) filter. The IIR filters are also called recursive filters, because both the input and the previously calculated output values are used for calculation. This form of feedback enables the transfer of energy from the output to the input, which leads to an infinitely long impulse response (IIR). A general form of the IIR filter, expressed as a transfer function in the Z-domain, is described as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1} + b_2z^{-2} + \ldots + b_N z^{-N}}{1 + a_1z^{-1} + a_2z^{-2} + \ldots + a_N z^{-N}}
\]

Equation 1.

where N denotes the filter order. The first-order IIR filter in the Z-domain is expressed as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1}}{1 + a_1z^{-1}}
\]

Equation 2.

which is transformed into a time-domain difference equation as follows:

\[
y(k) = b_0x(k) + b_1x(k - 1) - a_1y(k - 1)
\]

Equation 3.
The filter difference equation is implemented in the digital signal controller directly, as given in Equation 3 on page 17; this equation represents a direct-form I first-order IIR filter, as shown in Figure 2-1.

The coefficients of the filter shown in Figure 2-1 can be designed to meet the requirements for the first-order low-pass filter (LPF) or high-pass filter (HPF). The coefficient quantization error is not important in the case of a first-order filter due to a finite precision arithmetic. A higher-order LPF or HPF can be obtained by connecting a number of first-order filters in series. The number of connections gives the order of the resulting filter.

The filter coefficients must be defined before calling this function. As some coefficients can be greater than 1 (and lesser than 2), the coefficients are scaled down (divided) by 2.0 for the fractional version of the algorithm. For faster calculation, the A coefficient is sign-inverted. The function returns the filtered value of the input in the step k, and stores the input and the output values in the step k into the filter buffer.

### 2.1.1 Available versions

This function is available in the following versions:

- Fractional output - the output is the fractional portion of the result; the result is within the range <-1 ; 1).

The available versions of the GDFLIB_FilterIIR1Init function are shown in the following table:

<table>
<thead>
<tr>
<th>Function name</th>
<th>Parameters</th>
<th>Result type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GDFLIB_FilterIIR1Init_F16</td>
<td>GDFLIB_FILTER_IIR1_T_F32 *</td>
<td>void</td>
<td>Filter initialization (reset) function. The parameters' structure is pointed to by a pointer.</td>
</tr>
</tbody>
</table>
The available versions of the GDFLIB_FilterIIR1 function are shown in the following table:

<table>
<thead>
<tr>
<th>Function name</th>
<th>Input type</th>
<th>Parameters</th>
<th>Result type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GDFLIB_FilterIIR1_F16</td>
<td>frac16_t</td>
<td>GDFLIB_FILTER_IIR1_T_F32 *</td>
<td>frac16_t</td>
<td>The input argument is a 16-bit fractional value of the input signal to be filtered within the range (-1 ; 1). The parameters' structure is pointed to by a pointer. The function returns a 16-bit fractional value within the range (-1 ; 1).</td>
</tr>
</tbody>
</table>

2.1.4 Declaration

The available GDFLIB_FilterIIR1Init functions have the following declarations:

```c
void GDFLIB_FilterIIR1Init_F16(GDFLIB_FILTER_IIR1_T_F32 *psParam)
```

The available GDFLIB_FilterIIR1 functions have the following declarations:

```c
frac16_t GDFLIB_FilterIIR1_F16(frac16_t f16InX, GDFLIB_FILTER_IIR1_T_F32 *psParam)
```
2.1.5  Calculation of filter coefficients

There are plenty of methods for calculating the coefficients. The following example shows the use of Matlab to set up a low-pass filter with the 500 Hz sampling frequency, and 240 Hz stopped frequency with a 20 dB attenuation. Maximum passband ripple is 3 dB at the cut-off frequency of 50 Hz.

% sampling frequency 500 Hz, low pass
Ts = 1 / 500
% cut-off frequency 50 Hz
Fc = 50
% max. passband ripple 3 dB
Rp = 3
% stopped frequency 240Hz
Fs = 240
% attenuation 20 dB
Rs = 20

% checking order of the filter
n = buttord(2 * Ts * Fc, 2 * Ts * Fs, Rp, Rs)
% n = 1, i.e. the filter is achievable with the 1st order

% getting the filter coefficients
[b, a] = butter(n, 2 * Ts * Fc, 'low');

% the coefs are:
% b0 = 0.245237275252786, b1 = 0.245237275252786
% a0 = 1.0000, a1 = -0.509525449494429

The filter response is shown in Figure 2-2.
2.1.6 Function use

The use of the GDFLIB_FilterIIR1Init and GDFLIB_FilterIIR1 functions is shown in the following example. The filter uses the above-calculated coefficients:

```c
#include "gdflib.h"

static frac16_t f16Result;
static frac16_t f16InX;
static GDFLIB_FILTER_IIR1_T_F32 sFilterParam;

void Isr(void);

void main(void)
{
    sFilterParam.sFltCoeff.f32B0 = FRAC32(0.245237275252786 / 2.0);
    sFilterParam.sFltCoeff.f32B1 = FRAC32(0.245237275252786 / 2.0);
    sFilterParam.sFltCoeff.f32A1 = FRAC32(-0.509525449494429 / -2.0);

    GDFLIB_FilterIIR1Init_F16(&sFilterParam);
    f16InX = FRAC16(0.1);
}

/* periodically called function */
void Isr(void)
{
    f16Result = GDFLIB_FILTER_IIR1_F16(f16InX, &sFilterParam);
}
```
2.2 GDFLIB_FilterIIR2

This function calculates the second-order direct-form 1 IIR filter.

For a proper use, it is recommended that the algorithm is initialized by the GDFLIB_FilterIIR2Init function, before using the GDFLIB_FilterIIR2 function. The GDFLIB_FilterIIR2Init function initializes the buffer and coefficients of the second-order IIR filter.

The GDFLIB_FilterIIR2 function calculates the second-order infinite impulse response (IIR) filter. The IIR filters are also called recursive filters, because both the input and the previously calculated output values are used for calculation. This form of feedback enables the transfer of energy from the output to the input, which leads to an infinitely long impulse response (IIR). A general form of the IIR filter, expressed as a transfer function in the Z-domain, is described as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1} + b_2z^{-2} + \cdots + b_Nz^{-N}}{1 + a_1z^{-1} + a_2z^{-2} + \cdots + a_Nz^{-N}}
\]

Equation 4.

where N denotes the filter order. The second-order IIR filter in the Z-domain is expressed as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1} + b_2z^{-2}}{1 + a_1z^{-1} + a_2z^{-2}}
\]

Equation 5.

which is transformed into a time-domain difference equation as follows:

\[
y(k) = b_0x(k) + b_1x(k-1) + b_2x(k-2) - a_1y(k-1) - a_2y(k-2)
\]

Equation 6.

The filter difference equation is implemented in the digital signal controller directly, as given in Equation 6 on page 22; this equation represents a direct-form 1 second-order IIR filter, as depicted in Figure 2-3.
The coefficients of the filter depicted in Figure 2-3 can be designed to meet the requirements for the second-order low-pass filter (LPF), high-pass filter (HPF), band-pass filter (BPF) or band-stop filter (BSF). The coefficient quantization error can be neglected in the case of a second-order filter due to a finite precision arithmetic. A higher-order LPF or HPF can be obtained by connecting a number of second-order filters in series. The number of connections gives the order of the resulting filter.

The filter coefficients must be defined before calling this function. As some coefficients can be greater than 1 (and lesser than 2), the coefficients are scaled down (divided) by 2.0 for the fractional version of the algorithm. For faster calculation, the A coefficients are sign-inverted. The function returns the filtered value of the input in the step k, and stores the input and output values in the step k into the filter buffer.

### 2.2.1 Available versions

This function is available in the following versions:

- **Fractional output** - the output is the fractional portion of the result; the result is within the range <-1 ; 1).

The available versions of the GDFLIB_FilterIIR2Init function are shown in the following table:

<table>
<thead>
<tr>
<th>Function name</th>
<th>Parameters</th>
<th>Result type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GDFLIB_FilterIIR2Init_F16</td>
<td>GDFLIB_FILTER_IIR2_T_F32 *</td>
<td>void</td>
<td>Filter initialization (reset) function. The parameters' structure is pointed to by a pointer.</td>
</tr>
</tbody>
</table>
The available versions of the **GDFLIB_FilterIIR2** function are shown in the following table:

<table>

<td>frac32_t</td>
<td>A2 (sign-inverted) coefficient of the IIR2 filter. Set by the user, and must be divided by -2.</td>
</tr>
</tbody>
</table>

### 2.2.4 Declaration

The available **GDFLIB_FilterIIR2Init** functions have the following declarations:

```c
void GDFLIB_FilterIIR2Init_F16(GDFLIB_FILTER_IIR2_T_F32 *psParam)
```

The available **GDFLIB_FilterIIR2** functions have the following declarations:
2.2.5 Calculation of filter coefficients

There are plenty of methods for calculating the coefficients. The following example shows the use of Matlab to set up a stopband filter with the 1000 Hz sampling frequency, 100 Hz stop frequency with 10 dB attenuation, and 30 Hz bandwidth. Maximum passband ripple is 3 dB.

```matlab
% sampling frequency 1000 Hz, stop band
Ts = 1 / 1000

% center stop frequency 100 Hz
Fc = 50

% attenuation 10 dB
Rs = 10

% bandwidth 30 Hz
Fbw = 30

% max. passband ripple 3 dB
Rp = 3

% checking order of the filter
n = buttord([2 * Ts * (Fc - Fbw / 2 Fc + Fbw / 2), 2 * Ts * [Fc - Fbw Fc + Fbw]], Rp, Rs)
% n = 2, i.e. the filter is achievable with the 2nd order

% getting the filter coefficients
[b, a] = butter(n / 2, 2 * Ts * [Fc - Fbw / 2 Fc + Fbw / 2], 'stop')

% the coefficients are:
% b0 = 0.913635972986238, b1 = -1.745585863109291, b2 = 0.913635972986238
% a0 = 1.0000, a1 = -1.745585863109291, a2 = 0.827271945972476
```

The filter response is shown in Figure 2-4.
2.2.6 Function use

The use of the GDFLIB_FilterIIR2Init and GDFLIB_FilterIIR2 functions is shown in the following example. The filter uses the above-calculated coefficients:

```c
#include "gdflib.h"

static frac16_t f16Result;
static frac16_t f16InX;
static GDFLIB_FILTER_IIR2_T_F32 sFilterParam;

void Isr(void);

void main(void)
{
    sFilterParam.sFltCoeff.f32B0 = FRAC32(0.913635972986238 / 2.0);
    sFilterParam.sFltCoeff.f32B1 = FRAC32(-1.745585863109291 / 2.0);
    sFilterParam.sFltCoeff.f32B2 = FRAC32(0.913635972986238 / 2.0);
    sFilterParam.sFltCoeff.f32A1 = FRAC32(-1.745585863109291 / -2.0);
    sFilterParam.sFltCoeff.f32A2 = FRAC32(0.827271945972476 / -2.0);
    GDFLIB_FilterIIR2Init_F16(&sFilterParam);
    f16InX = FRAC16(0.1);
}

/* periodically called function */
void Isr(void)
{
    f16Result = GDFLIB_FilterIIR2_F16(f16InX, &sFilterParam);
}
```
2.3 GDFLIB_FilterIIR3

This function calculates the third-order direct-form 1 IIR filter.

For a proper use, it is recommended to initialize the algorithm by the GDFLIB_FilterIIR3Init function before using the GDFLIB.FilterIIR3 function. The GDFLIB_FilterIIR3Init function initializes the buffer and coefficients of the third-order IIR filter.

The GDFLIB_FilterIIR3 function calculates the third-order infinite impulse response (IIR) filter. The IIR filters are also called recursive filters because both the input and the previously calculated output values are used for calculation. This form of feedback enables the transfer of energy from the output to the input, which leads to an infinitely long impulse response (IIR). A general form of the IIR filter (expressed as a transfer function in the Z-domain) is described as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2} + \ldots + b_N z^{-N}}{1 + a_1 z^{-1} + a_2 z^{-2} + \ldots + a_N z^{-N}}
\]

Equation 7.

where N denotes the filter order. The third-order IIR filter in the Z-domain is expressed as follows:

\[
H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2} + b_3 z^{-3}}{1 + a_1 z^{-1} + a_2 z^{-2} + a_3 z^{-3}}
\]

Equation 8.

which is transformed into a time-domain difference equation as follows:

\[
y(k) = b_0 x(k) + b_1 x(k-1) + b_2 x(k-2) + b_3 x(k-3) - a_1 y(k-1) - a_2 y(k-2) - a_3 y(k-3)
\]

Equation 9.

The filter difference equation is implemented in the digital signal controller directly, as given in Equation 9 on page 27. This equation represents a direct-form 1 third-order IIR filter, as depicted in Figure 2-5.
The coefficients of the filter depicted in Figure 2-5 can be designed to meet the requirements for the third-order low-pass filter (LPF) or high-pass filter (HPF). The coefficient quantization error can be neglected in the case of a third-order filter due to a finite precision arithmetic. A higher-order LPF or HPF can be obtained by connecting a number of third-order filters in series. The number of connections gives the order of the resulting filter.

Define the filter coefficients before calling this function. As some coefficients can be greater than 1 (and lesser than 4), the coefficients are scaled down (divided) by 4.0 for the fractional version of the algorithm. For a faster calculation, the A coefficients are sign-inverted. The function returns the filtered value of the input in the step k, and stores the input and output values in the step k into the filter buffer.

### 2.3.1 Available versions

This function is available in the following versions:

- **Fractional output** - the output is the fractional portion of the result; the result is within the range $<-1; 1>$.

The available versions of the GDFLIB_FilterIIR3Init function are shown in the following table:

<table>
<thead>
<tr>
<th>Function name</th>
<th>Parameters</th>
<th>Result type</th>
<th>Description</th>
</tr>
</thead>
<tbody>

### 2.3.4 Declaration

The available GDFLIB_FilterIIR3Init functions have the following declarations:

```c
void GDFLIB_FILTER_IIR3Init_F16(GDFLIB_FILTER_IIR3_T_F32 *psParam)
```
The available `GDFLIB_FilterIIR3` functions have the following declarations:

```c
frac16_t GDFLIB_FilterIIR3_F16(frac16_t f16InX, GDFLIB_FILTER_IIR3_T_F32 *psParam)
```

### 2.3.5 Calculation of filter coefficients

There are plenty of methods for calculating the coefficients. The following example shows the use of Matlab to set up a high-pass filter with the 10000 Hz sampling frequency and 200 Hz stop frequency with 60 dB attenuation. The ripple is 3 dB at the cut-off frequency of 2000 Hz.

```matlab
% sampling frequency 10000 Hz, high pass
Ts = 1 / 10000

% cut-off frequency 2 KHz
Fc = 2000

% attenuation 60 dB
Rs = 60

% stop frequency 200 Hz
Fs = 200

% max. passband ripple 3 dB
Rp = 3

% checking order of the filter
n = buttord(2 * Ts * Fc, 2 * Ts * Fs, Rp, Rs)
% n = 3, i.e. the filter is achievable with the 3rd order

% getting the filter coefficients
[b, a] = butter(n, 2* Ts * Fc, 'high')
% the coefs are:
% b0 = 0.256915601248463, b1 = -0.770746803745390, b2 = 0.770746803745390,
% b3 = -0.256915601248463
% a0 = 1.0000, a1 = -0.577240524806303, a2 = 0.421787048689562, a3 = -0.056297236491843
```

The filter response is shown in Figure 2-6.
2.3.6 Function use

The use of the `GDFLIB_FilterIIR3Init` and `GDFLIB_FilterIIR3` functions is shown in the following example. The filter uses the above-calculated coefficients:

```c
#include "gdflib.h"

static frac16_t f16Result;
static frac16_t f16InX;
static GDFLIB_FILTER_IIR3_T_F32 sFilterParam;

void Isr(void);

void main(void)
{
    sFilterParam.sFltCoeff.f32B0 = FRAC32(0.256915601248463 / 4.0);
    sFilterParam.sFltCoeff.f32B1 = FRAC32(-0.770746803745390 / 4.0);
    sFilterParam.sFltCoeff.f32B2 = FRAC32(0.770746803745390 / 4.0);
    sFilterParam.sFltCoeff.f32B3 = FRAC32(-0.256915601248463 / 4.0);
    sFilterParam.sFltCoeff.f32A1 = FRAC32(-0.577240524806303 / -4.0);
    sFilterParam.sFltCoeff.f32A2 = FRAC32(0.421787048689562 / -4.0);
    sFilterParam.sFltCoeff.f32A3 = FRAC32(-0.056297236491843 / -4.0);

    GDFLIB_FilterIIR3Init_F16(&sFilterParam);
    f16InX = FRAC16(0.1);
}

/* periodically called function */
void Isr(void)
{
    // Code...
}
```

Figure 2-6. Filter response
2.4 GDFLIB_FilterIIR4

This function calculates the fourth-order direct-form 1 IIR filter.

For a proper use, it is recommended to initialize the algorithm by the GDFLIB_FilterIIR4Init function, before using the GDFLIB_FilterIIR4 function. The GDFLIB_FilterIIR4Init function initializes the buffer and coefficients of the fourth-order IIR filter.

The GDFLIB_FilterIIR4 function calculates the fourth-order infinite impulse response (IIR) filter. The IIR filters are also called recursive filters, because both the input and the previously calculated output values are used for calculation. This form of feedback enables the transfer of energy from the output to the input, which leads to an infinitely long impulse response (IIR). A general form of the IIR filter (expressed as a transfer function in the Z-domain) is described as follows:

\[ H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1} + b_2z^{-2} + \ldots + b_Nz^{-N}}{1 + a_1z^{-1} + a_2z^{-2} + \ldots + a_Nz^{-N}} \]

**Equation 10.**

where N denotes the filter order. The fourth-order IIR filter in the Z-domain is expressed as follows:

\[ H(z) = \frac{B(z)}{A(z)} = \frac{b_0 + b_1z^{-1} + b_2z^{-2} + b_3z^{-3} + b_4z^{-4}}{1 + a_1z^{-1} + a_2z^{-2} + a_3z^{-3} + a_4z^{-4}} \]

**Equation 11.**

which is transformed into a time-domain difference equation as follows:

\[ y(k) = b_0x(k) + b_1x(k-1) + b_2x(k-2) + b_3x(k-3) + b_4x(k-4) - a_1y(k-1) - a_2y(k-2) - a_3y(k-3) - a_4y(k-4) \]

**Equation 12.**

The filter difference equation is implemented directly in the digital signal controller, as given in Equation 12 on page 32; this equation represents a direct-form 1 fourth-order IIR filter, as shown in Figure 2-7.
Figure 2-7. Direct-form 1 fourth-order IIR filter

The coefficients of the filter shown in Figure 2-7 can be designed to meet the requirements for the fourth-order low-pass filter (LPF), high-pass filter (HPF), band-pass filter (BPF), or band-stop filter (BSF). The coefficient quantization error can be ignored in the case of a fourth-order filter due to a finite precision arithmetic. A higher-order LPF or HPF can be obtained by connecting a number of fourth-order filters in series. The number of connections gives the order of the resulting filter.

Define the filter coefficients before calling this function. As some coefficients can be greater than 1 (and lesser than 8), the coefficients are scaled down (divided) by 8.0 for the fractional version of the algorithm. For a faster calculation, the A coefficients are sign-inverted. The function returns the filtered value of the input in step k, and stores the input and output values in the step k into the filter buffer.

2.4.1 Available versions

This function is available in the following versions:

- Fractional output - the output is the fractional portion of the result; the result is within the range <-1 ; 1>.
The available versions of the GDFLIB_FilterIIR4Init function are shown in the following table:

### 2.4.4 Declaration

The available `GDFLIB_FilterIIR4Init` functions have the following declarations:

```c
void GDFLIB_FilterIIR4Init_F16(GDFLIB_FILTER_IIR4_T_F32 *psParam)
```

The available `GDFLIB_FilterIIR4` functions have the following declarations:

```c
frac16_t GDFLIB_FilterIIR4_F16(frac16_t f16InX, GDFLIB_FILTER_IIR4_T_F32 *psParam)
```

### 2.4.5 Calculation of filter coefficients

There are plenty of methods for the coefficients calculation. The following example shows the use of Matlab to set up a band-pass filter with the 10000 Hz sampling frequency, 1000 Hz pass frequency, and 250 Hz bandwidth. The maximum passband ripple is 3 dB, and the attenuation is 20 dB.

```matlab
% sampling frequency 10000 Hz, band pass
Ts = 1 / 10000

% center pass frequency 2000 Hz
Fc = 2000

% attenuation 20 dB
Rs = 20

% bandwidth 250 Hz
Fbw = 250

% max. passband ripple 3 dB
Rp = 3

% checking order of the filter
n = buttord(2 * Ts * [Fc - Fbw /2 Fc + Fbw / 2], 2 * Ts * [Fc - Fbw Fc + Fbw], Rp, Rs)
% n = 4, i.e. the filter is achievable with the 4th order

% getting the filter coefficients
[b, a] = butter(n / 2, 2 * Ts * [Fc - Fbw /2 Fc + Fbw / 2])
% the coefs are:
% b0 = 0.005542717210281, b1 = 0, b2 = -0.011085434420561, b3 = 0, b4 = 0.005542717210281
```
The filter response is shown in Figure 2-8.

![Figure 2-8. Filter response](image)

### 2.4.6 Function use

The use of the GDFLIB_FilterIIR4Init and GDFLIB_FilterIIR4 functions is shown in the following example. The filter uses the above-calculated coefficients:

```c
#include "gdflib.h"

static frac16_t f16Result;
static frac16_t f16InX;
static GDFLIB_FILTER_IIR4_T_F32 sFilterParam;

void Isr(void);

void main(void)
{
    sFilterParam.sFltCoeff.f32B0 = FRAC32(0.005542717210281 / 8.0);
    sFilterParam.sFltCoeff.f32B1 = FRAC32(0.0 / 8.0);
    sFilterParam.sFltCoeff.f32B2 = FRAC32(-0.011085434420561 / 8.0);
    sFilterParam.sFltCoeff.f32B3 = FRAC32(0.0 / 8.0);
    sFilterParam.sFltCoeff.f32B4 = FRAC32(0.005542717210281 / 8.0);
    sFilterParam.sFltCoeff.f32A1 = FRAC32(-1.171272075750262 / -8.0);
    sFilterParam.sFltCoeff.f32A2 = FRAC32(2.122554479822350 / -8.0);
    sFilterParam.sFltCoeff.f32A3 = FRAC32(-1.047780658093187 / -8.0);
    sFilterParam.sFltCoeff.f32A4 = FRAC32(0.800802646665706 / -8.0);
    GDFLIB_FilterIIR4Init_F16(&sFilterParam);
```
```c
f16InX = FRAC16(0.1);
}

void Isr(void)
{
    f16Result = GDFLIB_FilterIIR4_F16(f16InX, &sFilterParam);
}
```

## 2.5 GDFLIB_FilterMA

The GDFLIB_FilterMA function calculates a recursive form of a moving average filter. For a proper use, it is recommended that the algorithm is initialized by the GDFLIB_FilterMAInit function, before using the GDFLIB_FilterMA function.

The filter calculation consists of the following equations:

\[
\text{acc}(k) = \text{acc}(k - 1) + x(k)
\]

**Equation 13.**

\[
y(k) = \frac{\text{acc}(k)}{n_p}
\]

**Equation 14.**

\[
\text{acc}(k) \leftarrow \text{acc}(k) - y(k)
\]

**Equation 15.**

where:

- \( x(k) \) is the actual value of the input signal
- \( \text{acc}(k) \) is the internal filter accumulator
- \( y(k) \) is the actual filter output
- \( n_p \) is the number of points in the filter window

The size of the filter window (number of filtered points) must be defined before calling this function, and must be equal to or greater than 1.

The function returns the filtered value of the input at step \( k \), and stores the difference between the filter accumulator and the output at step \( k \) into the filter accumulator.

### 2.5.1 Available versions

This function is available in the following versions:
• Fractional output - the output is the fractional portion of the result; the result is within the range <-1 ; 1). The parameters use the accumulator types.

The available versions of the GDFLIB_FilterMAInit function are shown in the following table:

Table 2-9. Function versions

</tbody>
</table>
| u16Sh            | uint16_t   | Number of samples for averaging filtered points (size of the window) defined as a number of shifts: \[ n_p = 2^{u16Sh} \]
\[ u16Sh = \log_2 n_p \]
The parameter is a 16-bit unsigned integer type within the range <0 ; 15>. Set by the user.
2.5.3 Declaration

The available GDFLIB_FilterMAInit functions have the following declarations:

```c
void GDFLIB_FilterMAInit_F16(frac16_t f16InitVal, GDFLIB_FILTER_MA_T_A32 *psParam)
```

The available GDFLIB_FilterMA functions have the following declarations:

```c
frac16_t GDFLIB_FilterMA_F16(frac16_t f16InX, GDFLIB_FILTER_MA_T_A32 *psParam)
```

2.5.4 Function use

The use of GDFLIB_FilterMAInit and GDFLIB_FilterMA functions is shown in the following example:

```c
#include "gdflib.h"

static frac16_t f16Result;
static frac16_t f16InitVal, f16InX;
static GDFLIB_FILTER_MA_T_A32 sFilterParam;

void Isr(void);

void main(void)
{
    f16InitVal = FRAC16(0.0);                /* f16InitVal = 0.0 */
    /* Filter window = 2 ^ 2 = 4 points */
    sFilterParam.u16Sh = 2;
    GDFLIB_FilterMAInit_F16(f16InitVal, &sFilterParam);
    f16InX = FRAC16(0.8);
}

/* periodically called function */
void Isr(void)
{
    f16Result = GDFLIB_FilterMA_F16(f16InX, &sFilterParam);
}
```
Appendix A

A.1 bool_t

The bool_t type is a logical 16-bit type. It is able to store the boolean variables with two states: TRUE (1) or FALSE (0). Its definition is as follows:

typedef unsigned short bool_t;

The following figure shows the way in which the data is stored by this type:

To store a logical value as bool_t, use the FALSE or TRUE macros.

A.2 uint8_t

The uint8_t type is an unsigned 8-bit integer type. It is able to store the variables within the range <0 ; 255>. Its definition is as follows:

typedef unsigned char int8_t;

The following figure shows the way in which the data is stored by this type:

Table A-2. Data storage

A.4 uint32_t
The \texttt{uint32\_t} type is an unsigned 32-bit integer type. It is able to store the variables within the range \textless 0 ; 4294967295\textgreater. Its definition is as follows:

\begin{verbatim}
typedef unsigned long uint32\_t;
\end{verbatim}

The following figure shows the way in which the data is stored by this type:

\textbf{Table A-4. Data storage}

`Table continues on the next page...`

GDFLIB User's Guide, Rev. 2, 10/2015
To store a real number as `frac16_t`, use the `FRAC16` macro.

### A.10 frac32_t

The `frac32_t` type is a signed 32-bit fractional type. It is able to store the variables within the range <-1 ; 1). Its definition is as follows:

```c
typedef long frac32_t;
```

The following figure shows the way in which the data is stored by this type:

<table>
<thead>
<tr>
<th>Value</th>
<th>31 24 23</th>
<th>16 15</th>
<th>8 7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.9999999995</td>
<td>7 F</td>

<td>C D</td>
<td>B 2</td>
<td>D F</td>
<td>3 4</td>
</tr>
</tbody>
</table>

To store a real number as `frac32_t`, use the `FRAC32` macro.

### A.11 acc16_t

The `acc16_t` type is a signed 16-bit fractional type. It is able to store the variables within the range <-256 : 256). Its definition is as follows:

```c
typedef short acc16_t;
```

The following figure shows the way in which the data is stored by this type:
Table A-11. Data storage

</tbody>
</table>

To store a real number as acc16_t, use the ACC16 macro.

A.12 acc32_t

The acc32_t type is a signed 32-bit accumulator type. It is able to store the variables within the range <-65536 ; 65536). Its definition is as follows:

typedef long acc32_t;

The following figure shows the way in which the data is stored by this type:

Table A-12. Data storage

<table>

</tbody>
</table>

To store a real number as acc32_t, use the ACC32 macro.
A.13 FALSE

The **FALSE** macro serves to write a correct value standing for the logical FALSE value of the **bool_t** type. Its definition is as follows:

```c
#define FALSE    ((bool_t)0)
```

```c
#include "mlib.h"
static bool_t bVal;
void main(void)
{
    bVal = FALSE;               /* bVal = FALSE */
}
```

A.14 TRUE

The **TRUE** macro serves to write a correct value standing for the logical TRUE value of the **bool_t** type. Its definition is as follows:

```c
#define TRUE     ((bool_t)1)
```

```c
#include "mlib.h"
static bool_t bVal;
void main(void)
{
    bVal = TRUE;               /* bVal = TRUE */
}
```

A.15 FRAC8

The **FRAC8** macro serves to convert a real number to the **frac8_t** type. Its definition is as follows:

```c
#define FRAC8(x) ((frac8_t)((x) < 0.9921875 ? ((x) >= -1 ? (x)*0x80 : 0x80) : 0x7F))
```

The input is multiplied by 128 (=2^7). The output is limited to the range <0x80 ; 0x7F>, which corresponds to <-1.0 ; 1.0-2^-7>.
#include "mlib.h"
static frac8_t f8Val;
void main(void)
{
    f8Val = FRAC8(0.187); /* f8Val = 0.187 */
}

A.16 FRAC16

The FRAC16 macro serves to convert a real number to the frac16_t type. Its definition is as follows:

#define FRAC16(x) ((frac16_t)((x) < 0.999969482421875 ? ((x) >= -1 ? (x)*0x8000 : 0x8000) : 0x7FFF))

The input is multiplied by 32768 (=2^{15}). The output is limited to the range <0x8000 ; 0x7FFF>, which corresponds to <-1.0 ; 1.0-2^{-15}>.

#include "mlib.h"
static frac16_t f16Val;
void main(void)
{
    f16Val = FRAC16(0.736); /* f16Val = 0.736 */
}

A.17 FRAC32

The FRAC32 macro serves to convert a real number to the frac32_t type. Its definition is as follows:

#define FRAC32(x) ((frac32_t)((x) < 1 ? ((x) >= -1 ? (x)*0x80000000 : 0x80000000) : 0x7FFFFFFF))

The input is multiplied by 2147483648 (=2^{31}). The output is limited to the range <0x80000000 ; 0x7FFFFFFF>, which corresponds to <-1.0 ; 1.0-2^{-31}>.
A.18 ACC16

The ACC16 macro serves to convert a real number to the acc16_t type. Its definition is as follows:

```c
#define ACC16(x) ((acc16_t)((x) < 255.9921875 ? ((x) >= -256 ? (x)*0x80 : 0x8000) : 0x7FFF))
```

The input is multiplied by 128 (=2^7). The output is limited to the range <0x8000 ; 0x7FFF> that corresponds to <-256.0 ; 255.9921875>.

```c
#include "mlib.h"
static acc16_t a16Val;
void main(void)
{
    a16Val = ACC16(19.45627); /* a16Val = 19.45627 */
}
```

A.19 ACC32

The ACC32 macro serves to convert a real number to the acc32_t type. Its definition is as follows:

```c
#define ACC32(x) ((acc32_t)((x) < 65535.999969482421875 ? ((x) >= -65536 ? (x)*0x8000 : 0x80000000) : 0x7FFFFFFF))
```

The input is multiplied by 32768 (=2^15). The output is limited to the range <0x80000000 ; 0x7FFFFFFF>, which corresponds to <-65536.0 ; 65536.0-2^-15>.

```c
#include "mlib.h"
static acc32_t a32Val;
void main(void)
{
    a32Val = ACC32(-13.654437); /* a32Val = -13.654437 */
}
